Lafily, the quantity of water frozen by different de. Quamety grees of cold is bs no means dieetly in proportion to of ice

Q $\mathrm{q}_{2}$
the formed : not always in yroper. tion to the
(A) See NI. Bauche's Olffervations on the Norlh or Ice Sea, where he gives an account of various attempts degrec of made to reach the pole, from which he is convinced that the fea is there open, and that the thing is praticable. cold. M. de Pages, in his Travels, Vol. III. informs us, that he wifhed to take a voyage to the north feas, for the purpofe of bringing under one view the various obflacles from the ice, which have inmpeded the refeatches of navigators in thofe feas ; and for this purpofe he was prepared to continue his vogage to as high a latitude as polible, and hat he might be able to fay whether any land actualiy exits noth from the coatt of Greenland. He failed withont any encouragement from his court (France) on the 16 th of April 1775 from the Texel, in a Dutch veffel bound to Spitbergen. On the 1 Gth of May fhe was a little way north of $31^{\circ}$, the higheft la:itude the reached.
"Being now (fays the author) lefs than 180 leagnes from the ple, the idea of fo fmall a diflance ferved effefually to awaken my curiolity. Had I been able to infpire my fellow-voyagers with fentiments fimilar ta iny own, the winds and currents which at this moment carried us faft towards the pole, a reegion hitherto deemed innaccefiible to the eye of mortals, would have been faluted with acciamations of joy. This quarter, however, is not the moft eligible for fich an enterprize : here the feal lying in the vicinity of thofe banks of ice, fin frequent a little farther to the weft, is much too confined. Neverthelefs, when I confider the very changeable nature of the fhoals under whatever form, even in their moft crowded and compant fate; thei: confant changes and concufions which break and detach them from one another, and the varions expedients that may be employed tur freeing the fhip from confinement, as well as for obviating impending danger-I ana far from viewing a werHge to the pole ats a chimerical idea."

## 1 OL

 the interfity of the cold, but likewife to the duration of it. Thus, large bodies of water are never frozen in any temperature of forst duration, though flallow bodics often aie. Our author obferves, that as much of a given mafs of water was frozen in five hours of a temperature $12^{\circ}$ below the frecring point, as was frozen in one hour of the emperature $50^{\circ}$ below it ; and that loag duration of the remperature between 20 and $3^{2}$ is, with regard to the congelation of water, equivalent to intenfity of cold fuch as is marked 0 and below $o$ in Fahrenheit, but of fhort duration. See Cold and Con-hemifphere which is quite otherwife in the fouthern, from reafons not yet known or difcovered by us; or we mult think that Cramtz and others are miftaken, who fuppofe the ice floating in the ocean to be fait.
" The next remark is, That falt water does not freere at all; or if it does, it contains briny particles. M. de Buffon tells us, 'that the fea between Nova Zemblat and Spitzbergen, under the $79^{\circ}$ north latitude, does not freeze, as it is there confiderably broad: and that it is not to be apprehended to find the fea frozen not even under the pole itfelf; for inded there is no example of having ever found a fea wholly frozen over, and at a confiderable diftance from the thores; that the only infance of a fea entirely frozen is that of the Black Sca, which is narrow and not very falt, and receives a great many rivers coming from northern regions, and bringing downice that this fea therefore fometimes fieezes to fuch a degree, that its whole furface is congealed to a confiderable thicknefs ; and, if the hiftorians are to be credited, was frozen, in the reign of the emperor Confantine Copronymus, 30 ells thick, not including 20 ells of fuow which was lying on the ice. This fact, continues M. de Buffon, feemis to be exaggerated : but it is trie, however, that it freezes almol every winter; whilft the high feas which are 1000 leagues nearer towards the pole do not freeze; which can have no other eaule than the difference in faltnefs, and the little quantity of ice carried out by rivers, if compared to the enormous quantity of ice which the rivers convey into the Black Sea.' M. de Buffon is not miftaken when he mentions that the Black Sea frequently freezes. Strabo informs us, that the penple near the Bofphorus Cimmerius pafs this fea in carts from Panticapxum to Planagorea; and that Neoptolemus, a general of Mithridates Eupator, won a battle with his cavalry cn the ice on the very fpot where he gained a naval victory in the fummer. Marcellinus Comes relates, that under the confulhip of Vincentius and Fravita, in the year 40 after Chrilt, the whole furface of the Pontus was covered with ice, and that the ice in fpring was carried through the Propontis, during 30 days, like mountains. Zonaras mentions the fea between Conitantinople and Scutari frozen to fuch a degree in the reign of Conftantine Copronymus, that even loaded carts paffed over it. The prince Demetrius Cante. mir oblerves, that in the year $1620-1$ there happencd fo intenfe a froft, that the people walked over the ice from Conftantinople to Ifkodar. All thefe infances contirm M. de Buffon's afiertion. But as this great natural hiftorian fays that the Black Sea is the only intance of a fea being entirely frozen (B), I mult beg leave to diffent from him ; for it is cqually well attefted that the Baltic is fometimes cntirely frozen, according to Cafpar Schutz's account. In the year 1426 , the wintet was fo fevere, that penple travelled orer the ice acrofs the Baltic from Dantzic to Lubeck; and the fea was likewife paffable from Denmark to Mecklenburgh: and in the year 1459 the whole Baltic was entirely frozen, fo that perfons travelled, both on foot and on horfeback, over
(5) In the year 860 the Mediterranean was covered with ice, fo that people travelled in carts and horfes acrofs the lonian Sea to Venice ; (Hermannus Contratus ap. Pifor. Script. t. ii. p. 236.). And in 1234 the Mediterratacan was again thus frozen, that the Venetian merchants travelled over the ice with their merchandife to what place they chofe; Matho. Paris, P. $7^{8 .}$

## P O L <br> [ 309 <br> PO I

"Now, if fis or fever: degrecs of latitude, enntanirr
over ice from Denmark to the Vendick Hans-towne, called Lubock, Wifmar, Rofock, and Stralfunt, which had never huppencd before ; people likewife travelled acrofs the Baltic over ice fiom Reval in Entand to Denmark and to Sweden, and back again, without the leaft danger (c). But according to simmund Frode, cven the great German Ocean betwcen 1)enmark and Norway was frozen in the year 1048 , fo that the wolves frequently ran over the icc from one country to the other. 'The great northern ocean is likewife moft ce:tainly fometimes frozen to a great dillance from any land: for Muller relates, that in the year 1715 a CLf fack called Alarkoff, with fome other perfons, was f-nt ly the Rufian government to explore the north fea; hut finding it next to impofible to make any progrefs during fummer on account of the valt quantities of ice conmonly filling this ocean, he at latt determined to try the experiment during winter. He therefore touk feveral fledges drawn according to the cultom of the country by dogs, which commonly go about So or 100 verfts per day, 105 of which make a degree; and on March the 15 th, old ftyle, wilh this caravan of nine perfons, he left the fhores of Siberia at the mouth of the river Yana, under the $71^{\circ}$ of north latitude, and proceeded for feven days together northward, fo that he had reached at leaft the $77^{\circ}$ or $78^{\circ}$ north latitude, when he was flopped by the icc, which there began to appear in the flape of prodigious mountains. He climbed up to the top of fome of thefe ice-mountains: but feeing from thence no land, nor any thing except ice as far as the eye could reach, and having befides no more food for his dogs left, he thought it very necelfary to return ; which he with great difficulty petformed, on A pril the $3^{\text {d }}$, as feveral of the dogs, which had perifhed for want, were employed to fupport thofe that remaiied alive. Thefe facts, I believe, will convince the unprejudiced reader, that there are other feas befides the Black Sea which really do freeze in winter, and that the ice carried down the rivers could not at leaft freeze the German Ocean between Norway and Denmark, becaufe the rivers there are fo fimall, and bear a very inconfiderable proportion to the immenfe ocean, which, accordirg to experiments made by Mr Wilke, is very falt, though near the land, in the Swedilh harboar of Landferuna.
from $3^{\text {th }}$ in 420 fea-miles, ate not to be reckoned : groat diftance from the land, I do not know in matas manner to arguc, becaufe no diftance whatfoever will $b=$ reckoned tar finm any limd. Nay, if the Coffack Markoff, being mounted on one of the highent icemountains, may be allowed to fee at leaft to the diftarice of 20 le. gincs, the extemt alluded to above muft then be increated to +80 Englifinfer-miles; which certainly is very confiderable, and makes it more than probatile that the ocean is frozen in winter, in ligh are hern latitudes, even as far as the pole. Peclides, it invalidates the argument which thefe gentlemen wifh to infer frem thence that the ocean does not fieceac in ligg latitudes, efpecially yubere :bere is a confiderable lroad fia; for we lave flown infances to the contrary.
" Eut M. de lhuffon fpeaks of ice carried down the ivers into the northern ocean, and forming there theie immenfe quantities of ice. 'And in cafe, fayc he, we would fuppofe, againt all probability, that at the pole it could be fo cold as to congeal the furface of the fa, it would remain equally incompreienfible how thefe enormous floating ice-maffes could be formed if they had not land for a point to $f_{i x}$ on, and from whence they are fevered by the beat of the fun. The two fhips which the India Company fent in 1739 upon the difcovery of the auftral lands, found ice in $43^{\circ}$ or $4^{8^{\circ}}$ fouth latitude, but at no great diftance from land; which they difcovered, without being able to tapproach it. This ice, therefore, muft have enme from the interior parts of the lands near the fouth fole; and we maft conjenure, that it follows the courfe of feveral large rivers, walhing thefe unknown lands, in the fame manner as the rivers Oby, the Yerifea, and the other great rivers which fall into the northen fea, carry the icemaffes, which flop up the Araits of Waigats for the greater part of the year, and render the Tartanian fea inaccelfible upon this courfe.' Before we can allow the analogy betweel the tivers Oby, Yenifea, and the seft which fail into the nor thern ocean, and thofe coming from the interior parts of the auftral lands, let us compare the fituation of both countries, fuppofirg the auftal lands reaily to exift. The Oby, Yenifea, and the reft of the Siberian rivers, falling down into the northern
 nomumert. Cimbr. t. i. p. 1392 .

In ${ }_{3}$ go6 the Baltic was, during fnurteen weeks, coverct with ice between all the Danifh and Swedih iflands. (Ludwis. reliquite, MSS. t. is. P. 170.)

In 1323 there was a road for foot-pafengers and horfemen over the ice on the Baltic during fix weeks. (id. ilid.)

In $13+9$, people walking over the ice from Straifund to Denmark. (Incerti aut. cit. ap. I.wdweig. t. ix. p. 18 8 .)
In 1408 the whole fea between Gothland and Oclancl, and likewife between Roftock and Gezoer, was frezer. (id. ibid.)

In It 23 the ice bore riding from Prufin to Lubec. (Cruntzii Foandal. i. x. c. 40.) The whole fea was covered with ice from Mecklenburg to Denmark. (Inceri. aud. af. Ludevig. t. is. p. 125.)

In ${ }^{1461}$ (fays Nichol. NHurfchallas in Anmal. Herui. ap. Wefphal. t. i. p. 261.) Tanta erat hyems, ut concreto gelu oceano plaufris millia paffum fupia CCC me:ces ad ultimam Thylen (iceland) et Orcades velicrcntur - Germania tota pene bruma.

In 1545 the fea betwaen Roftock and Denmark, and likewife between Fionia and Sealand, was thus frozen, that the people travelled over the ice on foot, with fledges to which horfes and oach were put. (Anomyn. af. Ludrvis. t. ix. п. ${ }^{176 .)}$
In $129+$ the Cattegat or fea between Notway and Denmark was frozen; that from Oxflo in Norway, they could travcl on it to Jutland. (Strelozu Chron. Juhia'and, S. 148.)

## 1OL

ne: them ocean, have their fources in $48^{\circ}$ and $50^{\circ}$ rorth intiude, where the climate is mild and capable of producing ecrn of all kinds. All the rivers of this great continent increafing, thefe great rivers have likewife the ir frurces in mild and temperate climates, and the main direation of their courfe is from fouth to north; and the coalt of the northern ocean, not reckoning its finuolities, runs in general weft and eaft. The fmall rivers which are !ormed in high latitudes have, properly fpeaking, no fources, no ferings, but carry off only tire wa. ters sencrated by the melting of frow in fpring, and by the fall of rain in the fhert fummer, and are for the greatelt part dry in autumn. And the reafon of th is phenomenon is wions, alter confidering the comitution of the eath in thefe liegh northern climates. At Yakutk, in about $G_{2}{ }^{\circ}$ north latitude, the 101 is etermally frozen, even in the height of fimmer, at the depth of three feet from the fimace. In the years 1685 and 1686, an attompt was made to dig a weil; and a man, by greatand inderatigable labour, continued during two fummer feafons, and fincceeded to far in this laborious talk, that he at lalt raached the depth of gi feet; Lut the whole earth at this dep:l wats frozen, and he met with ro water ; which forced him to defift fiem fo fruitlefs an attempt. And it is eafy to infer from hence how imponitie it is that frings thould be formed in the womb of am elcrnally frozen foil.
"" The argument, therefore, is now reduced to this, That fout zeater does not freese at all; or, if it does, the i.e contuins luriny pariclis. But we have already prodiced numbcriefs intances, that the fea does freeze; nay, Crantz allows, that the flut pices of iee are fili, lecaule thay zucre congeale from fen-aciater. Whe beg leave to ald a few decifive facts relative to the freezing of the fea. Jarcntz obferves in the year 1595, September the 16th, the fea froze two fingers thick, and next night the ice was as thick again. This hapfoned in the midft of September; what effer then muit the intenfe frolt of a night in January not produce? When Captain Jimes wintered in Carleton's Inc, the feal froze in the middle of December 1631. It remains, therefore, only to examine, whether the ice formed in the fea mult neceffarily contain briny particles. And here I find myfelf in a very difagree. able dilemma; for during the intenie frof of the winter in 1776 , two fets of experiments were mate on the freering of fervater, and publithed, contradifing one another almot in every material point. The one by Mr Edward Nairne F. R. S. an ingenious and accurate oberwer; the cther by Dr Higgins, who reads lectures on chemitry and natural philnfophy, and confechenty noult be fuppofed to be well acquainted with the fubject. I will therefne fitil ventare to conficier the queftion as undecided by thefe experiments, and content myfelf with making a few obfervations on them : but frevioufly I beg leave to make this geneyal remark, that thote who are well acquainted with mechanics, chemifry, natural philofophy, and the vatif.us arts which require a nice obfervation of minnte circminances, need not be informed, that an experin:ent or machine fucceeds often very well when made
upon a fmaller fcalc, but will not anfwer if undertaken at large; and vice verfa, machines and experiments executed upen a fmall fale will nct produce the effect which they certainly have whon made in a more enlar. ged manner. A few years am an experiment made on the dycing of fcarlet, did not fucceed when undertaken on a fmall fcale, whereas it produced the clefired effect when tried at a dyer's houfs with the large apparates; and it evidently confirms the above affertion, which I think I have a right to apply to the freezing of falt-water, It is therefore prolable, that the ice formed in the ocean at large, in a higher latitude, and in a more intenfe degree of cold, whereof we have no idea here, may becoinc lolid, and free from any briny particics, though a few experiments made by Dr Higgins, in his houfe, on the freczing of falt-water, produced only a loofe fpongy ice flled with briny particles.
"The ice formed of fer-water by Mr Nairne was R very lard, $3 \frac{1}{2}$ inches long, and 2 inches in diameter: : it follow; from thence, that the wafhing the outide of this ice in frefh water, could not affet the infide of a larl fiece of ice. This ice when melted yielded freth water, which was fpecifically lighter than water which was :t mixture of :an and fnow-water, and next in lightneis to diftiled water. Had the ice thus obtained not been frefh, the refidum of the fea-water, after this ice had been taken out, could not have been fpectically heavier than fea-water, which, however, was the cafe in Mr Nairne's experiment. It feems, therefore, in my opinion, evident from hence, that falt-water does freeze, and has no other briny particles than what adhere to its outfide. All this perfectly agrees with the curicus fact related by Mr Adanfon ( D ), who had brought to France two bottles of fea-vater, taken up in different parts of the ocean, in order to examine it, and to compare its faltnces, when more at leifure; but both the bottles containing the falt-water were burf by being frozen, and the water produced from meling the ice proved perfectly freth. This fact is fo failly tlated, and fo very matural, that I cannot conccive it is necoflary to fuppofe, with. out the leaft foundation for it, that the boilles rusere changed, or that Mr. Adanfon docs not avernion the circumplanse iy zulich the fea-ruater wass thas altered upon its being diffolved: for as he exprefisly obferves the bottles to have been burf, it is obvious that the concentrated briny parts ran out, and were entirely duaned from the ice, which was formed of the freth water only.
"The ice formed by Dr Higgins from fearwater, configled of thin lamime, adbering to each ortwer readkly. Dr Higgins took cut the frozen ice from the veffels wherein he expofed the fea-water, and continued to do fo till the remaning concentrated fea-water began to form cryftals of fea-falt. Both thele expesiments, therefore, hy no means prove what the Woctor intended to infer from thence; for it was wrong to take out lich ice, which only confled of thin lamine, adhering to each other zusakly. Had he waited with patience, he would have obtained a hard ice as well as Mr Nairne, which by a more periect congelation, would have excludad

## POI [ 3 HI 1 POI

the briny particies intercented between the thin Lamina, adhering to cach cther aceakly; and would have connected the laniina, by others formed by fiefl water. The Dosor found afterwards, it is tue, thicker and fomewhat more fulid ice : but the fea-water hadd already becn fo much concentrated by repeated congelations, that it is no wonder the ice formed in it Lecame at latt brackifh : it fhould feem, then, that no conclufive arguments can be diawn from thefe experiments.

- There are two other rhjections againe the formation of the ice in the great occan. The firf? is taken from the inmenfe bulk and fize of the ice inatles formad in the ncean, which is the ciecerfa mafs of watior sue know of. Dut it has been experimentally proved, that in the midn of fummer, in the latiiudes of $55^{\circ}, 55^{\circ} 26^{\prime}$, and $64^{6}$ fouth, at 100 fathoms depth, the ther moneter food at $34^{\circ}, 34^{\circ} \%$ and $32^{\circ}$; and that in all intances, the differcuce between the temperature at top and 100 fathoms depth never excecded four degrees of Fahrenheit's thermometer, or that the temperature of the air did not differ five degrees from that of the ocean at 100 fathom deep. If we now add to this, that beyond the $71^{\circ}$ fonth the temperature of the air and ocean mult be fill colder, and that the rigours of an antaratic winter are certainly more than fufficient to cool the ocean to $28^{\circ} \frac{1}{6}$, which is requifite for congealing the aqueons particles in it; if we moreover confider, that thefe fevere frofts are continued during fix or eight months of the year, we may eafily ctriccive that there is time enough to congeal large and extenfive maffes of ice. But it is likewife ceriain, that there is more than onc way by which thofe immenfe ice maffes are formed. We fuppofe very jufly, that the ocean does Ireeze, having produced fo many inftances of it; we allow likewife, that the ice thus formed in a calm, perhaps does not exceed three or four yards in thicknefs; a form probably eften breaks fuch an ice-field, which Crantz allows to be 200 leagues one way and 80 the other; the prefiure of the broken fragments againft one ano ther frequently fets one upon the other piece, and they freeze in that manner logether; feveral fuch dotble pieces, thrown by another preflure upon one another, icim at laft large mafes of miles cstent, and ef $=0$, 40, (. 0 , and more fathoms thicknefs, or of a great bulk or height. Martens, in his defcription of Spitzbergen, remarks, that the pieces of ice caufe fo great a noife by their fhock, that the navigators in thofe regions can oaly with difficulty hear the words of thofe that ipeak; and as the ice-pieces are thrown one upon ::nother, ice-mountains are formed by it. And 1 obferved very frequently, in the years 1772 and 1773 , when wee were among the ice, maffes which had the mof crilent maks of fuch a formation, being compofed of frata of fome feet in thicknefs. This is in fome meafurc confirmed by the fate in which the Coffack Markoff found the ice at the difance of 420 miles north from the Siberian coatts. The high matfes were not found formed, as is furpected in the Second fufplement to the probalility of reaching the north pole, P. 143-145, near the land, under the high cliffs, but far out at fea; and when thefe ice mountains were climbed by Markoff, nothing but ice, and no veliges of land, appeared as far as the eye could rcach. The hish climates near the poles are lisewife fubject to heavy fails of fiow,
of fevenal yards in thicknefs, whith grow more and more compate, and by thaws and rain are formed into folid ice, which increafe the flupendous fize of th: floating ice momatain:
"'lic fecond oljoction againt the freezine of she ocean into fuch ice as is found floating in it, is taliene from the epacily of ice formad in falt water; becaule the largett malles are commonly tamearent lile crynal, with a fine blue tint, cauted by the refieainn if the fea. 'Ihis argument is very fpecious, and mieght be deemed wanfuerable by thofe who are not ufal to cold winters and their effens. lunt whofoever las $f_{p}$ ent feveral winters in countries which are fubject : intenfe frofts, will find nothing extracrdinary or dibiocult in this argument: for it is at well-knowal fat in cold counties, that the ice which covers thit lakes and rivers is often opaque, cfpecialiy whea the fro? fets in, accompanied by a fall of how ; for, in thote infances, the ice looks, before it hardens, like a dough or pafte, and when congealed it is opaque and white; however, in Spring, a rain and the thaw, followed by frofty nieglits, change the opacity and colour of the ice, and make it quite tranfparcnt and colourlefs like a cryfal: but, in cafe the thaw continucs, and it ceafes entirely to frecze, the fame tranfparent ice becomes foft and porous, and turns again entirely opaque. This I believe may be applicable to the ice feen by us in the ocean. The field-ice was commonly opaque; fome of the large mafles, probably drenched by rain, and frozen again, were tranfparent and pellucid; but the fmali fragments of loofe ice, formed by the decay of the larga maites, and foaked by long-continaed rains, we found to be porous, foft, and opactic.
"It is likewife urged as an argument ag, imet the formation of ice in the occin, that it always regnires land, in order to have a point upon which it may be fixed. Firf, I obferve, that in Mr Nairne's exporiments, the ice was generated on the farface, and was feen thooting cryfals downwaids : which cridently crinces, in my opinion, that ice is the:c formed or "generated where the intonfef cold is; as the :air foomen cools the furface than the depth of the ocean, the ise tho: ts naturall: downoard, and cools the ocear more and more, by which it is prepared for farther congelation. I fuppofe, however, that this happens always during calms, which are not nucommon in bigh latitudes, as we expericnced in the late cxpedition. Nor docs land feem atfolutiy necelfary in order to lix the ice ; for this may be cone with as mach eafe and propricty to the large ice mountains which remain ur.diitolved flcaturs in the ocean in high latitudes: or it man, perhaps, not be improper to fuppofe, that the whue polar region, from $80^{\circ}$ and upwards, in the fonthern hemifphere, temains a foldt ice for fevern! yoars tugether, to winich yealy a new circle of ice is adied, and of which, howerer, part is broken off by the winds and the return of the mild feafor. Wherever the ise floats in large mafies, and fometimes i:l compast bodies formed of an infinite number of frall pieces, there it is by no means difficult to freeze the whole into ore piece; for amongt the ice the wind las mot a power of raifng ligh and great waves. This circumeme was not entirely unkaown to the ancients; and it is probable they acquircl this information from the natives

## POL

of ancient Gaul, and from the Britons and other northern uations, who fometimes undertook long voyares. The northern ocean was ealled by the aneients the fro$z=n$, the clead, the lazy, and immoveable feu: fometimes they gave it the name mare cronium, the concrete fea, and merimarufa, the dead fea. And, what is very re markable, in all the northern cold countries the froft fometimes is fo intenfe, that all the waters become fuchdenly coagulated into a kind of pate or dough, and thus at once comgeal."

On this reafoning of Mr Forner's, however, we muft obferve, that it cannot polibly invalidate any fatt which Mr Barrington has advanced. The beft concented and moft plaufible theory in the world malt yield to experience; for this is in fatt what mult julge all theories. Now, from what we have already rehated, it is demonflrated, that in the fpace between the mouths or the rivers lianda and Chatanga more ise mult be formed, and more intenfe colds generated, than in any other thart of the world ; coniequently, for a confiderable fpace, both on the calt and welt fide of that, the fea mult be more full of ice than any where elfe. Now, betwcen thefe two rivers there is the promontory of Tainurn, which runs out to the lutitude of $78^{\circ}$, or near it, ard which of necelity mult obltruct the difperfion of the ice; and that it actually does fo is in fome degree probable; becaufe in one of the Rullian voyages abvementioned the eaftern mouth of the Lena was quite free, when the weflen ones were entirely choaked nup with ice. Now the mouth of the Yana lies feveral degrecs to the extward of the Lena: confequently, when the ise comes eaf ward from the cape of Taimura, it muth neeefliarily fill all that fea to the latitude of $78^{\circ}$ and upwards; but the Confack Markoff, if he preceedel dircaly north, could not be farther than the promontory of 'Tamura, and confequently fill enveloped among the ice. Befides, we are certain, that the fiea in $5^{-} 8^{\circ}$ is not att all frozen into at folid cake in fome phaces, hance Lord Mulgrave, in 1773 , reached $81^{\circ}$. Mr Fortter's argument, thel efore, either proves nothing, or it proves tro much. If it proves, that about the mindale of the ealten continent the coll is fo intenfe that a fufficient quantity of ice is formed to obftrute tile mevigation for feveral hundred miles tound, this proves nothing; becaufe we knew before that his muft be the cafe: But if it proves, that the fea mull be unn wivatable by reation of ice all rcund the globe at $78^{\circ}$ N. L. this is too mech; becaufe we certainly know, ilatin 1773 Lord Mulgave reached the latitude of $81^{\circ}$. Ioweser, though it hould be allowed that the feat is quite clear all the way to the pole, it mult be a very geat uncertainty whether any hip could by that way reach the Ealt Indies; becaufe we know that it mult fail down between the continents of Alia and America, through that frait whefe month muft of ten be blocked up wilh iee driving eallward along the continent of A Aat.

The foulh pole is fill more inacceffible than the north pole; for the ice is found in much lower fouthern than northern latitudes. Upon this fubjeat M. Pages fpeaks thus: "Having in former voyages (fays be) vifited many parts of the terraquesus globe in different latituics, 1 had opportunities of acquiring a conliderable hanwledige of climate in the torrid as well as in the temperate divifions of the earch. In a fubfequent vogage

I made it my bufinefs to be equally well informed refpecting the reputed inloofpitable genius of the South Seas; and upon my return from that expedition I entertained not the fmallefl doubt that there exifls a peculiar and perpetual rigour in the fouthern hemifphere.' (See his Travels round the Forld, v. iii. tranflated from the French, and printed at London, 1792, for Muray.) This fuperior degree of cold has by many been fuppofed to proceed fron a greater quantity of land about the fouth than the north pole *; and the notion of a vait continent in thefe regions prevailed almof univerfally, infomuch that many have fought for it, but hitherto in vain. See the articles Cook's Difcoverics, $n^{\circ} 38-49$. and $n^{\circ}$ 68. and 69. South-Sea, and TERRA Aufiralis.

POLEIN, in Englifl antiquity, is a fort of thoe, flarp or picked at the point. This faflion took its rife in the time of king William Rufus; and the picks were fo long, that they were tied up to the knees with filver or golden chains. They were forbidden by fat. an. 7 Edw. IV. cap. Tunc fusus crinium, tunc luxus veftium, tunc ufis calccorun sum arcuatis aculeis inventus gh. Malmerb. in Will. ii.

POLEMARCHUS was a magifrate at Athers, who had under his eare all the Itrangeis and fojourners in the city, over whom he had the fame autlority that the archon had over the citizens. It was his duty to offer Po a folemn facrifice to Enyalus (faid to be the fime with 6 Mars, though others will have it that he was only one of his attend.uns ), and another to Diana, furnamed Ayporepe, in honour of the famons patriot Harmodias. It was alfo his bufinefs to take care that the ehildren of thefe that had loft their lives in the fervice of their country thould be provided for out of the public treatiry.

POLEMICAL, in matters of literature, an apelli. tion given to books of controverfy', efipecially thote in divinity.

POLEMO, who fucceeded Zenocrates in the direction of the aealemy, was an Athenian of diftinguifhed birth, and in the earlier part of his life : man of loofe morals. The manner in which he was reclaimed from the parfuit of infamons pleafures, and brought under the difcipline of philofophy, affords at momorable example of the power of eloquence employed in the caufe of virtue. His hillory is thus reluted by Dr Enfield: "As he vass, one morning about the riling of the fun, returning home from the revels of the
night clad in a loofe robe, crowned with gatands, frongly perfumed, and intoxieated with wine, he palfed by the fehool of Xenocrates, and faw him furrounded with his difciples. Unable to relift fo fortunate an opportunity of indulging his sportive humour, he ruhthed without ceremony into the fchool, and took his place among the phitotophers. The whole alfembly was affonithed at this rude and indecent intruffom, anal all but Xenocrates difoovered figus of refentment. Xenocrates, however, preferved the perfeet command of his count nan e ; and with great prefence of mind turned his difinurfe from the fubject on which he was treating tu the tapies of temperance and $m$ deily, which he recommanded widh fuch frength of argument, and energy of langulage, that Polemo was conftrained to yield to the torce of convistion. Intead of turning the philofopher and his doctrine to ri licule, as he at firt intended, he became fenfible of the folly of his former condut ; was heartily athamed of the contemptible figure which he had made in fo refpectable an atfembly; took his garland from his head; concealet his naked arm under his cloak; affumed a fedate and thoughttul afpect; and, in fhort, refolved from that hour to relinquifh his lieentious pleafures, and devote himfelf to the purfuit of wifdom. Thus was this young man, by the powerful energy of truth and eloquence, in an initant converted from an infamnus libertine to a refpectable philofopher. In fuch a fudden change of character it is difficult to avoid palling from one extreme to another. Polemo, after his reformation, in order to brace up his mind to the tone of rigid virtue, ennflantly practiled the fevereft aufterity and mof hardy fortitude. From the thirtieth year of his age to his death he drank nothing but water. When he fuffered violent pain, he thowed no external fign of anguifh. In order to preferve his mind undif. turbed by pallion, he habituated himfelf to fpeak in an uniform tone of voice, without elevation or depreffion. The autterity of his manners was, however, tempered with urbanity and generofity. He was fond of folitude, and pafied much of his time in a garden near his fchool. He died, at an advanced age, of a confumption. Of his tenets little is faid by the ancients, becaufe he flrictly adhered to the doctrine of Plato."

POLemonium, Greex Valerian, or Gacob's Ladder: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking und $r$ the 29th order, Campanaca. The corolla is quinquepartite; the flamina inferted into feales which clofe the bottom of the corolla; the nig. ma is trifid: the capfule bilocular fuperior. 'There are two species, of which the mont remarkable is the cerruleum, with an empalement longer than the Hower. It grows niturally in fome places of Englind: however, its heanty has obtained it th place in the gardens. There are three valieties; one with a white, another with a blue, and another with a variegated fower; alfo a kind with voriegated leaves. They are eatily propagated by feeds; but that kind with variegated leaves is preferved by par: ing its roots, beciufe the plants raifed from feeds would be apt to degencrate and beeome plain.

POLEMOBCOl'E, in optics, the fume with Oferaclass. Sec l)optrics, p. 37. col. 1. par. 3 .
POLENBURG (Cornelius), an excellent painter of lote tandfuapes and figures, was born at Utreeht in r 586 , and chucated under Blomaert, whom he foon
quitted to travel into Italy ; and fitudiedfata a long time rien n in Rome and Flurence, where he fomed a Ayle eal tirely new, which, though preferable to the Ilemilh, is unlike any Italian, except in lis having ad med :is landfapes with ruins. 'There is a varnified froonthee?; and finifhing in his pigurec, that render them alwass pleafing, though fimple and tho neanly rembling on: another. The Roman cardinals were charmed witis the neatrefs of his works, as was alto the great dake : but could not retain him. He returned to Utrecit, and pleafed Rubens, who had fevernl of his performance: King Charles I. invited him to Lonlon, where he ge. nerally painted the figures in steenwyek's perfpectives: but the king could not prevail on him to fis there; fir after ftaying only four years, and being liandfomely rewarded by his majefty for feveral piece; which he performed for him, he returned to Utrecht, and diel there at the age of 74 . His wolls are very fearce and valuable.

POLERON, one of the Banda or nutmeg iffads in the Eaft Indies. This was one of thofe fpice iflands which put themfelves under the protection of the Englifh, and voluntarily acknowledged James I. king of England for their fovereign ; for which reafon the antives of this and the reft of the illands were murdered or driven thence by the Duich, together with the Englifh.

POLESIA, a province of Poland, bounded by Polachio and Proper Lithuania on the north, and by Volhinia on the fouth. It is one of the palatinates of Lithuania, and is commonly called $\operatorname{Br} f(i a$, and its cap:tal is of this name. It is full of forefts :and lakes.

POLESINO-de-Rovigo, a province of Italy, it the republic of Venice, lying to the north of the tiver Po; and bounded on that fide by the Paduan, on the fouth by the Ferrarefe, on the Eilt by Degado, and on the weft by the Veronefe. It is 45 miles in length, and 17 in breadth, and is a fertile country. Rovigo is the capital.
POLETR were ten magifrates of Athens, who, with three that had the management of money allowed for public fhows, were empoviered to let out the tributemoney and other public revenues, and to fe! 1 confifeated eftates; all which bargains were ratified by their prefident, or in his name. They were hy their office alfo bound to convict fuch as had not paid the tribute ealled mizorict, and fell them in the market by auction. The market where thefe wretches were fold was called

Polianthes, the Tuefrose: A genas of the monogynia order, belonging to the hexandria cla's of plants; and in the natural method ranking under the ioth order, Coronari.e. The eorolia is funnel-fhaped, incurvated, and equal; the filaments are inferted into the throat of the corolla; in the bottom of which the germen is fituated. There is hut one ipecies, conlitting of fome varieties; all of which being exoties of tender: quality, require aid of artificial hent, under thecter of frames and glafes, \&e. to bring them to flower in perfection in cold countries. The poliznthes, or tuberofe, hath an oblong, bulb-like, tuberous, white ront; crown. ed with a few long very narrow leaves; amidt them an upright, Alraight, firm Item, three or four feet high, terminated by a long fike of large white flowers ar. ranged altematcly. The varieties are the common th-

R r
berof,

## POL

Buifanthes. berofe, with fingle flowers,-double-flowerell,-dwarf-ftalked,-variegated-leaved. They all flower here in June, July, and Angult : the flowers are funnel or bell thaped; garnith the upper part of the tem in a long pike, conffing of from 10 to 20 or more feparate in alternate arrangements, the lower flowers opening firf, whith are fucceeded by thofe above, in regular order, making in the whole a molt beautiful appearance, highly anriched with a molt fragrant odour. The common fingle-flowered tuberve is the fort the moft commonly cultivated, as it generally blows the moft freely, and porfeffes the finelt fragrance. The double-flowered kind alfo highly merits culure, as when it blows fair it makes a fugrularly fine apppeance. The dwarf and the variegated kinds are infenim to the other two, but may be cultivated for variety.
All the varieties bcing exotics from warm countrics, although they are made to flower in great perfection in Britilh gardens by afitance of hot-beds, they will not profper in the open ground, and do not increafe freely in England; fo that a fupply of the roots is imported thither anoually from Genoa, and other parts of Italy, by molt of the eminent nurfery and feedimen, and the Italian warehoule-keepers; generally arriving in February or March, time enough for the enfuing fummer's bloom ; and are fold commonly at the rate of twelve or tifteen thillings per hundred, being careful always to procure as large roots as poffible, for on this depends the fuccels of having a complete blow. They, requiring artificial heat to blow them in cold countries, are planted in pots, and plunged in a hot-bed, under a deep frame tarnithed wi:h glafs lights; or placed in a hot-houfe, where they may be blowed to great perfection with little trouble. The principal feation for planting them is March and April: obferving, however, that in order 10 continue a long fuccefion of the bloom, it is proper to make two or three different plantings, at about a month interval ; one in March, another in April, and a third the beginning of May, whereby the biow may be vontinued from June until September; obferving, as above-mentioned, they may be flowered cither by aid of a common dung or bark hot-bed, or in a hot-houfe.

With refpeci to the propagation of thele plants, it is princip.lliy by offsets of the roots. The hlowing zoots that are brought annually from abroad for fale are offen furnilled with offscts, which ought to be feparated phevious to phanting. Thofe alfo that are planted in the gardens freguently furmilh offisets fit for feparation in antumn when the leaves decay; they mult then be Rie erved in fand all winter in a dry theltered place; and in the begiming of March, plant them either in a bed of light dry eath in the full ground ; or, to forward them as much as poffible, allow them a moderate hot-bed; and in either method indulge them with at thelter in cold weather, cither of a frame and lights, or arched with hoops and occafionally matted; but let them enjoy the full air in all mild weather, giving alfo plenty of water in ciry weather duriog the feafon of their growth in fipring and finmmer. Thus let them grow till their leaves a gain decay in autumn: then take them up, cle:m them from earth, and lay them in fand till fpring; at which time fuch roots as are large enough to blow may be planted and managed as already direcied, and the fmaller roots planted again in a nurfory-bect, to lave another year's growth; after-
wards plant them for flowering. The Egyptians put Policant the flowers of tuberofe into iweet oil; and by this means give it : molt excellent flavour, fcarce inferior to oil of jafmine.

POLICANDRO, a fmall ifland in the Archipelago, feated between Milo and Morgo. It has no harbour, but has a town about three miles from the fhore near a huge rock. It is a ragged fony illand, but yields as much corn as is fufficient for the inhabitimts, who confift of about 120 Greek families, all Chrifians. The only commodity is cotton; of which they make napkins, a dozen of which are fold for a crown. E. Long. 3525 . N. Lat. 36. 36.

POLICASTRO, an epifonpal town of Italy, in the kingdom of Naples, and in the Hither Princip.to; but now almof in ruins, for which reafon the bithop refides in another town. E. Long. 15. 46. N. Lat. 40. 26.

POLICY, or Polity, in matters of government. See Polity.

PoLicr of Infibance, or Afurance, of flips, is a contract or convention, whercby a perfon takes upon himfelf the rilks of a fea-voyage; obli ring himelf' to make good the loffes and damages that may befal the vellel, its equipage, tackle, victuilling, liding. \&c. either from tempefts, hhipwrecks, pirates, fire, war, reprifals, in part or in whole; in confideration of a certain fum of ieven, eight, or ten per cent. more or lefs accurding to the rifk run; which fum is paid down to the affurer by the affuree upon his ligning the policy. See Insurance.

POLIDORO da Caravaggio, an eminent painter, born at Caravaggio in the Milanefe in 1492. He wrent young to Rome, where he worked as a labourer in preparing fucco for the painters; and was fo animated by feeing them at work in the Vatican, that he folicited fome of them to teach him the rules of defigning. He attached himfelf particularly to Maturino, a young Florentine; and a fimilarity in talents and tale producing a difinterefled affection, they affociated like brothers, laboured together, and lived on one common purfe, until the death of Maturino. He underttood and prastifed the chiaro-furo in a degree fuperior to any in the Roman fehool; and finifhed an incredible number of pistures both in frefco and in oil, few of the public buildings at Rome being without fome of his paintings. leing obliged to fly from Rome when it was formed and pillaged, he retired to Melina, where he obtained a large fum of money with great reputation, by painting the triumphal arches for the reception of Charles V. after his vitory at Tunis: and when he was preparing to return to Rome, he was murdered, for the fake of his riches, by his Sicilian valet with other afldifins, in the year 1543 .

POLifolia. See Andromeda.
POLIGNiC (Melchier ( $t$ ), an excellent French genius and a cardinal, was born of an ancient and noble family at Pry, the capital of Velay, in 1662 . He was fent by Louis XIV. ambaffador extraordinary to Poland, where, on the death of Sobiefki, he formed a projeft of procuring the eleation of the prince of Conti. Bat failing, he returned home under fome difgrace; but when reftored to favour, he was fent to Rome as auditor of the Rot.. He was plenipotentiary during, the congrefs at Utrecht, at which time Clement I. created him a cardinal; and upon the otceffion of Louis XV' he was appointed to refide at Rome as miniter of France.

## POL [315]

France. Fie remained there till the year 1732, and died in the year 17 ft . He left behind him a MS. poem entitled Ant--Lucretius, fu De Dio et Natura: the plan of which he is faid to have formed in Holland in a conver fation with Mir laylc. This celebrated poem was firt publifhed in the year $t 7+9$, and has lince been feveral times printed in other countrics befides France. He had been received into the French Academy in 1704, inte the Academy of Sciences ii 1715, inten thit of the Belles Lettres in 1717 : and lie would have been an ornament to any fociety, having all the accompliflments of a man of parts and learning.

POLISHER, or Burnisher, amonf mechmics, an infrument ior polilling and burnifhing things proper to take a polith. The gilders ufe an iron -pulifher to prepare their metals before gilding, and the bloodflone to give them the bright polifh after gilding.
The polifhers, among cutlers, are a kind of wooden whee's made of walnut-tree, about an inch thick, and of a dimmeter at pleafure, which are turned round by at great wheel ; upon thefe they fmooth and polifh thicir work with emery and putty.

The polifhers for glats conlift of two picces of wood; the one flat, covered with old hat; the other long and half.round, fatened on the furmer, whofe edge it exceeds on both fides by fome inches, which ferves the workmen to take hold of, and to work backwards and forwards by.

The poliflars ufod by feetacle-makers are pieces of wood a foot long, feven or eight inches broad, and an inch and a half thick, covered with old beaver hat, whereon they polith the flee!! and horn frames their fpec-t.icle-olatles are to be fet in.

POLISHING, in general, the operation of giving a glots or lufte to certain fubitances, as metals, glafs, marble, \&c.
The operation of polifhing optic-glaffes, after being proper! y ground, is one of the moft dificult points of the whole procefs. See Telescope.

POLITENESS means elegance of manmers or good breeding: Lord Chefterfichl calls it the art of pleafing. It has alfo been called an artificial good nature; and indeed good nature is the foundation of true pelitencfs; without which art will make but a very indifferent figure, and whll generally defeat its own ends. "Where complimes and affent, caution and candour, fays an elegant effayit*, arife from a natural tendernefs of difpolition and foftnefs of nature, as they fometimes do, they are almof amiable and certainly excuíable; but as the effects of artifice, they mift be defpifed. The perfons who polfis then are, indeed, cften themfelves dupes of their own deceit, when they imasine others are deluded by it. For exceflive art always betrays itfelf; and many, who do not openly take natice of the deceiver, from motives of delicacy and tendernefs for his charadter, fecretly deride and warmly refent his ineffectual fubtilts."
earies "Ttue poitene's (frys an:other authort) is that con-
1.tory, tinual attention which humanity infipires us with, both to pleate others, and to avoid giving them offence. The firly plain-dealer exclaims loudly againt this virtue, and prefers his own thoching blunt nefs and Gothic freedom. T'he courtier and fawning flatterer, on the contrary, fublitute in its place infipid compliments, cringings, and a jurgon of unme:ning fenterces. The one blames polite-
neis, becaufe he takes it for a vice; and the other is Patene: the ocealion of this, becaufe that which he prastifes is re.ally fo."

Both thefe charaters act from motives equally ab. furd, though not equally criminal. The conduct of the artful flatterer is guided by telf-love, while that of the plaindealer is the effect of ignorance; for nothing is more certain, than that the delire of pleafing is founded on the mutual wants and the mutual withes of mankind; on the pleafure which we wilh to derive from in. cicty, and the charater which we wifh to acquire. Men having difonvered that it was necefing and ayrceable to unite for their common interefts, they have made laws to reprefs the wicked, they have fettied the duties of focinl life, and comented the idea of refpectability with the prastice of thofe duties; and after having preferibed the regulations neceflay to their common fafety, they bave endeavoured to render their commerce with one another agreeable, by eftablifhing the rules of politenef's and good breeding. Irdeed, as an elegant author a!ready quoted remarks, the philofopher who, in the aufterity of his virtue, fhould condema the art or pleafing as unworthy cultivation, would deferve little attention from mankind, ard might be difnifed to bis folitary tub, like his brolher Diugenes. It io the dictate of humanity, that we fhould ende:vour to rendes ourfelves agreeable to thofe in whofe company we are defined to travel in the journey of life. It is our is. terelt, it is the fource of perpetual fatisfation; it is one of our moft important duties as men, and particularly required in the profeffor of Chritianity."

It is needlefs to particularize the motives which have induced men to practife the agreeable virtues; for, from whatever fource the defire of plealing proceeds, it has always increafed in proportion to the general civilization of mankind. In a rude fate of fociety, pleafure is limited in its fources and in its operation. When the wants of mankind, and the means of attaining them, are few, perfonal appication is neceffary to gratify them, and it is generally fufficient; by which means an individual becomes more independent than can pofibly be the cafe in civilized life, and of courfe lefs difpofed to give or receive aflillance. Confined to the folitary will of furnithing means for his own happinefs, he is little intent on the pleafures of converfation and fociety. His defire of communieation is equal to the extent of his knowledge. But as fonn as the natural wants of life are filled up, we find unoccupied time, and we labour hard to make it pafs in an agreeable manner. It is then we perceive the advantage of poffefling a rational nature, and the delights of mutual intercourfe. When we confide: fociety in that ftate of perfection which enables a great part of the members of it to purfue at leifare the pleafures of converfation, we honld cxpet, both from the eafe of acquitting ourfelves to the fatisfaction of our afociates, and from the advantages ariing from this conduc, that the art of pleafing might be reduced to a few phin and dimple rules, and that there might be derived from a hight attention to general mamers.

The art of pleafing, in our intercourfe with mankinl, is indeed fo timple, that it requires nothing more thin the conftant defire to pleafe in all nur words and astions; and the practice of it can neither wound a man's felf-love, nor be prejudicial to his intereft in any poffible fituation.

Folitctef. Eut though this be certain, it is doubtlefs lefs attended in than in reaton it ought to be. Each particular man is fo zealous to promote his own ends or his own pleafure, as to forget that his neighbour has claims cqual to his own; that every man that erters into company gives lip for the time a great many of his peculiar rights; and that he then fornis part of an alfociation, met together nor for the particular gratification of any cne, but for the purpofe of general fatisfaction. Sce Breeding, Conversation, and Goord Manners.
The qualities cflential in the art of pleafing, are virtue, huowlelge, and noamers. All the vintues which form a good and refpefable charaGer in a moral renie are effential to the art of pleafing. This muft be an efablifhed prirciple, becaufe it depends on the wants and mutnal relations of fociety. In all affairs of connmon bufinefs, we delight in tranfacing with men in whom we can place confidence, and in whom we find integrity; but truth is fo naturally plealing, and the common affairs of life are fo interwoven with focial intercourfe, that we derive abundantly more fatisfaction from an honeft charater than from fpeciuus manners. "Should you be fufpected (fays Chefterfield) of injuftice, malignity, perfidy, lying, \&c. all the parts and knowledge of the world will never procure you etteem, friendihip, and refpect."
The firt of virtues in our commerce with the world, and the chief in giving pleafure to thofe with whom we alicciate, is inviolable fincerity of heart. We can never be to. punctual in the mof ferupulous tendernefs to our m:oral charadter in this refped, nor too nicely affeled in preferving our integrity.

The peculiar modes, cven of the fafminable world, wl ich are founded in difimulation, and which on this account have induced feveral to recommend the practice, would not prevent a man of the lighelt integrity from being acceptaile in the very bef company. Acknowledged fincerity gives the fame ornament $\because$ charater that modefly does to manners. It would abundinily atone for the want of ridiculous ceremony, or falte and unneaniog profeftions; and it would in no refipest diminifh the lufre of a noble air, or the perfection if an elegant addrets.

If integrity be the foundation of that character which is mof generally acceptable, or which, in other words, poliefles the power of pleafing in the higheft degree, humanity and modefly are its highelt ornaments.

The whole art of pleafing, as lar as the virtues are concerned, may be derived from the one or other uf thefe fources. Humanity comprehends the difplay of every thing amiable to others; modelly removes or fupprefles every thing offenfive in ourfelves.

This modefty, however, is not inconfiltent with firmnefs and dignity of charather: it arifes rather from the knowledge of our imperlection compared with a certain fandard, than from confcinus ignorance of what we ought to know. We mult thercfore dittinguilh between this modefty and what the French call mauvaifo bonti. The one is the auffeited and unaffuming pinciple which leads us to give preference to the merit of nthers, the other is the aukw.rd frusging of nature nver her own infimities. The fif gives an additional luftre to every grod quality; while fome penp.e, from feeling the pain and inconveniency of the mauvaife honte, have ruthed into the other extreme, and turncd
impudent, as cowards fometimes grow defpcrate from Polite excefs of danger. The medium between thefe two extremes marks out the well-bred nan; he feels himfelf firm and eafy in all companics, is modet without being bafhful, and fleady without being impudent.

A man poffeling the amiable virtues is Aill farther preparcd to pleafe, by having in his own mind a perpetual fund of fatisfation and entertainment. He is put to no trouble in concealing thoughts which it would be difgraceful to avow, and he is not anxious to difplay virturs which his daily converfation and his conltant looks render vifible.

The next ingredient in the art of pleafing, is to poffefs a correct and enlightened underflanding, and a fund of rational knowledge. With virtue and modefty we muft be able to entertain and inftruet thofe with whom we affociatc.

The faculty of communicating ideas is peculiar to man, and the pleafure which he deriv s from the interchange alone is one of the m . ft .anportant of his bleffings. Mankind are for men wish numberlets w..nts, and with a mutual power of atfliting each oticr. It is a beautiful and happy part of the rame perled pian, that they are likewie formed to delight in each ther's company, and in the mutual interchange of thcir thoughts. The different fpecies of ermmunication, in a highly polifhed age, are as numerous as the diffe ent ramks, employments, and occupations of men; and indeed the know. ledge which men wifh to communicate, takes its tinge from their peculiar profeflion or occupation.

Thus conmercial men de ight to talk of their trade, and of the nuture of public bufinef; men of pleafures, who with merely to vary or quicken their amufements, are in converfation light, tuifling, and infincele; and the literati delight to dwell on new books, learned men, and importam difcoveries in fcience or in arts. But as the different claifes of nien will frequently mect together, all parties mult fo contrive maters, as to combine the uleiul and agrecable tog ther, fo as to give the greatelt delight at the time, and the greateft , leature in reflection. An attention to thefe principles would make the man of pleafure and the man of learnins meet together on cqual terms, and derive mutual advantage from their different quallificativ:s Wilh due attention to fuch idens, we proceed to mention the kinds of kn whedye which are molt fitted for converfation. Thole who with to pleate fhould particularly endeavour to be informed in thefe points which moft generally occur. An accurate or extenfive knowledge on lea ned fubjects is by no means fufficient: we mut alfo h.ive an accurate and cxtenfive knowledge of the common occurser ces of life.

It is the know ledge of mankind, of governments, of hiftury, of public characters, and of the fprings which put the great and the little atoions of the world in motion, which give real pleafure and rational inftruction. The knowledge which we communica:e mult in fome fhape be interefing to thofe to whom we conimunicate it ; of that mature, that the defire (f receiving it may overbalance cuery kind of difgulf, excited ton often on the fore of envy and felflove, againf thofe who happen to poffers fuperior endowments, and at the fame time of that importance, as to elevate the thoughts fomewhat above the actions and the fatles of the narrow circle formed in our own immediate neigh bourhood.

## POL

cf. bourlood. On this account it is recommended by an duthor who fully hnew mankind, as a maxim of great importance in the art of plealing, to be acquainted with the private charater of thofe men who, from their faltion or their actions, are making a ligure in the world. We naturally wilh to fee fuch men in their retired and undifguifed moments; and he who can gratify us is highly accept.able. Hilary of all kin Is, [i1ly iutroduced, and occafooally cmbellifhed with plealing aneedotes, is a chicf part of our entertainment in the interconfe of life. This is receiving inltrudin, wihout exciting much envy; it depends on memory, and memory is one of thofe talent the polfeftion of which we lealt grudge to our neighbour. Our knowledge of hiftors, at the fame time, mult not appear in !org and tedi us details; but in aft and well chofen allufions, calculated to illuttrate the particular fubjeat of converfation. But the knowledge moft necefliny is that of the human heart. This is acguired by conftant obfervation on the manners and maxims of the werld, conneted with that which paflis in our own minds. This leads us fro $m$ the common details of conjuci, from flander and defamation, to the fources and pinsiples of action, and enables us to enter into what n!ay be called the philoforly of con. verfation. We may fee both the practicability of this kind of dilcourfe, and the nature of it, in the following lines of Horace:

Sermo oritur, non de villis domibufve alienis ;
Nec male necne Lepos faliet: ied quod magis ad nos Pertinet, \& nefcire malum eft, agitams : utrumme
Divitiis homines, an fint virtute beati?
Quidve ad amicitias, uits rektunne, tralhat nos?
Et que fit natura boni, fummumque quid ejus? \&c.
By this means conflant materials are fupplied for free, eafy, and fipirited communication. The reltraiots which arc impofed $n$ mankind, either from what their own character may fuffer, , rfiom the apprehention of giving offence to uther, are entircly taken off, and they have a fufficient quantity of current coin for all the common purpofes of li.e.

In addition to yirtue and knowledge, which are the chief ingredients in the art of pleafing, we liave to confider graceful and eafy manners. Lord Chetterfield indeed onnfiders there as the moft fien iall and important part; as if the diamond receaved its wh le value from the polifh. But thcugh be is unqueationably miftaken, there is yet a certain fiweetnets of manners which is particularly engaging in our commerce with the world. It is that which conflitutis the character which the French, under the appellation (ff l'aimable, fo much talk of, and fo jurly value. This is not fo ealily def:ibed as felt. It is the compound refult of different things; as complaifance, a fexibility, but not a fervility of manners, an air of foftnefs in the countenance, gelture, and expreffinn, equally whether you concur or dffer with the perfon jul enverfe with. This is particularly to be fuadied when we are obliged to refufe a favour afked of us, or to fay what in itfelf cannot be very agreeable to the perfon 10 whom we fay it. It is then the neceffary gilding of a difagrecable pill. But this, which snay be called the fuaviter in nosdo, would degenerate and fink into a mean and timid complailarice and parfivenefs, is not fupported by firmuefs and dignity of charader. Hence the Latin fentence, fuasiter in noodo,

## POL

fortiter in re, becomes an ufeful and important masim ia Politen-lso life.

Genuine eafy manners refuit from a comfant attention to the relations of perfons, things, time, and places. Were we to comverfe with one greally our fuperior, we are to be as eafy and unembar raded as with our equats; but jet every look, word, and action, thoul! imply, without any kind of fervile flatery, the greaten repuet. In mixed cumpanies, with our equals, greater calc and liberty are allowed; but they ton have their proper limits. There is a focial refpeat noceffary. Our words, gettures, and attitudes, have a grader degree of latitude though not an unbounded onc. That cafinds? of cariage and behawiour which is exceedingly engaging, widely differs from mogligence and imattention, and by no means implies that one may do whateror he pleafes; it only means, hat one is not to lie Riff, forindl, and cmbirralfed, difeonicerted and aflamed ; but it requires great attencion to, and a ferupu' ons obfervation off, what the French call les bienfeances; a word which implies "dccorum, gond-breeding, and propricty." Whatever we ought to do, is to be done with cale and unconcern; whatever is improper, muthet be done at all. In mixed companies, lifo, different ages and fexcs are to be differently addreffed. Although we are to be equally eafy with all, old age particulariy requires to be treated with a deree of deference and regard. It is a gond general rule, to accufom oni: felves to have a kind feeling to every thing comneeded with man: and when this is the cafe, we thall fe'dom crr in the application. Another important point in the lionfenges is, not to run sur own prefent hum ur and difpaition in:difriminately againt every bods, but to r.ble:ve and adupt theirs. And if we cansot command one prefent humour and difpolition, it is necelfary to fingle wit thofe to converie with who hoppen to be in the hamour the nearelt to our own. Pe:emptorineis and decifion, efpecially in young people, is contr iry to the $/ 1 \%$. feances: they fhould feld in feem to diffent, and always ufe fome foftening mitigating expreffion.
There is a bienfennce alfo with regatd to people of the lowelt degree; a genaleman oblerves it with his footman, and even indeed with the beggar in the ftrect. He conliders them as objects of compaffion, not of infult; he fpeaks to neithes in a harfh cone, but corrects the one coolly, and refufes the other with humanity.

The following obfervations perhaps contain the fum of the art of pleafing:
I. A fixed and habitual refolution of endeavouring to pleafc, is a circumlance which will feldom fail of effect, and its effect will every day become more vifible as this habit increafes in Atrength.
2. This refolution muft be regulated by a very confiderable degree of good fenfe.
3. It is a maxim of almof general application, that what pleafes us in annther will alfo, pleafe others in us.
4. A conftant and habitual attention to the diferent difpolitions of mankind, to their rulivg pafions, and to their peculiar or occational lumours, is abfolutely neceffary.
5. A man who would pleafe, murt poffefs a firm, equal, arid fteady temper. And,
6. An eary and graceful manner, as difant from bafhfulnefs on the one hand as fom impudence on the other.

## 1 OL

potioners, othas. "He who thinks himfett fure of pleafing (Gays Lord Chellerfield), and he who delpairs of it, are equal-
iy fure to fail." And he is undoubtedly in the right. The one, by his affuming vanity, is inattentive to the means of pleafing; and the other, from fear, is ren. de:ed incanable of employing them.

A variety of excellent rules for acquiring politenefs, with frifures on tarticular kinds of impolitenefs, may be -found in the Sperfalct, Rambler, Ither, Lounger, Ali, rits, and other periudical weress of that kind; in Kvox's Ef.
 Cheflerfeld's Art of Pleafing, and his Leettars, are allo worthy of perofal, provided the reader be on his guard againt the inflincerity and other vices whech thofe books are calculated to infure, and provided the ahways bears in mind what we have endeavoured to thow in this article, that true politenefs does not confift in ipecious aranners and a diffimulating addrefs, but that it muft alhays be funded on real worth and intrinlic virtue.

POLITIAN (Angclo), was born at Monte Pulciano in Tufcany in 145 . He learned the Greek tongue, of which lie became a complete mater, under Andronicus of Theflalonica. He is faid to have written verfes both in Greek and Latia) when he was not more than 12 gears of age. He fudied alio the Platonic philofoply under Misfrilius Finicus, and that of Arifotle under Argyropylus. He was one of the mot learned and polite writers of his time. The firf work which gained him a reputation was a poom on the Lournament of Julian de Nedicis. The account he wrote fome time after of the confpiracy of the P'azzi's was rery much eftecmed. He wrote many other pieces which have merited approbation; and had he lived longer, he would have enriched the republic of letters with many excellent works ; but he died at the age of 40 years. His morals anfivered the homeliness of his face rather than the beauty of his genius; for Paul Jovius informs us, that "he was a man of aukward and perverie manners, of a countenance by no means open and liberal, a nofe rem rkably large, and fquinting eyes. He was crafty, fatirical, and full of inward malice ; for his conftant way was, to fineer and ridicule the productions of other men, and never to allow any criti. cifm, however junt, upon his own."

He was, neverthelefs, as all acknowledge, a man of moll confummate erudition ; and not only f 0 , but a very polite and clegant writer. Erafmus, in his Cicerominnüs, calls him a rare miracle of nature, on account of lis excelling in every kind of writing: his words are semarkable: "Fatcor Angolum prorfus angelica fuiffe mente, rarman naturse miraculunn, ad quaduuque foriphigevals applicaret animum." Some of his pocms were fo nuch admired, that feveral learned men have made it their bufinefs to ceniment on them. It has been ofica reported that he fpoke of the Bible wit' great enntempt; and that, having rad it but once, he complained lie had nover fpent his time fo ill. But this is not probable, for it muft be remembered that he was a I rieft and comon of Florence; and we jearn from onc of his Epifles that he preached a whole Lent. It ches not indeed fullow hence, that he did not think contemptuoutly of the Bible, becaluife many of his church, eipecially among the better fort, have not been sery gnod believers, and he might be one of them: but it is not likely he wonld fpeak ont fo freely. "I could

री POL
(as Bayle fays) much more enfily beiieve the judgment he is faid to lave made on the Pfalms of David and the Odes of Pindar: he did not deny that there are many good and fine things in the Pfalms; but he pretended that the fame things appear in Pindar with more brightnefs and liwectnef:" The two Scaligers have fpoken highly of Politian: the elder has preferred a confolatory elegy of his to that which Ovid fent to Liria upon the death of Drufus, and fays, he had rather have been the author of it : the younger calls him an excellent $p$ et, but thinks the fyle of his epifties too elated and declamators.

Fis works have been printed at various times, and in vations places: his epinteshave probably been moft read, becaufe thefe are tlings which the gencrality of people are hef pleafed with."

POLITICAL, from roris "a city," fignifies any thing that relates to policy or civil government.

PoLsTictL Aritbuntic, is the art of reafoning by f.gures upon matters relating to government, fuch as the revenues, number of people, extent and value of lands laxes, trade, \&c. in any nation.

The re calculations are generally made with a view to afeertain the comparative ftrength, profperity, \&c. of any two or more nations. With this view, Sir William Petty, in inis Political Arithmetic, p. Tt, \&c. computes the land of Holland and Zealand to be about 1,0c0,000 acres, and that of France to be $8,000,000$; and yet the former is one.third part as rich and flrong as the latter. The thipping of Europe he computes to be abont 2,000,000, of which Britain has 500,000: Holland 900,000; France 100,000; 1Iamburgh, Denmark, Sweden, and Dantzic 250,000; and Spain, Portugal, Italy, scc the ref. The exports of lyance he computes at L. $5,000,000$, of which one fourth came to Britain; of Holland L. I8,000,000, of which L. $3: 0,000$, came to Britain. The money raifed yensly by the king of France was about L. $6,500,000$ Sterling ; that of all the Dutch provinces L. 3,000,000, of whick 2,100,000 was raifed in Holland and Zealand. The number of people in England he computcd to be fix millions, and their expences, at L. 7 per ammum a head, L. $42,000,000$; the rent of land L. 8,000,000; and the interelts, \&c. of perfonal eltates as much, the rents of houfes L.4,000,000, and the profits of labour L. $26,000,000$. The people of Ireland he reckoned 1,200,000. The corn fpent in England, at 5s. a bufhel for wheat, and 2s. $6 d$. for barley, a mounts to L. $10,000,000$ a-year. The navy of England then required 36,000 men to man it, and other trade and fhipping 48,000 . In France, to manage the whole fhipping trade, there were then required only 1500 men. The whole people of France were $13,500,000$; and thole of England, Scotland, and Ireland, about $9,500,000$. In the thrse kingdoms are about 20,000 clarchmen, and in France more than 270,000. In the dominions of England were abnve 40,000 feamen, and in France not more than 10,000: In England, Scotland, and Ireland, and all their dependencies, there was then about 60,000 ton of fhipping, worth about $4,500,000$ in money. The fea-line round England, Scotland, and Ireland, and the adjacent incs, is about $3: 300$ miles. In the whole world he rectoned about $350,000,000$ of people ; and thofe with whom the Englith and Dutch have any commerce, not more than eighty millions; and the value of commodities

## ? O L

## P O L

fes about $1,500,000$ men able to carry arms. The coun. Political try he fuppoles capable of fupporting one half mole Aribhetic inlabitants, or 9,oco,oco; for, according in Mr Templeman's finvey, Encgland contains 49,450 fquare milce, $\underbrace{\text { Dolity. }}$ that is, $31,6+8,000$ actes, of which $25,300,000$ ateres are proper to be cultivated; and all wints threc acres, well manured, for lise maintenatuce of rne perfon, there will be mantenance in Vingland for $8,+30,000$ people ; to which add the prodnce of lithing, and it will enable the country to fupport $2,000,000$. In Ireland, Mr Templeman reckions $17,536,000$ acres, of which Dr Brakenridge thinks $12,000,000$ are capable of cultivattion; ant fllowing four acres to each perfon, and the number of inhabitants to be only $1,000,000$, Ireland could maintain $2,080,000$ more people thitn it has now. In Scotland, containing $1,500,000$ people, and $17,728,000$ aeres of land, of which there are $11,000,000$ good acres, a!lowing live for cach perfon, he fuppote's there may be provifion for $2,200,000$ people, or for 700,000 more than there are at prefent. Hence he infers, that were both the Britith ifles properly cultivated, there is a provition for $6,000,000$ inhatitants bejond the prefent number. Extending his furvey to the whole globe, he fuppofes the whole furface tin be to the quantity of land as 8 to $3, i$. e . as $197,819,550$ to) $74,182.331$ fquare miles; nut of which, deducting one third fur walle-ground, there will be $49,454,887$ fquare miles, or 31,651,127,680 good acres. And tating the whole number of inhabitants on the globe to be $400,000,000$, there will be 79 good acres to each perion. Sce Dr Halley's Calculations on the fime fubject, and Dr. Price's (for a lift of whofe works fee his life at the Word Price), and King on the National Dibt

POLITICS, the firft part of econcmy or ethics, confifting in the well governing and regulating the affairs of a fate for the maintenance of the public fafety; order, tranquillits, and morals.

Lord Bacon divides politics into three parts, viz, the prefireation of the ftate, its lappincfs and flourifing, and its enlargemont. Of the firf two, he informs us, various authors have treated, but the laft lias never been handled; and be has given a fpecimen of an effay to fupply the want.

POLITY, or Policy, denotes the pecniiar form. and conftitution of the govenment of any fate or mation; or the laws, orders, and regulations, relating thereto *.--Polity differs only from politics, as the "See Gotheory from the practice of any art.
veramer:
Of the nature of our focial dutics, both private and political, we have already fpoken at fome length (fee MIORa. Pbilofoply, Part II. chap. iii. and particulaly fect, vii.) ; and we thall bave occation to tolke a view of the origin and nature of the feveral political eftablif, ments of Europe, $\mathbb{E c}$. hereafter. (Sec Citil Societr.) We fhall only further remark in this place upon the necellity of always joining politics and morality together. This view of the fubject is indeed antiquated and neglect. ed; hut the connection las always been externally refpected even by thofe who have feparated them the molt widely. Politics and morality, lar from lianding in oppofition to each other, have the mof intimate connetion, and exlibit the relation which the part bears to the whotes that is to fay, that politics are only a part or a branch. of morality. No truth can be more evident than this :

## POL

for as morality is the guide of human life, the principle of order, and the univerfal fource of real improvement and genuine happinefs to all mankind, every thing relative to the direction of individuals, or the government of nations, mut be comprehended within its fphere, and be fubfervient to its laws. All the fchemes and projefts of pretended political wifdom, that deviate from or violate the rules of this malter-fcience, turn out in the iffue often to the detriment of their contrivers, alwitys to that of the nation; and it is a palpable and abfurd crror to think of advancing the happinefs of onc conntry at the expence of the general good of mankind. The experience of ages, and the hifory of the world, confirm thefe affertions; from which, and from daily oblervation, we obtain a convincing proof of the wifdom of the good old maxim, both in its application to individuals and to nations, that "honefly is the beft policy." See Baron Dahlberg's Confiderations on the Conneesion bitween Morality atid Politics, read by himfelf to the Academy of Sciences at Erfurt.

POLL, a word ufed in ancient writings for the head: hence to poll, is either to vote, or to enter down the names of thofe perfons who give their votcs at an electio:

Pali-Evilo See Farriery, §xxuii.
Post-Moncy, or Capitation, a :ax impofed by authority of the Britith parliament on the perion or head ; either on all indifferently, or according to fome known mark or diltinction, as quality, calling, sic.

Thus, by the fatute 18 Car. II. every fuhject in the kingdom was affefled by the head, or poll, according to his degree; every duke L.100, marquis L.80, baronet L. 30 , knight L. 20 , efquire L.io, \&c. and every fingle private perfon 12 d .

This wat no new tas, as appears by former ads of parliament.

Pollachius, or Pollack. See Gadus.
POLLARD, or Crocard, the name of a fort of hafe money current in Ireland in the time of Edward I. See Simon's Hifary of Trifls Coins, p. 15 .

POLLEN, the fecundating or fertilizing duf contained within the anthere or tops of the flamina, and differfed upon the female organ when ripe for the purpofes of impregnation. Sce Betany.

This duft, correfponding to the feminal fluid in animals is commonly of a yellow colour; and is very confpicuous in the fummits of fome flowers, as the tulip and lily. Its particles are very minute, and of extreme hardnefs. Examined by the microfope, they are generally found to affume fome determinate form, which often predominates, not unly through all the fpecies of a particular genus, but alfo through the genera of a matural family ir order. The fowder in queftion being triturated, and otherwife prepared in the ftomach of bees, by whom great quamtities arc coilected in the fainy brufles with which their legs are covered, is fuppoicil by forme authors to produce the fublance known by the name of zuas; a ipecics of vecetable nil, renderat concree by the prefence of an acid, which mult be removed be're the fubitance can be andered flaid.

Pollentia, a town or colony of Roman citizens in the Balceris Major. It is now faid to be Alcudia, fituated on the nurth.eft fide of the inland Milji rea. These was anothen Pollentia of the Picenum, Likewife a colony. It is thought to be either the fame
with or near to the Urbs Salvia, but is now extinct. There was a third of Liguria, fituated at the conflucnce of the Stura and Tanarus. Suetonius calls it a municipium, and the people Pollcntina Plebs. It was famous for its abundance of black fleeces; but was afterwards, under A.readius and Henorius, tasined with a defeat rather of the Romans under Stilico than of the Goths under Alaricus, though palliated by Claudian the poet; after which Rome was taken and fet on fire. It is now called Solenza, a fmall town of Piedmont, not far from Afti.

POLLEX, in anatomy, denotes either the thumb or great toc, according as manus or pedis is added to it.

POLLICHIA, in botans: A genus of the monogymia order, belonging to the monandria clafs of plants; and in the natural method ranking with thofe that are doubtful. Of this there is only one fpecies, riz. the campefris, or whorl leaved pollichia, a native of the Cape of Good Hope, and fowers in September.
POLLICIPES, the toe-sheld, in natural hifory, is the name of a genus of fhells, the characters of which are thefe: they are multivalve flat mells, of a triangular figure, each being compofed of fevelal laminx, which end in a fharp point. They ftand upon pedicles, and are furnithed with a great number of hairs. We have only one known fpecies of this genus, which is always found in large clufters.
pollicis pressio, and Pollicis versio, were ufed at the combats of gladiators as lignals of life or death to the vanquithed combatant ; or to the victor to fpare or take the life of his antagonif. The pollicis preflio, by which the penple granted life to the proftrate gladiator, was no more than a clencling of the fingers of both hands together, and fo holding the two thumbs upright clofe together. The pollicis verfio, which authorifed the victor to kill the other as a coward, was the bending back of the thumbs. Such is Dacier's opinion; but others fay the policis preffio was when the people held up one hand with the thumb bent, and the pollicis verfio when they flowed the band with the thumb raifed. Authors, however, are not perfectly agreed, though the phrafes pollicem primere, and policenn vertere, frequently occur in the Latin clafics as indications of the people's will that a gladiator fhould live or die.

POLLIO (Caius Afinins), a celebrated Latin poet and orator, was of confular dignity, and compofed fome traged es which were etteemed, but are now loft. He was the firft who opened at Rome a library for the ufe of the public. He was the friend of Mark, Antuny ; which prevented his cimplying with the folicitations of Augulus, who preffed him to cmbrace his party. At length Augufus havi $g$ wrote fome verfes againft Pollio, he was urged to anfwer them: on which he faid, "I fhall take care of writing againft a man who has the power of proicribing us." He is praifed by Vrys 1 and Horace, whofe patron he was.

There was another Pollis, a friend of Augufus, who ufed to feed his fifhes with human flefh. This crueity was difcovered when one of his fervants brike a nlats in the prefence of Augulus, who had been irvited to a feati. The mater ordered the fervant to be fine ed, but he threw himfelf at the feet of the emperor, and begased him to interfere, and not to fuffer him to be devomied by fifhes. Upon this the caufes of his apprelentionn
wereeramined; and Augufus, afonifhed at the barbariity of his favourite, c:ufed the fervant to be difmiffed, all the fifin ponds to be filled up, and the cryfal glaffos of Dollio to be broken to pieces.
POLLUTION, in „eneral, firgnifics defilement, or the rendering a perion or place unclean or unholy. For the Jewifh pollutions, fee the article Impuratr.

The Romanifs hold a church to be polluted by the effufion ol blood or of feed thercin: and that it mourt he confecated anew. And the Indians are fof fuperflitions on this head, that they break all the velfols which thete of another religion have drank out of, or even only touched; and drain all the water out of a prond in which a flanger has bathed.

Pollution, in medicine, a difeafe which onnfifts in an involuntary cmifion of the feed in time of fleep. This, in different perfons, is very different in degree; time heireg aftefed with it only once in a weck, a fortnight, three weeks, or a month, and others being fubjont to it almoll every night. The perfons mof fabject to i, arc young men of a fanguineous temperament, who feed high and lad a redentary life. When this happeas to a perfon but once in a fortnight or a month, it is of no great confeguence; but when it happens almoft every night, it greatiy injures the healih; the patient looks pale and lickly; in fome the eycs become weak and inflamed, are fometimes affected with violent defuctions, and are ufually at laft encircled with a livid appearance of the fkin. This dillemper is to be cured rather by a change of life than by medicines. When it has taken its rife from a high diet and a fedentary life, a coarfer food and the ufe of exercife will gencrally cure it. Perlons fubject to this difeafe fhould never take any flimulating purges, and mult avoid as much as poftible all violent paffions of the mind : and though exercife is recommended in moderation, yet if this be too violent, it will ather increafe the diforder than contribute to its cure.

## Self-Poliution. See Onanism.

POILUX (Julius), a Greek writer of antiquity, flourithed in the reign of the emperor Commodus, and was born at Naucrates, a town in Egrpt. He was educated under the fophifts, and made great progrefs in grammatical and critical learning. He taught rhetoric at Athens, and became fo famous that he was made preceptor of the emperor Commodus. He drew up for his ufe, and inferibed to him, while his father Marcus Antoninus was living, an Onomaficon or Greek Vocabulary, divicicd into ten books. It is cetant, and contains a yat varicty of fynonymous words and phrafec, agteenbly to the copioufners of the Greek Congue, ranged wader the general claftes of things. It was intendel to facilitate the knowledge of the Greek language to the young prince; and it is lill very ufeful to all who lave a mind to be perfect in it. The firlt edition of it was printed at Venice by Aldus in 1502 , and a Latin verfion was afterwards made and publiflled with i:: but there was no correct and handfome edition of it till that of Am?erdam, rook, in folio, by Lederlinus and İcmicrhufus. J.cderlinus went through the firft feven books, correating the text and reefion, and fubjoining his own, with the notes of Salmafius, If. Voffius, Valcius, and of Kuhnius, whofe fcholar he had bech, and whom lice fucceeded in the profeffothip of the oriental languages in the unicority of Stranurg. Vos. XV.

Femferhufus continucd the fame method through the three laf books: this learned man has fruce difinguift. ed himfelf by an excellant cdition of I.ucinn, and uther monuments of folid and pufound literature.
I'ollux wrote many other thines, none of which remain. He lived to the age of $5^{13}$. Matoll ratus and Li1cian have treated him with much contompt and riblents. Pbilofrat. de vit. Sophijf. lib. ii. and Iuciate in Rheroruma pracepioren.

Porlux. SceCastorand Pullex.
Pollux, in aftronomy, a fixed far of the fecond magnitude in the contellation Gemini, or the Twin:See Castor.

Poulvex and Capor, a fiery metcor. Sice Cestor amb Polltw:

POLOCSIII, a palatinate ia the duchy of Lithua. nia, bounded on the north by the palatinate of Weyte.3fki, on the fouth by the Dwina, on the north by Minfe. yy, and on the wer by Livonia. It is a deferi country full of wood, and bad formerly its own dukes.

Polocsii, a town of Lithunia, and capital of a palatinate of the fame name, with two cafles to defend it. It was taken by the Mufcovites in 1563, and retaken the fame year. It is feated on the river Dwina, 50 miles fouth-wef of Weyteprk, and Sc ealt of Branaw. E. Ling. 29. O. N. Lat. 56. 4.

POLTROON, o: Poltron, a cowared or daftard, Wanting courage to perform any thing great or noble. The word is borrowed from the French, who according to Salmafius, derive it a pollice truncaio; becaufe ancient. $1_{5}$ thofe who would avoid going to the vars cut off their thumb. But Menage, with more probability, derives it from the Italinn poltrone, and that from poito a " bed;" becaufe timorous, pufillanimous penple tak"e pleafure in lying abed. Others choofe to derive the word from the Italian poltro a " colt;" becaufe of that creature's readinefs to run away.
POLVERINE, the calcined ahes of a plant ; of a fimilar nature with our potathes or pearl-athes. It is brought from the Levant and Syria; and in the glalstrade it is always to be preferred to any wher athes. The barilla, or put-afhes of Spain, yield more pure falt than the polverine of the Levant, but the glafs made with it has always lome blue tinge: that made with the polverine is perfectly white, which ought always to be ufed for the finef crytal.

FOLYADELPHIA (from moive many, and afinqix brotherhood), many brotherhoods. The name of the a 8 th clars of Linneus's fertial fyltem, confifing of plants with hermaphrodite flowers, in which feveral flamina or male organs arc united by their flaments into three or more dillinct bundles.

POLY FNUS, the name of many famous men recorded in ancient writers. Among them was Julius Polyznus, of whom we have fome Greek epigrams ext:mnt in the firt book of the Antbologia. The Polyw. nus whon it moft concerns us to know about, is the author of the cight books of the Stratagems of illultrious Commanders in War. He was probably a Macedonian, and perhaps a foldie: in the carly part of his life; but of this there is no certainty: He was undoubted!y a thetorician and a pleader of canfes; and appears, from the dedication of his work to the emperors Antoninus and Verus, to hiave lived towards the later fart ef the ficond century. 'lhe Srateginata were publilhe i s s

Pelyandria in Grees by Iface Cafaubon, with notes, in $5_{58} 8$, I2mo; but no good edition of them appeared till that of Leyclen, 1690 , in 8 vo . The title-page runs thus: Po'jreni Stralarematum libri oito, yufo Vallecio interprete, P'anciatius ITrafjuicius recenfuit, IJaaci Cafauboni nco non Fuaj notas adjecit.

We have in this work the various Aratagems of above 300 captains and generals of armies, chielly Greeks and Larbarians : for the Romans feldom ufed fuch fineffes; and Polyænus has thown further, that he was not well yerfed in Roman affairs. A great number of thefe firaragems appear to us to be ridiculous or impracticable; and neither the generals, nor even common foldiers of our days, would be found fimple enongh to be caught by thens. Few of this order are capable of reading Pojpanus's Stratagenes; and if they were, they would reap little bencfit from it. The book is ufeful to fuch as ftudy the Greck language and antiquity; for many things will be found in it, illuftrating the cuftoms and opinions of ancient times. The fixth and feventh books are imperfect.

Pulyrenus compofed other works befides the Stratage2uata. Stubcus has produced fome palfages out of a book Dz Repullica Macedonum; and Suidas mentions a piece concerning the Thebans and three books of Tacitus. If death had not prevented, he would have written MTemorabilia of the Enterors Antoninus and Verus: for he makes a promife of this in the preface to his fixth book of Stratagems. Cafaubon, in the dedication of Polyænus to Mornxus, calls him an elegant, acute, and learned owiter.
POLYANDRIA (from toxvs many, and ainp a man or bufbard), many linfoands. The name of the isth clafs in Limxus's fexual method, confifing of plants uith hermaphrodite fowers, which are furninhed with feveral famina, that are inferted into the common receptacle of the flower.

POLYANTHEA, a collection of common-places in alphabctical order, for the ufe of orators, preachers, \&c. The word is formed from the Greek rovus much, and ab foc flower; and has much the fame meaning with anthology or forilege. The firt author of the polyanthea was Dominic Nanni de Miratellio, whore labour has been improved on by Barth. Amantius, and Franc. Torfius; and fince thefe, by Jof. Langius, under the title of P'lyantbea nova, 1613.
polyanthus, in botany. See Primula.
POLYBIUS, a famous Greek hiftorian, was born at Mergalopolis, a city of Arcadia, 205 years before Chritt; and was the fon of Lycortas, chief of the republic of the Acheuns. He was trained to arms under the celebrated Fhilopemen, and is defcribed by Plutarch airrying the urn of that great but unfortunate general in his funcral procefion. He arofe to conliderable honours in his own country, but was compelled to vifit Rome with other principal Achæans, who were detainaf there as pledges for the fubmifion of their fate. from hence he hecame intimate with the fecond Scipio Aficanns, and was prefent with him at the demolition of Carthage. He faw Corinth alfo plundered by Mummius, and thence paffing through the cities of Achaia, reconciled them to Rome. He extended his travels into Egypt, France, and Spain, that he might avoid fuch geographical crrors as he has confured in others.

It was in Rome that be compofed his excellent hif.
tory, for the fake of which his travels were undertaken. $P^{\prime}$ This hiftory was divided into 40 books; but there only remains the five firft, with extracts of fome parts of the others. It has had feveral editions in Greek and Latin ; and there is an Englifh tranlation by Mr Hampton. He died at the age of 82 .

POLYCARP, one of the mof ancient fathers of the Chriltian church, was born towards the end of the reign of Nero, probably at Smyrna; where he was educated at the expence of Califta, a noble matron ditinguifhed by her piety and charity. He was unqueftionably a difciple of St John the Evangelift, and converfed familiarly with cther of the apoftles. When of a proper age, Bucolus ordained him a deacon and catcchilt of his church; and upon his death he fucceeded him in the bifhopric, to which he is faid to have been confecrated by St John, who alfo directed his Apocalypee, among others, to him, under the title of the angel of the churcb of Smyrna. At length the controverfy about the obfervation of Eafter beginning to grow high between the ealtern and weftern churches, he went to Rome to dif. courfe with thofe who were of the oppofite party. The fee was then poffeffed by Anicetus, with whom he had many conferences, that were carried on in the noot peaceable and amicable manner ; and though neither of them could bring the other to embrace his opinion, they both retained their own fentiments without violating that charity which is the great law of their religion.

Whilft at Rome he particularly oppofed the herefies of Marcian and Valentinus. His conduct on this occation is related by Ircnæus; who informs us, that when Polycarp paffed Marcian in the flrect without fpenking, Marcian faid, "Polycarp, own us!" To which he replied with indignation, "I own thee to be the firttborn of Satan." Irenæus adds, that when any hereti cal doftrines were fpoken in his prefence, he wonld Itop his cars and fay, "Good God! to what times haft thou reierved me, that I thould hear fuch things!" and immediately left the place. He was wont to tell, that St John, gning into a bath at Ephefus, and fiading Cerintlus the heretic in it, immediately flarted back withnut bathing, crying out, " Let us run away, leit the bath fhould fail upou us while Cerinthus the enemy of truth is in it." Polycarp governed the church of Smyrna with apofolic purity, till he fuffered mattyrdom in the 7 th year of Marcus Aurclius ; the manner of which is thus related.

The perfecution waxing hot at Smyrna, and many having fealed their faith with th.ir hlood, the general cry was, "Away with the impious; let Polycarp be fought for." Upon which he priv.ately with rew into a ncighbouring village, where he continusd for fome time pray ing night and day for the peace of the church. He was thus employed, when one night he fell into a trance, and dreamed that his pillow took fire, and was burnt to athes; which, when he awoke, he told his friends was a prefage that he fhould be burnt alive for the caufe of Chriat. Three days afterwards, in order to efcape the inceffant fearch for him, he retired into another village: his enemies, however, were at hand, who feized upon two youths (one of whom they ferced by ftripes to a confefliun), by whom they were conducted to his lodging. He might have faved himfelf by getting into another houfe; but he fubmitted, faying, "The will of the Lord be done." He therefore came

## POL [ 323 TOL

down from his bed-chamber, ard falating his perfecutors with a fercne and cheerful countenance, he ordered it table to be fet with provilions, invited them to partake ct them, and on!y requeited for hinifulf one hour lor frayer ; ater which he was fot 1 pon an arfs, and conducied towar's Simyrna. On the road he met Herod an irenarcli or julice of the prozince, and his fother, who were the principal inftigators of the perfecution. IFerod took hine up into his clariot, and ftrenunuf ly endeavoured to undermine his conteancy ; but ha:ving failed in the attempt, he thruft him out of the chariot with fo nach riolence and indignation, that he bruifed his thigh with the f.ll. When at the place of cxccution, there came, as is faid, a woice from lee:ven, fiyi", g , "Pulycarn, be ftrong, and quit thy felf lite a man." Defire the tribunal he was urged to divear by the: genius of Cxfir. "Repent (fays the proconful), ana fay with us, talie away the impious." Wherenpon the mavtyr looking round at the crowd with a fevere and a.ngry counte:ance, beckoned with his hand, and looking up to leaven, faid with a figh, in a very different tone from what they ment, "Take away the impious." At lut, coniefing himelf to be a Chrittian, the crier thrize proclaimed his confeflion, and the people lhouted, "Thi, is the great costor of Afia, and the father of the Chrilli.ins; this is the defroyer of nur gods, that teaches raen m:ot to do facrifice, or worthip the deities." When the fire was prepared, Polycarp requefted not to be nailed, as ufual, but only tied to the itake; and after a 1h:ort prayer, which he pronounced with a clear and audibie voice, the executioner blew up the fre, which increaling to a mighty flame, "Behold a wonder feen (fays my author) by t:s who were purpofely referved, that we might declare it to others ; the flames difpofing themfelves, into the refemblance of an arch, like the fails of a thip fwelled with the wind, gently encirclea the body of the mariyr, who ftood all the while in the midf, not like roalted fleth, but like the gold or filver purified in the furnace, his body fending forth a delightful fragrancy, which, like frankincenfe or fome othier coflly fpices, prefented itfelf to our fenfes. The infidels, exafperated by the miracle, commanded a fpearman to run him through with a frord: which he had no fooner dine, but fuch a valt quantity of blood flowed from the wound as extinguithed the fire; when a dove was feen to fly from the wound, which fome fuppofe to have been his foul, clothed in a vifible fhape at the time of its departure (1)." The Chrifians endeavoured to carry off his hody entire, but were not allowed by the irerarch, who commanded it to be burnt to afhes. The bores, however, were gathered up, and decently interred by the Chriltians.

Thuss died St Polpcarp, the ;th of the laalends of May, A. C. 167. The amplitheate on which he fuffred was monly remaining not many years ago ; and his tomb, which is in a little chapel in the fide of a
mountain, on the fouth-calt of the city, was flins:nly P lyenovifited by dle Crecls on his fotival day ; and fur ilie maintenance and repai ing of io, eravell:-s wite wont to throw a lew af ers inu ath eartlin pot that thands there for the purpofe. Ite wrete fore lomitius an'
 pians, which is a tury pous an?! ( ri. ${ }^{2}$ in poce, of

 pablic aflemblies of the infitic ciutches. POLICARPON, in botany: A genus of the titgynia order, bolonging to the triandria clafs of plant: ; and in the nitural method ranbiag under ifs $22 d \mathrm{c}$ der, Caryophylle:. The calys is pentaplyyl!ous; the: : are five very fmall ovate petals; the caplule is an-locula and trivalved.

POLYCHREST, in pharmacy, fignifis a medicine that ferves for many ufes, or that cures many difeafes.

Sal Polvchaest, a enmpound falt mad? of equal parts of faltpetre and fulphur, defl:grated in a red-i.as crucible.

POLYCNEMUM, in botany: A genus of the monogynia order, belonging to the triandria clafs of plan:s; and in the natural method ranking under the 12 th order, Holoraces. The calyx is triphyllous; and there are five calciform petals, with one feed almof naked.

POLYCRATES, was a tyrant of Samos, famous for the grood forture which always attended him. He became very powerful; and got poffefion not only ci the neighbouring iflands, but alfo of fome cities on the coalt of Afia. He had a fleet of 100 fhips of war and was fo univerfally elteemed, that Amalis the king of Egypt made a treaty of alliance with him. The Egyptian king was, however, afraid of his continucd profpsrity, and advifed him to chequer his enjoyments, by relinquilhing fome of his molt favourite objefis. Polycrates, in compliance, threw into the fea a beautiful feal, the molt valuable of his jewels. The lofs of fo precious a feal aflicted him for fome time; but foon after he received as a prefent a large fifh, in whofe belly it wa; found. Amalis no fooner heard this, than he gave uno all alliance with the tyrant of Samos, and obferved, that fooner or later his good fortune would vanilh. Some time after Polycrates vilited Magnelia on the Mrander, where he had been invited by Orontes the governor. Fere he was thamefully put to death, merely becaufe the goverror wilhed to terminate his profperity. The
diugh
(1) The miraculous part of this account is ridiculed by Dr Miduleton in his Free Enquiry and Defence of it ; but fomething is offered in its favour by Mr Jortin, who obferves, "the circumfances are futhicient orly to create a paufe and a doubt." Remarks on Eccl. Hijl. vol. i.
(B) Jortin, vol. i. p. 63. who to the particulars made out by Cotelerius, has added one from Galat. i;. 26 . and atiother from Hebr. iv. 12,13.
rolyeruts duthgter of Polyerates had difuaded her father from dyeans which the had, but in vain.

POLICROTA, in the naval arehitecture of the ancionts, is a word ufed to exprefs fuch of their galleys as had three, four, five, or more tiers of rowers, feated at diferent heights; they were diftinguifhed by this term from the monocroh, or thofe which had only ingle rows of nars. The number of rows of rowers in the polycrete galleys has given oecation to lome to fuppufe thofe veiths of fuch a height from the water as is fearce credible. Commentators are not at all agreed upon the conluruction of theie veffels.

POLYDAMAS, was a famous athlete, who imitated Hereules in whatever he did. He killed a lion with his fint, and it is reported he could fop a chariot with his hand in its moft rapid courfe. He was one day with fome of :is friends in a cave, when on a fudden a large piece of rock came tumbling down, and while all fled away lie attempted to receive the falling fragment in his arms. His prodigious ftrength, however, was infufficient, and he was inftantly crufled to pieces under the rock.

POLYDECTES, a fon of Magnes, was king of the ifland of Seriphos. He received with great kinduefs Danac and her fon Perfeus, who had been expofed on the fea by Acrifius. He took great care of the education of Perfeus ; but becoming enamoured of Danac, be removed her from his kingdom, apprchenfive of his refentment. He afterwards paid his addreffes to Danac ; and being rejected, he prepated to offer her vio. Ience. Dinae hed to the altar of Minerva for protection; and Dictys, the brother of Polydectes, who had limfelf faved her from the fea-waters, oppofed her ravilher, and armed himfelf in her defence. At this critical moment Perfens arrived; and with Medufa's head he tumed into fones Polydectes, with the afociates of his guilt. The crown of Seriphos was given to Dictys, who had fhown himfelf fo active in the caufe of innocence.

POLYDORE virgil. Sce Virgil.
POLYDORUS, a fon of Priam by Hecuba, or, according to others, by Laothoe, the daughter of Altes, ling of Pedafus. Being young and inexperienced when Troy was belieged by the Grceks, his father removed him to the court of Polymnentor, king of Thrace, to whofe care he entrufted the greatelt part of his treafures, till his country thould be freed from foreign invalion. On the death of Priam, Polymnefor made himfelf mafter of the riches which were in his poffeftion; and to ellfure them the better, he murdered the young prince, :md threw his body into the fea, where it was found by Hecuba. According to Virgil, his body was buried near the fhore by his affanin; and there grew on Kis grave a myrtle, whofe boughs dropped blood, when Aneas going to Italy, attempted to tear them from the tree.

IOLYGALA, milkwort: A genus of the oftandia order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the 33 d order, Lomentaces. The calyx is pentaphylous, with two of its leaflets wing-fhaped and coloured; the legumen is obeordate and bilocular. There are $2+$ fpecies; of which the moft remarkable are,

1. The vulgaris, or common milkwort, is a native of the Britifh heaths and dry paftures. The ftalks are
about five or fix inches long, feveral arifing from the Pol fame root: thic leaves are firm, fmooth, entire, and grow alternate upon the falks, which are terminated with fpikes of flowers, moft commonly blue, but often red or white: the calyx confits of five leaves, three of which are fmall and green, two below, and one above the corolla; the other two intermediate ones are large, oval, flat.coloured, veined, and refemble petals, which at length turn greenifh, and remain a defence to the feed-veffel; the corolla confifts of three petals folded together, and forming a tube : the carina is terminated by a kind of heart-flaped, concave appendage, fringed at the extremity. The root of this plant has a bitter talte, and has been found to poffers the virtues of the American rattlefnake-root. It purges without danger. and is alfo emetic and dituretic ; fometimes operating all the three ways at once. A fpoonful of the decocion made by boiling an ounce of the herb in a pint of wa. ter till one half has exhaled, has been found ferviceable in pleurifies and fevers, by promoting a diaphorefis and expectoration ; and three fpoonfuls of the fame, taken once an hour, has proved beneficial in the dropfy and anafarea. It has alfo been found ferviceable in confumptive complaints.
2. The fenerga, or feneka, rattlefnake-wort, grows niturally in mont parts of North America. This hath a perennial root compofed of feveral Hefhy fibres, from which arife three or four branching falks which grow ereet, garnifhed with fpear-fhaped leaves placed alternately. The flowers are produced in loofe fpikes at the end of the branches : they are fmall, white, and finaped like thore of the common fort. It fowers in July, but the plants do not produce feeds. The root of this fpecies operates more powerfully than the laft; but befides the virtues of a purgative, emetic, and diu. retic, it has been recommended as an antidote againft the poifon of a rattlefnake; but this opinion is now exploded. It ftill, however, maintains its character in feveral diforders. Its efficacy, particularly in pleurifies, is moft fully eftablifhed in Virginia : formerly near 50 out of 100 died of that diftemper, but by the happy ufe of this root hardly three out of the fame number have been loft.

As the feeds of the rattlefnake-wort feldom fucceed even in the countries where the plant is a native, the bet method of propagating it in Europe is to procure the roots fiom America, and plant them in a bed of light earth in a fheltered fituation, where they will thrive without any other culture than kecping them free fiom weeds. But though the plant will ftand out ordinary winters, it will be proper to cover it during that feafon with old tamner's bark, or other mulcli, io keep out the frot.

POLYGAMIA ( $\pi$ eגve many, and gopes marriage). This term, expreffing an intercommunication of fexes, is applied, by Linnæus, both to plants and flowers. A polygamous plant is that which bears both hermaphrodite flowers and male or female, or both.

POLYGAMY, a plurality of wives or hubands, in the poffeffion of one man or woman at the fame time.

Polygamy is fo univerfally efeemed unlawful, and cven unnatural, through Europe, and in all Chriftian countries, that we have generally reafoned upon this conviction. Both religion and reafon appear at firft figlat at leaft to condemn it ; and with this view of the fubject

## FOI

fubject mankind in general re̊ fatisfied : but fome bolder geniufes have taken the oppofite file of the quention ; have calt off the prejudiecs of cúncation, and attempted to thow that polygamy is not unlawful, but that it is jut and neceflary, and would be a public beneft. Such writers, to ufe the words of an intelligent critic *, "recur to the common fubterfuge, of which every fe:ter up of flrange gods, and every conscientious troubler of the puiblic peace, have artfully availed themfelves to filence the clamour of expoltulation. "I'ruth! Truth!' is their general cry : and with this hopeful pretence, prudence and humility, and every amiable and ufful virtuc; are left behind; while conscience (conficince!) blindly rufhes ferward to oppofe order, infult authority, and overturn the cuttoms of ages."

Butnotwithfandisg thefe fair preteaces, it will, we doubt not, be cafy to thow that truth is not upon their fide; prudence and delicacy are certainly at open war with them: for Dr Percival, Phil. Tranf, vol. lxvi. part i. p. 163 . has very juftly obferved, that the prattice is brutal, deltructive to friendfhip and moral fentiment, inconfiftent with one great end of marriage, the education of children, and fubverfive of the natural rights of more than half of the fpecies. Befides, it is injurious to population, and therefore can never be countenanced or allowed in a well-regulated fate ; for though the number of females in the world may confiderably exceed the number of males, yct there are more men capable of propagating their fpecies than women capable of bearing children; and it is a well-known fact, that Armenia, in which a plurality of wives is not allowed, abounds more with inhabitants than any other province of the 'lurkilh empire.

Indeed it appears, that in fome countries where it is allowed, the inhabitints do not take advantage of it. "The Europeans (fays M. Nicbuhr $\dagger$ ) are mifaken in in thinking the ftate of marriage fo different among the Muffulnans from what it is with Chriftian nations. I could not difcern any fuch difference in Arabia. The women of that country feem to be as free and as happy as thofe of Europe can poffibly be. Polygamy is permitted, indeed, among Mahometane, and the delicacy of ctre ladies is floocked at this idea; but the Arabians rarely avail $\ddagger$ themfelves of the privilege of marrying . four lawful vives, and entertaining at the fime rime any number of female flaves. None but rich voluptuaries nuarry fo many wives, and their conduct is blamed by all fober men. Men of fenfe, indeed, think this privilege rather troublefome than convenient. A hutband is by law obliged to treat his wives fuitably to their condition, and to dipenfe his favours among them with perfect equality: but thefe are duties not a litt!e difagreeable to moft Mufiulmans ; and fuch modes of luxary are too expenfive to the Arabians, who are feldom in eafy circumflances. I mult, however, except one cafe ; for it fometimes happens that a man marries a number of wives in the way of commercial fpeculation. I know a Mullah, in a town near the Euplirates, who had married four wives, and was fupported by the profits of their labour."

See a curious kind of polygamy under the article Nayres. The ancient Britons, too, had a kind of polygamy among them, 12 women being common to 12 men.

Selden has proved, in his Unor Hetraica, that plura.
lity of wives was alitowed of, not only among the Fis. Pulygamy: brews, bat alfo among all oher nations, and in all ages. It is tute, the ancient liomans were more fevere in their morals, and never practifed it, though it was not forbicl amonr them: and Mark Antony is mentioned as the firt who took the libesty of having two wives.

From that time it became pretty frequent in the cmpire till the reigns of 'Thendofius, Honorius, and Arcisdius, who firtt prohibited it by exprefs law in 393. After this the emperor Valentinian, by an edict, permitted all the fulyects of the empire if they pleafed, to marry feveral wives; nor does it appar, from the ecclefiatical hiftory of thofe times, that the bifrops made any oppofition to this introduction of polygamy. In cfteet, there are fome.cven among the Chriftian cafuills who do not look on polygamy as in itfelf criminal. Jurieu obferves, that the prohibition of polygamy is a pofitive law ; but from which a man may be exempted by fovereign neceflity. Baillet adds, that the examfle of the patriarchs is a very powerful argument in favour of polygamy: of thefe arguments we thall fpeak hereafter.

It has been much difputed among the doctors of the civillaw whether polygamy be adultery. In the Roman law it is called fuprum, and punifhed as fuch, that is, in fome cafes, capitally. But a fmaller punilhment is more confiftent with the Jewifh law, wherein the prohibition of adultery is perpetual, but that of polygamy temporary only.

In Germany, Holland, and Spain, this offence is differently punifhed. By a conflitution of Charles $V$. it was a capital crime. By the laws of ancient and modern Sweden it is punilhed with death. In Scothand it is pumifhed as perjury.

In England it is enacted by fatute I Jac. I. cap. Ir. that if any perfon, being married, do afterwards marry again, the former huband or wife being alive, it is felony, but within the benefit of clergy. The firf wife in this cafe flall not be admitted as an evidence againit her humand, becaufe fle is the true wife; but the fecond may, for fle is indeed no wife at all ; and fo qiee verfa of a fecond hufband. This act makes an exception to five cafes, in which fuch fecond marriage, tho' in tha three firft it is void, is, however, no felong. 1. Where cither party hath been enntinually abroad for feven years, whether the party in Engfland had notice of the other's being living or not. 2. Where either of the parties hath been abfent from the other feven years within the kingdom, and the remaining party hath had no notice of the other's being alive within that time. 3. Where there is a divorce or feparation a menfa et floora hy fen. tence in the ecclefiaftical court. 4. Where the firft marriage is declared abfolutely void by any fuch fentence, and the parties loofed a vincule. Or, 5. Where either of the partics was under the age of conient at the time of the firt marriage ; for in fuch cafe the firft marriage was voidable by the dilagrecment of cither party, which this fecond marriage very clearly amounts to. But if at the age of confent the parties had agreed to the marriage which completes the contran, and is indeed the real marriagc, and afterivards one of them fhould mary again, judge Blackftone apprehends that fuch fecond marriage would be within the reaion and penala ties of the att.

Bernardus Ochinus, general of the orier of Capt:chins, and afterwards a Proteftant, publifhed, about the: midile:

## POL <br> 326 ]

Polygany, midalle of the toth century, Dialogues in farour of Po- of polygamy in the Eaft, Mr Druce proceeds to confider Polye 1ygamy, which where anfwered by Theodore Beza. And about the conclufion of the lat century we had at London an areful treatife publifhed in behalf of a phurality of wives, uncler the title of Polyam:a Thianplatrix: the author whereof affumes the name of Theophilus Aletbisu ; but his true name was $L$ yeretis. He was a native of Saxony. It has been antweed by feveral.

A new argument in favour of polygamy has been adduced by Mr Bruce, on this principie, that in fome puts of the world the proportion of female children is mush greater than that of males. "From a diligent inquiry (firs he) into the fouth and ferpture-p.nt of Mefopotamia, Arncnia, and Syria, from Moniful or Nineveh to Aleppo and Antioch, I find the proportion to be fally two womentrone man. There is indeed a fraction over, but it is not a confalerable one. From Latikea, Ladicea ad mare, down the coaft of Syria to Sidon, the number is nearly three, or two and three fouths, to cne man. Through the Holy Land, the conuntry called Horan, in the Ilthmus of Suez, and the parts of the Dedta unfrequented by ftrangers, it is fomething lefs than thrce. But focm suez to the Straits of Iabelmandel, which contains the liree Arabias, the propotion is fully four women to one man; which I have reafon to believe holds as far as the line, and $30^{\circ}$ beyond it. The Imam of Sama was not an old man when I was in Arabia Felix in 1709; but he had 88 children then alive, of whom ifonly were fons. The pricil of the Nile had 70 and odd children; of whom, as I remember, above 50 were daughters.
"It may be objected, that Dr Arbusthnot, in quoting the bills of inortality for 20 years, gave the moft unexceptionable grounds for his opinion; and that my fingle affertion of what happens in a foreign country, without further foundation, cannot be admitted as equivalent teftinnony: and I am ready to admit this objection, is there are no bills of mortality in any of thefe commeries. I fhall thereforc fay in what maner I att:ined the knowledge which 1 have juit mentioned. Whenever I went into a town, village, or inhabited place, ilwelt long in a mountain, or travelled journeys with any fit of people, I always made it my bufinefs to inquire hove many children they had, or their fathers, their next neighbours or acquaintance. I then afked my landlord at Sidon, fuppofe him a weaver, how many children he has had? He tells me how many fons and how many daughters. The next I afs is a tailor, a tmith, \&c. in fhost every man who is not a ftranger, from whom I can get the proper information. I fay, thercfore, that a medium of both fexes, arifing from three or four hundred families, indifcriminately taken, thall be the proportion in which one diflers from the other: and this, $I$ am confident, will give the refult to be three women in $50^{\circ}$ of the $90^{\circ}$ under cycry meridian of the globe."

Our author corroborates this argument by fuppoling that Mahomet perseived this dilpropirtion, and that upon it he founded his inftitution allowing one man to liave four wives. "With this view he enacted, or rat ther revived, the law which gave liberty to every individual to marrry four wives, each of whom was to be equal in rank and honour, without any prefercnce but what the predilestion of the hufband gave her."

Ihaving thus cfablithed, as he fuppofes, the neceffey
whetice there is mot fome other reafons why it fhomld not be pracied in Britain farther than the mere equality ian numbers of the fexes to one another. This reafor he finds in the difierence between the conflitutions of the Europeans-and caliern nations. "Women in Englaid (bays he) are capable of chiid-bearing at 14 ; let the other term be $4^{9}$, wien they bear no more; $3+$ ycars therefore an Englifh woman bears children. At the age of 14 or 15 they are objeds of our love; they are endeared by bearing es children after that tinas; and none, I hope, will pretend, that at 48 and soan Englinawoman is not an agreeable companion. The Arab, on the other hand, if the begins to bear children at 1 i, feldom or never has a child after 20. The time, then, of her child-bearing is nine years; and four women, taken altogether, lave then the term of 36. So that the Engiiif woman that bears cliildren for $3+$ years has only two years lefs than the term enjoyed by the four wives whom Mahomet has allowed; and if it be granted that an Englifh wife may bear at 50 , the icrmis are equal. Ibut there are other grievous diferences. An Arabian girl, at in years nld, by her youth and beauty, is the object of man's defire: being an infant, however, in under!tanding, the is not a rational companion for him. A man marries there, fay at 20; and beforc he is 30 , his wife, improved as a companion, cenfes to be an viject of his defires and a mother of children: fo that all the beft and mof vigorous of his days are fpent with a woman he cannot love; with her be would be deflined to live 40, or 45 yenrs, without comfort to himfelf by increafe of family, or utility to the public. The reafons, then, againft polygamy, which fubfilt in England, do not by any means fubfift in Arabia; and that being the cafe, it would be unworthy of the wifdom of God, and an unevennefs in his ways, which we thall never fee, to fubject two nations under fuch different circumftances abfolutely to the fame obfervances."

To all this argumentation, however, it may be replied, that whatever we may now fuppofe to be the conllitution of nature in the warmer parts of the globe, it certainly was different at the begimning. We cannot indeed afcertain the exact pofition of the Garden of Eden; but it is with reafon fuppofed not to have been far from the ancient feat of Babylon. In that country, therefore, where Mr Druce contends that four women are neceflary to the comfort of one man, it pleafed God to grant only one to the firft m.un ; and that, too, when there was more occalion for population than ever there has been fince, becaufe the whole cath was to be peopled from a fingle pair. Matters were not alered at the flood; for Noalh had but one wife. And this is the very argument ufed by our Saviour himfelf when fpeaking of divorse without any fufficient caufe, and then marrying another woman, which is a fpecies of polygamy.-Again, with refpeet to the alleged multiplicity of females in the ealtern part of the world, it is by no means probable that the calculations of Mr Bruce cr any other perfon can be admitted in this cafe. Hiitory mentions no fuch thing in any nation; and contidering the valt deftruction among the male part of th? human fpecies more than of the females by war and oulier accidents, we may dafely fay, that if four women children were born fur every lingle male, there would

## P O L

, ary. in fuch countries be five or fix grown up women for every man; a proportion which we may venture to afirm does not, nor ever did, exilt anywhere in the world. That it was not fo in former times we can only judge from the particular examples recorded in hiftory, and thefe are but few. We read in the Greek hiftory, indeed, of the fiffy daughters of Dinnaus; but thefe were matched by as many fons of : another man. Job had only one wife, yet hi:d fercon fons and but three daughters. Jacob had two wives, who bore twelve fons, and only one daughtcr. Abraham had only one child by his firte wife, and that was at fon. By his fecond wife lieturah he had fix fons; and confidering his advanced age at the time he married her, it is by no means probable that he could have ${ }^{2}+$ daughters; nay, if, as Mr Bruce tells us, the women in the eatern countries bear children only for nine years, it was impoffible fhe could have fo many. Gideon, who had many wives, had no fewer than feventy fons by thefe wives, and even his concubine had a fon; fo that if all thefe women had produced according to Mr Bruce's proportion, of nearly three females to one male, he mult have had almoft $2.9+$ children; a better family than any of Mr Bruce's ealtern acquaintances can probably boaft of.

With regard to this fubjeet, however, it mult be obferved, that the procreation of male or female children depends in fome degree on the health and vigour of the parents. It is by no means improbable, therefore, that the eaftern voluptuaries, whofe conftitutions are debilitated by their excefles, may have many more female than male children born to them. The vomen themfelves, by premature enjoyment, will alfo be inclinell to produce females inftead of males; but neither of thefe circumftances can prove this to be an original law of nature. Something like this may be gathered fium facred hiftory. Gideon abovementioned, who was a hardy and active warrior, had many fons. The fame was the cafe with David, who led an active and litborious life; while Solomon, who was a voluptuary, had only one fon, notwithftanding his multitude of wives.

The moft barefaced defence of polygamy that has appeared in modern times is by the Rev. Mr Madan, who publithed a treatife, artfully vindicating, and Atrongly recommending it, under the title of Ticly;hthora; or, A trcatife on Female Ruin, in its Caufes, Effafs, Confequences, Prevention, and Remedy, \&c. Marriage, according to this writer, fimply and wholly conififts in the act of perfonal union, or aifus coitus. Adultery, he fays, is never ufed in the facred writings but to denote the defilement of a betrothed or married womant, and to this fenfe he reftriets the ufe of the term; fo that a married man, in his opinion, is no adulterer, if his commerce with the $f$ ex be confined to fingle women, who are under no obligations by efpoufals or marriage to other men: but, on the other hand, the woman who fhould dare to have even but once an intrigue with any other man befides her hufband, (let him have as many wives as Solomon), would, ip $\sqrt{0}$ forio, be an adulterefs, and ought, together with her gallant, to be punifhed with immediate death. This, he boldly fays, is the law of God: and on this foundation he limits the privilege of polygamy to the man; in fupport of which he refers to the polyga-
mous connections of the patriarchs and faints of the Polygany. Old 'I'cflament, and inlers the lawfulnefs of their pratiec from the bleffings which attended it, and the laws which were inflituted to regulate and fuperintend it. He contencis for the lawfulnefs of Chillians laaving, like the ancient Jews, more wives than one; and labours much to reconcile the genius of the evamgelical difpenfation to an arrangement of this fort. With this view he afferts, that there is not one text in the New ''eftament that cven hints at the criminality of a polygamous connection; and he would infer frem St Paul's dirction, that bilhops and deacons thould have but one wife, that it was lawful for laymen to have more. Chriit, he fays, was not the giver of a new law ; but the bufinefs of marriage, polygamy, \&c. had been fettled before his appearance in the world, by an authority which couldnot be revoked. Befides, this writer not only thinks polygamy lawful in a religious, but advantageous in a civil, light, and highly politic in a domeftic view.

In defence of his notion of marriage, which, he fays, confifts in the union of man and woman as onc body, the effetts of which in the fight of God no outward forms or ceremonies of man's invention can add to or detract from, he grounds his principal argument on the Hebrew words made ufe of in Gen. ii. 24 . to exprefs the primitive inAtitution of marriage. viz. .
 lation is adopted by the evangelift (Mat. xix. 5.) with the omillion only of the fiperfluous prepofition (rpos) after the verb. Our tranflation, " thall cleave to his wife," doth not, he fays, convey the idea of the Hebrew, which is literally, as Montanus renders the words, " fhall be joined or cemented in his womar, and they fall become (i. c. by this union) one fefl." But on this ciiticifm it is well remarked, that both the Hebrew and Greek terms mean fimply and literally attachment or adherence; and are evidently made ure of in the facred writings to expreis the whole foope of conjugal fidelity and duty though he vould reftrain them to the groffer part of it.
With refpect to the Mofaic law, for which Mir Miadan is a warm advocate, it was certainly a lncal and temporary inttitution, adapted to the ends for which it was appointed, and admirably calculated, in its relation to marriage, to maintain and perpetuate the feparation of the Jewifh people from the Gentiles. In attempting to depreciate the outward forms of marriage, this writer would make his readers believe, that Lecaufe none are explicitly defrribed, therefore none exifed; and confequently that they are the fuperfluous crsinances of humatr policy. But it is evident, from comparing Ruthiv. 10. ${ }_{13}$. with Tobit wii. 3. 14. and from the cafe of Dinah, related Gen, xxxiv. that fome forms were deemed ellential to an honourable alliance by the patriarchs and faints under the Old Teftament, exclufive of the cannal knowledge of each other's perfons. It is alfo evident in the cafe of the woman of Samaria, whofe connection with a man not her hufand is mentioned in John iv. that fomething befides cohabitation is neceliary to confitu e . marriage in the fight of God.
Having flated his notion of marriage, he urges, in defence of polygamy, that, motwithitanding the feventh commandment, it was allowcd by God himfelf,

## POL

Fonygany. who made laws for the regulation of it , wrought mi. racles in fupport of it by making the barren women fruitfu, and declured the iffie legitmate to all intents and purpores. God's allowance of polygamy is argned from Exod. xxi. to. and particularly from Deut. $\therefore$ xi. 15 , which, he fays, amounts to a demonftration. This paffage, however, at the utmoft, only prefupbofes that the practice might have exiftence among io hard-hearted and fickle a people as the Jews; and therefore wifely provides againt fome of its more uniuft and pernicious confequences, fuch as tended to afieet the rights and privileges of heirihip. Laws enacted to regulate it cannot be fairly urged in proot of its lawfulnefs on the author's own hypothefis; becaufe laws were alfo made to regulate divorce, which Mr hladan condenins as abfolutely unlawful, except in cafes of adulicry. Befides, it is more probable that the "hated "ife" had been difmilied by a bill of divorcement, than that fhe was retained by her hublond: and moreuver, it is not cotain but that the two wives, fo far from living with the fame hufornd at the fame time, might be dead; for the words may be tendered 'hus, " if there fionh have lecn to a man two wives, irc." The words exprefling the original inftitution of marriage, Gen. ii. 2f. compared with Mat. aix. 4, 5, 8. afford infuperable objestions againt Mr Madan's doctrine of polygamy.

If we appeal on this fubject, from the authority of Scipture to the writings of the earlieft fathers in the Chritian church, there is not to be found the fainten trace of ary thing refembling a teflimony to the law. fulnefs of polygamy; on the contrary, many pallages cocur, in which the prattice of it is ftrongly and explicitly condemned.
We fhall clofe this atticle with the words of an excellent anonymons writer already quoted, and to whofe critique on Mr Madan's work we are indebted for the above remarks: "In a word, when we reflect that the primitive inftitution of marriage limitcd it to one man and one woman; that this inftitution was adhered to by Noah and his fons, amdit the degeneracy of the age in which they lived, and in fite of the examples of poljgamy which the :accufed race of Cain had introduced; when we confider how very few (comparatively fpeakiug) the examples of this practice were among the fathiful; loow mach it brought its own punifhment with it ; and how dubious and equirocal thofe paffages are in which it appears to have the fanction of divine approbation ; when to thefe relections we add another, refpecting the lin:ited vicws and temporary nature of the more ancient difjenfations and inftitutions of religion-how viten the imperfections and even vices of the patriarchs and people of God, in old time, are recorded, without any exprefs notification of their criminality -how much is faid to be commanded, which our reverence for the holinefs of God and his law will only fufier us to fuppole, were, for wife ends, penmitted-how frequently the meffengers of God adapted themfelves to the genius of the people to whom they were fent, and the circumaltances of the times in which they lived :above all, when we confuer the purity, equity, and benevolence of the Chriftian law; the explicit declazation of our Lord, and his apoltle St Paul, refpecing tire inditution of marriage its defign and limita-
tion; -when we reffect, too, on the teftimony of the moll ancient fathers, who could not polibly be ignorant of the general and cominon prastice of the apoftolic church; and, finally, when to thefe conficierations we add thofe which are founded oa juflice to the temale fex, and all the regulations of domeltic economy and national policy-we mutt wholly condemn the revival of polygamy ; and thus bear our honeft teftimony againt the leading delign of this dangerous and ill-ad. vifed publication."

We would advie our readers to read the whole criticifms on Madan's book in the Monthly Review, together with their account of the feveral anfwers to it. The reverend atuthor of the Thelyplithora has there met with a moft able antagonift, who traces him through all his deceitful windings, and expofes the futility and falfehood of his arguments with tingular ability. See Monthly Review, vol. 1xiii. p. 273, \&ic.; fee alfo Paley's Aloral Philofophy, 4to. p. 262.

POLYGARS, are natives of Hindonan. They in. habit almof impenetrable woods, and are under the abfolnte direction of their own chieftains. In time of peace they are piofeflonally robbers, but in times of war are the guardians of the country. The general name of thefe people is Polygar. Their original inftitution, for they live in diftinct clans, is not very well underfood. It probably took its rife from the municipal regulations relative to the deftruction of tygers and other ferocions beafts. Certain tracts of woodland were indifutedlyallotted as rewards to thofe who frould flay a certain number of thofe animals; and thofe lands approximating, probably laid the foundation of the feveral confederacies of Polyçars.
"The Pollams, or woods, from which is clerived the word Polgar, lying in profufon through all the foutlsern parts of Hindoftan, the ravages committed in the open countries by thefe adventurous clans, are both frequent and deftructive. Catile and grain are the conftant booty of the Polygars. They not unfrequently even defpnil travellers of their property, and fometimes murder, if they meet with oppofition: yet thefe very Polygars are the hands into which the aged and infirm, the wives, children, and treafure, of both Hindoos and others are entruited, when the circumjacent country unfortunately happens to be the feat of war.' The protedion they afford is paid for ; but the price is inconflderable, when the heiplefs fituation of thofe who fly to them for fhelter is confidered, and efpecially when their own very feculiar character is properly attended to. The native governments of Hindoftan an under the neceffity of tolerating this honourable binditi. Míany of them are fo formidable as to be able to bring 15,000 and 20,000 men into the field.
"The Ifindoo code of laws, in fpenining of robberies, hath this remarkable claufe, 'The mode of thares amon, ft robbers thall he this:-If any thief or thieves, by the command of the magitrate, and with his af: fiftance, lave committed depredations upon, and brought awny any booty from, another province, the $m$ agitrate flall receive a fhare of one fixth part of the whole. If they received no command or afiftance from the magiftrate, they fhall give the magiftrate in that cafe onetenth part for his thare, and of the remuinder their chief thall receive four thares; and whofeever

## POL

gars: among them is perfert mafter of his ocenpation, flall reccive three flares: alfo, which ever of them is remarkably frong and fout, flall receive two fhares, and the relt fall receive each one flare.' Here, then, we fee not only a fanction, but cven an inducement, to frandulent prastices.-Another fingular incontiftency among a people who, in many periods of their hiftory, have been proverbial for innocency of manners, and for unciommom honefy in their conduct towards travellers and frangers.
"At the firf fight, it would appear that the toleration of the l'olygars, owing to their great numbers, and to the fecurity of their fortrefles, which are in general impenctrable but to Polygars; that the governmeat licence, in this manner given to them, to live on the fpoils of the indultrious-might have originally occafioned the formal divifion, and encouragement to perfeverance, which we have juft quoted: but the caufe I fhould rather fuppofe to lie in the nature of certain goveruments, than to have arifen from any accidental circumfance afterwards; and I am the more inclined to this opinion, from the fituation of the northern parts of Hindoftas, which are, and always have been, uninfefted by. thefe freebooters.
"The dominion of the Eaft was, in former days, moft probably divided and fubdivided into all the various branches of the feodal fytem. The veltiges in it remain to this hour: rajahs and zemindars are nothing more than chieftains of a certain degree of confequence in the empire. If, then, experience lias fhown, in other parts of the world, that clans have always been obferved to commit the moft pernicious acts of depredation and hoftility on each other, and that the paramount lord has feldom been able effectually to cruth fo general and fo complicated a feene of mifchief-may we not reafonably venture to fuppofe, that the Hindoo legiflature paffed this ordinance for the fuppreffion of fuch provincial warfare, and for the wholefome purpofe of drawing the people, by unalarming degrees, more immediately under the controul of the one fovereign authority? The conclufion, I own, appears to me fatisfactory. Morenver, Polygars cannot but be of modern growth; for the law relative to thefts is antecedent to the mention of Polygars in hiftory." Sullivan's Philofophical Rhapfoclies.

POLYGLOTT, among divines and critics, chiefy denotes a Bible printed in_feveral languages. See Brife and Printing.

POLYGLOTTUS, in ornithology. See Tur. dus.

POLYGNOTUS, a famous painter of Thafos, flou,ifhed abont 422 years before the Chrifian era, and was the fon and fcholar of A glanphon. He adorned one of the public porticoes of Athens with his paintings, in which he jad reprefented the moft friking events of the Trojin war. The Athenians were fo pleafed with him, that they offered to reward his labours with whatever he pleafed to accept; but he declined the offer; and the Amphiayonic council, which was compofed of the reprefentatives of the principal cities of Greece, ordered that Polygnotus thould be maintained at the public expence wherever he went.

Of the talents of Polygnotus much honcurable men. tion is made by many of the beft autlocrs of antiquity, as Arihotie and Plutarch, Dionyfits Halicarnafienfis, Vol. XV.
\&o. I'dufanias fpeaks of his piofures of the crents Prify, of the Trojan wat, and, in his 'Tcmath Brok, intro. F'ify:0. duces a vety long defeription of cther piatures by num. the fame art ft, painted alfo from Homer in the temple at Deiphos. 'the palfare, however, gives but a couftefed and imperfect idea of the painter's performance. How much the art is indebted to this ancient maller, what grace and foftnefs he gave to the human count:nance, what embellifhments le added to the female fi. gure and drefs, are much more happily defcribed by P'iny. "Primus mulieres lucida velte pinxit, capisa carum mitris verficoloribus opernit, plurimumqu: picture primus contulit: fiquidem inflitnit on a lapocris:, dentes oftendere, vultum ah antiquo rigore variare."The fame author likewife bears hrnourabe tefimos: to the liberal ipirit of this great artit, who refufed any reward for his ingenions labours in the protico."Porticuns , gratuito, cum partem ejus Mycon neerce. de pingeret." Plin. lib. 35 cop. 8.
POLYGON, in geometry, a figure with many fiden, or whofe perimeter confilts of more than fuur fides as lealt ; fuch are the pentagon, hexagon, heptagon, scc.
folfGONUM, Knot-grass: A genus of the trigynia order, belonging to the octandria clafs of plants; and in the natural method ranking under the 12 th or. der, Hollirace.c. There is no calys; the coroll, is quinquepartite, and calycine, or ferving inftead of a calys; there is one angulated feed. There are 27 fpecies; but the molt remarkable are, I. The biltorta, biltort, or greater fnakeweed, hath a thick oblique intorted root, blackifh without, and red within; a fimple, reund, flender ftem, near two feet high; oval leaves, having decurrent foot-ftalks, and the ftalk terminated by thick flort fikes of whitilh-red flowers. 2. The viviparum, or fmaller biflost, hath a thickifli root, a fimpla flender fem half a foot ligh, fpear-flapell leaves, and the falks and branches terminated by long fpikes of whitih-red flowers. Eoth thefe perenrials fower in May and June, fucceeded by ripe feeds in Augulf. They grow wild in England, sce. the firlt in ruoi, the other in mountainous, fituations. 3. Oriental polygonum, commonly called perficarin, hith fibrous roots; an upright, robuft, frong, jointed Item, rifing eight or ten feet high, dividing at top into feveral branches; very largc oval lancenlate alternate leaves, on broad foottalks half furrounding the ftem; and all the branches terminated by long, hiunder, hanging fpikes of reddith-purple heptandrous and dizynious flowers, from July till October. 4. Faropyrum, buckwheat, or brank, rites with an upright, imonth, branchy ftem, from about a font and a half to a yard high, heartthaped fagituated leaves, and the branchesterminatsad by clutters of whitifh flowers, fircceeded by large angular feeds; excellent for feeding figesns and mont forts of poultry.

All thefe plants are hardy, and finceed in almont any foil and fituation; the two firl aic peremanal in root; and the third and fourth are annual, whal!y decay at the end of fummer, or carly in winter. The fith two forts are retained in fome curious gardens for varicty; but their chief merit is for medical purpofes; ther are powerful aftringents, and are ufed both internally and extermally ; efteemed very eficaticus in hemombagics and other fluxes; and good to heal core menths. The third fort, Uriental foly gonum, or perficartia, is a mon. T t

## POL [ 330 ] <br> POL

Foryplo.
elcerant arnont for the cmbelifhment of pleafurcerect loxuiant hem, and lrorohy !ead; which being garnithed with noble lume foliage, and numerous penculcus fikes of firwets, in cenilant fuccelhon three of from monts, exnibits a very cmamental appearance firm Jure or Jnly until Oetrber, and is fo ealy of culfure, that frem its feattired fects in autumn, young Flants rife portmeoufly in aboudance the enfuing 1) rines, and thoot up fo japidly as to attain fix or c. I if feet in leeight by July, when they gencrally begin hiwering, and continue till attacked by the frolt, when they thelly ferifli; fo that :a frella duply mutt he raifed fiom feed annually. The fourth fort (back-wheat) is a fort of co:n, and is frequen:ly cultivated both by way of toduer, cu:ting it, nalks while young and green to fecd cattle, and for its grain to feed pigcoms, poultry, hogs, sic. It flourifhe $=$ in any fonil and fituation, but wenerally thrives beft in a light dry carth; and the drief feafors feldo: retard its growth. The firlt and fecond forts are eafily propagated in flenty, by parting the roots in autumn. The third fort, Oriental polygonum, being anamal is always propagated frem feed annually, either in the full ground, or by means of hotbetc.

Ui:. The rect of a kind of biftert, according to Gmelin, is ufed in Sheria for crdinary food. This ipedi.s is by Haller called biforta filis a toram nervefir, and by fome oller botanifts liforta montana minor. 'I l:e ratives coll it mouka; and fo indolent are they, 1?: $t$, to five themfelves the trouble of digging it out - if the erath, they go in froing and pillage the holes of the mountain rats, which they find filled with thefe 1. $\because$ s. In Britam, bifort is ufed as a medicine. All : he parts of bittont, have a rough aultere tafte, partisulally the root, which is one of the frongeft of the verctable aftringents. It is employed in all kinds of manderate hxmor hagies and other fuxes, both interwhly and externally, where aftringency is the on!y indication. It is cortainly a very powerfu] Ryptic, and to be looked on fimply as fuch; the fudorific, antipeftilential, ard other like virtues afcribed to it, it has no other claim to than in confequence of its aftivgen$\because$, and of itie antifeptic power which it has in common whth cher vergetable liyptic:. The largelt dofe of the root in poxder is a fingle dram.

POLYGRAPHY, Polygraphia, or Poygraphice, the art © $f$ witing in various unufual mamers or ciphers; is alfo of deciphering the fame. The word is formed from the Greet, $\pi \cdot 0 \%$ maltum, and riaq月 forijura, "writing."

The ancients feem to have been very little accuainted with this art ; nor is there any mark of their having gone beyend the Lacedemonian feytala. Trithemiu, Porta, Vigenerc, and father Niceron, have written an the futject of polygraphy os ciphers. Sec Cipher.

POLYHYMNIA, in the pargan mythology, one of the nine mufor, thus namedfrom the Gieek words noxus "mucly" and iss"os "fong." She rrefided over liflory, or rather rhetoric ; and is reprefented with a crown of pearls and a white robe; her right hand in attion as if haragu ng, and holding in her left a caduceas orfceptre to lonw hir rower.

POLYHEDRON, in genmetry, denotes a body or dilid comprehended under many lides or planes.

Pozshenon, in oftics, is a muliplying rlats or
lens, confating of feveral plane furfaces difpored into a Polyma convex form. See Oprics, $n^{\circ} 256$.

POLYMATHY, denotes the knowledze of many arts and fciences. The word is derived from the Greek, nerv mulitum, and ratavce, difin.

POLYMNESTOR, was a king of the Thracian Cherfonefus. He married Ilione, Priam's cldeft danghter; and for the fake of the treafure with which he was entrufted by Priam during the fiege of Troy, he murdered Polydorus, (fee Polynorus). The fieet in which the victorious Greeks returned, together with their Trojan captives, among whom was Hecuba, fopped on the c.ants of Thrace, where ore of the female captives difcovered on the thore the body of Polydorus, whom Polymneflor had thrown into the fea. The dreadful intelligence was immediately communicated to Hiccuba his m ther, who recollecting the frightful dreams fhe had the preceding night, did not doubt but Polymneftor was the cruel affamin. Refulved to revenge hev fon's death, the immediately called out Polymneftor, as if to impart to him fomething of importance. He was drawn into the frare ; and no fooner was he introduced into the apartment of the Trojan princefs, than the female captives rufhing upon him, put out his eyes with their pins, while Hecuba murdered his two children, who had accompanied him. Euripides informs us, that the Grceks cordemned Polymnefor to be banifhed into a diftant illand for his perfidy. Hyginus, however, relates the whole diferently, and tells us, that when Polydorus was fent to Thrace, Ilione his fifter took him infead of her fon Deiphilus, who was of the fame age, being fearful of her liubland's cruelif. The monatch, unacquainted with the impofition, looked upon I'ulydorus as his own fon, and tieated Deiphilus as her brother. After the deftruction of Troy, the conquerors withed the houfe and family of Priam to be castis pated, and therefore offered Electia the diughter of Agamemmon to Polymncftor, if he would deftroy Ilione and Pclydorus. He accepted the cffer, and immediately difpatcled his own fon Deiphilus, whom he took for Polydorus. Polydorus, who paffed as the fon of Polymnettos, confulted the oracle after the murder of Deiphilue, and being informed that his father was dead, his mother a captive in the hands of the Greeks, mad his country in ruins, he communicated the anfwer to llione, whom he had always regarded as his mother. She tol! him the meafures the had purfued to fave his life, upon which he avenged the peridy of Polymnefor by putting out his eyes.

POLYMNIA, in botany: A genus of the polygnmia necelfaria order, belonging to the fyngenefia clafs of plants; and in the nateral method ranking under the 40 th order, Comiofiti. The ieceptacle is paleaceous; there is no pappus ; the exterior calyz is tetraphyllots, or pentaphyllous; the interior decaphyllous, and compoled of concave leafets.

POLYNICES, the fon of CEdipus by his mother Jocall $L$. See Jocasta, CEdipus and Eteoclis.

POLYPE. Sce Polypus.
POLYPETALOUS, amone botanits, an epithet applied to fuch flowers as confift of feveral petals or flower-leaves.

POLYPHENTUS (fab hit.), a celebrated Cycleps, and king of all the Cyclops in Sicily, was the fon of Neptume and Thorfathe daughter of Phorcys. He is faid to hare been a monfter of great hrere ${ }^{+h}$, very tall,
and with one cye in the middle of the forelicad. He eat human flefh, and kept his flocks on the coaft of Sicily, when Ulyffes, at his return from the Trojan war, was driven there. Ulyllits, together with 12 of his companions, vifted the coall, and with them was feized by the Cyclops, who coufned them in his cave, and daily de outral two of them. Uly fles would have hared the fitte of the teft, had he not intoxicated the Cyclops, and put out his eye will a fieltrind when he was affeep. Polyphemus was awalkened by the fudden p,iin, and fiopped the entrance of his cave; but Ulyiles efcaped, by creeping Letween the legs of the rams of the Cyclops, as they were led out to feed on the mountains. Pol phemus became enimnoured of Galatea; ; but his addrefies were dificgarded, and the nymph flumned his prelence. The Cyelops was fill more eariuet ; and when he faw Galatxa: furtender herfelf to the pleafures of Acis, he crulhed his rival with a piece of a broken rock.
POLYPODIUNI, in botany; a genus of the order of filices, belonging to the cryptogamia cl.rfs of plants. The fructifications are in roundif points, feattered over the inferior difc of the frons or leaf.There are $6 ;$ fpecies, of which the molt remarkable is the filix mas, or common male fern. This grows in great plenty throughout Britain in woods and fony unculcivated foils. The greatef part of the root lies horizontally, and has a great number of appendages phaced clofe to each other in a vertical die eqiun, whilite at number of frall fibres frike downwards. The lenves are a cubit high, and grow in circular tufts. They are at firl alternately pinnate, the pinn:x increafing in fize from the bafe towards the middle. and afterwards gradually decreafing upwards to the fummit of the leaf. Thefé pinnx are again pinnatifid, or fubdivided almoft to the nerve intw obture parallel labes, crenated on the edgcs. The ftalks are covered with brown filmy fcales. The fructifications are kidney-1laped, and covercd with a permanent fcaly fhield or involucrum. The capfilles are of a pale brown, furrounded with a faffron-coloured elaftic ring.

This fern has nearly the fame qualities, and is ufed for mof of the fame intentions, as the pteris aquilina. They are hoth burnt together for the fake of their afthes, which are purclafed by the foap and glafs - makers. In the illand of Jura are exported annually 1501 . worth of thefe : :thes.
Cunner relates, in his Flor. Noveg. that the young curled leaves, at their firt appearance out of the ground, are by fome boiled and eaten like atparagus; and that the poorer Norwegians cut of thofe fucculent lamine, like the nails of the finger at the crown of the root, which arc the bafes of the future flalks, and brew them into beer, adding thereto a third portion of malt, and in tines of greats fearcity mix the fame in their bread. The fame author adds, that this fern cut green, and dried in the open air, affords not orly an excellent lit:er for cattle, but, if infured in hot water, becomes no con:emptible forder to goais, fheep, and other cattle, which will readily eat and formetines grow fat upon it: a circumfance well worth the attention of the inhabitants of the Highlands and Hebrides, as great mumbers of their catule, ia hard winters, frequently pe1:th for want of food.
But the anthelmintic quality of the root of the male fera is that for which it is chielly to be valued, and of

1. 343 . cul. 2.
 comfe it has been confounded lyy mott of the Lingina botanifls with the fpecies which wie hatye nowy di. foribed, and the polypodium thelypteris. It hats it latge faly root, wrapped and ticd tigether will mall frong fibres, not to be feparated without diflecults.The frublifita na are on the magins both when yount and old, and bever run into one another: the lobes alic oval and plain. It is fout times as large :ts the thelepteris, and grows in diry woods, moors or lills, and we:y feldom near water; all which charaters are videly di. ferent from thole of the fpecies with which it has be i: confoumded. It is to be found both in Einglais an: Sicotand, in the latter place very plentifully. Sec limnaan Trunfanions, vol. 1. J. İ̈'s.

POLYPREMUM, in botany: A genus of the mo. nogynia order, belonging to the tetrandria clafs of plants ; and in the matural method ranking under the 22d order, Caryonlitic. The calfx is teiraplayllous; the corolla quadrifid and rotaceous, with it lobes obcordate ; the captule comprefled, cmarginatid, and bilocular.

POLYPUS, a fpecies of frefh-water infects, belonering to the genus of hydra, of the order of zoopliytes, and clafs of vermes. (See Animalcule, $n^{\circ} 24,8 x$.) The name of bydra wats given them by Linnxus on accoun: of the property they have of reproducing themfelves when cutin pieces, every part foon becoming a perfeit animal. Dr Hill called them lioto, on account of the ftong principle of life with which cvery part of thens is endowed.

Thefe animals were firt difcovered by Leeuwenhocl:, who gave fome account of them in the Philofophecat Trantactions for 1703, but their wonderful properties were not thoroughly known till the year $174^{\circ}$, when Mr Trembley began to invelingate them. Previous to his difcoveries, indeed, Leibnitz and Boerhave, by reafonings a priori, had concluded that animals miglit be found which would propagate by flips like plants; and their conjectures were foon verified by the ohfervations of the gentlemen above-mentioned. At firit, however, Mr Trembley was uncertain whether he flould reckon thefe creatures animals or plants; and while thus uncertain, he wrote a letter on the fubject to Mr Bonnet in January 1741 ; but in March the fame jear he had fatisfied himfelf that they were real animals. The furpric of Mir Trembley, and of others, on difovering the true nature of the fe inimals, was very great. When Mr Reaumar faw for the firf time two polypes formed from one which he had divided into two parts, lie could hard? believe his own cyes; and even ater liaving repeatil the operation an hendred tirnes, he faid that the figlis was by no means familiar to him. On the 1 sth of Jul:1741, M. Buffon wrote to Martin lwhes, Ler; prelident of the Royal Sociery, acquain ing lim with "the: difcovery of a mall infert called a polypur, vhichs is found about the commonduclsween ; and which, beciat? cut in two, puts forth frem the upper part a tail, and from the lower end a he:ad, lo as to hecome taso animals intead of one. If it be cut into three parte, the middemont alfo putsoutfrom one end alsead, and fron tlie other. a tail, fo as to become three diflinet animate, all living like the firt, and performing the various oflices of their

Polypus. Fecies."--In September the fume year, a letter was commanicated from C. Bentinl, Eff; at the Hague, defcriting the infeats difeovered by Mr Trembley, adding, that he himfelf had feen them; and in November that year, a letter was read before the Sociely fom Gronoriuc, at Leyden, giving an atcount of a waterinflef, which, fays he, if cut into five or fix pieces, in a few hours there will be as many animals exacily fimilar to their parert. Thefe accounts, however, were :all deemed fo extracrdinary, that they were not credited, until p:oteffors Albinus and Mufchenbrocets provided themfelves with them, and $f$ ur.d every thing related concersing them to be exaaly true. In Narch 1742, Mr Folkes gave an :ccount of them to the Royal society, from fome cbfervations made on feveral polypes which Mr Trembley had fent from Hoiland. They were foon after found in England, and the obfervations ruade upon them were publifhed by feveral perfons; fo that no doubt remained concerning the ee:ility of what had been related coneerning them.

The general charader of the polype is, that it fixes itfelf by its bafe; is gelatinous, linear, naked, contractile; and can change its place. The mouth, which is placed at one end, is furrounded by hair-like feelers. The young ones grow out from its fides; but in autumn it proluces eggs from its fides. There are fix varietes.

1. The viridis, or green polype, has commonly ten f.dirt ams.
2. The fuffa has frequently eight arms feveral times longer than the body.
3. The grijea is of a yellowifh colour, fmall towards the $b$ ttom, and has long arms, generally about feven in number.
4. The pallens has generally about fix arms of a moderate length.
5. The lyditula has a veficular body, and four obfoleie arms. It is found in the abdomen of theep, fiwine, \&c.
6. The fentorea has been called the tuynel-fraped, and has a mouth furrounded with a row of liairs.
7. The focialis is bearded, thick, and wrinkled.

The drree firft fpecies are thofe on which the greatef number of experiments have been made; and their thapes are fo vatious, that it is by no means eafy to detcribe them. They are generally found in ditches. Whoever has carefully examined thefe when the fun is very powerful, will find many little tranfparent lumps of the appearance of a jelly, and fize of a pea, and hatted upon one fide. The fime kind of fubftinces are like. wife to be met with on the under fide of the leaves of flants which grow in fuch places. Thefe are the polypes in a quiefcent ftate, and apparently inanimate. They are generally fixed by one end to foune folid fub. ftance, wih a large opering, which is the mouth, at the other; having feveral arms fixed round it, projecting as rays from the centre. They are fiender, pellucid, and formed of a tender fubfatice like the horns of a finail, and capable of contracting themfelves into a very fmall compats, or of extending to a confiderable length. The arms are capable of the rame contrasion and expanfion as the body; and with thefe they lay hold of minute worms and other infeas, bringing them to the mouth and fwallowing them; the indizeltible parts are ayan thenw out by the month.

## POL

The green poiype was that firt difcovered by Mr Tremisey; and the tirlt appearanees of fpontane us mution were perceived in its arms, which it can enntiact, extend, and twif about in various directions. On the firt appearance of danger they contratt to fueh a degree that they appear little bigger than a frain of fand, of a fine green colour, the arms difappeating entirel. Soon after he found the grifea, and atterwards the fufca.
The bodies of the virilis and grifea diminifh almoft infenfibly from the anterior to the pofterior extremity; but the tufca is for the molt part of an equal fize for two-thirds of its length from the anterior to the pofte. rior ewiremity, from which it becomes abruptly fmaller, and then continues of a regular fize to the end. T'befe three kinds have at leaft fix, and at moit 12 or 13 arms, though fometimes the grifea is met with having 18 arms. They can contract themfelves till their bodies do not exceed one-tenth of an mch in length, and they can ftop at any intermediate degree of contration no extenfion. They are of various fize ; from half an inch to an inch and an half long; their aims are feldom longer than their bodies, though feme have them an inch, and fome even eight inches, long. The thicknel's of their bodies decreates as they extend themfelves, and rice verfa; and they may be made to contrat themfelves either by agitating the water in which they are rontained, or by toueling the animals themfelves. When taken out of the water, they all contract fo much that they appear only like a little lump of jelly. The arms have the fame power of contraction or expanfion that the body has; and they can coltract or expand one arm, or any number of arms, independent of the reit; and they can likewife bend their bodies or arms in all poliible directions. They can alfo dilate or contract their bodies in various places, and femetimes appear thick fet with folds, which, when carclefly viewed, appear like rings. Their progrefive motion is performed by that power which they have of contracting and dilating their bodies. When about to move, they bend down their head and arnis, lay hold by means of them on fome other fublance to which they delign to fatten themfelves; then they loofen their tail, and uraw it towards the head; then either fix it in that place, or ilretching forward their head as before, repeat the fame operation. They afcend or defcend at pleafure in this manner upon aquatic plants, or upon the fides of the veffel in which they are kept; they fometimes hang by the tail from the firface of the water, or fometimes by one of the arms; and they can walk with eafe upon the farface of the water. On examining the tail with a microfecpe, a fmall part of it will be fonnd to be dry above the furfice of the water, and as it were in a little concave fpace, of which the tail forms the buttom; fo that it feems to be fuipended on the furface of the water on the fame principle that a fmall pin or needle is made to fwim. When a polype, therefore, means to fals from the fides of the glafs to the furface of the water, it has only to put that part out of the water by which it is to be fupported, and to give it time to dry, which it always does upon thefe occarions; and they attach themfelves fo firmly by the tail to aquatic planes, flones, \&c. that they camnut be eafily difengiged: they often fu:ther firengthen thefe attachments by means

## POL [333] FOX

Mis. means of me or two of their arms, which ferve as a kind of anchors for fixing them to the a jacent fubtances.

The fomach of the polype is a kind of bag or guit into which the mouth opens, and goes from the head to the t.it. 'This, in a Arong hight, is vifithe to the naked eye, cipecially if the at imal be phaced between the ege ind at candle; for theic animals are quite tranfparent whatever their col ur may be. The ftomach, however, appears to more advantage through a powerful magnificr. Mr Tienthey, by cutting one of thefe animals tranferfely into three parts, fatioficd himielf that they were perforated throughont. Each piece immediately contracted itfelf, and the perforation was very vilible thought a microicope. The floin which inclofes the Homach is that of the polype itfelf; fo that the whole anima', proferly fpeaking, contifts ouly of one fkin, in the form of at ube, and open at both ends. No velfels ot any kind are to be diltinguithed.
The mouth is fituated at the anterior end in the middle hetween the fhooting forth of the armis, and affiunes different appearances according to circumfances; being fometimes lengthened out in the form of a nipple, at others appearing truncited; fometimes the aperture is quite clofed, at others there is a hollow; though at all times a fmall aperture may be dificovered by a powerful magnifier.

The $\mathfrak{R k}$ in of a polype, when examined with a microfoope, appears like thagreen, or as if covered with little grains, more or leis feparated from each other, according to the degree of contraction of the body. If the lirs of a polype be cut tranfverfely, and placed fo that the cut part of the fkin may lie directly before the microfonpe, the fkin thr ughout its whole thicknefs will be found to confift of an istinite number of grains, and the interior part is found to be more fhagreened than the exterior one; but they are not flongly united to each other, and may be feparated without much trouble. They even feparate of themfelves, thongh in no great numbers, in the mof healthy animals of this kind; for where they are obferved to feparate in large quantities, it is a fymptom of a very dangerous difinder. In the progrefs of this diforder, the furface of the polype becomes gradually more and more rough and unequal, and no longer well defined or terminated as before. The grains fall off on all fides; the body and arms contract and dilate, and affume a white thining colour; and at laft the whole diffolves into an heap of grainc, which is more particularly obferved in the green polype. By a careful examination we find, that the ikin of the polype is entirely compofed of grains, cemented by means of a kind of gummy fubfance; but it is to the grains entirely that the polype owes its colour. The ftructure of the arms is analogous to that of the body; and they appear flagreened when examined by the microfope, whether they be in a flate of contration or extenfion; but if very much contraded, they appear more fhagrcened than the body, though almoft quite fmooth when in their utimof f.ate of extenfion. In the green polype the appearance of the am is continully varying; and thete variations are more fenfible towards the extermity of the arm than at its origin, but more fcattered in the parts further on. The estremity is often terminated by a knob, the hairs of which cannot be obferved without a very powerful mag-
nificr. "They have a remarkible inclitation of turning Polypirne towards the lightr ; fo thit if that part of the ghait on which they are be turned from the light, they will quickly remove to the ather.

That fpecies numed the fufo has the longef arms, and makes ufe ot the molt curious manceuvers to fcize its pres. They are belt viewed in a glafs feven or cight inches deep, whon their arms commonly hang down 10 the bottom. When this, or any nther kind, is hungry, it fpreads its arms in a kind of circle to a confuderable extent, inclofing in this, as in a net, every infect which has the misfortune to come within the circunifirence. (Siee Animalcule, $\mathrm{n}^{\circ} 27$ ). While the animal is con. tracted by deizing its prey, the arms are obfived to fwell like the mufcles of the human body when in action. Though no appeatance of ejes can be obferved in the polype, they certainly have fome hnow. ledge of the approach of their prey, and flow the greatelt attention to it as foon as it comes near them. It feizes a worm the moment it is touched by ne of the arms; and in conveying it to the mouth, it frequently twifts the arm into a fpiral like a corkfcrew; by which means the infect is brought to the mouth in a much thorter time than otherwife it would be; and fo foon are the infects on which the polypes feed killed by them, that M. Fontana thinks they mult contain the mot powerful kind of poifon; for the lips farce tcuch the animal when it expires, thengh there cannct tie any wound porceived on it when dead. The worm, when fivallowed, appears fometimes fingle, fometimes double, according to circumitances. When full, the polype contracts ittilf, hangs down as in a hind of Aupor, but extends again in proportion as the food is digefed and the excrementitious part is difcharged. The bodies of the infeas, when fwallored, arc firit macerated in the fomach, then reduced into fragments, and driven backward and forward from one end of the fomach to the other, and even into the arms, however fine they may be; whence it appears that the arms, as well as the other parts of this remarkable creature, are a kind of hollow guts or fonmachs. In order to obferve this motion, it is beft to feed the polypes with fuch food as will give a lively colour ; fuch, for inflance, as thofe worms which are furnifhed with a red juice. Sume bits of a fmall black frail being given to a polype, the fubitance of the fkin was foon diffolved into at pulp confifting of dinall black fragments; and 0.1 examining the polype with a microfoope, it was found that the particles were driven about in the fomach, and that they paifed into the arms, from thence back into the fomach, then to the tail; from whence they palfed again into the arms, and fo on. The grains of which the body of the polype confit take their colour from the fond with which it is nourithed, and become red or black as the food harpens to afiord the one coleur or the other. They are likewife more or lefs tinged with thefe culours in proportion to the flength of the nutritive juices; and it is obfervable that they lofe their co-l-ur if fed with aliments of at colour different from themfelves. They feed ou mot infects found in frech water; and will alfo be fupported w th worms, the larve of gnats, \&ic. and even with finails, large aquatic infeets, and fifh or flefh, if cut into fmall bits. Sometimes two polypes lay hold of the fame worn, and cach begins

Polypus. begins to frallow its own end till their mouths meet and the worm breats. But fhould this happen not to be the cafe, the ene polype will fometimes devour the onther alony with its portion. It appears, however, that the fomach of ons polype is not fitted for difiolving the fubfance of another; for the one which is fwallowed always gets clear again after being imprifoned for an hont or two.

The manner in which the polypes generate is mont perceptible in the grifea and fufca, as being confiderably larger than the viridis. If we examine one of them in fimmer, when the animals are molt attive, and prepared for propagation, fome fmall tubercles will be found pro. ceedng from its fides, which confantly increafe in bulk, untilat laf in two or three days they aftume the figure of fimall polypes. When they firt begin to thoot, the excreffence becomes pointed, affuming a conical figure, and deeper colour than the relt of the body. In a thort time it becomes truncated, and then cylindrizal, after which the arms begin to fhoot from the anterior ead. The tail adheres to the body of the parent-animal, but gradually grows fimaller, until at lat it adheres only by a point, and is then ready to be fepurated. When this is the cafe, both the mother and youag ones fix themfelves to the fides of the glafs, and are feparated fom each other by a fudden jerk. The time requifite tor the formation of the young ones is very different, according to the warmth of the weather and the nuture of the foud eaten by the mother. Sometimes thes are linlly formed, and ready to drop ofi, in $2+$ hours; in wher cafes, when the weather is cold, 15 days have been requifite for bringing them to perfection.

It is remarkable, that there is a reciprocal communication of food betwixt the young and old before they be feparated. The young ones, as foon as they are furnithed with arms, catch prey for themfelves, and comImmicate the digefted food to the old ones, who on the other hand do the fame to the young ones. This was filly verified by the following experiment: One of the large polypes of the fufca kind being placed on a dlip of paper in a little water, the midule of the body of a young one growing out from it was cut open; when the fuperior part of that end which remained fixed to the parent was found to be open alfo. By cutting over the parent polspe on each ficle of the fhoot, a fhort cylinder was ohtained, open at both ends; which being viewed through a microfiope, the light was oberved to come through the young one into the fomach of the old one. On cutting open the cylindrical portion lengthwife, not only the hote of communication was oblerved, but one might fee through the end of the young one 4] fo. On changing the fituation of the two pieces, the light was feen through the hole of communication.

This may be feen between the parent polype and its young ones afier feeding them; for, atter the phents have eaten, the bodies of the young ones fwell as if they thenfelves had been eating.

The polypes produce young ones indifcriminately from all parts of their bolies, and five or fix young ones have frequently been produced at once; nay, Nir 'Irembley has oblerved nime or ten ploduced at the fame time.

Nothing lite copulation among thefe creatures was ever obicred by Mr Trembley, though for two years he had thonfads of them under his infrection. To be
more certain on this fubject, he took two young ones the moment they came from their parent, and placed them in Eeparate glaffes. Both of them multiplied, not only themfelves, but alfo their offspring, which were feparated and watched in the fame manner to the feventh gearation; they have even the fame power of generation while adhering to their parent. In this ftate the rarent, with its children and grandchildren, exhibits a fingular appearance, looking like a fhrub thick fet with branches. Thus feveral generations fometimes are attached to one another, and all cf them to one parent. Mr Adamsgives a figure of one polype with nineteen young ones langing at it ; the whole group being about an inch broad, and an inch and an half in length; the dd polype eat about twelve monoculi per day, and the young unes about 20 among them.

When a polype is cut tranfverfely or longitudinally into two or three parts, each fatt in a fhort lime be. comes a pertect animal ; and fo great is this prolific power, that a new animal will be produced even from a fmall portion of the thin of the old one. If the young 'ones be mutilated while they grow upon the parent, the parts focut off will be reproduccd, and the fame property belongs to the parent. A truncated portion will fend forth young ones before it has acquired a new head and tail of its own, and fometimes the head of a young one fupplies the place of that which thould have grown out of the old one. If we flit a polype longitudinally through the head to the middle of the body, we flall lave onc formed with two heads; and by flitting tlicfe again in the fame manner we may form one with as many heads as we pleare.

A fitl more furprifing property of thefe animals is, that they may be grafted together. If the truncated portions of a polype be placed end to end, and gently pulhed together, they will unite into a fingle one. The two portions are firf joined together by a flender neck, which gradually fills up and difapears, the food paffing from the one part into the other; and thus we may form polypes not only from portions of the fame, but of different animals; we may fix the head of one to the body of another, and the compound animal will grow, eat, and multiply, as if it had never been divided. By pulhing the body of one into the mouth of another, fo lar that their heads may be brought into contact, and kept there for fome time, they will at laft unite into one animal, only having double the number of arms which it would otherwife hirke had. The bydra fufa may be turned infide out like a glove, at the fame time that it continacs to live and atet as before. The lining of the Alomach now forms the outer Aitn, and the former epidermis conititutes the lining of the tomach. If previous to this operation the polype have joung ones attuched to it, tuch as nire but nevily beginning to veget ite turn themfelves infide out, while the larger ones continue to increafe in fize till they reach berond the mouth of the parent, and are then leparated in the ufualmuner from the body. When thus turned the polype combines itfelf in many different ways. The foc part frequent) clofes and becomes a fupemumerary tail. The animal, which was at firlt Iraight, now bends itfelf, fo that the two tails refemble the legs of a p.ir of compaffes, which it can open and fhnt. 'the old mouth is placed as it were at the joint of the comptfies, but lofes its puwer of action ; to funply which, a new one is
formed
ur. formed in its neighbourhond; and in a little tome there is ancw pecies. f hydra ti rmed with feveral mouths.

The fidus of a polype, which has been cut through in a longitudinal diradion, legin to re ll the mfelves up, commonly tron one of the extremities, with the catfide of the fkin inwards; but in a little time they unroll themelyes, and the two cut edges join together, fontetimes begioning at once extremity, and fometimes approuching throwinout their whole length. As foon as the edges joia, they unite to elofely that no farar can be peacived. If a pulype be partly tursed back, the open pant clofes, and new mouths are formed in diffe. rel.t places. Every pertion of a polype is eapible of derouring infoct, almoft as ion as it is cut off: and the vordity of the whlle genus is afonilhing; for Mir A dums oblerves, that not of the infeets on which the: feed bear the lame propertion to the: mouth of a polype that an ar ple of the fize of a man's head bears to bis mi uth.

The hydrup paliens is very rarely met with, and is deferibed only by M. Roetel. It is of a pale yellow co. lour, growing gradually innaller from the bottom; the tail is round or knobbed; the arms are abont the length of the body, of a white colour, generally feven in number, and are apparently compofed of a chain of globules. The young are brought forth from all parts of its body.

The bydratula is mentioned by many medical writers. Dr Ty Ton, in diffesting an antelope, found leveral hydatides or films, about the fize of a pigeon's erge, filled with water, and of an oval form, fattened to the omentum; and fome in the pelvis between the bladder of urine and rectum. He futperted them $\omega$ be animils for the following reafons: i. Becaufe they were included in a membrane like amatrix, foloofely, that byopening it with the finger or a knue, the internal bladder, containing the ferum or lympha, feemed nowhere to have any connestion with it, but would very readily drop out, Atill retaining its liquor wi hout fpilling any. 2. This in. ternal bladder had a neck or white body, more opaque than the reft, and protuberant from it, with an crifice at its extremity; by which, as with a mouth, it exhaufted the ferum from the external mombrare, and fo fupplied its bladuler or flomach. 3. On bringing this neck near the candle, it moved and fhortened iticli. It is found in the abdomen of theep, fiwine, mice, \&cc. lying between the peritoneum and the inteftines.

The fentorea, or funnel like polype, is of three enlours, green, blue, and white; but the laft is the molt common. They do not form cluters, but adhere fingly by the tail to whatever comes in their way: the anterior end is wider thin the poflerior; and, beirg round, gives the animal fomewhat of a funnel form, though the circle is interrupted by a kird of litit or gap. The edgo of this $g^{2 p}$ is furrounded with a great number of little fimbrille, which by their motions excite a curreat of water, that forcesinto the mouth of the animal the fmall bodies that come within its reach. NIr Trembley fays, that he has often feen a great number of amimaleules fall into the mouths of thefe creatues; fome of which were let ont again at an oponine which he could not defribe. They can fafhinn their mouths into feveral different forns ; and they multiply by dividing neither tranfverfely nor longitudinally, but diagonally.

The focialis is deferibed by Muller under the tide of Folyruse voricello. They are found in cluturs; and when viewed by a mierofiope, appear like a circle furrounded with crowns or ciliated heads, tical by fmall thin tails to a common centre, from whence they advance towards the circumference, and then turn like a wheel, occalioniars a vortex which brings along with it the food proper fur them.
The anafolica, or cluftering polypes, form a group refembling a clunter, ar rather an open fower, bupported by a flem, which is fixed by its lower extemity to fome of the aquatic plants or extranenn; bodies that are found in the water; the upper extremity is formed inten eight or nine lateral branches, perfeetly fimilar to cach other, which have alfo fubordinate branches, whofe cullective form much refembles that of a leaf. Every on: of thete allemblages is compofec of one principal branch or nerve, which makes the main fem of the elufter an angle fomewhat larger than a right one: the fmitis il.. teral branches proceed frem both lides of this nerve, and thefe are fhorter the nearer their origin is to the princtpal branch. There is a polype at hine ex'remity, and others on both fides of the lateral twiss, but at different dilances from their extremities. They are all exceedingly fimall, and bell-fhaped, with a quick motion about the mouth, though it is impolfible to difeern the caufe of it. Sce Animalcule, $1^{\circ}$ 24, 26, Pulex, and Vorticella.

The feveral ftrange propertios recorded of this animal, though very furprifing, are, however, none of them pecular to it alone. The Surinam toad is well known to produce its young, not in the ordinary way, but in cells upon its biat. Mr Sherw od b.is very lately difcovered the fmall eels in fuur palle to be withour exception full of living young ones. And as to the mott amazing of all its piopertics, the reproduction of its parts, we know the crab and lobfter, if a leg be broken off, alway s produce a new one: and Moni. Bonnet, Monf. Lyonet, Monf. de Retumur, and Mr Folkes, have all found, by experiment, that feveral carth and wate: worms have the fame property, fome of them even when cut into thirty pieces. The urtica marina, o: feanetule, has been alfo fund to have the fame; and the fed tar lih, of which the polype is truly a fpecies, thouth it had long efcaped the fearches of the naturalits, was always well known by the fifhermen to have it alfo.

MIaine PoLl Pus, is different in form from the frefhwater polype alre.2dy deferibed; but is nourilhed, increafes, and may be propagated, after the fame monner ; Mr Ellis having often tound, in his inquirics, that fmall fieces cut off from the living parent, in order to view the feveral parts more accurately, foon gave indications that they contained not only the priciples of life, but like wife the faculty of increafing and multiplying into 2 numerous ifue. It has been lately ditcovered and fufficien:ly proved by Peylifnel, Ellis, Julficu, Reaumur, Donati, \&ce. that many of thofe fubtances which had frimerly been confidered by naturalits as marine vegetable or fea-plants, are in reality aumal-productinns; and that they are formed by polypes of different thapes and fizes, fur their habitation, defence, and propagation. To this cha's may be referred the eorals, corallines, keratophyta, efchar., fponges, and alcyonimm: nor is it improbable, that the more compat bodiss, known by

Pelypes, the common appellations of far-fouzes, brain foutes, to trifeed fungi, and the like, brought from various pats of the Ealt and Weft Indies, ate of the fame origin. Too this purpofe Mr Ellis obferves, that the ocean, in all the warmer latitudes near the fhorc, and wherever it is poffible to obferve, abound fo much with animal life, that mo inanimate body can long remain unoccupied by fonte fipecies. In thofe regiens, fhips'-bottoms are foon covercd with the laabitations of throufands of animals: rocks, Rones, and every thing lifelefs, are covered with them inflantly; and even the branches of living vegeidbles that hang into the water are inmediately loaded with the fpawn of different animals, fhell- fifh of various kinds: and fhell- fifh themfelves, when they become impotent and old, are the bafis of netr colunies of animals, from whofe attacks they can mo longer defend them-

## P O L Y T H E I S M,

1)cfation.

THE dogtrins of a plurality of gods or invifible powers fiuperior to man.
"That there exilt beings, one or many, powerful above the human race, is a propofition (fays Lord Kames*) univerfally admitted as true in all ages and among all nations. I boidly call it univerful, notwithftanding what is reported of fome grofs favages; for reposts that contradid what is acknowledged to be genezal among men, require more able vouchers than a tew illiterdte royagers. Among many favage tribes, there are no words but for objechs of external fenfe: it is furprifing that fuch people are incapable of exprefing their religious perceptions, or any perception of internal fenfe? The conviation that men have of fuperior powers, in eveIy country where there are words to exprefs it, is io well vouched, that in fair reafoning it ought to be taken for granted among the few tribes where language is deficient."

Thefe are judicious obfervations, of which every man will admit the force who has not fome favourite fyltem to build upon the unflable foundation which his Lordfhip overturns. Traking it for granted, then, that our conviction of fuperior powers has long been univerfal, the important quedion is, From what caufe it proceeds? The fame ingenious author fhows, with great flrength of reafoning, that the operations of nature and the government of this world, which to us loudly procluim the exillence of a Deity, are not fufficient to account for the univerfal belief of fuperior beings among favage tribes. He is therefore of opinion, that this univerfality of conviction can fering noly from the image of Deity ftamped upon the mind of every human being, the ig. norant equally with the leained. "Nothing lefs (he fays) is fufficient: and the onginal perception which we have of Deity mun proceed (he thinks) from an interna! fenfe, which may be termed the fenfe of Deity."

We have elfe where espreffed our opinion of that phi. lofophy which accomnts for every phenomenen in hman nature, by attributing it to a particular inninet (fee Instinet) ; but to this inllindt or finfe of Dity, conbidered as complete cridence, many objections, more than ufually powerful, force themfelves upon us All nations, except the Jews, were once folytheilts and idolaters. If therefore his Lordthip's hypothefis be ad-
felves. For a farther account of this fyfem, fee Coral Poly and Corallines.

Polifus of the Heart. See Menicine, $n^{\circ} 97,98,{ }^{\text {Polyr }}$ iol
4 , and 200 . 274, and 200.

POLisARCTA, or Corpulency. See Medicine, $n^{0} 335$.

POLYSCHIDES, or sea hunger. See Fucus.
POLYSPERMOUS (from woru and $\sigma \pi \pi^{p} \mu a$ feed), in botany, is applied to fuch plants as have more than four feeds fucceeding each flower, without any certain order or number.

POLYSYLLABLE, in grammar, a word confifing of more than three fyllables; for when a word confilts of one, two, or three fyllables, it is called a monofllable, a dify labl.c, and triljl'able.

POLYSYNDETON. See Oratory, $n^{\circ} 67$.
mitted, either the doctrine of polytheifm mut be tru: theology, or this inftinct or fenfe is of fuch a nature as to l.ave at different periods of the worldmifled all mankind. All favage tribes are at prefent polytheints and idolaters; but among favages every inflinet appears in greater purity and vigour than among people polithed by arts and feiences; and inftinct never miftakes its object. The inftinet or primary imprefion of nature, which gives rife to felf-love, affection between the fexes, love of progeny, \&c. has in all nations, and in every period of time, a precife and determinate object which it inflexibly purfues. How then comes it to paf:, that this particular inftinct, which if real is furely of as much im. portance as any other, fhould have uniformly led thof. who had no other guide to purfue improper objects, to fall into the groffet errors and the moft pernicious prastices? 'T'o no purpofe are we told, that the fenfe of Deity, like the moral fenfe, makes no capital figure among favages. There is reafon to believe that the feeling or perception, which is called the moral fenfe, is not wholly inftinctive; but whether it be or not, a fingle inftance cannot be produced in which it multiplies its objects, or makes even 2 favage exprefs gratitude to a thoufand perfons for benefits which his prince alone had power to confer.

For thefe, and other reafons which might eafily be afligned, we cannot help thinking, that the fert religinus principles mult have been derived from a fource diffe. rent as well from internal fenfe as from the deductions of reafon; fiom a fource which the majority of mankind had early forgotten; and which, when it was binifhed from their minds, left nothing behind to prevent the very firf pinciple of religion from being perverted by various accidents or caufes, or, in fome extramdinary concurrence of circumftances, from being perhaps entirely obliterated. This fource of religion cvery confiftent Theit mult believe to be revelation. lieafon, 'To ${ }^{3}$ en it is acknowledged, and we thall afterwards flow (fee tion. Reficion), could not have introduced favages to the knowledge of God; and we have juft feen, that a fonge of Deity is an hypothefis clogged with infuperable difficulties. Set it is undeniable, that all mankind have believed in fuperior invifible povers: and if reafon and inflinet be fet afide, there remains no other origin of.

## 「 O L Y T H E I S M.

this unireafal belief that pireval revelation, corrupted, indeed, as it palfied by oral tradition from fatler to fon, in the courfe of many generations. It is no flight fuppart to this doatrine, that if there really be a Deity*, oi it is highly pretimable, that hewould reveal himfelf to the firt men-creatires when ' e : . I formed with fircultes to adore atd to werfhip hime. To other animats, the know'edge of a Deity is of no importance; in man, it is of the firit importance. Were we totally innoralt of a Deity, this world would arpear to us al miere chwos. Inder the goremment of a wife and bewievolint Deier, chame is exslnded; and every erent appers to be ti.c refu't of ellablinted lavs. Good men iolomit to whatever happens without repining, knowing t'ine evare eve t is orderad by Divine Paridence: they fabmit with entire relignation; and fuch relignation is a forerign balam for every misfortune or evil in lie.

Admituing, then, that the knowldge of Deity was originally dorived from revelation, and that the firt mell protefied pure theifm, it fhall be our bufines' in the prefent article to traze the rife and progrefs of folyt'i, $i / n$ and iubotary; and to afeertain, if we can, the real opinor.s of the Pagan world c. nceming that multitude of gods with which they filled heaven, eanth, and hell. In this inquiry, though we thall have oceation to appeal to the writings of Moles, we fhall attribute to them no other authosity than what is due to records of the carlieft ages, nicre ancierit aud authentic than any others which arc now extant.

Whether we believe, with the author of the book of Genclis, that a!l men have defcended from the fame progenitors; or adopt the hypothcfis of modern theoritte, that there have becn fuccefive creations of men, and that thec Eurosican derives his origin from one pair, the Afratic from another, the woolly-headed African from a third, and the copper-coloured American from a fourth-polytheifin and idolatry will be feen to have arifin from the fame caufes, and to have advanced nearIs in the fime order from ore degree of impiety to anoth.e.. On either fuppolition, it mult be taken for grantcd , that the original progenitors were inftukted by their Crcator in the truths of genuine theifm: and there is no room to dcubt, but that thofe truths, fimple and fublime as they are, would be conveyed pure from father to fon as long as the race lived in one family, and were not ipread over a large extent of country. If any credit be due to the records of antiquity, the primerial inhabitants of this globe lived to fo great an age, that they muft have increafed to a very large number long Lefore the death of the common parent, who would of courre be the bond of uaion to the whole fociety, and whofe dinates, efpecially in what related to the origin of his being and the cxiftence of his C'reator, would be li?cned to with the utmoft refpeat by every indiridual of his namcrons progeny.

Miny c:ufes, bowever, weuld confpirc to difolve this f. mily, ifter the cieath of its ancefor, into feparate and inceeperdent tribes, of which fome would be driven by violence, or would enluntarily wander, to a diflance from the reft. lirom this difperion great changes woul. 1 take place in the opiniors ot fume of the tribes refpecting the object of their religious worlhip. A fingle family, or a foall tribe bamilhed into a defat wihlenneis (hich as the whole easth mult thea have been), would Yos. XV.
find enployment for all their time in provicing the Polythintu means of fubliftence, and in dufiding thentiches irm ${ }_{5}$ beafts of prey. In fich circumfinces they wulld have Cirribilittle liffire fur meditation, and, being conftanly con- fancos verfant with oljeefs cf fenfe, they w. hid qrictamity loic which 'ed the pocuer of meditating upjn the Ip ritual rature of to pnlyo that Being by whon their : -cilors lad twa he them thame that all things wore created. $\quad$ Arris wolld no doubt retain in tolerabls puity ther original netions of Deity; and t'ey would certanly con-avent to inapreis thole notions upon their children: but in circurnit mees isninitely more favoumble to fpeculation than thairs cowld have been, the hum in mind dwells not loris upon noticus furcly intellectual. We are fo accuftera:ad to ferfible objects, and to the ideas of fpace eztenfion, and figure, which they are perpztuaily imprefing upon the imagiantion, that we find it extremely dithcult to conceive any bciars without atigning to him a form and a place. Hence a learned wates * has fup. P Minop pofed, that the carlielt generations of men (even thofe I.aw ininis to whon he contends that frequent revelations reere Confideravouchified) may have been no better haan antioropomer- tioas on the $=$ phites in their conceptions of the Divine Being.

Be this as it may, it is not conceiv:ble but that the members of thofe firt colonies would quichly lofe many of the arts ard mucls of the fcience which perhaps prevailed in the parent flate; and that fatigued with the contempiation of intellectual objects, they would relisve their overAmined faculties, by attributiag to the Deity a place of abode, if not a human form. To men tj. Firn ${ }^{6}$ tpps tilly illiterate, the place fiteft for the habitation of the in the proDeity would undoubredly appear to be the fun, the gref.
moll beautiful and glorious object of which they could form any idea; an object, too, from which they could not but be fenfible that they received the benefits of light and heat, and which experience mult foon have taught them to be in a great meafure the fource of vegetation. The great fpirit therefore inhabiting the fun, which they would conlider as the power of light and heat, was in all probability the firt objeet of idolatrous adcration.

From looking upon the fun as the habitation of their The fririt God, they would fun proceed to confider it as his of lightither body. Of pure mind entirely feparated from matter, firt yod of me:i in their circumftances could not long retain the faganifa, fainteft notion; but confcious cach of power in him. Self, aud experiencing the effects of power in the fun, the would naturally conceive that luminary to le arimated as their bodies were animated. They would feel his influence when above the horizon; they would fee him moving from eaft to weft; they would confider him when fet as gone to take his repoic: and thofe exertions and intermifions of power being analagous to What they e.:perienced in themfelves, they would look upon the fun as a real arimal. Thus would the Divinity appear to their untutored minds to be a compcund being like man, partly corporeal and partly fpiritual; and as foon as they imbibed fuch notions, though pe:haps uct before, they may be froneunced to liave been abfolute idolaters.

When man had once got into this train, their gods would muitiply upon them with wonderful rapidity. Darknefs and cold they corih not but perceive to be contrery to ligbt and he it , inn: having philefophy

Magianifn tive effets, the would eonfider darknefs and cold as
8
The fpirit us power of darknefs the ferond. entities equally real with light and heat; and attribute thefe different and contrary effects to different and contrary powers. Hence the fpirit or power of darknefs was in all probability the fecond god in the Pagan calendar; and as they confidered the power of light as a benevolent principle, the fource of all that is good, they mult have looked upon the contrary power of darknefs as a malevolent fpirit, the fource of all that is evil. 'This we know from authentic hillory to have been the belief of the Perfian magi, a very ancicat feet, who called their good god $\mathrm{V}^{2}$ azdan, and alfo Ormuzd, and the evil god Abranian. Confidering light as the fymbol, or perhaps as the body, of Ormuzd, they always worfhipped him before the fire, the fource of light, and efpecially before the fin, the fource of the moft perfen light ; and for the fame reafon fres were kept continually burning on his atars. That they fometimes addreffed prayers to the evil priaciple, we are informed by Platarch in his life of Themiftocles; but with what particular rites he vas worfhipper, or where he was fuppoled to retide, is not fo cvident. Certain it is, that his worfhippers held bim in detefation; and when they had occafion to write his name, they always inverted it (uvubuqV), to denote the malignity of his nature.

The principles of the magi, though widely diftant from pure theifm, were mach lefs abturd than thofe of other idolaters. It does not appear that they ever worlhipped their gods by the medium of graven images, or had any other emblems of them than light and darhnefs. Indeed we are told by Diogenes Latertius and Clemens Alexandrinus, that they condemned all flatues and images allowing fire and water to be the only proper emblems or jeprefentatives of their gods.
De Legi- And we learn from Ciccro *, that at their infligation
bus, lih, li. Xerxes was faid to have burnt all the temples of Greece,

* 10. becaufe the builders of thofe edifices impioully prefumed to inclote within walls the gods, to whom all things nught to be open and frec, and whofe proper temple is the whole world. To thefe authorities we may add that of all the hiforians, who agree, that when magianifm was the religion of the coust, the Perfiun monarchs made war upon imazes, and upon every emblem of idolatry different from their own.

The Magi, however, were but one fert, and not the Jargef fect of ancient idolaters. The worfhip of the fion, as the fource of light and heat, foon introduced into the calendar of divinities the other heavenly bodies, solybleifm. the moon, the planets, and the fised fars. Men could in the abfence of their chief god; and when they lad proceeded fo far as to admit two divine principles, a good and an evil, it wha natu:al for nainds clouded with finh prejudices to confider the mon and the Aars as benevolent intelligences, fent to oppofe the power of darknefs whilf their firlt and greatelt divinity was abfent or alleep. It was thels, as they imagined, that he maintained (for all held that he did maintain) a conlhan fuperionity over the evil principle. Though to affronomers the moon is known to be an epake body of very finall dimenfions when compared with a planet or a fixed ftar, to the vulgar eye the appears much more magnificent than either. By thofe early idolaters fle was confudered as the divinity fecond in rank and in
power; and whillt the fun was worfhipped as the king, fhe was adored as the queen, of heaven.

The earth, confidered as the common mother of all things ; the ocean, whofe waters are never at reft ; the air, the region of forms and tempelts, and indeed all the ele-ments-were gradually added to the number of divi. nities; not that mankind in this early age had fo far degenerated from the principles of their anceftors as 10 worthip brute matter. If fuch worthip was ever practifed, which to us is hardly conceivable, it was at a later period, when it was confined to the very loweft of the vulgar, in nations otherwife highly civilized. The polytheilts, of whom we now treat, conccived every thing in motion to be animated, and ammated by an intelligence powerful in proportion to the magnitude of the body moved.

This fect of idolaters, which remains in fome parts of the Eaft to this day, was known by the name of Scuiv ans, which they pretend to have derived from Sabius a fon of Seth; and among the buoks in which their lid. cied doctrines are contained, they have one which they eall the book of Seth. We need hardly obferve, that thefe are fenfelefs and extravagant fables. The name Sabian is nodoubtedly derived from the Hebrew word Tfaba, which digaifies "a hoft or army:" and this clats of polytheifts was io called, becaufe they worfhipped "the holt of heaven;" the Tfaba befomim, againit which Mofes fo pathetically cautions the people of $I 1^{\circ}-$ racl *.

This fpecies of idolatry is thought to have freft pre- c. iv vailed in Chaldea, and to have been that from which Abraham feparated himfelf, when, at the command of Aro the true God, he "departed from his country, and tha from his kindred, and from his father's houfe." But as it nowhere appears that the Chaldeans had fallen into the favage fate before they became polytheifts and idolaters, and as it is certain that they were not favages at the call of Abraham, their early Sabiifm may be thought inconfiftent witl the account which we have given of the origin of that fpecies of idolatry. If a great and civilized nation was led to worflip the hof of heaven, why fhould that worthip be fuppofed to lave arifers: 2 mong favages? 'Theories, however plaufible, cannot be admitted in oppofition to facts.

True: but we beg leave to reply, that our account of the origin of polytheifm is oppofed by no fact; becaule we have not fuppofed that the worfhip of the hof of heaven arofe among favages only. That favarges, between whom it is impollible to imagine any intercourfe to have had place, have univerfiliy wouthipped, as their firt and fupreme divinities, the fun, moon, and fars, is a fact evinced by every hiftorian and by every traveller; and we have fhown how their rude and uncultivated fate natarally leads them to that fpecies of idolatty. But there may lave been circumftances peculiar to the Chaldeans, which lew them likewife to the worthip of the heavenly holt, even in a flate of high civilization.We judge of the philofophy of the ancients by that of ourfelycs, and imagine that the fime refined fyftem of metapholics was celtivated by them as by the follow. ers of Deforites and Locke. But this is a great miAake; for fo grofs were the notions of early antiquity, that it may be doubted whether there was a fingle man uninfpired, who had any notion of mind as a being di-

## 1O O Y Y I I E I S M.

in. find and entircly feparated from matter (fee Meta. Phenician, a more ancient writcr than either of thefe, physics, Part Ill.c. 4). From feveral palfages in the books of Mufes, we le:rn, that when in the firlt ages of the world the Supreme Being condelcended to manifett his prefence to men, he penerally cxhbibited fome fenfible emblem of his power and glory, and declared his will from the mift of a preternatural fire. It was thus that he apreared to the Iewilh lawgiver himfolf, when he fpoke to him from the midat of a burning bufn; it was by a pillar of cloud and fare that he led the Ifraelites from Egypt to the land of Promife; and it was in the midfl of fmoke, and fire, and thunderings, that the law was delivered from Mount SinaiI'hat fuch manifetations of the Divine Prefence would be nccafionally made to the defcendants of Noalr who fottled in Chaldea foon after the deluge, nuft appar cxtremely probable to cerery one who adnits the authority of the Hebrew Scriptures: and he who queftions that authority, has no right to make the objeation to which we now reply ; becaufe it is only from the book of Genefis that we know the Chaldeans to have been a civilized people when they fell into idolat:y. All hifories ayree in reprefenting the iuhabitants of Claldea as at n very early period corrupted by luxury and funk in vice. When this happened, vie mult fuppofe that the moral Governor of the univerfe would withdraw from them thofe occational manife!tations of himfelf, and leave then to their own inventions. 'In fuch circumתuaces, it was not unnatural for a people addiacd to the ftudy of attronomy, who had been taught to believe that the Deity frequently appeared to their ancefters in a flame of fire, to confider the fun as the place of his permanent refidence, if not as his body. But when cither opinion was firmly eftablilhed, polytheifm would be its inevitable confequence, and the progrefs of Sabiifm would, in the moft polithed nation, be fuch as we lave traced it anoong favage tribes.

From Chaldea the idolatrous worhip of the hof of heaven fpread itfelf over all the Eaft, paffed into Egypt, ratyl. and thence into Greece; for Plato affirms $\dagger$, that " the firt inhabitants of Greece feemed to him to have worinto thipped no other gods but the fun, moon, earth, fars, and heavenc, as mop barbarous mations (continues he) ftill do." That Sabiifm, or the worthip of the hof of heaven, was the firlt fpecies of idolatry, befides the probability of the thing, and the many allufions to it in facred Scripture, we have the pofitive eviderec of the moft ancient pagan hiftoitins of whofe writings any part has been tranfmitted to us. Herodotus *, ipeaking of the religion of the Perfians, falys, that " they worlhip the funt, moon, and eartio, fire, water, and the ruists; and this adoration they have all along paid from the beginning." He teltifies the fame thing of the favage Africanc, of whom he afirms $t$, that they all worthipped the fun, and moon, and no other divinity. DiodoFus Siculus, writing of the Egyptians + , tells us, that "ihe firt men looking up to the worid above them, and terrified and fruck with admiration at the nature of the univerfe, fuppofed the fun and moon to be the principal and cternal gods." And Sanchoniathon the
infornis us, in the fragment of his hiftory preferved by Eufebius, that " the two lirt mortals were Aion and l'rotogonus; and their children were Genus and Genea, who inhabited Phenicia; and when they were forehed with the heat, they lifted up their hands to the fun, whom they believed to be the Lord of Ifcaven, and called hian Lial fan $n$, the fame whom the Greeks call Zeus."

Hitherto thofe divinities were worfliped in perfor, or, as Dr Prideaux expreffes it, in their factla, or facred taliernacles; for the votaries of each direted their derotions tnwa:ds the planet which they fuppofed to be animated by the particular intelligence whom they meant to adore. But thefe orlos, by thcir rifing and fetting, being as much below the horizon as above it, and their grofsly ignorant wothippers not fuppofing it pollible that any iatclligence, however divine, could exert its influence but iu union with fome body, flatues And pan or pillars were foon thought of as proper emblems of duced fa. the abient gods. Sanchoniathon, in the frazment al- the worready quoted, informs us, that "Hyffouranios and his brother Oufous, Phoenicium patriarchs, ereded two pillars, the one to fire, and the other to air or ceind, :ind wor thipped thofe pillars, pouring out to them libations of the blood of the wild beaths hunted down in the chace." As thefe early monuments of idolatry were called $\beta_{z a t u a n t, ~ a ~ w e r d ~ e v i d e n t l y ~ d e r i v e d ~ f r o m ~ t h e ~ H e-~}^{\text {- }}$ brew Betbel, the probability is, that they were altars of loofe Rones, fuch as that which was luilt by Jacob $\delta$, § Genefiss and from him received the fame name. As his was ch. xx.xv. coafecrated to the true God, theirs were confecrated to the hoft of heaven; and the form of confecration feems to have been nothing more than the anointing of the flone or pillar with oil ( 1 ), in the name of the divinity whom it was intended to reprefent. When this cercmony was performed, the ignorant idolaters, who fancied that their gods could not hear them but when they were vifible, fuppofed that the intelligences by which the fun and planets were animated, took poffiefion, in fumc inexplicable manner, of the confecrated pillars, and were as well pleafed with the prayers and praifes offered up before thofe pillars, as with the devotions which were addrefied towards the luminaries themelves. Hence Sanchoniathon calls them azimated or lizing, fones, arbous suluxous, from the portion of the Divine Spirit which was believed to refide in them ; and as they were dadicated to the hof of heaven, they were generaily ercled on the tops of mountains; or in countries which, like Egypt, were low and level, they were clevated to a great height by the labour of men.

It has been fuppofed, that this practice of raifing the with the pillars on lighly places proceeded from a defire to make the idolatry obje?ts of wor hip confpicuous and magnificent: but we of high are ftrongly inclined to believe, that the erectors of placs. Eutudia hid fomeching farther in view, and that they thought of nothing lefs than to bring the facred flone or pillar as near as pofmble to the god whom it reprefented. Whatever be in this, we know that the prastice itfelf prevaited univerfally through the eaft; and that
 which Arnobius calls hulricatan bepidem, et ex olivi ung nine fordidatum.--Stilling tleet's Or igyes Sairis.

## P O L Y T H E I S"M.

Damons. there was nothing which the Jewifh legiflator more ftricly enjoined his people to deftroy, than the altars, fatues, and illars, erected for idolatrous worflhip upon mountains and high places. "Ye thall utterly deftroy (fays he) all the places wherein the nations which ye thall poffefs ferved thcir gods, upon the bigh mountains, and upon the hills, and under every green tree. And ye fhall overthow their aluars, and break down their - Deut. xi:. pillars, and burn their groves with fire*."

The mention of groves by the Hebrew lawgiver, brings to our recollection another fecies of idolatry, which was perhaps the fecond in order, as men deviating from the primciplos of pure theifm were more and more intangled in the labyrinths of error. The Chaldeans, Egyptians, and all the eaftern nations who believed in a fuperintending providence, imagined that the government of this world, the care of particular nations, and even the fuperintendence of groves, rivers, and mountains, in each nation, was committed by the gods to a clafs of firits fuperior to the foul of man, but inferior to thofe heavenly intelligences which animated the fun, the moon, and the planets. Thefe fpirits were by the Greeks called dotecves, demons, and by the Romans genii. Timazus the Locrian, who flourifhed before

Origiu of dixmonworfing
which demons, the Supreme God, the ruler over all, hath committed the government and adminiftration of this world, which is made up of gods, men, and ant:mals.

Concerning the origin of thefe intermediate beings, fcholars and philofophers have framed various hypothefes. The belief of their exifence may have been derived from five different fources.
I. It feems to have been imponible for the limited capacities of thofe men, who could not form a notion of a God divefted of a body and a place, to conceive how the influence and agency of fuch a being could every intant extend to every point of the univerfe. Hence, as we have feen, they placed the heavenly regions under the government of a multitude of heavenly gods, the fun, the moon, and the flars. But as the neareft of thofe divinities was at an immenfe diftance from the earth, and as the intelligence animating the earth itfelf had fufficient employment in regulating the general affairs of the whole globe, a notion infineated itfelf into the untutored mind, that thefe fuperior governors of univerfal nature found it neceffary, or at leaft expedient, to employ fubordinate intelligences or demoons as minitters to exacute their behefts in the various parts of their vilidely extended dominions.
2. Such an univerfal and uninterrupted courfe of action, as was deemed neceffary to adminitter the affairs of the univerfe, would be judged altogether inconfiftent with that fate of indolence, which, efpecially in the eaft, *was hehl an indifipenfable ingredient in perfect felicity. It was this notion, abfurd as it is, which made Epicurus deny the providence, whila he admitted the exijfence of gods. And if it had fuch an effeet upon a philofo. pher who in the moft enlightened ages had many folfowers, we need not furely wonder if it made untaught Whlaters imagine that the governor or governors of the
univerfe had devolved a great part of their trouble on deputies and minifters.
3. When men came to reflef on the infinite diflance between themfelves and the gods, they would naturally form a wifh, that there might fomewhere exitt a chafs of intermediate intelligences, whom they might employ as mediators and interceflors with their far diflant divinities. But what men earnelly wifh, they very readily believe. Hence the fuppofed diftance of their gods would, anong untutored barbazians, prove a fruitful fource of intermediate inteligences, more pure and more elevated than human fouls.
4. Thefe three opinions may be denominated popu. lar; but that which we are now to flate, wherever it may have prevailed, was the offspring of philofophy.On this earth we perceive a fcale of beings rifing gradually above each other in perfection, from mere brute matter through the various fpecies of foffils, vegetables, infeets, fifhes, birds, and beafts, up to man. But the diftance between man and God is infinite, and capable of admitting numberlefs orders of intelligences, all fuperior to the human foul, and each rifing gradually above the other till they reach that point, wherever it may be, at which creation fops. Part of this imnenfe chafm the philofophers perceived to be aftually filled by the heavenly bodies; for in philofophical polytheifm there was one invifible God fupreme over all thefe: but fill there was left an immenfe vacuity between the human fpecies and the moon, which was known to be the lowelt of the heavenly hoft; and this they imagined muft certainly be occupied by invifible inhabitants of different erders and difpofitions, which they called good and evil dicmons.
5. There is yet another fource from which the univerfal belief of good and evil demons may be derived, with perhaps greater probability than from any or all of thefe. If the Mofraic account of the creation of the world, the peopling of the earth, and the difperfion of mankind, be admitted as true (and a more confifent account has not as yet been given or devifed), fome knowledge of good and evil angels murt neceffarily have been tranfmitted from father to fon by the channel of oral tradition. This tradition would be corrupted at the fame time, and in the fame manner, with others of greater importance. When the true God was fo far miftaken as to be conlidered, not as the fole governor of the univerfe, but ouly as the felfexifent power of light and good, the Devil would be elevated from the rank of a rebcllious createl Cpirit to that of the independent power of darknefs and evil; the angels of light would be transformed into good demons, and thofe of darknefs into demons that are evil. This account of the origin of dremonology reccives no fmall fupport from Plato, who derives one branch of it wholly from tradition. "With refpect to thofe demens (fays he $\ddagger$ ) who inhabit the fpacc between the earth and the moon, to underfand and de. lare their generation is a talk too arduous for my flender abilities. Ia this cafe we mult credit the report of men of other times, who, according to their own account, were the defendants of the gods, and has, by fome me:ms or other, gained exact intelligence of that myftery from their ancefors. We mult not queftion the veracity of the children of the zods, even though they fhould tranfgreis the bounds

## P O L Y T H E I S M.

of probability, and produce no evidence to fupport their affertions. We mult, I fay, notwithatanding, give them credit, becaufe they prolefs to give a detail of facts with which they are intimately acequainted, and the haws of our conntry oblige us to believe then."
Though thefe demons were generally invifible, they were not luppofed to be pure difembodied firits. Proclus, in his Comnentary upon Plato's Timxus, tells us, that " cvery drmon fuperior to human fuls confilted of an intellectual mind and an ethcreal vehicle." Indeed it is very little probable, that thofe who gave a body and a place to the Suprene God, thould have thought that the inferior orders of his minilers were fpirits entirely feparated from matter. Plato himfelf divides the cl.1fs of dxmons into three orders ** and whilt he holds their fouls to be particles or emanations from the divine cffence, he affirms that the bodies of each order of demons are compofed of that particular element in which they for the moft part refide. "Thofe of the firft and higheft order are compuied of pure ether; thofe of the fecond order confift of grofer air; and dxmons of the thind or loweit rank have vehicles extracted from the elcment of water. Dxmons of the firlt and fecond orders are invifible to mankind. The aquatic dぇmons, being invefted with vehicles of groffer materials, are fometimes vifible and fometimes invifible. When they do appear, though faintly obfervable by the human eye, they ftrike the beholder with terror and afonifhment.'" Dremons of this latt order were fuppofed to have parfions and affections fimilar to thofe of men ; and though all nature was full of them, they were believed to have local attachments to mountains, rivers, and groves, where their appearances were moll frequent. The reafon of thefo attachments feems to be obvious. Polytheifin took its rife in countries fcorched by a burning fun; and dæmons by their compofition being necef. farily fubject in fome degree to the influence of heat and cold, it was natural to fuppofe that they, like men, would delight in the thady grove and in the purling fream. Hence the earlieft altars of pazanifm werc gesecrally built in the midft of groves, or on the banks of rivers; becaure it was believed that in fuch places were affembled multitudes of thofe intelligences, whofe office it was to regulate the affairs of men, and to carry the prayers and oblations of the devnut to the far-diftant refidence of the celeitial gods. Hence too are to be derived the mountain and river gods, with the dryads and hamadryads, the fatyrs, nymphs, and fawns, which held a place in the creed of ancient paganifm, and make fo confpicuous a figure in the Greek and Roman poets.

Thefe different orders of intelligences, which, though worfhipped as gods or demigods, were yer believed to partake of human pafions and appetites, led the way to the deification of departed heroes and other eminent benefators of the human racc. By the philofophers all fouls were belicved to be cmanations from the divinity; but "gratitude $\dagger$ and admiration, the warmelt and moft active affictions of cur nature, concurred to enlarge the object of religious worthip, and to make man regard the inventors of arts and the founders of fociety as having in them more than a common ray of the divinity. So that rod-like benefits, befpeaking as it were a goll-ike mind, the deccafed parent of a people was eafily advanced into the rank of dxmon. When the religious bias was in fo good atrain, matural affetion would
have its flate in promoting this new mode of adnotion. Wैashup. l'iety to parents would naturally take the lead, as it wiss fupported by gratiuds and admiration, the friman mo. bile of the whole fyltem: and ia thofe early agen, the nutural father of tha tribe ofen hippenced to lie the poo liical futber of tine people, and the liander of the liat:Fondaces for the off pring would next have its turn; and a dificonfolate fither, at the head of a peo te, what it contive to footh his grief for the untimely death of it favourite child, and to gratify his pride under the want of fuccefion, by paying divinc homones to its memory." "For a father $\ddagger$ afl acd with un:imely mourving, when he had made an image of his child foon takeri away, now honoured himis a gol, who was then a dead min, and delivered to thofe that were under him ceremonies and facrifices." That this was the origin and poogrels of the worthip of departed fouls, we have the atulioticy of the famous fragnent of Sunchoniathon already quoted, whecre the vaious motives for this fpecies of idulatry are recounted in exprefs words. "After many gencrations (fays he) came Cloryfor; and he invented many things ufeful to civil life, for which, after his deceafe, he was worthipped as a goll. Then flouifhed Ourcanos and his filter $G c$, who deified and offered facrifices to their father Hypfiflos, when he had been torn in pieces by wild bealts. Afterwards Cronos confecrated MIAth his fon, and was himfelf confecrated by his fubjeets."

In the reign of Cronos flourifhed a perfonage of great reputation for wifdom, who by the Egyptians was called Thoth, by the Phocnicians Tanutos, and by the Greeks Hermes. According to Plutarch, he was a profound politician, and chief comfellor to Ofris, then the king, and afterwards the principal divinity, of Egypt : and we are told by Pbilo Byblius, the tranill tor of Sanchoniathon, "that it was this Thath or Her- A political mes who firft took the malters of religions worthip out invention of the hands of unfkilful men, and brought them into due which inmethod and order." His objeet was to make religion fervice:ble to the interctis of the ftate. With this view he appointed Ofrits and other departed princes to be joined with the fars and wormpecd as gods; and boing by Cronos made king of Egypt, he vals, after lis death, worfhipped himfelf as a god by the Eygyptians. To this honour, if what is recorded of him be true, lie had indeed a better tide than mof princes; for he is faid to have been the inventor of letters, ariilmetic, geometry, aftronomy, and hierogiyphics, and was thereforc one of the greatef benefactors of the heman race which any age or comitry hats cver prodaced.

That the grods of Creece and Rome were derived from Egypt and Phenicia, is fo univerfally known, that it is needlefs to multiply quotations in order to prove that the progrefs of polytheifm among the Creelis and Romans was the fame vith that which we have traced in more ancient nations. The following tranfation, however, of the account given by Hefiod of the deification of departed heroes, with which we have been favoured by it learmed and ingenious friend, is fo juit, and in our opinion fo beratiful, that we canmot deny ourfelves the pleafure of giving it to our readers.
"The gods who dwell on high Olympus' hill,
Firft fram'd a golden race of men, who liv'd
Under old Saturn's calm aulpicious fway.
Like gods they liv'd, their hearts devoid of care,

Beyond the reach of pain and picreing woes; Th' intirmities of age ner felt, nor fear'd. Their nerves witl youthful vigour Atrung, their days In jocund mirth they paft, remote from ills.Now when this gollike race was lodg'd in enrth, By Jove's high will to demigods they rofe, And airy dxinons, who benign on earth Convetre-the guides and gratuans of mankind. In darknefs veil'd, they range eath's utnoolt bound, Difpenfing wealdh to mortals. This reward

National
and tutelar god.

The deification of departed heroes and fatefmen was that which in all probability introduced the univerfal belief of national and tutclur gods, as well as the practice of worlaipping thofe gods throarh the medium of fatues cut into a bianian figurc. When the founder of a fate or any other public benefiftor was elevated to the rank of a god, as be was belicved fill to retain human par. fions and affections, it was extremely natural to fuppofe that he would regard with a favourable eye that nation for which he had done fo mach upon earth; that ho would oppofe its enemies, and protect the laws and inficutions which he himelf had given it. Dy indulging the fame train of fentiment, each city, and even every family of confequence, found Lares and Penales among their departed ancellors, to whom they paid the warmelt adoration, and under whofe protection they believed their private affairs to be placed. As thofe national and houfehold gol's were believed to be in their deified ftate clothed with airy bodies, io thofe bodies were fuppofed to retain the form which their grofier bodies had upon earth. The image of a departed friend might perhaps be formed by the hand of forrowful affection, before the fatue or the flarine of a deity was thought of; but when that friend or benefaator became the obje?t of religious adoration, it was natural for his votaries to enliven their devotion by the view of his fimilitude. Maximus Tyzius tells us $\$$, that " there is no race of men, whether barbarian or Grecian, living on the fea-coalt or on the continent, wandering in deferts or living in cities, which hath not confecrated fome kind of fymbol or other in honour of the gods." 'This is certainly true; but there is no grood evidence that the firlt fymbols of the gods were flatues of men and women. While the fan and other heavenly bodies continued to be the fole nhecis of religious worthip, the fymbols confecrated to them were pillars of a conical or pyramidal figure; and if fuch pillars are ever called grazen images by Mfes and other ancient writcrs, it was probably on account of the allegoric figures and charalters, or hiexoglyphic writing, with which they were inferibed.

Hitherto we have confidered the fouls of departed herces as holding the rank on'y of demons or demigods; but they gradually rofe in the fcale of divinities, till they dethroned the heavenly badics, and became themfelves the die majoruyn gentium. This revolution was effeated by the comtined operation of the prince and the prief ; and the fift ftcp taken towards it feems to have been the complimerting of their leroes and public benefacters with the name of that being which was moft efteemed and woithipped. "Thus at king for his beneficence was called the for, and a gucen for her beenuty the monn. Diodorus relates, that Sow frit reisned
in Esypt, called fo from the luminary of that name in the heavens. This will help us to underftand an odd pallage in the fragment of Sanchoniathon, where it is faid that Cronus bod feven fons by Rleca, the youngef of auhom suas a god as foon cs born. The meaning probably is, that this younguit fon was called after fome luminary in the heavens to which they paid divine honours; and thefe honours came in procel's of time to be transterreal to the terreltrial namefake. The fame hiftorian had before told us, that the fons of Genos, mortals like their father, were called by the names of the ele-ments-light, fire, and fame, of which they had difcovered the we:."
"As this adulation adranced into an eftablifhed worfhip, they turned the compliment the other way, and called the planet or luminary after the hero, the better to accuftom the people, even in the ant Planet-WorBip, to this nezu :adoration. Diodorus, in the pallage alrcady quoted, having told us, that by the firte inhiabitants of Egypt the finn and moon were fuppofed to be the principal and eternal gods, adds, that the former twas called Osiris, and the latter Isis. This was indeed the general pradice; for we learn from Macrobius, that the Ammonites called the tiun Moloch; the Syrians Adad; the Arals Diorijfus; the Aflyians Polus; the Phoencians Saturn; the Carthaginians Aiercules; and the Palmyrians Elcgabalus. Acrain, by the Phrygians the moon was called Cilucle, or the mothe: of the gods; by the Athenians Minerva; by the Cy prians Vonus; by the Cretans Diana; by the Sicilians Profertine; by others Hicate, B:llona, Yogla, C゙ranins Luvina, \&c. Philo Byblius explains this practice: "lt is remarkable (fays he) that the ancient idolators innpofed on the elements, and on thofe parts of mature which they cfleemed gods, the names of their kings: for the natural gods which they acknowledged were only the fun, moon, planets, elernents, and the like; they beng now in the humour of having gods of both claftes, the mortal and the immortal."
"As a farther pronf that bero-worinip was thus fuperinduced upon the planetary, it is worthy of obfervation, that the firt Matues confecrated to the greater hero-gods-thofe who were fuppofed to be fupromewere not of a human form, but conical cr tyramidal, like thofe which in the earlieft ages of idolatry were dedicated to the fun and planets. Thus the feholiaft on the Vefic of Arifophanes tells w, that the fatues of A pollo and Bacchus were conic pillars or nbelifks; and Paufanias, that the fatue of Yupiter Meilichins rcprefented a ityramid; that of the Argive Juno did the fame, as appears from a verfe of Phoronis quoted by Clemens Alexandrinus $\ddagger$; and indeed the practice was $\ddagger$ Stere univerfal as well amongt the early barbatians as amongtt 1 , 1 . thic Greeks. But it is well known that the ancicnts reprefented the rays of light by pillars of a conical or pyramidal form ; and thesefore it follows, that when they crefed mel pillars as reprefentatives of their heromods, thefe laticr had furceeded to the titics, ;ights, and honours of the natural and celeffaldicinities*:
But though it ferms to be certain that hero-worthip was thus cngrafted on the flanetery, and that fome of thofe heroes in procefs of time fupplanted the planets themelves, this was fuch a revolution in thenligy as onild not have been fuddenly effected by the united influcnce of the printe and the pric!t. We doubt not

## P O I. Y T

the fact that soc was beilieved to have reigncd in Egypt, and was afterwards worfhipped under the nanco of Ofiris; but it was furely impoffilite to perfuade any nation, however flupid or prone to idolatry, that a man, whom they remembered difcharging the duties of their fovereign and legiflator, was the identical fun whom they beheld in the heavens. Ofiris, if there was in Egypt a king of that name, may have been deifed immediately after his death, and honoured with that worflip which wats paid to good demons; but he nutt have been dead for ages bifore any attenppt wis made to perfuade the nation that he was tle fupreme Gork. Even then great addeds would be requilite to make fuch an attempt fucceffful. The prince or prich who entered upon it would probaldy begin wich declaring from the oracle, that the divine intelligence which arimates and governs the fun had defçended to earth and animated the perion of their renowned legiflator; and that, alter their laws were framed, and the other purpofes ferved for which the deicent was made, the fame intelligence had returned to its original refidence and cmyloynont among the celeftials. 'The poffibility of this double tranimigration from heaven to carth and from earth to heaven, woald withrut difficulty be admitted in an age when the pre-exifence of fulls was the univerfal belief. Haring proceeded thus far in the aputheofis of dead men, the next Rep taken in order to reader it in fome degrec probable that the early founders of ftates, and inventors of arts, werc divine intelligences clothed with human bodies, was to attribute to one fuch bencfactor of mankind the agions of many of the fame name. Voffiue, who employed rat erudition and much time on the fubjef, has proved, that before the æra of the Trojan vars moft kings who were very powerful, or highly renowned for their thill in legination, \&c. werc called Goue; and when the actions of all thefe were attributed to one Yove of Crete, it would be eafy for the crafty prieft, fapported by all the power and influence of the thate, to perfuade an ignorant and larbarons people, that he whofe wifdom and hernic exploits fo far furpalfed thofe of ordinary men muft lave been the fupreme God in human form.

This flort fketch of the progreis of polythciifm and idolatry will enable the reader to account for many circumftances recorded of the pagan gods of antiquity, which at firft view feem very furprifing, and which at lail brought the whole fyitem into contempt among the philofnpliers of Athens and Rome. The circumfances to which we allude are the immoral characters of thofe divinitics, and the abominable rites with which they were worfhipped. Jupiter, Apolio, Mars, and the whole rabble of them, are defribed by the poets as ravilhers of women and notorious adulterers. Hermes or Mercury was a thief, and the god of thieves. Venus was a proftitute, and Bacchus a drunkard. The malice and revenge of Juno were implacable; and fin little regard was any of them fuppofed to pay to the laws of honour and rectitude, that it was a common practice of thie komans, when befieging a town, to crocate the tutelar deity, and to tempt him by a reward to betray Livii, his fiiends and votaries $\dagger$. In a word, they were, in $: 2 \mathrm{I}$. the language of the poet,

[^1]This was the natural confequence of their origin. Ma. Worbip. ving ence animated human bodice, and being fuppoicd fill to retain luman pafions and appetites, they were Accoumed believed, in their flate of dcification, to feel the fame fos. fenfital defircs which they had felt upon earth, and to purfue the fame means for thecir gratification. As the men could inot well attempt to furpafs the gods in purity and virtue, they werc cafly peifuaded by artfuland profligate priefts, that the noft acceptable worfhip which could be rendered to any particular deity was to imitate the cxample of that deity, and to indulge in the practices over which he profided. Hence the worthip of Bacchus was performed during the night by men and women mising in the dark after intenyperate cating and drinkug. Hence too it was the practice in Cyprus and fome other countries to facrifice to Vcmus the virginity of young women fome days before their marriage, in order, as it was pretended, to fecure their chaftity ever afterwards; and, if Herodotus may te credited, every woman among the Babylonians was obliged once in her life to prollitute herfelf in the temple of the goddefs $M T_{y}$ litre (Venus), that fhe might thenceforward be prooi againt all temptation.

The progrefs of poly theifm, as far as we have traced Irugecfs cr̂ it, has been regular ; and after the enormons error of idolecry res forfaking the worthip of the true God was admitted, cular and every fubfequent ttep appears to be natural. It would univcrfal, be no difficult tak to prove that it has likewife been univerfal. Sir William Jobes, the learned prefident of the Afiatic Society, has diforered fuch a flikiking refemblance between the gods of ancient Greece and thofe of the pagans of Hindof:an $\dagger$, as puts it beyond a doubt + Afratic that thofe divinities had the fame origin. The Ganesa Refearchesj, of the Hindoos he has clearly proved to be the Janus vol. i. of the Grecks and Romans. As the latter was rcprefented with two and fometimes with four faces, as cm blems of prudence and circumpection, the former is painted with an elephant's head, the well-known fymbol 26 mong the Indians of fagacious difcernment. The SA-Indian idac turn of Greese and Rome appears to have been the latry, fame perfonage with the Menu or Satvatrata of Hindoftan, whofe patrony mic name is Vaivaswata, or child of the furz; which fuficiently marks his origin. Among the Romans there were many Jupiters, of whom one appsars from Ennius to have been nothing more than the firmament perfonifed.

## Afpice hoc fublime candens, quem inrocant omnes Jovem.

But this Japiter had the fame attributes with the Indian god of the vifible heavens called ladra or the hing, and Dirvepetir or thic lord of the f.f, whofe confort is Sacti, and whefe weapon is cajra or the thunderbolt. InDRA is the regent of winds and howers; and though the eafl is peculiarly undcr his care, yet his Olympus is the north pole, allegosically reprefented as a mountain of gold and gems. With all his power he is confidered as a fubordinate decity, and far incerior to the Indian triad Brahma, Vishnou, and Mahadeva or Siva*, who are three forms of one and the fame gudhead. The prefident having taced the relemblance between the idolatry of Rome and Inda through many other gods, obferves, that "we mult not be furprited at finding, on a clofe examination, that the characters of all the pagan dcities melt into each cther, and at 1 .fe

- Plate. cccos.

Hero. V7ornip.

Scand na-
into one or two; for it feems a well-founded opinion, that the whole crowd of gods and goddeffes in ancient liome, and likewife in Hindoftan, mean only the powers of nature, and principally thofe of the fun, expreffed in a varisty of ways, and by a multitule of fanciful names."

Nor is it only in Grecce, Rome, Egypt, and Indi:?, that the progrefs of idolatiy has beenfrom planetary to herowothip. From every account which moden travellers have given us of the religion of favage nations, it appears that thofe nations adore, as thior fisf :and gleatelt gods, the fun, moon, and fars ; and that fuclo of them as have any other divinities have proeeeded in the fame rnad witl the celebrated nations of antiquity, fir m the wom thip of the heavenly bodies to that of celettial demons, and from celeftial demons to the deificaion of dead men. It appears likewife that they univerfally believe their herorgods ant demi-gods to tetain the paifions, appetites, and propenfitics of men.

That the Scandinavians and cur Sdxon anceftors had the fame notions of the gods with the other pagams wh fe ophions we have fated, is evident from their colling the days of the week by the names of their divinitios, and from the forms of the fatues by which thoic divinitics were reprefented *. 1. The idol of the fun, from which Sundyy is derircl, anong the Latins dies Solis, was placed in a temple, and adored and facrificed to; for they believed that the fun did co-operate with this idol. Ifc was reprefented like a man hall naked, with his face like the fun, holding a burning wheel with both hands on his breaft, fignifying his courle round the world ; and by its fiery gleams, the light and heat with which he warms and nouriheth all things.2. The idol of the moon, from which enmeth ou: ATonduy, dies Lunx, anciently Moonday, appears frangely fingular, being habited in a fhort coat like a man. Her holding a moon expreffes what the is; but the reafon of her fort coat and long-eared cap is loft in oblivion. 3. Tuifio, the matt anciont and peculiar god of the Germais, reprefented in his garment of a kin according to their ancient manner of clothing, was next to the fin and moor, the idol of himhelt 1 ank in the calendar of nosthern pezanifm. To him the third day in the week was delicated; and hence is derived the name Tueflay, anciently Tuiffuy, called in Latim dics Martis, though it muft be confeffed that Mars dees not fo much r.fenhic this divinity as he does Odin or VVoden.

- Wrolez was a valiant prince among the Suxons. Itis inage was prayed to for virory ore their enemies; wh, if they obrained, they wually facrificed the prioners taken in battle to him. Our Wednefday is derived from lim, anciently Thoneflaj. The northern hiftories make him the father of Fh,r, and Trina to be bis wife.

5. Thor was placed in a larye ball, fitting on a bed eanopied over, with a crown of gold on his head, and 12 ftars over it, holding a fepptre in the right hand. To him was attributed the power cver both lieaven and
eath; and that as he was pleafed or difplenfed he could fend thander, tempets, plagues, \&ec. or fair, ferfonable weather, and caufe fertili, From him our Thurfay derives its name, anciently $\mathcal{T}$...ijety; among the Romans dies Jovis, as this idol nury be fubftituted for Jupiter.
6. Frizs reprefented both fexes, holding a drawn froord in the right hand and bow in the left; denoting that women as well as men thould fight in times of need. She was frencralky taken for a goddels; and was repu. teal the giver of pace and plenty, ard caufer of love and amity. Fier day of wordap was called by the Saxons Frigedear, now Friday, dic's Tereris; but the habit and treapons of this figure have a refemblance of Diama rather than Venus.
7. Seterer, or Gredo, ltood on the prickly back of a perch. He was thin-vifa cd and long-haired, with a long beard, bare-heaced and bare-footed, carrying a pail of water in his right hand whercin are fruit and fowers, and holding up a wheel in his left, and his coat tied with along girdle. Ilis ftanding on the farp fins of this fith dignified to the Saxons, that by worihipping him they thould pais throngh all dangers unhutt; by lis girdle flying both ways was fhown the Saxons freedom; and by the pail with fruit and fowers, was de. noted that he wou!d nourilh the earth. From him, or from the Roman deity Saturn, comes Seturdety.

Such were the principal gods of the northern nations: but thefe people hat at the fame time inferior deities, who were fuppofed to have been tranllated into heaven for their heroic deeds, and whofe greateft happinefs confilted in drinking ale out of the flkulls of their enemies in the ball of l:oden. But the limits preferibed to the prefent article do not permit us to purfue this fubject; nor is it neceffary that we fhould purfuc it. The attentive reader of the article Mythology, of the hiftories given in this work of the various divinities of paganifm, and of the different nations by whom thofe divinities were worfhipped, will perceive that the progrefs of polytheirm and idolatry has been uniform over the whole earth.

There is, however, one fpecies of itolatry more wende:ful than any thing that has yet been mentioned, of which our readers will certainly expect fome account. It is the worfhip of brutes, reptiles, and argetables, among the Egyptians. To the Grecks and Rumans, as well wormi as to us, that fupertition appeared fo monhrous, that the Fg? to enumerate every hypothefis, ancient and modern, by tians. which philofophers have codeavoured to account for it, would fivell this article beyond all proportion. Bruteworlhip prevailed at fo early a period in Egypt, that the philofophers of antiquity, whofe writings have defeended to us, had little or no advantage over the noderns in purfuing their refearches into its origin; and among the modern hypothefes, thore of Mofbeim and Warturton appear to us by much the molt probable if any that we have feen (13). The former of thefe leatned writers attributes it wholly to the policy of the prince
(D) There is, however, another hypothefis worthy of fome attention, if it were only for the learning and ingenuty of its antlon. The celebrated rudworth infers, from the writings of Philo and other Platonifts of the Alcxandrian fohool, that the ancient Egyptians held the Platonic doatrine of ideas exifting from cternity, and corntitutigg, in one of the perfons of the godhe.d, the intelligibe and archetypal werld. (Sce Pbaronism.)
and the craft of the prief. The latter contends, with much earnefuefs and ingenuity, that it refulted from the ufe of hieroglyphic writing. We are ftrongly inclined to believe that both theic caufes contributed to the production of fo portentous an cffect ; and that the ufe of hieroglyphics as tacred fymbols, atter they were haid afide in civil life, completed that wonderful tuperAtition which the cralt of the prielt and the policy of the prince had undoubtedly begun.

We learn from Herodolus*, that in his time the number of ufeful animals in Egypt was fo fmall as hardly to be fufficient for tillage and the other purpofes of civil life; whilf ierpents and other noxious animals, fuch as the crocodile, wolf, bear, and hippopotamus, abounded in that country. From this fact Aothein very naturally concludes $\dagger$, that the founders of foucty and goyemment in Egypt would by every art endearour to increate the number of uleful animals as the number of inhabitants increafed; and that with thes view they would make it criminal to kill or even to hurt theep, cows, oxen, or groats, \&c. whilft they wonld wage perpetual war upon the noxious animals and beafts (if pre). Such animals ats were allitting to them in the carrying on of this watare would be juftly confidered as in a high degree uieful to lociety. Hence the malt grievous punthments were decreed againft the killing, or 10 much as the wounding, of the icbreunno: and ibis; bec:ate the former was looked upon as the inftinctive enemy of the crocodile, and the later of every fipecies of icrpents*. The learned writer, however, obferves, that in Egypt as in other conntries, prople would be tempted to facrifice the grood of the public to the gratification of their own appetites, and fometimes even to the indulgence of a momentary caprice. Hence he thinks it was tound neceflary to ftrengthen the authonity of the laws enacted for the prefervation of ufeful animals by the fanctions of religion: and he fays, that with this view the priefts declared that certain animals were under the immediate protection of certain gods; that fome of thofe animals had a divine virtue retiding in them; and that they could not be killed without the molt lacrilegious wickednefs, incurring the highell indignation of the gods. When once the idolatrous Egyptians were perfuaded that certain animals were facred to the immortal gods, and lad a divine virtue refiding in them, they could not avoid viewing thote animals with fome degree of veneration; and the priells, taking advantage of the fuperfition of the pooYos. XV.
ple, appointed for each fipecies of faered animals appropriated rites and ceremonies, which were quickly followed with building thrines and temples to them, and approaching them with oblations, and facrifices, and other rites of divine adoration.

To corroborate this hypothefis, he oiberves, that, befides the animals facred over ail Egypt, each p:ovince and each city had its particular animal to which the inhabitants paid their devotions. This arofe from the univerial prastice among idolaters of confecrating to themfelves Lares and Pernates; and as the animals which were worlhipped over the whole lingdom were confidercd as facied to the Dii mojorum geatum, fo the animals whofe worthip was confined to particular citics or provinces were facred to the Lares of thate citios and provinces. Hence there was in Uppor Egypt a city called $I$ Iycopolis, becaufe its inhabitants worlhipped, the wolf, whillt the inhabitanis of Tlicles or Heliapo'is' paill their devotions to the eagle, which was probably looked apon as facred to the fin. Our author, however, holds it as a fact which will admit of no difput:, that there was not one noxious animal or beaft of prev wornipped by the Lgyptians till after the conquett of their country by the Perfians. That the carlictt gods of Egypt were all benevolent bcings, he appeals to the teftimony of Diodorous Siculus; bat he quotes Herodotus and Plutarch, as agreeing that the latter Egyptians worhipped an evil principle under the name: of Typhon. This Typhon was the invecterate enemy of Ofiris, jult as Ahbraman was of Ormuad; and therefors he thinks it in the higheft degree probable that the Egyptians derived their belief of two felf-exitent principles, a good and an evil, from their Pertian conqucrors, among whom that opinion prevailed from the carlieft ages.

From whatever fource their belief was derived, TYphon was certainly worfhipped in Egypt, not with a view of obtaining from him any goond, for there was nothing good in his nature, but in hopes of keeping him quict, and averting much cvil. As ce:tain animals had long been facred to all the benevolent deities, it was natural for a people fo befotted with fuperfiition as the Egyptians to confecrate emblems of the fime kind to their god Typhon. Hence arofe the worthip of ferpents, crocodiles, bears, and other noxious animals and bealts of prey. It may indeed feen at firf fight very incondiftent to deily fuch animals, after they had been in the pratice for ages of worfhipping others for being
$\qquad$

Wornif.
their deftroyers; bet it is to beremembered, that long before the deincation of crocodiks, \&c. the real origin of biute-wordhip was totally forgotten by the people, if they were ever acquainted with it. The crafty pieft who wilhes to introduce a gainful fuperfition, mult at frit employ fome plaufible reafon to deludz the multitede; but after the fupertition has been loug and firm'y eftablifhed, it is obviouly his bulinefs to ':eep its origin out of fight.

Such is Motheim's account of the origin and progre's of that fpecics of idolatry which was peculiar to Egypt; and with refpee to the rife of lrute-worhip, it appears perfecily fatisfactory. But the Egyptians worfipped feveral fpecies of vegetables; and it furely could be no part of the policy of wife legiflators to preferve them from deftruction, as vegetables ate ufeful ouly as they contribute to animal fubtiftence. W'e are therefure obliged to call in the aid of Warburton's hypothefis to account for this branch of Egyptian fuperilition.

- Div. Leg. That learned and ingenious auther having proved *, book 4th, with great clearnefs and frength of argument, that hierect. $4^{\text {th. }}$.

33
Costi.ued
by the
meatas of hiero ${ }^{\text {l }}$ ythic wriximg, add roglyphic writing was prior to the inventicn of a'phabetic charatturs; and having traced that kind of writing from fuch rude pifures, as thofe which were in ofe among the Mexicans, through all the different fpecies of w! at he calls earial lgic, tiopical, and fymbo:ic hierog'yphics (SceHieroc lyphics)- -fhows, by many quotati.ns from ancient authors, that the Egyptian prietts wrapt up their thenlogy in the fymbolic hieroglyphics, attur al whabetic characters had banifhed from the tranfadions of civil life a mode of communicating information necelfarily fo obfcure. Thefe fymbols were the figures of animals and vegetables, denoting, from fome inaginary analogy, certain attributes of their divinisies; and when the vulgar, forgetting this analogy, ceated to underfland them as a fpecies of writing, and wete yet wught to confider them as facred, they could not well liew them in any other light than as emblems of the divinities whom they adored. But if rude fulptures upon tone could be emblematical of the divinities, it was furely not unnatural to infer, that the living animals and regetables which thofe feulptures reprefented mut ta emblenas of the fame divinites more Ariking and more facted. Hence the learned author thinks arofe that wonderful fuperitition peculiar to the Egyptians, which made them worthip not only animals and vegeables, but alfo a thouf.nd chimeras of their own creasion; fuch as figures with human hodies and the heads or feet of brute, or with brutal bodies and the heads and feet of men.
Thefe two hypothefes combined together appear to us to account fufficiently for the idolatry of Egypt, monllrous as it was. We are perfuaded, that with reipeat to the origin of brute worthip, Molheim is in the ught ( $c$ ); and it was a very cafy flep for people in fo
good training to proceed upou the crutches of hieroglyWhics to the worlhip of plants and thofe chimeras, which, as they never had a real exifience in nature, could not have been thought of as emhlens of the divinity, had they not been ufed in that fymbolic writing which Warburton io ably and ingenioully explains.

To this account of the origin of brute-worlhip wa are fully aware that objections will occur. Frim at learned friend, who peruled the article in manulcript. we have been favoured with one which, as it is exceedingly plaulible, we fall endeavour to obviate. "Bruteworthip was not peculiar to Egypt. The Findoos, is is well knowa, have a religious veneration for the cow and the alligator; but there is no evidence that in India the number of ufeful animals was cver fo, fmall as to make the interference of the prince and the prieft ne. celfary for their prefervation; weither does it appeas that the Hindoos adoped from any other people the worthip of a felf-exiftent principle of evil." Such is the objection. T'u which we reply,

That there is every reafun to helieve that bruteworthip was introduced into India by a colony of Egyptians at a very remote period. That between thefe two nations there was an early intercourfe, is univerfal. fid ly allowed: and though the learned prefident of the $A$ fiatic Society has laboured to prove, that the Egyptians derived all that widdum for which they were famad, as well as the rudiments of their religious fyftem, from the natives of Hindoflan, he does not appear to us to have laboured with fuccefs. To examine his arguments at length would fiwell this article beyond its due proportion; and we have noticed fome of them elien here (fee Philolocy, $\mathrm{n}^{0} 33$ and 39.) At prefent we thall enly oblerve, that Sefoltris undoubtedly made an invadinto India, and conquered part of the courtry, whilte we nowhere read of the Hindoos having at any time conquered the kingdom of Egypt. Now, the ugh the victors have $f$ metimes adopted the religion of the vanquifhed, the contrary has hapyeried to much more frequently, and is in ittelf a procefs fo much more natural, that this fing!e circumfance uffords a Atrong prefumption that the Egyptian menarch would rather impofe his gods upon the Hindoos than adopt theirs and carry then with him to Egypt. Brate-wothip night likewife be introduced into Hinde fan by thode valt colanien of Egyptians who took refage in that commery fiom the tyranny and opprellion of the thepherd-kings. That fuch colonies did fettie on fome orcation or uther in India, feems undeniable from monuments fill remaining in that c untry of forms which could hardly have occurred to a native of Afia, though they are very natural as the wirkmanthip of Aficans. But we need not reafon in this manner. We have feen a manuicript letter from Mr Burt, a learned furgecn in Bengal, and a member of the Afiatic Sociciy, which puts it beyond a doubt that great numbers of Egyptians had at a very early
(c) To prove that it was merely to preferve and increafe the breed of ufeful animals in Egrpt, that the frince and the prieft frrg taught the perple to confider fueh animals as facred, he argues thus: "Hac ita etie, non 'ex eo tantum liquet, quod paulo ante obfervavi, nullas beftias univerio Egypterum $p$ pulo facras frife, prater eas, que manifeltam regioni utilitatem comparant; fed inde quoque apparet, quod lonse major ratio habita fuit femelarum inter animalia, quam marium. Boves diis immolare licebat, vaccas nuilo modo. Canes femina contumulabantar, non item mares." Lege Herodot. Hiflor. lib. ii. cap. 41. à cap. 67.
nof. enls paidd not only fettled in Lindonan, bnt alfo brought witat them wriangs relating to the hiftory of their country. As the fhephord-kings were enemics in the arts and to literature, it is probable that this fertlement took place on their conquelt of Egypt. Mr Bart's words are: " Mr Wilford, lieuienant of engineers, has extrasted moft wonderful difeoveries from the Shanferit records; fuch as the origin and hifory of the Egrptian pyramids, and even the account of the exjence in thcir building." Upon our hypothefis there is mothing incredible in this account; upon the hypo. thefis of Sir Wrilliam Jones, it is not eafy to be conccived how the hitary of Egyptian pyramids could have found a place in the Shanficit records.

We may admit that the Hindoos have never adopted from the Perfians or Eggptians the worfhip of an independent principle of evil, and yet difpefe of the other part of the objection with very little dificulty. It will befeen liy and bye, that the bramins believe a kind of triad of hypoftafes in the divine nature, of which one is viewed as the defroger, and known by fereral names, fuch as Siva and Ifaurra. When brute-worfhip was introduced into Hindoltan, it was not unnaturaì to confider the alligator as emblematical of I/wara; and hence in all probability it is that the Hindoos believe that a man cannot depart more happily from this world than by falling into the Ganges, and being devoured by one of thofe fieced animals. Upon the whole, the bruteworlhip of the Hindoos, inftead of militating againft our account of that monftrous fuperftition as it prevailed in Egypt, feems to lend no fmall fupport to that account, 25 there was unqueltionably an early intercourfe between the two nations, and as colonies of Egrptians fettled in India. To him who is not fatisfied with our reafoning on this fubject, we beg leave to recommend an attentive perufd of Maurice's Indian Antiquities, where he will find many facts brought together, which tend to prove that Egypt has a juft claim to a higher antiquity than India.

Haring thus traced the rife and progrefs of polytheifm and idolatry as they prevailed in the moft celebrated nations of antiquity, we now proceed to inquire into the real opinions of thefe nations concerning the mature of the gods whom they adored. And here it is evident from the writings of Homer, Hefiod, and the other poets, who were the principal theologians among the Greeks and Romans, that though heaven, earth, hell, and all the elcments, were filled with divinities, there was yet one who, whether called Jove, Ofiris, Orzouzd, or by any other tifle, was confidered as fuprenie over all the reft. "Whence cach of the gods was generated (fiys Herodotus*), or whether they lave all exifted from eternity, and what are their forms, is a thing that was not known till rery lately; for Ifefiod and Homer vere, as I fuppofe, not above fuur hundred years my feniors; and thefe were they who introduced

II F. I S. M.
the theogery rmang the Grecks, and gare thin gots Ti.cos.... their feveral names." Now flefiod $t$, towats the le - Fiof. ginning of his theognar, ceprofly involes lis nure to ief-iz. eclebrate in futable mimbers the generntion of the ins. mortal gods who had froung from the enth, the duk night, the farry heavens, and the falt ica. Ile calis up from rn her likewifa to $f$ fy, "itn what manner the gens, the whom the carth, the sivers, occan, fats, and fimanent, were ge c.ther dis.
 them of benevolant dijpolitions toward, mmkind." e"shers:" 1 : From this invoeation, it is evident llat the poet did not confider the gois of Greece as folforiftent bevegs: neither could he look upon them as cratares; for of creation the amcient Greelis had no conception (fice Metafissics, $n^{\circ} 264$.) ; bat he confỉured them as emanations coeval with the eath and heavens, from fome fuperior principles; and by the divine inteilizences fprong from them, there cannot be a doubt but that he underitood benevolent damons. The fint principles of all things, according to the fame Hefiod, were Clion, and Turtarus, and Love; rf which onls the laft being active, mult undoubtedly have been conccived by this father of Grecian polytheifm to he the greateft and onis felf-exifing god. This we fay meft undonbtedly have been Hefiod's belief, unlefs by Tartarus we lere underitand a felf-exiftent priaciple of evil ; and in the: cate his creed will be the fame with that of the ancient Perfians, whe, as we have feen, believed in the feliexiftence as well of cibramar as of Ormuz

Hefiod is fuppofed to have taken his theology from Orpheus; and it is evident that his doctrine concerning the generation of the gods is the fame with that taught in certain verfes* afually attributed to Orpheus, in * Argowhich Love and Chaos are thas brought together. nau:. pag. "We will firt fing (fays the poet) a pleafant and delightful fong concerning the ancient Chaos, how the heavens, earth, and feas, were formed out of it; as allo concerning that all-wife Love, the oldeft and felf-perfect principle, which actively produced all thefe chings, feparating one from another." In the original paffige, Love is faid not only to be $\pi 0 \lambda$ veutas of much ruifiom or fagazity, and therefore a real intelligent fubfance; but alio to be $\pi$ fiseburatos and anecrexes the clliff and felf.perfea, and therefore a being of fuperior order to the other divinities who were generated rogether with the elements over which they wese conceived to prefide.

With the theology of Homer our readers of all defcriptions are fo well acquainted, that we need not firell the article with quotations, to prove that the father of epic poetry held Jowe to be the father of gods and men. But the doctrine of the poets was the crecd of the mulgar Greeks and Romans ; and therefore we may conclude, that thofe nations, though they worfhipped gods and lords imumerable, admit:ed but one, or at the moft two (D), felfexiftent principles; the one good and the olher evil. It does not indecd appear, that in the

1yfem
(D) Plutarch is commorly fuppofed, and we think junty fuppofed, to have beea a believer in twn felfexiltent principles, a good and an evil. His own opinion, whatever it was, he declares (de Ifide ot Ofiride) to have been moft ancient and univerfat, and derived from theologers and lawgivers by poe:s and philofophers. "Though the firf author of it he unknown get (fass he) it hath been fo firmly believed ceveryaubere, that traces of it are to be found in the facrifices and myfteries both of the karbarians and the Greels. There is a confufed mixture of good ard evil in crery thingz and nothing is produced by naiure /arre. Where-

Theogony

Though cach was by the vulgar confdered as unaccountable in his own proviace. in the 1 . Such . God, to whom worflip was ultimately due; and they adored the fubordinate divinities as his children and miniters, by whom the courfe of Providence was carried on. With refpect to the origin of thofe divinities,
*Tinisus. Plato is very explicit; where he tells us**, that " when all the gods, both thofe who move vigbly round the heavens, and thofe who appear to us as often as they pleafe, were generated, that God, who made the whole univerfe, fpoke to them after this manner: Ye gods of gods, of whom I myfelf am father, attend." Cieero teaches the very fame doctrine with Plato concerning
$\dagger$ ruse.
Quef. lib. s.c. 29. ct de Nat. Denrum, ${ }_{\ddagger}{ }^{\text {palfim. }}$ Differt. I . the gods $\dagger$; and Maximus Tyrius, who feems to have undertood the genius of polytheifm as thoroughly as any man, gives us the following clear account of that fyitem as received by the philotophers.
" [ will now more plainly declare my fenfe $\ddagger$ by this fimilitucle : Imagine a great and powerful kingdom or principality, in which alh agree freeiy and with one confent to direct their actions according to the will and command of one fupreme king, the oldeft and the beft; and then fuppofe the bounds and limits of this empire nut to be the river Halys, nor the Hellefpont, nor the

Meotian lake, nor the flores of the occan ; but heaven Theoge above, at:d the earth beneath. Here then let that great king fit immoveable, prefcribing to all his fubjects laws, in the obfervance of which contift their fafety and happinefs : the partakers of his empire being many, buth vilible and invifible gods; fome of which that are neareit, and immediately attending on him, are in the high. eft regal dignity, leafting as it were at the fame table; others again are their minifters and attendants; and a third fort are inferior to them both: and thus you fee how the order and chain of this government defcends down by feps and degrees from the fupreme God to the earth and men." In this paffage we have a plain acknowledgment of one fupreme God, the fovereign of the univerfe, and of three inferior orders of gods, who were his minifters in the government of the world; and it is worthy of obfervation, that the fame writer
 fons and friends of God. He likewife affirms, that all ranks of men, and all nations on earth, whether barbarous or civilized, held the fame opinions refpecting one fupreme Numen and the generation of the other gods.
"If there were a meeting (fays he*) called of all * Lbid thefe feveral profeffions, a painter, a ftatuary, a poet, and a philofopher, and all of them were required to declare their fenfe concerning the God; do you think that the painter would fay one thing, the fatuary another, the poet a third, and the philofopher a fourth? No; nor the Scythian neither, nor the Greek, nor the Hyperborean. In other things we find men fpeaking very difcordantly, all men as it were differing from all. But amidft this war, contention, and difoord, you may find everywhere, throughout the whole world, one miniform law and opinion, that there is one God, the king and father of all, and many gods, the sons of God, who reign with God. Thefe things both the Greek and barbarian affirm, both the inhabitants of the continent and of the fea-conat, both the wife and the unwife."
This account of philofophical polytheifm reeeives no Indian fmall fupport from the Aliatic Rescarches of Sir Wil- Branin liam Jones. "It muft always be remembered (fays that accomplifhed fcholar), that the learned Indians, as they are indructed by their own books, aclnowledge
fure it is not one only difpenfer of things, whe, as it were, out of feveral veffels difributeth thefe feveral liquors of good and evil, mingling them together, and dalhing them as he pleafes; but there are two diltinct and contrary powers or principles in the world, one of them always leading, as it were to the right hand, but the other tugging the contrary way. For if nothing can be made wit out a caufe, and that which is good camot be the caufe of evil, there mutt needs be a diftinct principle in nature for the production of evil as well as good."

That this is palpable manicheifm (fee Manicheisn), appears to us fo very evident, as to admit of nodebate. It appeared in the fame light to the leamed Cudworth; but that author habours to prove that Plutarch mifook the fenfe of Pythagoras, Empedocles, Heraclitus, Anaxagoras, and Plato, when he attributed to tlem the fame opinions which were held by himfclf. Mofhein, on the other hand, has put it beyond a doubt, that whatever was Plutarch's belief refpecting the origin of evil and the exitence of two independent principles, it was taken implicitly from the writings of Plato. But the pious chancellor of Gotingen, actum ated by the fame motives with Cudworth, wifhes to perfuade his readers, that by Plato and Plutarch nothing afive was underfood by their evil principle but only that tendency to confufion, which was then deemedinfeparable from matter. But that fomething more was meant feems undeniable; for immediately after the words which
 are trua gods, as it revere of contrary trades or crafts, of which one is the author of all good and the other of allevila See Moglaing, ed. Cultworth. Syferm. Intillct. lib. i. cap. $4 . \$ 13$.
gony. only one Supreme Being, whom they call Brabme, or the great one, in the neuter gender. They believe his cfience to be infinitcly ramoved from the conprehenfion of any mind but his own; and they fuppore him to manifent his power by the operation of his divine finit, whom they name Visunow the pervader, and Nt'ra'yan or moring on the auaters, both in the malculine gender; whence he is often denominated the fir $\beta$ male. When they confider the divine power as exerted in creating or giving exiftence to that which exifted not before, they call the dei:y Drahma'; when they view lim in the light of diftroger, or rather changer of furms, they give him a thoufand names, of which Sira, Iswara, and Maradeva, are the moft common; and when they confider him as the preferver of created things, they give him the name of Vishnou. As the foul of the world, or the pervading mind, fo finely defcribed by Virgil, we fee Jove reprefented by feveral Roman poets; and with great fublimity by Lucan in the wall known fueech of Cato concerning the Ammonian oracle. 'Jupiter is wherever we look, wherever we move.' This is precifely the Indian icca of Vishnou: for fince the power of preferving created things by a fuperintending providence belongs eminently to the godhead, they hold that power to exift tranfcendently in the preferving member of the triad, whom they fuppofe to be everywhere always, not in fubfance, but in fipirit and energy." This fupreme god Brah. ME , in his triple form, is the only felf-exiftent divinity acknowledged by the philofophical Hindoos. The other divinities Genesa, Indra, Cuvera, \&ce, are all looked upon either as his creatures or his children; and of courfe are workipped only with inferior adoration.
It was upon this principle of the generation of the gods, and of their acting as minifters to the fupreme Numen, that all the philofophers of Grecce, who were not atheifts, wornipped many divinities, though they either openly condenmed or fccretly delpifed the traditions of the poets refpecting the amours and villamies of Jupiter, Venus, Mercury, and the reft of the tribe. It was the fame principle fincerely admitted, and not an ill-timed jelt, as has been abfurdly furpofed, that made Socrates, after he had fwallowed the poifon, requeft his friend to offer a votive cock for him to Eiculapius.
But a theogony was not peculiar to the Greeks, Romans, and the Hindoos; it made part of every fyttem of polytheifm. Even the Egyptians themfelves, the §roffelt of all idolaters, believed in one felfexifing God, from whom all their other divinities defcended by gencration. This appears probable from the writings of Horus Apcillo, Jimblicus, Porphyry, and many other ancient authors; but if the infeription on the gates of the temple of Neith in Sais, as we have it from Plutarch and Prochus, be genuine, it will admit of no doubt. This fanous in!cription, according to the laft of thefe writers, was to this purpofe: "I am whatever is, what-
ever farll be, and whatever hath Lecn. Ify voil no Theogong. man hauh renowed. The offspring which I brought forth was the finn (E)."

The Perfian magi, as we have feen, belicecd in two foll-exiftent principles, a grood and an evil: but if Dis. genes Laertins defieves in be credited, they held that fire, carth, and water, which they called gods, werc generated of thefe two. It was obferved in the beginning of this :rricle, that the firft object of idolatrous worthip was probab!y the fun, and that this feecics of idolatry took its rile in Chaldea or Portia. But when it became the pratice of eattern monarchs to conceal thenifelves wholly from their people, the cuftom, as implying dignity, was fuppofed to prevail as woll in heaven as oul earth; and Zoroafter, the reformer of the Perfian theology, taughti*, hat "Ormuzd was as "Pluarch, far removed from the fun as the fun is removed trom the de fride en carth." According to this modification of magianifm, Ufir. the fun was one of the generated gods, and lield the office of prime miniter or vicegerent to the invilible fountain of light and good. Still, however, a felfexiftent principie of evil was admitted; but though he could not be deftroyed or annihilated by any power, it was bclieved that he would at laft be completely vanquifhed by Ormuzd and his minifters, and rendered thenceforward incapable of producing any mifchief.

From this fhort view of polytheifm, as we find it delineated by the beft writers of antiquity, we think ourfelves warranted to conclude, that the whole pagan world believed in but one, or at moft two, EELF-FXistent gods, from whom they conceived all the other divinities to have defcended in a manner analogous to human generation. It appears, however, that the vulgar pagans confidered each divinity as fupreme and unaccountable within his own province, ard therefore intitled to worfhip, which relted ultimately in himfelf. The philofophers, on the other hand, feem to have vi ${ }^{33}$ viewcd the inferior gods as accountable for every part lytheins of their conduat to him who was their fire and fove- lefs culreign, and to have paid to them only that inferior kind the phitoof devorinn which the church of Rome pays to departed fophira.
faints. The vulgar pagans were funk in the giofieit ignorance, from which fatefmen, priefts, and foets, cxcrted their utmof influence to keep them from emer: ging; for it was a maxim which, however abfurd, was univerfally received, that "there were many things truc in religion*, which it was not coavenient for the " Vatro vulgar to know; and fome things which, though falfe, apud 1). it was yet expedient that they thould bslieve." The Ausum. de polytheifin and idolatry of the vulgar, therefore, was Civ. Dei. their misfortune rather than their fault. But the philofophers were wholly " without excufe*; bccaule * Rons.i that when they know God, they glorified him not as $20.21,22$ n. God, neither were thankful, but became vain in their ${ }^{25}$. imaginations, and their foolifh heart was darkened. Profeffing themfelves wife, they became fools, and worfhipped and ferved the creature more than the Creitor, who is God blefficd for ever."

POLY-
 vevsio. The antiquity of this infcription is admitted by Cudworth, denied by Mothein, and doubted by Jablom-
 JablonRki's Panthon REgyptioriun.

## POL

Polytichuzi.

POLFTRICHUM, in botany: A gems of the order of mufci, belonging to the cryptoramia clais of plants. The anthera is operculated, and placed upon a very fmall apophylis or articulation ; the calyptra villous; the ftar of the female is on a diftind individual. There are three fpecies; the mof remarkable of which is the communa, or great golden maiden bair, frequenty to be met with in the bogs and wet places of Britain. It grows in patches, the ftalks ereat, zencrally fingle and unbranched, from three inches to if foot, or even a yard high. The leaves are nume. rous, fiff, lanceolate, acute, growing round the falk without order, and, if viewed with a microfcope, ap. pear to have their edges finely ferrated. They are of ad bright green when young and frefl, but reddifh when dried or in decay: the filaments, or peduncles, are of a thining red, or crange colour, from two to four inches long, arifing fingly from the top of the ftalks, and furrounded at thair bafe with a cylindrical tubular vagima, or perichetium. The anthera, or capfule, is quadrangular, green at firt, alterwards yellow, and sed when ripe, having an annular pedeftal, or apophyfis, at its bafe. The operculum is flat, with a projeting point in the centre; :und underneath is a whitift circular membrane, placed in the middle of the capfule's orisice, and fuftained there by numerous arched threads, or cilia, connefted by one cad to the circumference of this membrane, and by the other fafened to the ring of the anthera. The pollen, or, as others term it, the fced, is frced from the anthera or capfule through the fpace between the cilia. The calyptra is twofold, an internal and caternal one ; both which at firt entirely cover and hang over the anthera. The internal one is conical, membranaceous, and fmooth; the external one is compofed only of tawny hairs, connected into a fort of mat, lacerated at the bafe, and ferving like a roof of thatch to defend the other. Befides the fialks before deferibed, there are commonly fome others near at hand, which are deftitute both of filaments and capfules, but are terminated with a kind of rofaceous cup, cither of a bright red or yellowifh colour, compofed of leaves of different fizes; the outermoft broad, the innermoft lanceolate, growing gradually more and more fine and flender to the centre. This cup is lonked upen by Linneus as the femate flower of this mors; but Hatler is of opinim, that it is only the gem or crigin of a new flalk, which frequently rifes from its centre, and this again becomes fometimes proliferous. There are two varieties of this mofs: the frit lias much fiorter thalks than the preceding, and often branched; the leaves flifier, ereet, and more crowded; in other iefpeets the fame. The other las a falk fcarcely more than half an inch high, terminated with a clufter of linear, erent, rigid leaves, for the moft part entire on the cdyes, and tipped each with a white hair. The filament is about an inch high, and the capfule quadrangrular. The femaic flower, or gem, is of a bright red colour.

The firft kind, when it grows long enough for the purpoie, is fometimes ufed in England and Holland to make brooms or brufhes. Of the female fort the Laplanders, whien oblisred to neep in defert places, frequently make a speedy and convenient bed. Their manner of doing it is curious: Where this mofs grows thick together, they mark out, wilh a knife, a piece of
ground, about two yards fquare, or of the fize of a Polyzat common blanket; then beginuing at one corner, they gently fever the turf from the ground, and as the roots of the mofs are clufly interwoven and matted together, they by degrees firip off the whole circumfrilied turf in one enture picce; afterwards they mark and draw up another piece, exacily correfponding with the firtt ; then, fiaking them both wich their hands, they lay one upon thie ground, with the mofs upperniof, inltead of a mattrais, and the other over it, with the mof; downards, intead of a sug; and between them both take a comfortable nap, free from fleas and bugs, and without fear of contagious diftempers. It is pro. bable they might take the hunt of making fuch a bed from the bear; a cohabitant of their country, which prepares his winter-quatters with a large collection of this fame mols. Sce Musci, p. 473. and Plate CCCXXI.

PoLiXAENUS, ar Polyenus. See Polyenves.
POLYXO, a priefefs of Apollo's temple in Lemnos. She was likewife murfe to queen Hypfipyle. It was hy her advice that the Lemnian women murdered all threir hufbands.-There was another Polyxo, a native of Argos, who married Tlepolemus fon of Hercuis. She foliowed him to Rhodes after the murder of his uncle Licymmius; and when he departed for the Trojan war with the seft of the Greek princes, the became the fole miftrefs of the kingdom. After the Trojan war, Helen fled from Peloponnefus to Rhodes, where Pulyxo reigned. Polyxo detained her; and to punilh her as being the caule of a war in which Tleporlemus had perifhed, fhe ordered her to be langed on a tree by her fernale fervants, difguifed in the habit of Furies.

POMACE $E$, (fomum "an apple,") the name of the 3 6th order in Linneas's Fragments of a Natural Method, the genera of which have a polpy efculent frnit of the apple, berry, and cherry kind. See Botany, Sect. vi. P. 465.

POMATUM, an unguent generally ufed in dreffing the hair. It is alfo ufed as a medicine. Sce PAARmacy, $\mathrm{n}^{\circ} 636$, \&c.

## pOMEGRANATE. See Punica.

POMERANIA, a province of Germany, in the circle of Upper Saxony, with the title of a duchy. It is bounded on the north by the Baltic Sea, on the eaf by Pruffia and Poland, on the fouth by the marquifate of Brandenburg, and on the wef by the duchy of Mecklenturg; and is absut 250 miles in length, and in fome places 75 miles and in nthers 50 in breadith. It is watered by feveral rivers, the moft confiderable of which are the Oder, the Pene, the Rega, the Perlant, the Wipper, the Stolp, the Lapo, and the Lobo. The air is cold; but the foil :bounds in paftures, and prow duces com, of which a great deal is exported. It is a flat country ; containing many lakes, woods, and forefts, and has feveral good harbours. It is divided into the Hither and Fartler Pomerania, and the territnries of the kings of Sweden and Pruffia in this duchy are divided by the river Pene.

POMET (Teter), an aoie druggif at Faris, was horn in 1658. He collected at a great expence from ail countries drugs of every kind, and rendered himfelf celebrated by bis book eaticted If,foire Gemerale der Drognes

Ther Privecipal InoLs of the Sirucoms mershippeat in Britmon.

## POM

Drogus, which is the moit corapiete book on the fub. jer that has yet been printed. Whe gave demonftrations with refpeet to his drugs in the king's garden, and a cataligue of all the druys contained in his wi $r$ h, with a lift of all the rutites of his calmet, which he propoted to publith by fubiription ; but was prevented by his death, which happened in 1699, up. o the very day when the patent for a penfion granted l:im by Louis XIV. was made out.

POMFREI' (John), an Eaglifls poet, fon of the rector of Luton in lectfordilhre, was born in 1667, and educated at Cambridge; after which he tock orders, and was prefented to the living of Malden in Bedfordthire. About 1703 he went to Lendon for inftitution to a larger and very conliderable livi g g ; but was Itopped fome time by Comptum, then biflop of London, on account of thefe lour lines of his poem, entitled the Choice:
"And as I near approach'd the verge of life,
Scme kind relation (for I'd have no wife)
Should take upon him all my worldly care,
While I did for a better ftate prepare."
The paren hefes in thefe lines were fo miliciouffy reprefented, that the good bithop was made to be'ieve that Pomfret preferred a miltefs to a wife. But het was foon convinced that this reprefentation was the mere effect of malice, as Pirmiret at that time was actually married. The ippoition, however, which his flanderers had made to h m had its effeg ; for, being by this obliged to ftay in London longer than he intended, he catched the fmallpor, and died of it, aged 35 .

He publilhed a volume of his poems in 1699 , with a very modeft and fenfible preface. Two pieces of his were publthed after his death by his friend P ilalethes; one in itled Reafon, and written in 1700 , when the difputes about the Trinity ran high; the other Dies Navifima, or the "Laft Epiphany," a Pindaric ode. His verfification is not unmufical; but there is not the force in his writings which is necelfary to conftitute a pret. A diffent'ng teacher of his name, and who publifted fome rlymes upon fipiritual lubjeats, occafioned fanaticifm to be imputed to him; but his fiend Philalethes has jufly cleared him from the imputation. Pomfret had a very flrong misture of devotion in him, but no fanaticifm.
"The Chnice (fays Di Johnfon) exhibits a fyftem of life adapted io common notions, and equal to common expectations; fich a tate as affords plenty and tranquillity, without exclufion of intellectual pleafures. Perhaps no compofition in our language has been of tener perufed than Pomfrei's Choice. In his other poems there is an eafy volubility; the pleafure of fmooth metre is afforded to the ear, and the mind is not oppreffed with ponderous, or entangled with intricate, fentiment. He pleafes many; and he who pleafes many mult have merit."

POMME, or Pommettr, in heraldry, is a crofs with one or more balls or knobs at each of the ends.

POMMEL, or Pummet, in the manege, a piece of brafs or other mattor at the top and in the middle of the faddle-how.

FOMMERCULLIA, in botany: A genus of the
monogynia orucr, belonging to the triandria chaf, of Pazarriem plants ; and in the matural method ranking under the $4^{\text {tha }}$ arder, Graninu. Tlie calyx is bivalved, and thaped liken-top; the valvula quadifid, and beardel on the back. The corollh has two unequal valves; the filaments thrce, with long pointed artherx; the fyle fimple. The whole flower f.rm; ittelf into a ilairp point, and the corrlla ferves as a enveling to the feed, which is long, clear, and fmooth. There is only one fpecies, vir, the Dianthoides.

POMCLRIUM, in Roman antiquity, was, accordins to Livy, that fpice of ground, both within and without the walls, which the angurs, at the firlt building of cities, folemnly confecrated, and on which no edifices were allowed to be raifed. Plurarch gives this account of the ceremony of drawing the pomerium: "They dug a trench, and threw into it the firt-fruits of all things, either goo 1 by cultom, or neceffary by nature ; and every man taking a fmall turf of earth of the country from whence he came, they caft them in promifcuoufly. Then making this trench their centre, they defcribed the city in a circle round it. Alter this, the frunder yoking a bull and a cow together, ploughed a deep furrow, with a brayen ploughthare, round the bound. The attendants took care that all the clods fill inwards, i. e. toward the city. This furrow they called pomerium, and built the wall upon it."-Plutarch, in this account, is to 'e undertood as $f_{f}$ eaking of Rome.

Poiuerium Proferre, fignifies to extend or enlarge a city, which could not be done by any, but thole who had taken away fome part of an enemy's country in war. But this qualification was fometimes difen ed with. Pomerium is quafi fone mrenia, "behnd the walls."

POMONA, in fabulcus hifrory, the tutelar deity of orchards and fruit-trees. See Vertumnus.

POMPEII (anc. geog.), a town of Campania near Herculaneum, and deltroyed along with it by the great eruption of Vefuvius in the time of Titus. See Her. culanfum. It is about 15 miles from Naples, and fix or feven from Porsici-So mach has been faid and written on the difoovery of this place, as makics it unnecellity for us to fay much: we thall therefore only give a fi rtextract on the fubject from an anonymous work lately publithed, apparently of confiderable mefit. "On entering the city (hiys our author *), the firlt *Comparaobject is a pretty fquare, with arcailes, after the pre- tive skecth fent maneer of Italy. This was, as it is imagined, the of Enpland quarter of the foldiers; numbers of military weapons and italy, being found here.
"A narrow, but inng lireet, with feveral fhops on each on Nuifions fide, is now perfectly cleanfed from its rubbilh, and in twnal Adgond prefervation. Each h ufe has a court. In fime vantages. of them are paintings all frefoo, principally in chiarofcuro; and their colonrs not in the leall injured by time. The few colours. which the ancients knew werc extracted only from minerals; and this may be a fufficient reafon for their frellinefs. The Atreet is paved with irregular fones of a fout and half or two fect long, like the $A$ ppian way.
"In difiovering this city, it was at frift doubted whether it were actually Pompeii : but the name infribed over the gateway put it beyond all doubt. The fkeletons

POM
Pompey fieletors found were innumerable: It is faid that many II had fpades in their hands, endeavouring, probably at Dompona- firft, to clear away the torrent of athes with which they tins. were deluged. Indeed the fatisfaction which is felt at the view of ancent habitations, is much allayed by inevitable reflections on this frightful fcene of defolation, thicugh at the difance of fo many centuries.
"An ancient vill:a is alfo feen cntire at a little di. fance feom Pompeii. The houfe is really elegant and ipacious, but only two fories high. The pavement of the chambers is compofed of teffelated marble, and, when polifhed, difplays the defign perfeatly well.There is fome at the mufeum of Portici brought from this pl.ce, whit the eye would really mifake for painting. Under the houfe is a fine trianguldr celliar, of which cach pat is 100 fect long, well filled with amphore. The fikelatons of 29 perfons were found here, Lippofed to have flad to it for fafety. Each houfe is filled with athes: they have almolt penetrated through cvery crevice; and it is incredible how fuch a volume of them cuuld have been thrown out by Vefuvius with iufficient force to have reached fo far." See Swinbune's Travels in the Trwo Sicilice, vol. 2. p. 93, \&ec.; Lady Miller's Lettres, or The La Labule; Captain Sutherlual's Tour up the S ratis, from Gibraltar to Confants"th; P. 75. \&c.; Dr Smilh's Skitch of a Tour on the Con inent, in 1786 and 1787 , vol. 2. P. 118 , \&̌. ; and Watkins's Tour through Swiftrland, Ilaly, \&c.

Pomper the Great, (Cncius Pompeins Mag. nus), the renowned rival of Julius Cæfir. Baing dereated by him at the battle of Pharfalia, owing to the difeaton of his cavalry, he fled to Egypt by fea, where he was baiely affalfinated by orjer of Theodotus, prime minitter to "tolomy the Younger, then a minor, $-S e c$ Rome +8 B. C ${ }^{*}$.

POMPEYS (Cneius and Sextus), his fons, commanded a powerful army when they loft their illuftrious father. Julius Cafar puifued them into Spain , and defeated them at the battle of Munda, in which Cneius was flain, 45 D. C. Sextus made himfelf malter of Sicily; but being defeated in the celebrated nav.il engagement at Actium by Augufus and Lcpilus, he fled to Afa with only 7 thips, the remains of his fleet, which comifined of more than 350 ; and from thence, unable to continue the war, he was obliged to retice t. Lenbos, where renswing the war by railing an army, and faizing on fome contiderable cities, Marcus T'itius, ins the interelt of Marc Antony, gave him battle, deteated him, took him priloner and bafely put him to death, 35 B. C. Sce Rume.

Pomifi's-Pillar. See Alexanvria, p. 393.
POMP'ILUS, in ichthyology, a dipecies of Corr. phoena.

POMPONATIUS (Peter), an eminent Italian philof pher, was bornat Mantuain 1462 . He was of fo fmall at Acture that he was little better than a dwarf; yet he polfelled an exalted genius, ind was confidered as rane of the greatelt philofophers of the age in which he lived. Ho taught philofophy, firft at l'adua and afterwards at Dologna, woth the higheft reputation. He had frequent difFutations with the celcbrated Achillini, whofe puraling oujesions would have confounded him, had it not been for his fitll ial parry ing them by fome joke. His brok De, inmortalitats, Animue, publified in 1510 , made a forat noile. He maintained, that the immortality of
but folemnly declared his belief of it as an article of faith. This precaution did not, however, fave him; many adverfaries rofe up againt him, who did not fcruple to treat him as an atheif; and the monks procured his book, although he wrote feveral apologies for it, to be burnt at Venice. His book upon Incantations was alfo thouglit very dangerous. He fhows in it, that he believed nothing of magic and forcery ; amb he lays a prodigious ftrefs on occult virtues in certain men, by which they produced miraculous effects. He gives a grcat many examples of this; but his adverfaries do not admit them to be true, or free from magic.Paal Jovius fays, that he died in 1525 , in his grand climacteric. He was three times married; and had but one daughter, to whom he left a large fum of money. He ufed to apply himfelf to the folution of difficulties fi) very intentely, that he frequently forgot to cat, drink, fleep, and penform the ordinary functions of mature: naj, it made him almoft diftracted, and a laugh-ing-linck to every one, as he limfelf tells us.
pompolijus mela. See Meta.
POMUM, an Apple; a fpecies of feed.vefele, compored of a fucculent flefhy pulp; in the middle of which is generally found a membranous capfule, with a number of cells, or cavities, for containing the feeds. Seedvelfels of this kind have no external opening or valve. At the end oppofite to the foot-ftalk is frequently a fmall cavity, called by the gardeners the cye of the fruit, and by botanifts umbilicus, the " navel," from its fancied refemblance to the navel in animals. Gourd, cucumber, melon, pomegranate, pear, and apple, furnilh inftances of the fruit or feed-vcfel in queftion.

## POND, or Fish-Pond. Sce Fish-Ponds.

Pond, is a fimall pool or lake of water from whence no fream iflues. In the Tranfuaions of the Society infitued at Loudon for the Encuruagenent of Arts, Manufadures, and Comnerce, vol. viii. and printed in the ycar 1790 , there is a fhost account of a machine for draining ponds without difturbing the mud. It was communicated to the fociety, !ogether with a drawing and model of the machine, by Lieutenant-colonel Danfey. The model was made from the defcription of a machine wied by : gendeman near Taunton for many ycars before, for fupplying a cafcade in his pleafure-grounds.'The colonel's iegiment was thenlying at Windfor; and thinking that the invention might be ufeful to fupply the grand cafcade at Virginia water, he made the model, and prefented it to the king, who was gracioufI5 pleated to approve of it. In confequence of which, by his majefly's defue, a penfock on that principle was coniturted from the model at one of the ponds in the nighbourhood. - The colonel thinks the machine may be uifful in the hands of men of fcience, and applicable to filk, cotton, and other mills, where a feady and uniform velocity of water is wanted; which might be regulated at rleafure, occafioning no current to difturb the mud or fift, as the itream contantly rums from the furface. He fays he has often made the experiment by the model in a tub of water.

Of this machine we lave given an engraving, taken from the abovementioned Tranfactions; and we fhall now add the defoription which accompanies the plate in that work.

In figure 1. A is the pipe, loaded with a rim of lead, cci

## PON [ 353 ] PON

of fuch weight as ferves to fink it below the furface of the water. $B$ is the difcharging pipe, laid through the bank HI. C is the joint on which the pipe A turns its form, which is fhown fig. 2. D is the ball or float, which, fivimming on the furface of the pond, prevents the pipe $A$ from defcending deeper than the length of the chain by which they are cometted. E is a chain winding on the windlafs F , an.l ferving to raife the tube A above the diurlace of the water, when the machinery is not in ufe. G is a flage. HI is the bank, reprefented as if cut through at $I$, to thow the tube 1 lying within it. $K$ is a poft on receive the tule $A$ when lowered, and to prevent its finking in the mud. In figure 2. A is a ca.t cylinder, with a plate or cheek, B, which is fallened to the timber of the tube on one fide, but not on the other, as the part of the cylinder C turns in the hollow of the wooden tube when it is immerged. A piece of frong fole le:ther is put inflide the brafs-plate B, to prevent leaking.

Pond.Weed, in botany. See Potamogeton.
PONDICHERRY, is a large town of Afia, in the pcrinfula on this lide the Ganges, and on the coaft of Coromandel. Its fintion is low, and the fhips anchor about a mile and a half from it; nor can the boats or canoes come nearer it than a mufket-fhot, on account of the breakers, fo that the blacks come in flat.bottomed boats to carry the men and merchandifes to the fleet. The fort is 200 paces from the fea, and very irregular; built with bricks, and covered with fine plafter, refembling white marble. The huts of the blacks lie here and there, and the walls are of bamboos mixed with the branches of trees. The French are greatly addicted to women, from whom they catch difeafes that render them pale, livid, and meagre, with a frightiul afpef. However, feveral of the French are married to a fort of Portuguefe women, who are of a mixed breed, being a kind of Mulattoes. The country about it is barren, and confequently moft of their provifions are brought fiom other places. Their trade confifts of cottor-cloth, filks, pepper, faltpetre, and other merchandifis that are brouglt from Bengal. With regard to the religion of the natives, the moft numerous are the Centoos; but there are Mahometans or Moors who hold a great many ridiculous opinions. The Gentoos are of different fects, and that of the Brahmins are priefts. The cultom of women burning themfelves with the bodies of their dead hufbands was very common, but of late much diferuntenanced. The flaves or fervants are very numerous, and their chief fond is rice. This place was taken, and the fortifications demolifhed, by Colonel Coote; it was refored to the French by the peace of 1763 ; and was retaken in the beginning of the prefent war with the French republic. It is 60 miles louth of Fort Si George. E. Long. 79. 58. N. Lat. It 1.42 .

PONDICO, an ifland of the Archipelago, lying on the gulph of Zit in, near the cealt of Negropont. It is fmall and uninhabited, as well as two others that lie near it.

PONG-hou J/2es, in the province of Fo-kien in China, form an archipelago between the port of Emouy and the inand of Formora. A Chinefe garrifon is kept here, with one of thofe mandarins who are called literati, whofe principal employment is to watch the tradVol XV.
ing velfels which paifs from China to Formofa, or from Poniord Formofa to China.

As thefe illands are only fand-banks or rocke, the Ponefras. inhabitunts are obliged to imp re every necetfary of life; neither thrubs nor buthes are feen upon them; all their ornament confifts of one foltary tree. The harbour is good, and lheltered from every wind ; it hats from 20 to 25 feet depth of water. Altnough it is an uncultivated and unimbabited in.ind, it is abfolutely necelfary for the prefervation of Formufa, which has no port ca. pable of receiving veifels that draw ahove 8 feet of water.

PONIARD, a little pointed dagger, very fharp edged ; borne in the hand, or at the girdle, or hid in the pocket. The word is formed from the French poignard, and that from poignnée, "handicu." - The poniard was anciently of very great ufe; but it is now in a good meafure fet afide, except among alfaffins. Sword and poniard were the ancient arms of duelifts; and are faid to continue fill fo among the Spaniards. The practice of fword and poniard till make a part of the exercife taught by the mafters of defence.

PONS, a town of France, in Saintonge, very famnus in the time of the Huguenots. It is feated on a hill, near the river Suigne, 10 miles from Saintes. W. Long. 0.30 N. Lat. $45 \cdot 36$.

PONT-du-gard, is a bridge of France, in Lower Languedoc, built over the river Gardon, which ferved for an aqueduct. It is a very remarkable and a moft magnificent work, and was raifed by the ancient Romans. It confilts of three bridges, one above another ; the uppermoft of which was the aqueduct, to convey water to the city of Nifmes, which is eight miles to the fouth. They are altogether 192 feet high, and the uppermof 580 feet long. They are conftruted between two rocks. E. Long. 4. 26. N. Lat. 43.58.

PONTEDERIA, in botany: A genus of the monogynia order, belonging to the hexandria clafj of plants; and in the natural method ranking under the fixth order, Enfata. The corolla is monopetalcus, fexfid, bilabiate ; there are three ftamina inferted into the top, and three into the tube of the corolla; the capfule is bilocular.

PONTEFRACT, or Pomfret, a town of the Weft Riding of YorkThire in England, fituated on the river Are. It is faid to take its name from a broken bridge, which is fuppofed to have been laid anciently over that marfhy foot called the $W a / b$. Here are the ruins of a noble old caftle, were Richard II. was barbaronfly murdered, and two of Edward V.'s uncles. The collegiate chapel of St Clement, which had a dean, three prebendaries, \&c. is niil diatinguilhable in it. This town has a good market, and fairs for horfes, fheep, and other cattle. It is a corparation, governed by a mayor, recorder, aldermen, and burgeffes and gives title of earl to the family of Fermor. In the reign of Queen Elizabeth, 200 1. was left by George Talbot, earl of Shrewibury, to be lent for ever, at 5 l. a time, on proper fecurity, for three years, to the poor artificers of the town; and Thomas Wentworth, Efq: anceftor to the marquis of Rocking. ham, left 2001 . to the charity-fool. A branch of the great Roman military way called Ernuinfreet, which paffed from Lincoln to York, may be traced betwixt

Pontifes fown and Doncafter. The adjacent country yields
Pont. plenty oflineftone, together with liquorice and flirrets, W. Long. 1. 5. N. Litt. 53. 42.

PONTIFEX, Pontife, or High-prief, a perfon who has the fuperintendance and direction of divine worthip as the offering of facrifices and other religious folemnitics. The Romans had a college of pontiffs; and over thefe a fovereign pontiff, or pontifex maximus, influted by Numa, whofe function it was to pretribe the ceremonies each god was to be worlhipped withal, compofe the rituals, dircet the veftals, and for a good while to perform the bufinefs of augury, till, on fome fuperflitious occafion, he was prohibited intermeddling therewith. The office of the college of pontiffs was to allitt the high-prielt in giving judgment in all cates relating to religion, inquiring into the lives and manners of the inferior priefts, and purifhing them if they faw occafion, \&c. The Jews too had their pontifs; and among the Romanifts, the pope is fill nyled the forn rign pontiff:

PONIIFICATL, is uled for the fate or dignity of a poniff or high prich; but more particularly in modern writers for the reign of a pope.

PONTIUS (Pilate.) See Pilate.
PONTON, or PONTOON, in war, a kind of flat bottomed boat, whole carcate of wood is hined within and whihout with tin : they ferve to lay bridges over rivers for the antiliery and army to march over. 'The Fisench pontoms, and thofe of moft other powers, are made of copper on the cutlide : though thefe con more at firf, yet they latt much longer than the fe of tin ; and when woin out, the copper fells nearly for as mutch as it coft at firtt but when ours are rendered ufelefs, they fell for nothing. Our pontoons are 21 feet long, five feet broad, and depth within two feet 1.5 inches.

Pontoon-Carriage, is made with two wheels only, and two long fide-pieces, whofe fore-ends are fupported by a limber; and ferves to carry the pontoon, boards, crofs-timbers, anchors, and every other thing neceflary for making a bridge.

Pontoon. Bridge, is made of pontoors llipped into the water, and placed about five or fix feet afunder; each fattened with an anchor, when the river has a ftrong cartent; or to a ftrong rope that goes acrofs the siver, running through the rings of the pontoons. Each boat has an anchor, cable, baulks, and chefts. The baulks are about five or fix inches fquare, and 21 feet long. The chefts are boards joined together by wooden bars, about three feet broad and 12 fect long. The baulks are laid acrois the pontoons at fome diftance from one another, and the chens upon them jnined clofe; which makes a bridge in a vers fhort time, capable of fupporting any weight.

PJNT St Espkit, is a town of France, in Languedec, in the diocele of Ufez. It is feated on the river Rhone, over which is one of the finett bridges in France. It is 840 yards long, and confits of 26 arches. Each
picr is piereed with an aperture, in order to facilitate the pafige of the water where the river is high. The town is large, but the ftreets are narrow and ill-built. It formerly contained feveral cliur hes and convents. It is 17 miles fouth of Viviers, and 55 northecalt of Montpelier. E. Long. 4. 46. N. Lat. 44. 13 .

PONTUS, the name of an ancient kinglom of Afia, originally a part of Cappadocia; bunded on the ealt by Colchis, on the wefl by the river Halys, on the north by the Euxine Sex, and on the fouth by Armenia Minor: Some derive the nanie of Puntua from the neighbouring fea, commonly called by the Latins Ponfus Euxinus; others from an ancient king named Ponitus, who imparted his nanie both to the conatry and the fea; but Bochart deduces it from the Phonician word lomo, lignifying a flberd, as if that nut abounded re. markably in this place. Bat this derivation feems to be very far fetched; and the common opinina that the country derived its name from the fea, feems by tar the moft probable. The kingdom was diviled into three parts; the fint, nomed Pontur Gallaticur, extending from the river Halys to the 'Thermndon; the fecond, named Pontus Polemanaicus, extended from the Thermodon io the borders of Pontus Cespfadocirus; and this laft extenl. ed from Puntus Polemonaicus to Colchis, having Armenia Ninor and the upper flream of the Euphraies for its fonthera bomday.

It is commonly believed, that the firf inhabitants of Pontus were defcended from Tubal; but in procefs of time mixed with Cappadocians, Paphlaronians, and other foreign nations, befides many Gritek Colonies which fettled in thofe parts, and maintained their liberty till the time of Mithridates the Great and Pharnaces. The firf king of this country whem we find mentioned in hiltory is Artabazes, who had the crown beftowed Artala on him by Darius (A) Hyltafpes. The next was Khodn- king. bates, who reigned in the time of Darius Nothus. After him came Mithridates, who, refuing to pay the ufual tribute to the Perfians, was defeated by Artaxerxes Mnemon; but a peace was foon after concluded by the mediation of Tiffaphernes. Befides this, we hear nothing of him farther than that he was treacheroutly taken prifoner by Clearchus afterwards tyrant of Heraclea, and obliged to pay a large firm for his ranfom.

Mithridates I. was fucceeded by Ariobarzanes, who being appointed by Artaxerxes governor of Lydia, Ionia, and Phrygia, employed the forces that were under his care in the extending of his own dominions, and fubduing thofe of inis natural prince. The king of Perfia fent one Autophrodatec againft him; but A:iobarzanes, having with great promies prevaiicd on Age. filatus and Timothreus the Athemian to come to his affifance, obliged Autophrodates to retire. He then rewarded Agetilans with a great fum of moner, and, beflowed on Timothrus the cities of Seltos and Atydos, which he lad lately taken from the Perlians. He ufed his utmof endeavours to reconcile the Lacedemonians and Thebans; but not being able to bring the latter
(A) This country, togetier, with the adjacent provinces, was in different periods under the dominion of the Afyrians, Medes, and Perlians; the laft of whom divided Cappadocia into fatrapies or govemments, and beflowed that divifion which was afterwards called Pontus on one of the anceftors of Mithridates. This regulation. was efiected in the reign of Darius the fon of Hyfafpes, wh has been regardcdas the date of the kingloma

to any reafonable terme, he affited the Lacciemnnians with valt fums of money. 'Ithe Athenians thowed fo much refpect for this prince, that they not only made him fice of their city, but granted both him and his children whatever they atked of them. He was murdered in the 28 th year of his reign by one Mithridates, whonm authors fuppole to hatve been his fon. This happened at the time that Alexander the Great invaded Atia, to that Pontus for a time fell under the power of the Mucedonians.

In the reign of Antigonus, Mithridates the fon of Ariobarzmes thook off the Macedonian yoke; the particulars of which event are rclated as follow. Antigonus having dreaned that he had a ficld in which gold g:ew after the manner of corn, and that. Mthridates cut it down and carried it into Pontus, began to be very jealons of him, and ordered him to be put to death frivately. But Mithridates, having got nutice of the king's intention, withdrew into Paphlagonia, attended only by fix horfemen. Herc, being joined by many others, he poffelled himfelt of Cinatum, a lirong hold fituated near mount Olgaiys; from whence, as hinarmy c mentally increafed, he made an irruption into Capfadocia; and having driven the commanders of Antigenus from that part which borders upon Pontus, he entered his patirnal kingdom, which, in fpite of the utmoft efforts if Antigonus, he held for the fpace of 25 sears, and tranfmitted to his poiterity.

L'nder the reigns of Mithridates III. Ariobarmanes II. and Mithridates IV. the immediate fuccellors of Mi\%hridates II. nothing remark:tble huppened. But Mihridates V. made war on the inhabitants of Sinope, a city on the coatt of Paphlagonia. He made himfelf matter of thl the adjacent piaces; but finding the whole peninfula, on which Sinope i:felf ftood, well fortified and garrufoned, not only by the ithabi ants, bus by their allies the Rhodians, he abondoned tise cnterprife. He alterwards proved a great friend to the Rdodians, and affifted them with money to repair the loffes they had fuftained by an carliquake. He entered alio intn a frict ailiance with Antiotucs the Great, who married one of his daughters namsin Etodice.

Atter the death of Mithri..tre $V$. hi fon Pharnaces $I$. attacking the city of Sincpe, uncxpectediy tuole it by Rorm. On this the Rhodians fen' amh. Tidors to Rome, complaining of the behaviour of the king of Pontus; but Hharnaces was io far fron beipg intimidated by their threats, that he invaded the terrio ies of Eumenes their great ally. The latter fent ambathedors to Rome, and entered irto an alliance with Ariura hes hing of Carpadocia. Itharnaces, in his turn, fe $t$ ambatadors to Rome, complaining of Eurrenes and Ararathes; upon which fome Romars were fent into Alia to intquire iat the fiate of matters. The fe found Eumenes and his affociates wiling to accomodate the dfference, but Pharmaces in a quite oppofite difpoition, which they accordingly reported at Rome.

In the mean time a war was commenced between Eumenes and Pharnaces; but the latier, heng difap$p$ inted of aCiftance from Seleucus king of Sy ria, whom the Romans would not alluw to join him, was at laft forced to fue for peace ; which was granted him upon the following conditions: 'Ihat he frould forthwith wihduaw his forces from Galaia, and difanul all engagements and alliances with the imhabisants of that
country; that he flould in like manner cracuate Pa. Pontiv. phagonia, and fead back fucl: as he had from thence cantied into flavery; that he thould reftore to A riarathes all the places which he had taken during the war, the hottages of both kings, all their prifoncrs without ran. fon, and moreover hould deliver up to them fuch of their fubjects as from the firt breaking out of the war had Hed to him; that he lhould retutn to Morziss, a petty king in thetc parts, and to Ariarathes, g00 ta. lents which he had feised in the war, and pay down 300 nore to Eumones as a fine for invading his dominions without provecation. Mithridates, king of Armenia, having in this war joincd Phdrnaces, wa,, by the articles of the treaty, obliged to pay 300 talents to Ariarathes for having allitted his encmy contrary to an alliance at that time fublifting between them. Soonafter Pharnace; died, and left the kingdom to his fon Miahridates VI. more weakened by this peace than by the mof defruc. tive war.

The new king entered into an alliance with the Ro. His fon mans, and proved fuch a daithful friend, that he was enters into rewarded by the fenate with Phrygia $I$ 'ajor, and ho- alliance noured with the title of the friend anc all ${ }^{*}$ of the people with the of Rome. After a long and profperous reign, he was murdered by fome of his intimate acquaintance, and was fucceeded by his fon Mithridates VII. furnamed the Great.

The new prince, though not exceeding 13 years of Mithrida. age, began his reigal with moft inhuman aets of cruelty tes tine to his mother and neareft relations. His father, by his srest a laft will, had appointed him and his mother joint heirs cruel to the kingdom; but he, claiming the whole, threw prince. her into prifon, where the foon died through the hard ufage the met with. Thofe to whom the care of his education was committed, obferving him to be of a cruel and unruly temper, made various attempts on his life, but could never effect their defign, as the king was always on his guard, and armed, in that tender age, agginft all kind of treachery, without fhowing the leaft difidence.

In his yfuth Mithridates took carc to inure himfelf His ex to hardfips, palfing whole months in the open air, ordmary empioyed in the exercife of hunting, and often taking qualitics, his retamidn the frozen fnow. When he came of age, he married his fifer named Laodice, by whom he had a fon named Pbarnuces. After this he took a journey through many dferent kingdoms of Afia, having nothing lefs in view than the whole continent. He learned their diffrent languages, of which he is faid to have fpuken 22: took an eftimate of their ftrength; and above all viewed narowly their frong holds and for:ified towns. In this journey he fpent three years; dilring which time, a report being fpread abroad that ke was dead, his wife Laodice had a criminal converfation with one of the lords of her court, and had a fon by him. When her huband returned, the prefented him with a poifoned bowl; but Mithridates had accuftomed himfelf to t.lie poifon from his infancy, fo that it had now no other effect than to halten the deftruction of his wife, whic.t very fon took place, together with all thole who had been any way acceffory to her difloyalty and incontinence.

The king now began to put in execution his fchemes of conquelt. However, he certainly took the wrong method by attacking firlt $t$ ofe nations which were im.

Comquers feveral countries. to be mur. dered.
mediately under the protection of Rome, and thus at once provoking that powerful people to fall upon him. He began with Paphlagonia, which the Romans had declared a free ftate. This country he eafily reduced, died of grief; and in him ended the family of Pharnaces, who had ruled Cappadocia from the time of Cyrus the Great.

Nicomedes, king of Bythynia, beirg now greatly afraid of Mithridates, and fuppofing that his own dominims would next fall a prey to the ambitinus conqueror, fuborned a youth of a comely and majellic afpect to pretend that he was a third fon of Ariarathes, to gn to Rome, and demand the kingdom of Cappadocia as his jult zight. He was received by the fenate with the

greateft kindnefs, and Laodice the wife of Nicomedes cven confirmed the deceit by her oath. But in the mean time Mithridates having got intelligence of the poot, fent notice of it by Gordius to the Romans, fo the kingdom of Cappadocia to Ariobarzanes, al d make peace with Nicomedes, or be accounted an enemy of the Roman people. With this aniwer they were commanded to depart the city that very day, and told that no more ambalfadors could be adn.itted till fuch tinje as their commands were obesed.

In the mean time both parties prepared for war. The Ruman legates in Afia drew together all the forces they could mutter in Bithynia, Cappadocia, Paphlagonia, and Galatia; and, being joined by Caflius governor

of Afia, took the field againl Mithidates in the year contributing large fums towards the defraying the ex. 19 B. C. They divided the:r army into Ceveral fmall bedies: Callius encamped on the confines of Bithynia and Galatia; Manins Aquilius with his body poffered himfelf of the avenues leading from Pontus into Bithyni2; Quintus Oppius fecured the entr.nne into Cappadocia; and the admirals Minucius Retus and C. Popilius lay with a fleet of 300 fail at Byzantium, to prevent the enemy from enterin? the Euxine fea. E.ach of the gencrals had under his command an army of $40,000 \mathrm{men}$; belides : body of 50,000 font and 6000 horie brought to their alfitance by Nicomedes.

On the other hand, Mithridates having invited feveral of the ncighbouring nations to join him, collected an army of 250,000 foot, 50,000 horfe, 130 chariots armed wirh ficy thes; befides 300 fhips and roogrlleys. Part of this furce he detached agaiall Nicorredes; and utterly defeated him, th ugh much luperior in number, as he was taking pulfellino ot an advantagenus poft by order of Callius. Annther part he detached ag.innft Manius Aquilius, whons he alfo defeated with the lofs of 10,000 killed on the fpot, and 3000 taken prifoners; on which the other Roman generals abandoned their poft, the fleet alin difper fed, and moft of the fhips were either taken or funk by the admirals of Mithridates.

The king of Poutus now retolving to improve the opportunity, and drive the Romans entirely out of A lia, over-ran all Phrygia, Myfia, A fia Proper, Caria, Lycia, Pamphylia, Paphlayonia, and Bithynia, with all the refl of the countries which had either belonged to or fided with the Romans, as far as Ionia. He was received everywhere with the greatelf demonftrations of joy; the inhabitants flocking to him in white garments, and calling him their fa.her, deliverer, their god, and the great and fole lord of ail Afia. What gained him the affections of the people was his kind ufage to the priloners he had taken in the two engagements abovementioned; for he not only fent them all home without raniom, but furnifhed them with plenty of provifions, and noney fufficient to defray their expences by the way. Ambalfadors flncked to him from all parts; and among others, fr m Laodicea $n n$ the Lycos, to wh $m$ the king promifed his protection, provided they delivered up to him Q. Oppius governor of Pamphylia, who had fled thither for protection. This equelt was readly complied with; Oppus was fent to him in chains, with lign's walking betore him in derition of the Roman pride and oite tation. Mithridates was overjoyed to fee a Rumin general and procon ul in his power; and his joy was toon af er increafed by the ar. rival of Manius Aquilius, whom the Leßiass, revilting from the $R$ mans, tent tw him in fetters, toge: her with may other Romans of diftinction win had taken thelter among them. As he had been the chief author of the war, Mithrisates led h.m about with him wherever he went, either bound on al afs, or on font coupled with one Battarnes a public malefstor, compelling him to proclaim to the crowds who came to fee him, that he . Was Manius Aquilius the Roman legate. When he came to Pergamus, he cauted him firtt to be publicly whipped, then to be put on the rack, and lafly melted gold to be poured down his throat.

Mithridates being now looked upon as invincible, all the free cities of Alia received him as their fovereign,
pences of the war'; by which rneans he became polfefed of fuch treafures as enabled him to keep feveral numerous armies in the feld for five years without le: ying any taxes on his fubjects. As muny Roman cilizens were difperfed in the proviaces which Mithridates had fubs dued, he conlidered thefe as formany fics who would not fail to fend an account of ! is proceedings to Rom:: for which reafon he refilved to cut them all off at once cruelly by al general malfacre; which ibarbarous policy, it is miffises faid, had never been heard of till his time, but has been all the Roo fince practifed by other nations. He difpatched private m, nis in letters to all the governors and nagillates of the cuties where the Romans selided, enjoining them on pain of death, and the entire delfruction of their country, to caule all the Ital an race, winen atad chlden not excepted, to be nurdered on the $z_{0}$ th day fir $m$ the date of his letters, and to let their bodies lie unburict in the rpen fietds. Cre moiety of their go ds was to be forfeied to the king, and the other beftowed as a reward on the aff.llins. Whatever llave murdered his mafter was to receive his liberty, and one hall of the debt was to be remited to the debter that fhould kill his creditor. Whoever conceated an Italian, under any pretence whatever, was to be pun fhed with immedinte death. On the fatal day, all the gates of the cities being thut, and the avenues kept with foldiers, the king's orders were prnclained, which caufed an univerfal horror, not ouly among the unhappy victims themielves, but among thole who had any feelings of humanity, at leemg themfelves obliged either to betray and murder their innocsnt guefts, triends, and relations, or to become liable to a cruel death. However, as moft of the Aliatics bore a mortal hatred to the $R$ mans, and were moreover animated by the promite of an ample reward, the orders were without delay put in execution. The inhabitants of Ephe us, where Mithridares then refided, dragged fuch as had taken fanctuary in the temple of Diana from the very tatue of the goddefs, and put them to t.e fivord. The Pergamenians dilcharged thowers of daris upon them as they embrated the it itues in the temple of Efculapius. At Adramyttinm in Myfia many were murdered in the water, while they were attempting, with their children on their backs, to fwim over to the infand of Lefb is. The Caunians, who not long before had been delivered from the yoke of the Rhodia s, and reftored to their ancient privileges, excelled all the reft in cruelty: for, as if they had apoftatiled frim human nature, they took pleafure in tormentray and butchering the innocent children before their mothers' ejes; fome of them running diftracted, and others dying with grief at a fight which nature could not bear. The Tralians were the nnly people on the conrinent who would not have the cruelty to imbrue their h.nds in the blood of the innocent Italians. However, as the king's orders were peremptory, they hired one Theophilus a Paphlagonian to difatch the few Romans that lived among them. He, having fhut them all up together in the temple of C nenrj, firft cut off their hands as thicy embraced the ftatues of the gods, and then hacked them in pieces. Many Romans were faved on the floating inlands of Lydia called Calaminu, where they concealed themfelves till fuch time as they found an opportunity of efcaping out of Afia. Neverthelefs,

## PON

Tontus. thelefs, acenrding to Plutarch and Dion, $\mathrm{t} 50,000$ Roman citizens were maffacred on that day; but, according to others, only 80,000 .

Mithridates having now got rid of thofe whom he wous in dread of on the continent, embarked great part
22. of his forces in order to reduce the iflands of the Ar-

Neduces
the ifland of Cos. chipclago. At Cos he was gladly received, and had delive: ed up to him the young Alexander, fon of Alexander king of Egypt, who being driven out of that conntry, was killed by Chareas a lea-captain as lie was retiring in a fmall veflel to Cyprus. With the young prince, they put into the king's hands valt fums of money, with all the golden vefiels and jewels, to an immenfe value, which his grandmother Cleopatra had been amaling for many years. 'To the young prince Mithridates gave an education fuitable for a king's fon, but kept the treafures to himfelf. Here likewife he found Soo talcuts in ready money, which, at the firll breaking out of the war, had been depofited by the Jews of 23 Alia, and were defigned for the temple of Jerufalem. Fut fails in From Cos Mithridates fteered his courfe for Rhodes, hisattempt where at that time all the Romans who had efcaped upon Rhodes. the mafficre abovementioned found a fanctuary, and, amongt others, L. Caflius the proconful. The Rhodians, however, being very expert in maritime affairs, Mithridates did not think proper to venture an engagement. As the enemy's fleet advanced, therefore, he retired; bat fix of the Rhodian thips coming up with 25 of his, a flarp action enfued, in which the Rhodians funk two of the king's thips, and put the reft to flight. In this encounter, though Mithridates had never feen a fea fight before, he belaved with great intrepidity ; but one of the hips of his own fquadron falling foul of that which carried him, he was very near being taken prifoner. From this time forth he abhorred the fea, and took an averfion to all the Chians, becaufe the pilot of that fhip was a Chian. However, he again appeared before the ifland; but was forced anew to leave it with difgrace, and to give over all thoughts of reducing it.

Mithridates nove retired into Alia, with a defign to rals reduce fettle the civil government of the countries which he al. Grecse had conquered, commiting the care of the war to his generals. Archelaus, his generalifimo, was fent into Greece with an army of 120,000 men; where, by treachery, he made himfelf matter of Athens, and either put to the fivord or fent to Mithridates all thofe who favoured or were fulpected to faveur the Romans. From Athens he difpatched partics to reduce the neighbouring calles and the inland of Delos, which they did accordingly; but Orobius, a Roman general, hearing that the cnemy kept no guards, but palfed their time in caroufing and debauchery, fell upon them unexpectcdiy, and cut off the whole party, exeept Apellion the commander.

In the mean tine, Metrophanes, another of the king's generals, entcring Eubce., laid wafte the whole country, exerting his rage chiefly againt the cities of Demetrins and Magnefia, which refufed to open their gates to him. But as he was filing off with a great bonty, Bryttius, the prator or governor of Macedonia, coming up with hint, funk fome of his thips, and touk others, putting all the prifoners to the iword. Mithridates, upon the news of this lofs, fent his inn Ariarathes with a powerful army to invade Macedonia; which be foon reduced, to-
gecher with the kingdom of Thrace, driving the Ro- $p$ m.ms everywhere before him. The gcnerals whom he fent into other quarters were no lefs fuccessful; fo that Mithridates had, according to Aulus Gellius, 25 diffcrent nations who paid him homage. The fame author adds, that he was flilled in every one of their various languages, fo that he comld converfe with the natives without an interpreter. Among thefe nations we find the Rhoxani, now the Ruffians or Mufeovites whom Deiphoutus, cne of he king's generals, brought under fubjection, aftcr having faim in an engagement 50,000 of the barbanims.

All this time the Romans had been too much taken up with their own domeftic quarrels to take fuch effectual meafures as they otherwife would have done for checking the prozrefs of Mithridates. But at latt, ha- $\mathrm{s}_{\mathrm{y}}$ ving received certain advice that the kins deligned to ag: invade Italy, and that he had even been folicited to do hin fo by fome of the revolted Italians, they fent againt hini Lucius Sylln, who had already given fufficient proofs of his courage, conduct, and experience in war. He had with him only five legions and a few cohorts. With this inconficlerable foree he landed in Attica, and in a thort time made hintelf malter of the capitai; Archelaus not daring, or, according to others, through te eachery, not caring, to engage him. As Sylla had but a few frigates, he fent Lucullus to the inand of Rhodes, with orders to the Rhodians to join him with their fleet. The undertaking was very dangerous, as the king's flect in a manner covered the fea. However, Lucullus, defpifing all danger, ventured out, and faiied, without meeting with any perverfe accident, to Syria, Egypt, Libsa, and Cyprus; from whence he returned with fuch fupplies of thips and experienced mariners, as enabled Sylla, after their conjunction with che Rhodiaus, to atd offenfively by fea alfo. A rchelaus now difpatched meffengers to Taxiles, who commanded in Thrace and Macedon, defiring him to join him with all his forces; which the other readily did, and between both mullered an army of 120,000 men. Sylla met them near Chet onea with only 15,000 foot and 1500 horie; but gave them a moft dreadful overthrow, no fewer thim 110,000 of the Afiatics being flaughtered, while the Romans lofi only 12 men.

This fuccets laving raifed envy and jealoufy againft Sylla in Rome, the fenate fent Lucius Valerius Flaccus, the conful of that year, with two legions in A A ia, in appearance to attack Mithridates on that lide, but with private inffructions to fall upon Sylla himfelf, if they found him difafiested to the fenate. As flaccus was I a man of no experience in war, C. Fimbii, a fena- i tor of great repute among the foldiery, was appointed $f$ to attend him with the charater of legate and leute-nant-rceneral. Sylla was at that time in Bocotia; but, hearing what had happened at Rome, he marched with all expedition into Theffaly, with a delign to mect Flaccus, who, he expected, was to land in that province. But no fonner had he left Bcootia, than the country was over-ruaby an army of Afiatics, under the command of Dorylaus the king's chief favou:ite. On this advice Sylla returned into Bceotia, where he gained two fignal victories, which put an end to the war in Greece. In the firt of there Dorylaus loft 150,000 of his men according to fome, or 200,000 according to others; and in the next all the rell. In this laft engagement

20,000 were driven into a river, where they all perifh. cd : an cqual number were purfued into a marfh, and entirely cut off; the reft were killed in the heat of battle, the Romans giving ro quarter to men who had treated their fellow-citizens affer fuch a barbarnus manner in Afia. Piutarch iclls us, that the marlhes were dyed with blood; that die courfe of the river was flopped by tie dead bodies; :nd that even in his time, that is, near 200 yeurs after, in great number of bows, be'mets, coats of nail, and fwords were found buried in the mad. Archelaus, who had joincel Dorylius with a body of 10,000 men a few days before the battle, lay tiree days stripped among the Rain till he found a fmall velcel ithen carried him to Eubcea, where he gathered whavioces. he conld, but was never afain able to appiow in the ficld. Indeed Livy tells us, that Arche!icu. betrayed the king's caufe; and Aurelius Vifor, that the Ling's feet was intercepted by Sylla through the treache1y of Arcleclitus: a deling, that there was a good underlhanding between the two commanders, as was It in from Syili's beftwing up Archelaus 10,000 acres of land ne ir the city oi C alcis in Eubres. Strabo alfo informis us, that A:chelias was afterwards greatly efteemed and careficd by Silla and the fenate; bu. Sylla himelf in his commentaries, and Dio, endeatvult to cicar Arcliclaus from all fufpicion of treachery.

Inthe mean time, Sylla having given up Bootia to be plundered by his filders, mached ints Theflaly, Where he tonk ip his winter-quartels, caufed his old hips to be refized and fereral new a nes built, in order to pats over into Afia in the beginning of the fpring, that he might drive from thence not only Mithridates, but his mival Flaccus alf, whom the fenate, out of oppotition to him, had appointed governor of that province. But before he arrived, fome differences having arifen hatween Flaccus and Fimbrit, the lat:er was by the conful depirived of his command. Upon this Fimbria, having gained over the feldiery to his fide, made war on the c nful, took him prifoner, put him to death, and alfunted the command of all the Roman forces in Afia. In this fation he behaved with the greateft cruelty, infomuch that his name became more odious th:m even that of Mithadites itfelf. This batred the king of Puntus endeavoured to improve to his own advantage: and therefore onnmanded his fon, by nome alfo Mitbeidues, to join Tasiles, Diophantes, and Menander, three of his moft expcrienced cumanders, to return at the head of a mumernus army into A fia; not doubring but the inhathitants, thos haralfed by FimLria, would fiale ofis the Roman yoke when they faw fuch a powerful army in the firld re.dy to proted them. But Fimbria, dityaftirg the Ariatics, marched out to meet the enemy, and offered them batile before they e en:cred the province. As the king's army was greatly fuperior to the R irnans in number, the latter foffered gieatly in the cngagement, but held out till night parted then, when they withdrew to the oppofite fide of a river, which was at a fmall ditance from the field of battle. Here they defignied to inter.ch themíives: Lut in the mean time a violent form arifing, Fimb:ia laid ho!d of that opportonity to repafs the river and forprife the enemy: of whom he made fuch havock as they lay in their tents, that only the commanders and fome few troops of horfe cfeaped. Among thele was the king's fon; who, attended by a few horfe, got fafe

10 Pergamns, wh:ere his father refided. But Fimbria, $\underbrace{\text { Pantuan }}$ purfuing hinn night and day without intermion, entored P'ergamus fivord in hand ; and hearing that both Mithridates and his fon had fled from thence a few hours before, he continued his purfint, and would have taken the king himfelf, had he not entered Pitane with a confiderabic bud); of horfe. The place was clofely iavefted by Fimbia; but as he had no flips to block it up ly fea alfio, he fent a metienger to Luctullas, who conmanded the Roman nary in Afia, intreating him, as he tendered the wellare of the republic, to make what hafle he cond to litane, and affit him in taking the moft invctcra:c enemy the Romans had. Eut Lu- Wbn is cullus, preferring the gratification of a private pique to fered by the good of his conntry, refuled to come: and thusal- Luculluz lowed the fleet of Mithridates tu carry him in fafcty to to efrape: Mit flene.

So 11 after the king's departure, Fimbria too! Pitane by form, and rcluced molt of the cities of Afia, particulatly Troy, which he alfo took by Horm in eleven days, and put moft of the imhabitants th the fword, becaufe they had fent an embally ti) Sylia, offering to fubmit to him rather than to Fimbria.- To add to the misfortunes of Mithridates, his fleet was eritirely defeated in two engagements by Lucullus; fo that be began to be weary of the war, and therefore defired Ar. chelaus to conclude a peace upon as honourable terms as he could. The king himfelf had afterwards alio a conference with Syilla, and a peace was concluded in $8_{5}$ B. C. on the following terms, viz. That Mithridates thould relinoquilh all his conquents, and content himfelf with his paternal cominions, which were confined within the limies of Puntus: that he flonld immediately refign Bithynia to Nicomedes, and Cappadocia to Ariobarzanes, and releafe without ranfom all the prifoners he had taken during the war: that he lhould pay to the Romans 2000 , or as others will have it 3000 , talents, and deliver up to Sylla so thips with all their arms and ammunition, and 500 archers; and laflly, that he fhould not moleft fuch cities or perfons as had during the war revolted from hina and fided with the Romans.

Sylla, having thus concluded the war with great glory to himfelf and advantage to the republic, turned his army againlt Fimbria; but the latter, finding himielf in no condition to oppofe his rival by force, had reccurfe in treachery, and attempted to get Sylla murdered. The plot mifcarried, and Fimbria put an end to his own life; upon which Syllia, having now an uncontrouled power in Afia, declared the Chians, Rhodians, Lycians, Macrnefians, and Trcjanis, free, and friends of tha peoplc of Rome, by way of reward for their laving fided with the Romans : but on the cther cities he haid heavy firics; condemning them in nate ycar to fay 20,000 talents, and ituartering hisfoldiers in the houf.s of thofe who had thown diadfication to the Romans. Each private man was to receive of his landlord 16 drachmas addy, and each oficer 50 ; and befides, both were to be finpplied with provifions, not only fur themfelves, but for fuch of their friends as they thought proper to invite. By thefe impofitions moft of the people of Afia were reduced to beggary; efpecially the inhabitants of Ephefirs, who had above all others thown their hatred to the Romans. Sylla then, having colleated immenfe treafare, fet fail for laly; laving bolind him Lucuilus

defeated.
with the claracter of quefor, and Muræna with that of prator.

The two legion; which Fimbria had commanded were given to Murxna, becaufe Sylla fufpected them of an inclination to the faction of Marius, whofe party he was going to crufh at Rome.
Mithridates in the mean time no fooner returned into Pontus, than he fet about the reduction of thofe nations which had revolted from him during the war. He began with the Colchi; who immediately fubmitted, upon condition that Mithridates would give his fon for a king over them. This was complied with; but the old king had thenceforward a jealouly of his fon, and therefore firt imprifoned and then put him to death. Soon after this, the king having made great preparations under pretence of redueing the Bolphori, a warlike nation who had revolted from him, the Romans began to be jealous. Their jealoufy was further increafed by Archelaus, who fed to them, and affured them that the preparations of Mithridates were not at all defigned agaiult the Bofphori. On hearing this, Muræna invaded Pontus without any farther provocation. The king put him in mind of the articles of peace concluded with Sylla: but Muræna replied that he knew of no fuch articles; for Sylla had fet nothing down in writing, but contented himfelt with the execution of what had been agreed upon. Having given this anfwer, the Roman general began to lay wafte and plunder the country, without faring even the treafures or temples confecrated to the gods. Having put all to fire and fword on the frontiers of Pontus towards Cappadocia, he palfed the river Halys, and on that fide poifeffed himtelf of 400 villages without oppofition; for Mithridates was unwilling to commit any hollilities before the return of an ambaifador whom he had fent to Rome to complain of the conduct of Murxna. At lalt the ambalfador returned, and with him one Callidius; who, in public affembly, commanded Murenato forbear molefting a friend and ally of the Roman people; but afterwards, calling him afide, he had a private conference with him, in which it is fuppofed, as he brought no decree of the fenate, that he encouraged him to purfue the war. Whatever might be in this, it is certain that Murxna fill continued to practife the fame hoftilities, and even made an attempt on Sinope, where the king refided and the royal treafures were kept. But as the town was well fortified, he was forced to retire with fome lofs. In the mean time Mithridates himfelf taking the field, appeared at the head of a powerful army, drove the Romans out of their camp, and forced them with great flaughter to fave themfelves over the mountains into Phryga; which fudden victory again induced many cities to join Mithridates, and gave him an opportunity once more of driving the Romians out of Cappadocil.
In the mean time, Sylla, being created dictator at Rome, fent a mellenger to Murana, charging him in his name not to molelt Mithidates, whom he had honoured with the title of a fiend and ally of Rome. Muree a did not think proper to difregard this meflage; and therefore immediately abandoned all the places he had feized, and Mithridates again renounced Cappadocia, giving his own fon as an hoftage of his fidelity. Beng then at leifure to purlue his other plan, Mithridates feil upon the Bofphori; and, having form fubdued them, appointed Machates one of his fons king of the
country. But leading his army from thence againf the Achrans, a people bordering on the Colchi, and originally defcended from the Greeks, who returning from Troy had mittaken their way into Greece and fettled there, he was defeated with the lofs of three fourths of his men. On his return to Pontus, however, he recruit- F ed his army, and made valt preparations to invade them in anew; but in the mean time, hearing of Sylla's death, he came to the imprudent refolution of entering into a m fecond war with the Romans. Having therefore induced his f.n-in-law Tigranes, king of Armenia, to invade Cappad cia, he himfelf entered Paphlagonia at the head of 120,000 foot difciplined after the Ruman manner, 16,000 horfe, and ron chariots armed with fcythes. This country readily fubmitted; after which the king marched into Bihynia, which alf, fubmitted wihout oppolition ; the province of Afid followed the example of the ruft; for thefe countries being oppreffed with exorbitant taxes, l oked upon him as their deliverer. In entering the cities of Afia, he caufed M. Marius or Varius, whom Sertorius had fent him out of Spain to difcipline his troops, walk before him with the enfigns of confular dignity as if he was the chie! magiftrate; the king following as one of his attendants. He made feveral cities free; but at the fame time acquainte 1 the inhabitants, that they were indebted to Sertolius for their liberty; and thus, by the connivance of that general, many cities revolted from the Romans without knowing that they had done fo. But in the mean time Julius Čæfar, being at that time at Rhodes, whither he had gone to ftudy oratory, and hearing what havock the king's officers made in the adjacent countries, he collected what troops he could, and f.lling unespectedly upon them, drove them quite out of the province of Afia.

The Roman fenate, now finding a war unavoidable, $L$ appointed Lucullus to manage it. The other conful an Cotta, having folicited an employment in this war, was fer fent with a fleet to guard the Propontis and defend Bi - hi thywia. Lucullus having raifed one legion in Italy, paffed over with it into Afia, where he was joined by four others, two of which, as they had ferved under Fimbria, proved at firft very mutinous and refractory; nor were the other two much better, having been immerfed in the Afratic luxuries. The difciplining of thefe troops took up a contiderable time, which was prejudieial to the Roman atfairs; for almoft all the Afiatics were ready to revolt, and Mithridates was making the greateft preparations. One of his armies was ordered to marcla into Cappadocia, under the command of Diophantus Matharus, in order to oppofe Lucullus if he thould attempt to enter Pontus on that fide; another, commanded by Mithridates in perfon, confifted of 150,000 foot, 12,000 hoife, and 100 chariots arned with feythes; a third army, commanded by Marius and Eumachus, two generals of great expetience in war, wis encamped in the neighbourhood of Heraclea in Pontus.

The beginning of the war proved favourable to Mi - mi thridates. Cotta being defired by Lucullas to keep his tes fleet within the harbour, as being inferior to that of fue Mithridates, refulped to take the firft opportunity of fighting the king by land, not doubting f an eafy victhry. Having tor this purpofe collected all the forces he could, Cotta difpatched his legate, P. Rutilius, with

## FON

a confiderable body to obferve the motions of the cue-
my. This cominander being met by Marius and Eumachus, an engarcment enfued, in which the Romans were defeated, and the greatelt part of tham, ingether with their commander, cut in pieces. The lanic miffortune befel leveral other oflicers of difindion fent out to oppofe Mithriates; whe, being clated with fuccefs, ordered his admiral to fail into the very harbour, and fire the Roman fleet. This was accordingly periormed without the lant oppolition from Cotta; and 60 thips were taken, funk, or burnt, on that occafion.
Thefe victories having increared the rebellious difpofution of the A fatics, made Lucullus haten his march in or.ter to ftop the pherrefs of the enemy. But finding the king's army much more numerous than he expedt$\mathrm{c} J$, lic thought proper to decline an engatgement. However, fereralikirmithes happened, in which the Romans had alway's fo much the advantage, that they became impatient for a general engagement. But Lucullus did not at this tine choofe to run fo great a rikk ; and therefore Mithridates, feeing he could not force the Romans to a battle, decamped in the night-time, and by daybreak reached Cyxicum, a molt important city, and greatly atached to the Romans. Lucullus purfued him; and, falling on his reat, killed 10,000 , and took ${ }^{13}, 000$ prifoncrs. After this, the Roman general, by a nanocuvre, gained an important pafs, which enabled him to cut off all commutrication between the army of Mithridates and the neighbouring country. The king, fecing himfelf thus in danger of famine, redoubled his efforts to gain the city; but finding that he could not batter down the walls, he refolved to undermine them. In this alfo ho was unfucceffful ; the befieged funk countermines, and had very near taken the king limfelf in one of his nom mines. In the mean time, winter coming on, the army of Mithridates was fo dif. trelled for want of provifions, that many died of hunger, while the furvivors were forced to feed on the flefh of thei- dead companions. The famine was followed by a plague ; which deftroyed fuch numbers, that Mithridates was obliged to think of are treat ; and even this was become very dangerons. However, he laid hold of the opporturity when Lucullus went away to befiege al neighbouring cafle, and fent off the greateft part of lis cavalry in the night ; crdering them not to halt till they were out of the reach of the enemy. But Lucullus having got intelligence of their march, fuddenly reof tumed, and purfued them fo clofe, that he came up with them as they were paffing a river, trok 600 horfe, all their beafts of burden, 15,000 men, and put the reft to the fword. On his return he fell in with Arinoricus the king's admiral, whom he took, juft as he was ready to fail with a large fum of money defgacd to bribe the Roman army. In the mean time Nithridates, findiag himelf reduced to the late extremity, embarked in the night-time with the greateft part of the forces, while Marius and Eumachus, with $30,000 \mathrm{mcn}$, made the beft of their way to Lampfacus. But being clofely purfued by the Romans, they were overtaken at the river Gifopus, which at that time was not fordable, by reafon of its having been fivelled by heavy rains. Twenty thoufand were killed on the fpet; nor could a fingle man have elcaped, had not the Afatics fcattered great quarlities of gold and fiver in Voz. XV'.
the way, that the march of the Romans might be retarded by their Aopping to gather it up. Lucullus on his return entered Cywicunt annidt the acclamations of the citizens; who alterwards inllituted public forrts in honour of him, which they called Lacesllea. T'ue city was declared free and all the privicres, cempltions, ard immunities, beftowed upon the citions whilh were enjoyed by the inhabitants of Rome itfeli.

From Cyzicum, Lacultus narched along the coatt of I.ucthu, thic Hellefiont till he came to Troas; where ho equip gains a ped his fleet, and put to fea in queft of Marius, Ales. - great vice ander, and Dionyfius, three of the king's generals, who had a fleet of 50 hips , with 10,000 lind fores on board. Lucullus came up with them near the ifland of Lemnos, took 32 of their fhips, and put a great number of theit land-forces to the fword. The day after the engagement the three generals were difoovered in at cave where they had concealed themílives, and dragged from thence to Lucullus; who after having foverely upbraided Marius for fizhting afainft his country, caufed him to be put to death. Alexancer and Dionyfius were refervei for the triumph; but the latter p.ifoned himfelf to avoid that difyrace. Lucullus then fteered his courfe for Lithynia, on receiving intclligenc: that Mithridates had appeared with his fleet on thol: coafts: but the king having notice of his approach, made what hafte he could to ga: Pontus, and arrived at Heraclea on board a pirate named Selenus; with whom he was obliged to truf himfelf, his fiect being difperted by a violent form, and the thip that carried him caft away.

In the mean time Mithridates was no lefs wifortu- Farther nate by land than by fea. Triarius, one of the officers fucecfies of of Lucullus, reduced the cities of A pamea, Prufa, Pru- Luculius. fias, and Nicxa. From thence he marched with all expedition to Nicomedia, where the king himfelf was, and near which place Cotta lay encamped. But before the two armies could be joined, Mithridates elcaped, firft to Heraclea, which was betrayed to him, and from thence to Sinope. Nor was Lucullus l:imfelf all this time inactivc. Having reduced all laphagonia and Bithynia, he marehed through Cappadocia, and jomed Cotta and Triarius at Nicomedia, with a defign to invade Pontus; bur hearing that Heraelea was in the hands of Mithridates, he difpatched Cotta to reduce that city. Triazius was ordered with the flest to the Hellefpont and Propontis, to intercept the king's flect. which was daily expected from Spain with fupplies from Sertorius. Lucullus himfelf, with the main frength of the army, purfied his march into Pontus. His army was greatly harafied, efpecially ia the narrow palles between Cappadocia and Pontus, by llying parties of the enemy. But the greatelt inconvenicnce was the want of provifions, as the king's troops hadlad watte all the comatry romad ; infomuch that Lucullus having loft almoft all his beafts of burden, was obliged to take along with the army 30,000 Galatians, eacla of them carrjing a fack of corn on his back. At laft, however, he gained the plains of Pontus; where provifions were fo plentiful, that an $0 x$ was fold for a drachma, and cuers thing elfe in proportion.

The Roman general having now cas ricd the war int, the enemy's country, divided his forces, and at the fame time invented a very frong town named Anijus; another called Eupatoria, Luilt by Mithridates, and made 7. z
the

Portin. lory in isa.
the place of his refidence; and another, named Themif-
cyra, fituated on the banks of the Thermodoon. Eupatoria was foon taken, but Themifcyra made a vigorous refiftance. The townfmen galled the Romans to fach a degrec, that, not daring to approach the walls openly, they contented themfelves with undermining them: but in this too they met with no fmall difficulty ; for the enemy countermined, and often engaged them, under ground, letting into the mines bears and other wild bealts, with fwarms of bees, which obliged them to abandon their works. However, the town was at laft obliged to furrender for want of provifions. As for Amifus, Lucullus himfelf fat down before it: but finding it ftongly fortified and garrifoned with the flower of the king's troops, the Roman general thought proper to reduce it by famine; and on this occafion his countrymen firft complained of him as protracting the war for his own advantage.

In the mean time Mithridates having recruited his fhattered army, advanced to Cabirx, a city not far dif:ant from Amifus. Lucullus, leaving part of the army to continne the fiege, marched at the head of the relt to oppofe Mithridates. But the king having drawn his cavalry into a general engagement, defeated them with confiderable lofs, and drove them back to the mountains, throngh the paffes of which Lucullus had lately marched to attack him. This check obliged the Roman gencral to retire to a rifing ground near the city of Cabirx, where the enemy could not force him to an engagement. Herc provifions beginning to grow fcarce, I.ucullus fent out frong parties from his army into Cappaalocia, the only place from whence he could have lupplies. One of thefe parties entitely defeated Taxiles and Diophantes, two of the king's generals, who had been fationed there to prevent Lucullus from having any communication with the country. The king, upnu the news of this defeat, refolved to break up his

14

## The aray

 of Mithidutes mutines, whinh -bleres the kinstor $\mathrm{P}_{\mathrm{y}}$ into Armicnia. camp and retire, not queftioning but that Lucullus would attack him as foon as his forces returned. This refolution he no fooner imparted to his nobles, than they began privately to fend away their moft valuable gonds; which being found out by the foldiers, they took it in fuch bad part that no intelligence had been given them, that they plundered their baggage, and put thofe who had the care of it to the fword. After this they betonk themfelves to flight, crowding out of the gates in the utmort confufion. The king haftened to flop their fight ; but nobody fhowing him the leaft reSpe f , he was carried away by the crowd, and in great danger of being trampled to death. Having with difficulty made his efcape, he retired with a fmall retinue, firlt to Cabira, and then to his fon--n law Tigranes king of Armenia. Lucullus difpatched the beft part of his cavalry to purfue the fugitives; while he himfelf with the reft, invelted the camp of Mithridates, where thofe remained who could not fly with the reft. The camp was eanly taken; but mint of the foldiers made their efiape, while the Romans, contrary to thir general's orders, were bufied in plundering. Lucullus then purtied hard after the king ; who, being overtaken by a conipany of Galatians, caufed a mule loaded winh part of his treafures to be driven in among them, by which means he made his efcape while they quarrelled about the booty. Milhridates, remenbering in his fight, that be had left his fiters, wives, and concubines
at Pharnacia, difpatched an eunuch, named Bacchus or Bacchides, with orders to put them all to death, left they thould fall into the hands of the enemy; which was accordingly done.

After the fight of Mithridates, the Romans no longer met with any oppofition; the king's governors flocking from all parts to put themfelves under the proteation of the conqueror. Among thefe was the grandfather of Strabo the geographer, whom the king had difobliged by putting to death his coufin-german Ti bias, and his fon Theophilus. He was a man of fuch credit, that it was no fooner heard that he had abandoned the king's party, than 15 other commanders delivered up to Lucullus the places with which they had been intrufted; and about the fame time Triarius fall. ing in with the king's fleet near the illand of Tenedos, obtained a complete victory, having either taken or funk 60 of the enemy's velfels.

All this time Cotta had been employed without fuccefs in befieging Heraclea, which he could never have reduced without the affittance of Triarius. That commander, having defeated the fleet, foon reduced the town to fuch diitrefs, that a third part of the gar. rifon died of hunger; upon which the governor, Conacorix, privately agrced with Triarius to deliver one of the gates to him. This was accordingly done; and the Romans, entering, made a terrible flaughter of the helplefs inhabitants. But in the mean time Cotta, provoked at feeing himfelf deprived both of all fhare of the booty, and the honour of reducing a place before which he had fat fo long, fell upon his countrymen as they were bufied in plundering; which would have occafioned a great deal of bloodfhed, had not 'Triarius promifed to divide the booty equally. Conacorix, in order to conceal his treachery, after marching out of Heraclea, feized on two forts belonging to the Rornans; and Tiarius being fent to recover them, Cotta, in his abience, plundered the city anew, rifled the temples which the other had fpared, put all the citizens he could meet with to the fword, and having. carried off every thing valuable, at laft fet fire to the city in feveral places, by which means it was foon reduced to afhes. Cotta then, having no farther occafion for his troops, difiniffed the auxiliaries, religned his legions to Lacullus, and put to fea himfelf in order to return to Rome. But he had farce gut ont of the harbour, when part of his fhips, being overloaded with the fpoils of the city, funk; and the others were by a vlolent north wind dafhed again? the fhore, which occafioned the lofs of a great part of the booty. However, on his retun to Rome, he was highly applauded by the fenate, and honoured with the title of Ponticus.

Lucullus, having now reduced Pontus, marched againit the Chaldeans, Tibarenims, and inhabitants of Armenia Minor ; who voluntarily fubmitted to him, and put him in polfefion of all their ferong holds. From Armenia, he returned before Anuifus, which fill held out; Callimachus, governor of the place, hatving harafed the Romans to fuch a degrec by engines of his own contriving, that they had given over their aldaults, and contented themfelves with blocking it up by land, though the garrifon was at the fame time plentifully fupplied with provifions by fea. Lucullus, on his arrival, dummoned the city to furrender, offer-

## PON [ 363 1 PON

 relufed, he made a general aflault at the time when is knew that Callimacluss ufed to draw off great pat of his troops to give them fonte refpite. The Romans applying their fcaling litdders, got over the wall before Callimachus could come to the affitance of thofe whom he had left to guard it; however, by fetting the city on lire, he found means in that confulion to make his eleape. Lucullus commanded his men to ufe their utmelt endeavours to fave the city ; but they being intent only upon plundering, regarded nothing but the furniturc. At lat the fire was extinguilted by a violent fhower; and Lucullus, having with much ado seftrained his foldiers from committing any farther excelles, repaired the city in fome meafure before he left it, and fuffered the inhabitants to enjoy their pof. fetlions in peace.Nothing was now wanting but the eaptivity of Mitherefore Lucullus demanded him from his fon-in-law Tigranes. But though that prince could not be prevailed to fee Mithridates on account of his mifconduct, he could as little be induced to deliver him up to his enemies. After this refufal, however, he for the firf time condefeended to fee his father-in-law, after lie had refided a year and eight months in his dominions. In a private conference held by the two kings, it was agreed, that Tigranes fhould march againft the Romans, and Mithridates with ro,000 horfe return into Pontus, where he fhould make what levies he could, and rejoin Tigranes, before Lucullus, who was then employed in the fiege of Sinope, could enter Armenia. But, in the mean time, Sinope having furrendered, Lucullus with all poffible expedition marched againft ' C granes, and, having drawn him into a general engagement, gave him an entire defeat, as is related under the article Armenia.

Mithridates was marching to his affiftance, when he met his fon-in-1aw flying with a fmall retinue to fhelter himfelf in fome remote corner of the kingdom. He encouraged him to raife new forces; not doubting but that another campaign would repair all former luffes, provided be would commit to kis management every thing relating to the war. To this Tigranes agreeing, as he thought him more fit to deal with the Romans than himfelf, orders were iffued out for railing 2 new arniy, and all the Armenians able to bear arms fummoned to mect at the place of the general rendezvous. Out of there Mithridates chofe 70,000 foot and 35,000 horfe ; and having trained them up during the winter, after the Roman difcipline, in the begisning of the fpring he left part of them with Tigranes, and marched himfelf with the reft into Pontus, where he recovered many important places, and overeame in a pitched battle M. F'abius, whom Lucullus had appointed governor of that province. Being flufhed with this fuccels, as foon as the wounds he received in the engagement fuflered him to move, he purfued Fabius, and belieged him in the city of Cabira, whither he had retired; but in the mean time Triarius, who was marching out of A fia to join Lucullus, hearing what diftefs the Romans were in, haftened to their relief, and appearing unexpeetedly on the neighbouring hill, Atruck fuch terror into the enemp, that they raited the fiege, and made the beft of their way into Cappadocia. Tri-
arius purfued them, and got fo near them as to be parted only by a siver: Here he halted with a defygn to pats the river after he had allowed his men fome relt; for they were tired out with long marehes. Bu:t Mishridates was before-land with him, and crolling the river on a bridge, where he had placed a flrong guard, attacked the Romans with great refolution before they had time to refrelh themfelves. The battle Mithriwas bloody, and the event doulstfsl, till lie bridge datesilebreaking down with the weight of the nultitute that feated. paffect, the king's troop; who had engaged, relying chiefly on their numbers, began to lofe courase, fceing they could receive no farther allillance; and the Row mans charging them with frefh vigour, they betook themlelves to a precipitate fight. After this eng.gement, as winter came on, both armies were glad to tetire to their winter-quarters.

During the winter, Mithridates raifed new forces; and having received confiderable fupplies from Tigranes, took the field early in the fping, in hopes of driving the Romans quite out of Pontus, before Lucullus, who had work enough on his hands in Armenia, conld come to their aflifance. With this view he marched ftraighe againft Triarius and Sornatius, to whom Lucullus had committed the care and defence of that province; ant finding them encamped near the city of Gaziurfa, profferred them batle; which they declining, be fent a Arong detachment to befiege a caftle where the Romans had left all their baggage, hoping they would rather venture an engagement to relieve the place, that lofe all they had got with fo much toil and labour during the war : neither was he difappointed in his hopes; for though Triarius was for keeping clofe in his camp till the arival of Lncullus, whom he daily expested, having acquainted him with the danger, the foldiers liearing that the caftle was befieged, declared in atumultuous manner, that if he did not lead them they would march to the relief of tle place withoat his $4^{8}$ leave. Triarius being thus forced by his own men to Defeat fight, drew out his forces againt the king, whofe army Triarius. was three times his number; bat while they were upon the point of engaging, both armies were by a violent ftorm forced to retire to their refpetive camps; but Triarius receiving that very day intelligence of the approach of Lucullus, and faring he would fnatch the victory out of his hands, relolved to make a bold pulh, and next morning by break of day attack the king in his camp. It he conquered, the glory he thought would be entirely his own; if he were overcome, the enemy conld reap no great alvantage frons his victory, Lucullus being at hand with a powerful army. The king, in that furprife, putting himfelf at the head of a few troops of his guards, futained the brunt of the Romans, till the reft of his army drawing up came to his relief, and attacked the enemy with fuch fury, that the Roman foot were forced to give way, and were driven into a morafs, where they were furrounded, and great numbers of them cut in pieces.

Their hocre were likewile put to flight, and purfoed with great flaughter, till a Roman centurio:s in the king's fervice, pitying his comeryman, attempted to kill lim. The king's life w:as fived by lis breatplate; but as he received a deep wound in the thigh, he was obliged to give over the purfuit limfelf, ind thofe that were about him canfed the retreat to he

Pontus.
Councled, which, as it was unexpested, occalioned a great confufion in the whole army. The centurion was immediately cut in pieces; but the Roman horfe in the me:n time getting the fart of the enemy, found means to make their elcape. Alove 7000 of the Romans were killed in that battle; and anong them 150 centurions and 24 tribunes, the greateft number of efficers that had been loft in any engagement to that day. Mithridates being cured of his wound, that he might All the Ro- Mithridates being cured of his the for the future be expofed to fuch dangers, cauled firvice of all the Romans that ferved in his army to be formed Mithridates mazfacred. into ore body, as if they were to be fent out on a party, and then ordered them to retire to their tents, where they were all to a man cut in pieces.

The king, however elated with fuccefs, yet would not engage Lacullus; but with long marches haftened into Armenia Minor, and encamped upon a hill near the town of Talura, expecting Tigranes, who was advancing with a ftrong army to join him. Lucullus, in purfuit of Mithridates, marched over the field of battle, leaving thofe unburied who had fallen in the engagement, which alienated the minds of the foldiery from him, and thay began to be very mutinous; being firred up by Appius Claudius, whom Lucullus had turned out of his command for his vile behaviour, notwithftanding he was nearly related to him, Lucullus having married his fifter. The difcontent that prevailed in the army came to fuch a height, that Lucullus was obliged to lie ftill in his camp all that fummer ; the foldiers declaring in a mutinous manner, that they would not follow himany longer, nor ferve under a general who refufed to flare the booty with them.

Thefe complaints, and the general difcontent that reigned in the ammy, obliged the fenate to recal Lucullus, and appoint Manius Acilius Glabrio, conful of that ycar, ia his room. Glabrio arriving in Bithynia, gave notice by public cries to all the cities, that the fenate had difcharged Lucullus and his army, and confifcated his goods for protrasting the war and refufing: to consply with their injunctions. Hereupon Lucullus was abandoned by the greater part of his aumy, and forced to retire into Galatia, not being in a condition to make head againft the joint forces of the two kings; who, laying hold of that opportunity, recovered the beft part of Pontus, Bithynia, Cappadicia, and Armenia Minor : for though Glabrio had haltened into Pontus, as if he had intended to engage the enemy and rob Lucullas of the victory, yet, upen the firt news of the approach of the two kings, he thought fit to retire and leave the country open on all fides to the enemy.

When this was heard at Rome, a law was enatted there by C. Manilitus, a tribune of the people, whereby the management of the war againf Mithridates and Figranes was committed to Pompcy, and libewife the provinces of Cilicia, then under Quintus Marcius, and of Bithynia under Glabrio. By the fame law he was continued in that unlimited power by fea, with which he was inveated when he firlt fet nut againt the pisates of C licia. In virtue of this law, Pompey, who had juft then ended the war with the Cilician pirates, took upon him the command of the army, and directcd all the allies of the Roman people to join him with :ll polfible expedition : but before he took the field, he renewed the alliance which Sylla and Lucullus had sonchuded with Phrahates king of Parthia, and then
fent friendly propofals to Mithridates; who at fivt feemed inclined to give ear to them, and accordingly difpatched an ambatfador to the Roman army to treat of a peace. Pompey required of him to lay down his arms if he was in earnelt, and deliver up to him all thofe who had revolted from the Romans during the war. 'I'his demand was no fooner reported abroad in the king's camp, of pear but the deferters, wha were very numerous in the king's army, betaking themfelves to their arms, threatcned to put Mithridates himfelf to deatls; and would have occalioned a great difturbance, had not the king appeafed the growing tumult, by affuring them, that he liad fent ambaffadors, not to treat of a peace, but only to take, under pretence of fuing for peace, a view of the enemy's ftrength. He moreover obliged himfelf, by a folemn oath in the prefence of the whole army, never to enter into any treaty of friend(hip with the Romans. nor to deliver up to them fuch as had ever ferved under him.

Pompey, finding his propofals rejected, advanced againlt the king with an army of 30,000 foot and 20,00 h horfe, as Plutarch writes, or 30,000 , as we read in Appian, all chofen troops; for he difcharged moft of thofe who had ferved under Glabrio and Lucul. lus. As he entered Galatia, he was met by Lacullus, who endeavoured to perfuade him to march back, the war being near finifhed, and even deputies fent by the republic to fettle the province of Pontus; but not being able to prevail with him, after mutual complaints againt each other, they parted ; and Pompey removing his camp, commanded the troops that were with Lucullus to join him, except 1600 whom he left to attend Lucullus in his triumpl. From thence Lucullus fet out for Rome, where he was received by the fenate with great marks of efleem, moft men thinking him highly injured by the anthors of the Manilian law. Pompey purfued his march into Pontus; but finding that he could not by any means draw the king to is battle, he marched back into Armenia Minor, with a defign cither to reduce that province, or oblige Míthridates to venture a battle in order to relieve it. Mithridates followed him at fome diftance ; and entering Armenia, encamped on a hill over-againft the Romans, and, by intereepting their convoys, reduced them to fuch diftrefs, that they were obliged to remove to a more convenient place, the ling cutting off many in theirrear, and harafing them with frequent attacks, till he fell into an ambufcade laid by Pompey, whofe perional courage and prudent conduct on that occalion confirmed the king in lis refolution not to hazard at general engagement. The two armies encamped overagainft each other ; Pompey on one hill, and the king on another, near the ciry of Daftira, in the province of Aciflene, at a fmall difance from the Euphrates, which divides Acifilene from Armenia Minor.

Here Pompey, feeing he could neither draw the king Is be 5 to a battle, nor force his camp, which wats pitched on by ic a fteep and craggy mountnin, began to block him up pry, with a ditch which he carried round the bottom of the hill where the king was encamped; and meeting with no oppofition, finilhed his work, and quite cut off the enemy's communication with the country. Pompey was amazed to tee the king thus tamely fuffer himfelf to be fuit up; and could not help faying, That he was cither a grreat fool or a great coward: a faol, if he did

## PON [ 365 ] PON

not appreinend the danger he was in; a coward, if, being apprifed of it, he did not to the utmoft of his power preventit. By this ditch, which was 150 fullongs in cirenit, and defended by many forts raifed at fmall diltances from each other, the king was fo clofely befieged, that he could ncither fend out partics to forage, nor receive the fupplics that came to him from Pontus. He was thus betieged for the fpace of 45 or 50 days; and his army reduced to fuch ftraits, that, having cor:fumed all their provifions, they were at laff forced tolive on their dead horfes. Hercupon Mithridates refolved at all events to break through the Roman fortifications: and accordingly, having put to the fivord all thofe that were fick or difabled, that they might not fall into the enemy's hands, he attacked in the dead of the night the Roman guards; and having overpowered them with his numbers, got firfe into the open fields, and continued his march all night towards Armenia Major, where he was expected by Iligranes.

Pompey next morning by break of day purfued the enemy with his whole arms; and having with much ado overtaken them, found the king encamped on a hill, to which there was but one afcent, and that guarded by a ftrong body of foot. The Romans encamped over-againft them; but Pompey, fearing the king fhould make his efcape in the night-time, privately decamped, and taking the fame rout the enemy were to hold in order to gain Armenia, poffeffed pimfelf of all the eminences and defiles through which the king was to pafs. Mithridates Uhinking that Pompey was returned to his former camp, purfued his march, and about the duf: of the evening entered a narrow valley, which was furrounded on all fides by feep hills. On thefe hills the Romans lay concealed, expecting the fignal to fall upon the enemy and attack them on all fides at once, while they were tired with their march, and feeningly, as they had fent out no fccuts, in great fecurity. l'ompey was at frlt for futting off the attack till the next morning, thinking it not fafe to engage in the nighttime among fuch teep and craggy meuntains; but was at laft prevailed upon, by the earneft prayers and intreaties of all the chief officers of the army, to fall upon the enemy tha: very night. It was therefore agreed, that in the dead of the night all the trumpets foould at once found the charge, that this fignal fhould be followed by an univer fal thont of the whole army, and that the foldiers fhould make what noife they could, by frikirg their fpears againft the brafs velfels that were ufed in the camp. The king's army at this fudden and unexpeted noife, which was cchoed again by the mountains, imagined at firt that the gods themfelves were come down from heaven to deftroy them; :nn the Romans charging them on all fides with fhowers of fones and arrows from the tops of the hills, they betook themelves to a precipitate flight ; but finding all the paffes befet with ftrong bodies of horfe and foot, were lorced to fly back into the valley, where, for many hours together, they were expofed to the enemy's fhot, without being able, in that confufion, cither to attack them or defend themfelves. 'They attempted indecd to make fome refiltance when the moon rofe; but the Romans running down upon them from the hills, did not give them time to draw up, and the place was fo narrow that they had not room even to make ufe of their fwords. The hing lot on that occalion 10,000
men according to $A_{p p i a n}$, but 40,0c0, according to Eutropius and cthers. On Pomper's fide there fell between 20 and $3^{\circ}$ private men, and two centurions.

Mithridates, at the bead of 8 co horfe, broke through Minthri- of the Roman army, and being after this efort abanden- dates. ed by all the rett, becaufe they were clofely purlued by the enemy, he trivelled all night attended by three perfuns only, viz. his wife, or, as Plutarch calls her, his conculine, by name My佔cratia, his daughter 1ripetine, and an oflicer. At day-break he fell in with a body of mercenary horfe, and 3000 foot, who were marching to join him. By thefe he was efcorted to the cafte of Sinoria, fituated on the borders of the two Armenias. As great part of his treafures were lodged here, he rewarded very liberaliy thofe who accompanied him in his flight; and taking 6 cco talents, withdrew into Armenia. As foon as he entercd the borders, he difpatched ambafiaders to Tigranes, acquainting him with his arrival; but that prince, who was then on the point of concluding a feparate peace with the Romans, clapped his ambaffadors in irons, pretending that his fon Tigranes, had at the infligation of Mithridates, revolted firlt to the Parthians, and :hen to the Romans. Mithridates finding hinfelf thus abandoned, even by his fon-in-law, left Armenia; and directing his courfe towards Colchis, wbich was fuljeet to him, and not as yet invaded by the Romans, palled. the Euphrates the fourth day, and got fafe into his own territories.

Pompey fent out feveral parties in purfuit of the king; but remained himfelf with the main body of the arrmy in the field of battle, where he built a city, calling it from rinat remarkable victory Nicopolis. This city, with the adjoining territory, he beflowed upon fuclt of his foldiers as were old or difabled; and many tocking to it from the neighbouring comeries, it became in a fhort time a very confiderable place. This battle was certainly attended with very fatal confequences for Mithridates; who was forced, his army being entirely either cut off or difperfed, to abandon his own dami fie fics in. nions, and lly for thelter to the moft remiote parts of and finm, Scythia. Pompey having concluded a peace widh $\Gamma$. granes, as we have related in the hifory of Armenia, and fettled the affairs of that kingdom, began his march in purfuit of Mithr:dates through thofe countries that lie about mount Caucafus. The barbarous naticns through which he paffed, chiefly the Allbanians and Iberians, attempted to ftop his march, but were foon pu: to flight. However, he was obliged, by the excelive cold and decp roads, to pats the winter near the rive: Cyrus. Early in the fpring he purfued his march; but meeting with great oppolition from the Therians, a warlike nation, and entirely devoted to Mithridates, he vas employed molt part of the fummer in reducing them. In the mean time, Mithridates, who had wintered at Diofeunias, on the ifhmus between the Euxire and Cafian feas, and had been joined there by fuch of his troops as had made their efcape from the late unfortunate battle, continued his flight through the countrics of the Achaans, Zygians, Heniochiane, Cercetans, Mofchi, and Colchians. Of theic nations fome seccived him kindly, and even entered into alliance with him ; through others he was forced to make himafelf a way with his fivord.
Pompey tock the fame rout, dirceting his conrfo.

Pontus. by the Aars, efpecially in the northern parts of Scythia, and carrying with him even provifion of water, to fupply the army in the valt deferts through which pompey's he marched. He fpent two years in warring with further thefe nations, and was often in danger of lofing both his life and his army : but at laft he overcame them all ; and believing Mithridates, of whom he could have no account, to be dead, he marched back into Armenia Minor, where he allowed fome reft to his foldiers, who were quite worn out with the hardllips they had endured in that expedition. Having refrethed his army, he marched into Pontus, to reduce fome ftrong holds which were ftill garrifoned by the king's troops. While he was at Afpis in Pontus, many of the king's concubines were brought to him; but he fent them all home to their parents, without offering them the lealt injury, and thereby gained the affection of the chief lords of Pontus, whofe daughters they were. The trong cafle of Symphori was delivered up to him by Stratonix, one of the king's concubines, upon no other terms than that he would fpare her fon Xiphares, who was with the king, in cafe he fhould fall into his hands. She likewife difcovered to him great treafures hid under ground, which he, with great generofty, beftowed upon her, referving for himfelf only fome veffiels to fer off his triumph. Having taken another fort, cal!ed the Neru Cafle, and to that time looked upors as impregnable, he found in it great ftore of gold, filver, and other valuable things, which he aftervards confecrated to Jupiter Capitolinus. Here, in looking over the king's manufcripts, he came to dif. cover where the reft of his treafures were concealed, what troops he could raife and maintain, what fums were yearly paid him by his fubjects and tributaries, \&.c. whereby he could make a true eftimate of his whole power and wealth. Amongit other manufcripts he found fome books of phyfic, wrote by Mithridates himfelf, which he commanded Lenæas, a learned grammarian, to trauliate into Latin.

Pompey, having thus reduced all Pontus, marched into Syria, with a defign to recover that kingdom, and panfing through Arabia to penetrate as far as the

At the fame time he fent ambaffadors to Pompey to treat of a peace, offering to pay a yearly tribute to the republic, on condition he reftored to lim his king. dom. Pompey replied, that he would hearken to no propofals whatfoever, withont the king came to treat with him in perfon, as Tigranes had done. This Mithridates looked upon as nowife confiftent with his dignity ; and therefore laying afide all thoughts of an accommodation, began to make what preparations he could for renewing the rar.

He fummoned all his fubjeets that were able to bear R arms to meet at an appointed place; and laving cho. Se fen out of the whole multitude 60 cohorts, each con- Pl filting of 100 men, he incorporated them with the regular troops that were already on foot. Being now in a condition to ast uffenively, for Pompey had left but a fmall number of troop)s in Pontus, he poffelled himfelf of Phanagorium, Cherfonefus, Theodofia, Nymphxum, and feveral other important places. But in the mean time, Caltor, whom Mithridates had appointed governor of Phanagorium, falling ont with Tripho, one of the king's favourite eunuchs, killed him, and dreading the king's refentment, firred up the inhabitants to a revolt: by which means Planagorium was again loft; but the caltle, which was defended by four of the king's fons, Artaphernes, Darius, Xerxes, and Oxathres, held out for fome time. The king haftened to their relief; but the caftle being fet on fire by the rebels, they wore forced to furrender themfelves to Caftor before his arrival. Thefe four fons, with one of the king's daughters, by name Cleopatra, Caltor fent to the Romans; and fortifying himfelf in the town, perfuaded molt of the neighbouring cities, which were oppreifed with heavy taxes, and ftrangely haraffed by the king's collectors, to join in the rebellion.

Mithridates finding that he could neither rely up. I on the foldiery, molt of them being forced into the $j$ fervice, nor on his other fubjects, who were diffatis- $c$ fied by reafon of the exorbitant taxes, fent ambalfadors to invite the princes of Scythia to his relief, and with them his daughters, to be beftowed in marriage upon fuch as fhowed themfelves moft inclined to allift him. But as the ambaffadors he employed on this occafion were eunuchs, a race of men no lefs abhorred by the army than favoured by the king, over whom they had a great afcendant, efpecially in his old age, the foldiers who were fent to attend them on their journey, put them all to the fword as foon as they were out of the king's reach, and delivered his daughters up to the Romans. Mithridates, finding himielf thus deprived of his children, betrayed by his army, and forfaken even by thofe on whom he chiefly relied, could not yct be induced to fubmit to the Romans, though lompey promifed him honourable conditions, provided he came to treat with him in perfon. In this delpesate condition, he left no fone unturned to Rir up the princes of Afia againt the Rcmans, efpecially the Parthians; but finding them awed by the great opinion they all had of Pompey, he had recturfe at lall to the Eurnpc:n Gauls whom he underfood to be at wat with the Remans; and having font before fome of his trufty fiiends to engage them in his tavour, taking leave of his own kingdom, he began his long march, defigning to pafs through Bolphorous, Cimmerius, Scy-

## PON <br> PON

thia, Panonia, \&ec. and joining the Gauls, pais the Alps, and invade Italy.
This d:fign was no fooner known in the army, but the foldiers opealy began to complain and mutiny; exaggerating the boldneis of the attempt, the length of the march, and the unfurmountable dificulties that mult neceflarily attend fuch a delperate enterprife. The chief commanders did all that lity in their power to divert him from it; reprefenting to him, that if he was not able to cope with the Romans in his own kingdom, much lefs would he be a match for them in Italy or Gaul, where they could daily receive new fupplies; whereas he would lofe the greatell part of his army in folong and difficult a march, and the reft perhaps in the firft engagement, without any poffibility of repairing the lofs. But all was to no purpofe; for they found him fo unalterably fixed in his refolution, that he caufed thofe to be put to death who with molt warmth remonftrated againft it, not fparing even his own fon Exipodras, for dropping fome unguarded expreffions on that occafion. Thus they were forced to let him purfue his own meafures, till they found a more proper opportunity to oppofe them, which foon after offered, as they were encamped at Bofphorus Cimmerius, on their marcly into Scythia.

Here Pharnaces, the king's favourite fon, whom he had appointed to fucceed him, obferving the general difcontent that reigned in the army, began to entertain thoughts of placing the crown on his own head; and not doubting but the foldiery would ftand by him, if he declared againf the intended expedition into Ita$l_{5}$, openly protelted among the Roman deferters, who were a confiderable part of the army, that if they sould follow him he would return into Pontus. The Romans who were well apprifed of the danger that atter ded fuch an undertaking, and had moit of all exclaimed againft it, promifed to fupport him to the utmoft of their power, and even encouraged him, upon fome expreffions which he purpofely dropped, to affume the title of king, a title which his father feemed determined to hold till he had deftroyed, by his rafh and defperate attempts, himfelf, his friends, and his army. Pharnaces, tinding he could depend on the Ro. mans, enyaged the fame night molt of the chief commanders in his party, and by their means the greater part of the foldiery. It was agreed, that next morning by break of day all tho ee who had declared in his favour fhould appear in arms, and with a loud fhout proclaim Pharn:aces king; which was done accordingly, and the fhout returned even by thofe whom Ph.arnaces had not thr ught fit to let into the fecret. The king, who had taken up his quarters in the city, being awakened by the noife, fent out fome of his domeftics to know what had happened in the army. Neither did the officers or foldiers diffemble the matter, but boldly anfivered, that they had chofen a young king inftead of an old dotard governed by eunuchs.

Hereupon Mithridates mounting on horfeback, and attended by his guards, went out to appeafe the tumult: lut his guards frrfaking him, and his horfe being killed under him, he was obliged to fy back into the city; from whence he fent feveral of his attendants one after auother to defire of his fon a fafe conduct for himfelf and his friends. But as none of the mefiengers returned, fome being flain, and others fiding
with the new king, Mithridates endeavoured to move his fon to comfathon, by fignifying to him from the walls the diftrelfed condition he wis reduced to by a fon whom he had favoured above the relt of his children; but finding him nuwife aflected by his fpeech, turning to the geds, he befeeched them with many tears to make his fon know one day by experience the grief and agony which a father mult feel in feeing his love and iendernefs requited with fuch ungrateful and monftrons returns. Having thus fpoke, he thanked in a very obliging manner thofe who had food by him to the lat, and exhorted them to make their fub. miffion to the new king on the beft terms they could procure ; adJing, that as for himielf, he was determined not to outlive the rebellion of a fon whom he had always diftinguifhed with particular marks of paternal affection.

After this, he withdrew into the apartment of his Mithriwives and concubines, where he firlt took poition him- dates atfelf, and then prefented it to them, and to his favou-tempes to rite daughters Mithridatis and Nifla, who not long dellroy. before had been betrothed to the kings of Egypt and Cyprus. To the women it proved iminediate death; but on the king, who from his infancy had inured his conftitution to porfonous potions, it had fo flow an operation, that he was furced, through fear of falling into the rebels' hands, to recur to his fiword. Neither did the wound, as he was greally weakened by the poifon, prove mortal : fo that the rebels, having in the mean time formed the town, and broke into the houfe, found the hing wallowing in his blood, but Aill alive, and in his fenfes; which Pharnaces hearing, fent fome of thofe that were about him to drefs his wounds, with a defign to deliver him up to the Romans, and thereby ingratiate himfelf with Pompey.But, in the mean time, a Gaul, who ferved in the ar. A Gaul my, by name Bitatus, or Buthocus, entering the king's putsanend room in quer of booty, and being tcuched with compaffion in feeing him forfaken by all his friends, and Aruggling on the bare grotind with the pangs of death, drawing his fword, put an end to his prefent agonies, and prevented the infults which he chicfly apprehended if he theuld fall alive into his fon's hands. The barbarian is faid, when he firlt faw the king, to have been fo a wed with the majefty of his countenance, that, forgetful of his booty, he fied out of the rocm ; but being called back, and earnelly intreated by the dying prince to put an end to his mifery, he fummoned all his courage to perform, as he did, wi:h a trembling hand, that office; and immediately retired without touching any thing that belonged to the king, though the hoper of a rich booty was the only motive that had led him thither.

Pompcy, who was at that time engaged in a war with the Jews, received the firf notice of the death of Mithridates as he was on his march to Jerufalem. The melfenger who brought the joyful tidings was fent by Pharnaces, and appeared unexpectedly befure Pompey with the branch of a laurel, as was cultomary on the like occainns, twitted round the head of his javelin. When he heard what had happenel at Pantica- Exceffive prum, he was fo impatient to impart it to the fol- joy of the diery, that he coukl not even wait till they had raifed Romans at him a mount of turf trom whence to fpeak to the army, his death. according to the cultom of the camp; but ordered

Pontus.

## -

 thofe who were by him to form a hind of mount with their faddles, and from thence aequainted the foldiery that Mithridates had haid violent hands on himfelf, and lis fon Pharnaces was ready to acknowledge the kingdom as a gift of the people of Rome, or relign it if they were unvilling he fhould reign. This news was aceeived with joytul flouts of the whole army, and the day folemnized with fealts and facrifices throughout the camp, as if in Mithidates alone all the enemies of the republic had dicl. Iompey difpatched withont delay a meflienger with letters to the fenate, acquainting them with the de:th of Mithridates, and the fubmifion of his fon Tharnaces. When his letters were read, the fenators were fo overjoyed, that they appointed at the propnfal of Cicero, then cormul, i 2 days for reumning due thanks to the gods, who had delivered them from fuel an infulting and powerful enemy; and the tribunes of the people enaded a law, wherehy Pompey, in confderation of his eminent fervice in the Mithridatic war, was to wear a crown of laurel, with the thiumplayl gnwn at the Circenfian fionts, and a purple gown at the Eenical plays.Pharnaces, when he heard of his father's death, enufed his body to be preferved in Lrine, propofing to prelent it to lomper, who had promied to return into lontus after the reduction of Judea, and there fettle matters to his fatisfaction. And aceordingly having taken the city and temple of Jerufalem, he fet out with two legions for Pontus; and being arrived at Sinope, he was there met by ambaffadors from Pharnaces, acquainting hin, that their matter had for bore affuming the title of king till his will and pleafure were
known; that he put both laimfelf and the kingdom entirely into his hands; and that he was willing to attend him at what time or place he thought fit to appoint. The fame ambaffadors delivered up to Pompey thofe who had taken Mamius Aquilius the Roman legate, whom Mithridates had put to a eruel death, all the prifoners, hollages, and deferters, whether Romans, Greeks, or Barbarims, and the body of Mithridates wich his nich apparel and arms, which were greatly admired by Pompey and the other Roman $\mathrm{m}_{\text {. Both Col- }}$ diers and officers floeked to fee the king's body; but Pompey declined that fight; and, faying that all enmiry between that great prince and the people of Rome was ended with his lific, he returned the boly to the ambafladors, and caufed it to be interred with the utmolt pomp and magnifieence among his ancelors in the burying.place of the kings of Pontus, Pompey defraying all the charges of that ceremony, whic'? was the moft collly and pompous that ever had been feen in thofe parts. With the body Pompey reftored his wearing apparel and atmour; but the ficalbard of his fiword, which coft 400 talerts, was folen by Rublius a Koman, and fold to Ariarthes king of Cappadocia ; and his eap or tuiban, which was a very curions piece of workmanthip, was privately taken by one Caius, who prefented it to Faultus the fon of Sylla, in whofe houfe it was kept, and fhown for many years after among the many rarities which Sylla had brought out of Aifia.

Pompey beftowed the kingdom of Bofphorus on Pharnaces, and honoured him with the title of a fricme and ally of the people of Rome. Pharraces being thus actnowledged king of Borphorus, fent orders
to all the garrifons of Pontus to fubmit themfelves with the caltles and treafures with which they were entrufted, to Pompey, who by that means amaffed an immenfe booty. In the city of L'alaura, which Nithridates ufed to eall his wardrobe, he found zooo cups of onyx fet in gold, with fuch tore of gold and filver veffels, of coftly furniture, of faddles, bridles, and trappings, fet with jewels and precious fones, that the Roman commiflaries fpent 30 days in taking the inventory of the whole. In another cafle he found three large tables with nine falvers of mally gold, enriched with precious fones to an ineftimable value; the flatues of Minerva, Mars, and Apollo, of pure gold and moft curious werkmanlhip; and a pair of gaming-tables of two precious floncs, three feet broad, and four feet long, on which was a moun of gold weighing 30 pounds, with their men, all of the fume precious flone. In a fort fituated among the mountains, were delivered up to him the king's fatue of maffy gold, eight cubits high, his throne and fceptre, and the bed of Darius the fon of Hyttafpes. Mott of thefe treafures thad been tranfinitted to him from his anceftors, chiefly from Darius king of Perfia; fore belonging to the Ptolemies of Egypt, and had been depofited by Clerpatra, as we have linted above, in the hands of the Coans, who delivered them to Mithridates; and great part of them had been collected by the king limelf, who was very fond of rich and frately furniture.

Pompey having thus got entire poffeffion of Pontus, who and reduced it to the form of a Roman province, frows marched into Afra properly fo called; and having win- hinn 1 tered at Ephefus, early in the fpring fet out for Italy, lined bof with a fleet of 700 thips. As he brought over his army with him, the fenate was under no imall apprehenfion left he thould make himfelf abfolnte, and rule without controul. But he no fooner landed at Brundufium, than he difbanded the army, without waiting for any decree cither of the fenate or people ; what neither his friends nor his enemies had believed. His triumph lafted two whole days; and though he was attended in his triumphal chariot by 324 captives of diftinction, among whom were five fons and two daughters of Whithridates, yet he would not fuffer any of them to be put to death, as had been done by others ; but fent them all back, except fuch as were of ricyal extration, to their refpective cowatries, and even fupplied them with money to defray the charges of their journey. After his triumph he delivered into the treafury 20,000 talents, though, at the difmiffing of the army, he had divided 16,000 talents among the tribunes and centurions, 2000 fettertiums among the qua:tors, and had given to cach fuldier 50 feftertiums.

Pompey had no fooner left Afia, but Tharnaces fell phar unexpectedily upon the Phanagorenfes, a people of falls, Porphorus, whom Pompey had delared free, beenufe with they had revolted the firtt of all from Michridates, and by their example induced others to abandon the king's party. Pharnaces befieged their chief city Phanagoria, and kept them blocked up till, for want of provifions, they were forced to fally out, and put all to the iffue of a battle; which proving unfuccelsful, they delivered up themelves and their city to the conqueror. Some years after, the civil wa: breaking out between Cafar and Pompey, he laid hold of that oppotemnity
to recorer the provinecs which his father had formerly poifeifed ; and laving :aifed a confiderable army, overran Pontus, Colchis, Bithyni?, Armenia, and the hingdom of Mofchic, where he phandered, as Strabo cib. letres, the temple of the goddefs Leucothea. He took the llrong and important city of Sinope, but conld not reduce Amifus. But, in the nean time, Celar having got the better of Pumpey and his party, appointed Cin. Domitius Calvinus governor of A fia, enjoming lim to make was upon Pharnaces with the legions that were quartered in that province. Donitius immediatciy difpatched amballadors to Pharnaces, commending him to withdraw his treops from Armenia and Cappadccia. The king retumed anfiver, that he was willing to abandon Cappadocia, but as for the lingtom of Aimenia Minor, it was part of his hereditary dominion:; and therefore he would not refign it till le had :in ofpuitmity of laying his pretenfions beiore Cxar limfelf, whom he was ready to obey in all things. Hercupon Domitius drawing together what forces he could, n:arched into Cappaciocia, which he recovered without ofpolition, Plarnaces having abandoned it to make a ftand in Armenia, which lay nearer his own dominions. Thither Domitius purfued him; and having overtaken him near Nicopolis, found his army drawn up in battie-array, and the king ready to come in an ongagement; which Domitius not declining, both armies advanced.

The king, at the head of a chvice body of men, fell upon the Romans' left wing, confifing mofty of raw and uadifciplined Affatics; and having without moch ado put them to flight, penetrated to the centre, where the thirty-fifth legion, the only one which Do. mitius had, after a faint refiflance, gave ground, and, retiring to the neighbouring mountains, left their allies to fhitt for themielves, who were all cut off. Domimitins will the remains of his. featered army marched back into Cappadocia; and from thence, winter drawir.g on, into the province of Afia. The king being puifed up with this vistory, and hearing that Cæfar, with the flower of the Roman forces, was engaged at the fiege of Alexandria, appointed ore Afander go vernor of Bofphorus, and marched himfelf into Cap. padocia in purfuit of Domitius, with a defign to invade Afia, and recover all the provinces which had been once fubdued by his father. Bithynia and Cappadocia readily fubmitted; but Armenia the Lefler, which was held by Dejotarus, made fo vizorous a refiftance, that he was forced to give over the enterprife, left the Ronians thould in the mean time frengthen themfelves in Afia, whither he was in hafe to march, in hopes of meeting there with the fome duecefs as his father Mithridates lad done. But before he reached that province, he was informed that A fander had revolted, in hopes of gaining thereby the good-will of the Romans, and obtaining of then the lingdom of Bofphorus for himflr. At the fame time, he received in. telligence that Cofar, living at laft reduced Alewandria, and fettled the atrairs of Egypt and Syria, was marchi:g irto Armenia.

IIc was not a little difmayed at this rews, and therefore without celay difpatched ambafladers to fue for peace ; hoping that Cefar, who was haftening into Italy with a delign to pats over into Africa, would willinely give car to any propefals of that anture.
loz. XV.

Crefar couricouny entertained the ambafinders: and though he did not proper ie to argree to their conditions, yet, that he might come upora llazn:ces unawares, he flowed hiracis vary defrous of entering inio a treaty of peace. But, i:1 the menn tizec, l.e puffuch lis march with all pufliéc c..putition; and znining :a the confines of Putteus, o deacd :111 the troops that werc quartened in the neimlor uring prowinees to jain him; for he had bromgit from Alexandra but one legion, namely the fixth, and hat coarriting of 1000 men only, the reft having been lilled at the hege of Alexandria. Defides this veteran legrion, he found at the place of general rendezvous three others, but all of then vory indifferently armed, and worfe difcipinacd. With thefe forces, howcter, fuch as thoy wecre, he ad. vanced againt Plarnaces; who being greatly frighitene at his approach, by reafon of the fuccefs that lad at. tended lim in all his expeditions, again difpathed amballadors to him with a crown of grold, offerins him his dauchter in marriage, and promifing to do whaterer he thould require. The ambafiadors toak care to let him know that their mafter, though highty obliged to Pomper, yet had never been prevailed uposs to fond him any fupplies during the civil war, which Dejotarus, king of Armenia the Lefler, whom he had honoured with his friendlhip, had done. Cafar returred for anfwer, that he was willing to conclude a paace with Pharnaces, provided he retired without delay from Pontus, returned all the captives and hofages whether Roman or their a!lies, and reftored the goods of the Roman citizens and publicans which he has feized fince he firtt tool: up arans. He added, that as to his not fending fupplies to Pompey, they ought rather to have concealed fuch an ungrateful procceding of their matter than alleged it as any merit, fince the forfaking of one to whom he was indebted for his crown, befpoke him a man of mean, felfilh, and unworthy principles.

Pharnaces, upon the return of his ambaffadors, acquainted Cxfar that be agiced to the conditions; but finding that Cafar's affelirs cal'ed him into Italy, he required a longer term of time for the performanee of what was ftipulated between them, farting daily new difficultics, in hopes that Cefar would in the mean time be obliged to depart, and leave his alfairs of Pontus in the funte pofture he had found them. Cæfar fecing himfelf difippointed, and put off from day to diy, coula not longer brooke the king's deceitiul behaviour. Where. fore he determined to put himilelf at the head of his fmall army, and attack the enemy in his camp when he leaft expefted it. Aud accordingly, marehing out in the night, he came by break of day in fight of the ling's army; and uttering thefe words, Sball this treachcrous parricide go unpunijbed? broke into the camp at the head of icoo lurie. The king's charints, which were arnied with feyth.s, caufed fome fmall diforder among Cwitr's horfe; but in the mean time the relt of his army coming up, he put the enemy to fight, and nbtaired a complete vietory. This battle was fought Dy whom near the phace where Mithrivates had routed with great he is ctflughter the Roman army under the command of Tri tirely dearius. Moft of the king's army were either taken or feated. cut in pieces; hut Phanac shimfelf had the gocd luck to make his efeal whe he Romans were buly in phundering the carr: "1. rifory was fo quick, that

## PON

Caffr in a letter to his friend Aminitius, or Anitius, at Rome, expreffed it in three words, thus: "I came, I faw, I conquered." He ever afterwards ufed to call Ponspey a fortunate rather than a great commander, fince he had gained his chief glory in the Mithridatic war, fighting with fo cowardly an enemy. He divided the rich booty and the fpoils of his camp among his foldiers ; and becaufe Mithridates had erected a tro. Ily near that place as a monument of his victory over l'rianius, which Cæfar, as it was confecrated to the gods, did not think lawful to pull down, he fet lip another over-againg it to tranfinit to pofterity his vittory over Pharnaces. After this victory he recosored and rehored to the allies of the people of Rome sll the places which Pharnaces had poffelfed himfelf of during the war, declared Amifus a fiee city, and appointed Mithridates Pergamenus ling of Bofphorus in the room of Pharnaces.

Having thus fetuled the affairs of Pontus, he fet fail for Italy; leaving Domitins Calvinus to purfue the war againf Pharnaces, if he fhould appear again in the field. Pharnaces had retircd atter the battle to Sinope with 1000 horfe, where he was quickly befieged by Domitius, to whom he furrendered the town, upon no other condition than that he hould be fuffered to retire into Bofphorus with the fmall body that attended him. This Domitius willingly granted; but caufed all the king's horfes to be killed, lince he had afked a fafeconduat only for his horfemen. With thefe and a band of Scy thians and Sarmatians he attempted to recover the lingdom of Bofphorus; but being met hetween Theo- docia and Panticapeum, both which cities he had reduced, by Afander, who was fill in poffeflion of the kingdom, a fharp engagement enfued, wherein the king's men, as not being ufed to fight on foot, were put to flight, and Pharnaces himfelf, who remained alone in the field, was furrounded by the enemy, and cut in pieces, after having reigned in Bofphorus Cimmerius, the kingcom which Pompey had beltowed upon him, according to Appian, fifteen years, according to others, feventeen.

Upon the death of Pharnaces the lingdom of Pontus,
was again reduced to the form of a province, and fo continued to the triumvirate of Marc Antony, who after the battle at Philippi conferred it upon Darius the fon of Pharnaces for his fervices during the civil war. He continued faithful to the Romans; but did nothing during his reign worth mentioning.

Darius was fucceeded in the kingdom by Polemon, likewife preferred to that honour by Marc Antony. He was the fon of Zeno, a famous orator of Laodicea, and greatly favoured by Antony. From him that part of Pontus which borders on Cappadocia botrowed the name of Polemoniutus. He attended Marc Antony in his expectition againt the Parthians; and being taken prifoner in that unfuccefsful battle fought by Statianus, he was ient by the king of the Medes, an ally of the Parhhans, to conclude a peace with the Romans. In which cmbally he acquitted himfelf fo well, that Antony alded the kingdom of Armenia to his own dominions. In the war between Antony and Auguitus he fuded with the former: but after the battle of Actium he was received into favour by the latter; and being fent by Agrippa againt Scribonius, who upon the death of A fander liad ufurped the kingdom of Bofphorus, he
overcame him, and reduced the kingdom of Colchis, which was beftowed upon him by Agrippa, who likewife honoured him with the title of fritnd anl ally of the people of Rome. He afterwards waged war with the neighbouring barbarians refufing to live in fubjection to the Romans ; but was oycrcome, taken, and put to death, by the Afpungitani, a people bordering, according to Strabo, on the Palus Mieotis.

Upon his death his fon Polemon II. was by the emperor Caligula raifed to the throne of Bofphorus and Pontus. But the emperor obliged him to exchange the king dom of Bofphorus with part of Cilicia; and Nero, with his confent, reduced that part of Pontus which he enjoyed to the form of a province. He fellin love with Berenice, daughter to Agrippa king cf Judæa; and in order to marry her embraced the Jewifh religion. But as fhe foon became tired of his riotons way of living, and returned to her father ; fo he remounced his new religion, and again embraced the fuperftitions of Paganifm. Polemon dying without iffue, the ancient kingdom of is Pontus was parcelled our into feveral parts, and added to the proviaces of Bithynia, Galatia, and Cappadocia, only that part of it which was called Pontus Polemoniacus retaining the dignity of a diftinct and feparate province. During the civil difcords between Vefpainan and Vitellius, one Anicetus, firf a flave, afterwards freedman, to king Polemon, and lattly commander of the royal navy, took up arms with a defign to refcue the kingdom from the Roman bondage ; and being joined by great multitudes drawn together with the profpect of ipoil, over-ran the country, and poffeffed himfelf of Trapefund, a city founded by the Grecians on the utmolt confines of Pontus. Here he cut in pieces a cohort made up of the inhabitants, but which had been former1 y prefented with the privilege of Roman citizens. He likewife burnt the fleet, and with fcom and infults fcoured the fea; Mucianus having called to Byzantium moft of the Roman galleys. Hereupon Vefpafian, who was at that time in Syria, fent Verdius Gemnius into Pontus with a choice body of auxiliaries from the legions. He affaling the enemy while they were in difordcr, and roaming afunder in purfuit of prey, drove them into their vefiels; then with fome galleys chafed Anicetus into the mouth of the river Chobus, where he thought himfelf fafe under the protection of Sedochus king of the Lazians, whofe alliance he had purchafed with large fums and rich prefents. Sedochus at firlt refufed to deliver him up to the Romans; but was foon prevailed upon, partly by threats, partly by pretents, 10 furrender both him and all the other fugitives who had taken fanctuary in his doninions. Thus ended that fervile war; and the Kingdem of Pontus continued to be a province of the empire till the time of David and Alexis Comneni, who being driven from Constantinople by the French and Venetians A. D. 1204, under the command of Baldwin earl of Flanders, fettled, the one at Heraclea, the other at Trebifond. 'I'he troubles that arofe among the Latins gave Alexis Comnenus an opportunity of erecting here a new empire, which cornprehended great pait of Pontus, and was known by the name of the cmpire of Trebifond. The Comneni held it about 250 years, till the time of Mohammed II. who carried David Comnenus, the lat emperor of Trebifond, prifoner to Confantinople, A. D. 1462, with all his family, and fubjected his empire to that of Conftanti-
nol, nople ; in which abject flavers Trebifond and all Pontus have continued ever fince.

PONTYPOOL, a town of Monmonthfhire in Eng. land, feated between two hills. It is but a fmall place, though noted for its iron-mills, great manufacture of japanned mugs, \&c. WV. Long. 3. 6. N. Lat. 5 1. 42.

PONZA, or Pontia, is a fmall ifland of the Pufcan Sea, well known to be the place to which many illuftious Romans were formerly banifhed. It is.fituated on the coalt of Italy near Teracina, and in the neighbourhond of other fmall illauds or rocks named Patmarole, Zinnone, Ecc. between the ifland of Ventotienne and Monte Circello. All thefe inlands were vifited by Sir William Hamilton in the year 1785 ; and an account of his joumey is given in it letter to Sir J. Banks, which appeared in the Phil. Tranf. vol. lexvi. p. 36j. Sir Willian arrived at Pouza on the 2oth Augult; and, according to his account, it lies about 30 milesfrom Ventotienne. On the 21t he went round it in a boat. Its length is about five miles, but its breadth is nowhere above half a mile, and in fome places not more than 500 feet. It is furrounded by a multitude of detached rocks, fome of them very high, and moft of them compofed of a compact lava. There are many irregnlarly formed bafaltes, but none in large columns. In fome places they have a reddifh tinge from iron ochre, are very fimill, and irregularly laid over one another. Some ftand perpendicularly, others obliquely, and fome lie horizontally. The rocks themfelves in which thefe maffics are found are lava of the fame nature with the bafaltes. At firf fight they appear like the ruins of anciene Roman brick or tyle buildings. One rock is compofed of large ipherical bafaltes, and in other places our anthor found the liva inclined to take the like fpherical form, though on a much fmaller fcale, fome of the former balaltes being near two feet in diameter. All thefe rocks, in our author's opinion, have been detached by the fea from this ifland, which is entirely compoled of volcanic matter, lavas, and turas of various qualities and colours, as green, yellow, black, and white. Some of thefe matters are more compate in their texture than others; and in fome parts great tracts feem to have undergone fimilar nuerations, which fill fubfit at a fpot called the Pifiarelli, on the outfide of the Solfatara, near Puzzole, and where a hot fulphureous vitriolic acid vipour converts all which it penetrates, whether lawas, tufas, volcanic athes, or pumice ftones, into a pure clay, monly white, or with a tint of red, b!ue, green, or yellow.

In one part of this ifland there is a fort of tufa remarkably good for the purpole of butheing. It is as hard as Bath Atone, and nearly of the lime colour, without any mixture of lava or pumice-ftene, which ufually abound in the tufas of Naples, Baia, and Puzzoli.

The ifland ot Palmarole which is about four miles from Ponza, is not much more than a mile in circum. ference. It is compofed of the fame volcanic matter, and probably was once a part of Ponza; and in our author's opinion it looks as if the illand of Zannone, which lies about the fame diftance from Ponza, was once likewile a part of the fame; for many rocks of lava rife above water in a line betwixt the two lalt-mentioned illands, and the water there is much more flallow than in the gulf of Terracina.

Zanone is much larger and higher than Palmarole ;
and that half of it next the contizent is compofed of a lime fone fimilar to that of the Apennines near it; the other half is compofed of lavas and tufas, refeml ling in every other refpeet the foil of the iflands jult deferised. Neither Palmarole nor Zannone are inhabited; but the latter furnifhes abundance of brufhwood for the wie of the inhabitants of l'onza, whofe number, inclating th: garrifon, amounts to ne:tr 1700 . The uniwhabited illand of St Stefano in like manner furnithes woud for the penple of Ventotionne. It is probable that ail thefc illunds and rocks may in time be levelicd by the action of the fea. Pone, in its prefent ttate, is thie mere fkeleton of a volcanic illand; little more than its hard or vitrified parts remaining, and they feem to be nowly and gradually mouldering away. 'The governor of the caftle of Ponza, who had refided there 53 yєa:s. told our author that the ifland was ftill dubject to earthe quakes; that there had been one violent fhock there about four jears before; but that the moit violent ous he ever felt was on the very daly and at the hour that Lifbon was dettroyed. T'wo houfes out of three which were then on the ifland were thrown down. "This (fays our anthor) feems to prove that the volcanic matter which gave birth to thefe illands is not exhaufted."

Fig. 1. Plate CCCCXII. is a plan of the illand of Ponza as it is given in the Philofoohical Tranfactions. Fig. 2. is a view of the infide of the harbour of the: inland. A in the fame figure is a rock of lava. In many parts it is formed into regular bafiltes of a reddith colour, linged in all probability with fome ochre. Molt of the detached rocks of the ifland refemble this. DB repreients a trath of rolcanic country, converted by it hot fulphureous vitriolic acid vapour into a pure clay, the ground colour of which is moftly white. Fig. 3. is a view from the outide of the harbour, near the lighthoufe. $C$ is a rock of volcanic matter converted th pure clay; $D$ is a rock of the fame kind, with Atrat. of pumice-Itone: $E$ is a rock of lava, inclining to take balaltic forms; and $F$ is a rock compofed of fpherical bafaltes.

POOD is a Ruffian weight, equal to 40 Rufian ot $3^{6}$ Englifh pounds.

POOL is properly a refervoir of water fupplied with fpringe, and difcharging the overplus by fluices, defen. ders, weirs, and other caufeways.

Pool, a fea-port town of Dorfethire in England. It is furrounded on all fides by the fea, except on the north, where there is an entrance through a gate. It was formerly nothing but a place where a few fifher* men lived: but in the reign of Henry VI. it was greatly enlarged, and the inhabitants had the privilege to wall it round. It was allo made a county of itfelt, and fent two members to parliament. It is governed by a mayor, a fenior bailiff, four other juftices, and an indeterminate number of burgefles. Tiee town conlifts of a church and about 600 houres, with broad paved firects; and has a manufactory of knit hofe. It is 47 miles went-fouth-selt of Winchefter, and 1 :o welt-by-fouth of Lonlon. W. Long. 2. o. N. Lat. 50. 42 .

POOLE (Matthew), a very learned writer in the 17th century, was born at York in $162 \%$. H: was educated at Emanuel-college, Cambridrge, and afterwards incorporated in the univerlity of Oxford. He fucceded Dr Anthony Tackney in the reftory of St Michael de Quern, in London, about 16.8. In I $65^{-3}$ 3 A 2
ins

he et on foot a project for maintaning youths of grent expences and expecations of his family, he finds ha can parts at the univerfities, and had the approbation of the heads of houfes in both of them. He folicited the aftair with fo much vigour, that in a flort time 9001. pere aiman was procured for that purpore; but this defien was laid afise at the Reforation. In 1662 be was cjected from his living tor nonconformity. He was ten ycais employed in compofing his Synotis Ceriticorum, \&c. Defides this great work he publihed fevcral other pieces. Whem Dr Oates's deporitions concerning the perith plot were printed, our arithor found his name in the lifi of thofe whan were to be cut off, on the account (as was fuppofed) of what he had writien againft the papirts in his Nullity of the Fiomif, Faith. So that he wais oblized to retire into Holland, where he died in r679, and left belind him the charader of a very able critic and cafuin.
yOOP, the Rem of a hip; or the highof, uppermof, and hinder part of: fhip's hull. See Stern.

POOR, in law, an appellation given to all thofe who are in fuch a low and mean condition, that they cither are or may become a burden to the community.
They who rank pity amongit the original impulfes of our nature rightly contend, that when it prompts us to the relief of human mifery, it indicates fufficiently the Divine intention, and our duty. Indeed, the fame conclufion is deducible from the exifence of the palfion, whatever account be given of its origin. Whether it be infinct, or a habit founded in affociation (fee Passow, it is in fact a property of our nature which God appointed : and the final caute for which it was appointed is tn afford to the miferable, in the compafion of their fellow-creatures, a remedy for thofe inequalities and diftreffes to which many are neceffarily expofed under every pofitile rule for the diltribution of properiy. That the poor have a claim upon the rich, foundcd in the law of nature, can be queftioned by no man who admits the benevolence of the Deity, and confiders his purpofe in creating the world (fee Theology, Patt I. Sect. ii.) ; and upon this claim the Chriftian Scriptures are more explicit than almof upon any other.

The rights of the poor, however, to be relieved by the rich, as they originate, in nature, and are fanctioned by Chrifianity, are evidently of that kind which is callad inperjaz (Sce Moral Pl:lofopphy, $\mathrm{n}^{\circ}$ 15r.) It is furcly needlefs to warn our readers in this place, that imperfect rights are in themfelves as facred, and the duties refulting from them as obligatory in foro conficentie, as the moit rigid claim; of jultice. Every one l:uows, that they are called imperfat only becaule the exient of them in proticular initances cannot be afcertained by pofitive laws, nor the breach of them be purnificel by the civil magiltrate. Hence the apoitle, thn' he enjoins a weekly contribution to be made for the Foor in the church of Corinth, yet leaves the fom to be contributed by each individual wholly undetcrmined. "Now concerning the colleation for the faints, as I have fiven order to the churches of Galatia, even fo do ye. Upon the firt day of the week let every one of you lay by lim in tore as God hath propered him." By which'St Paul certainly recommends to every man to contribute, not a fixed fum, but as much as, from a deliberate comparifon of his fortune, with the reafonable
fpare for charitable purpofes.
It is well known that thofe weekly contributions were laid at the feet of the apofles, who transferred the management of the fund thence arifing to deacons elccied by the people, and ordained by them to fee that the money was properly diftributed. Hence, under Ciriftianity, the maintenance of the foor became clicfly at: ecclefiaftical concern; and when that holy and benevolent religion was eftablinicd in the Roman empire, a fourth part of the tithes was in fome countries of Europe, and particularly in England, fet apart for that purpofe. Afterwards, when the tithes of nany parithes were appropriated to the mona!leries, thefe focieties were the principal refource of the poor, who were farther relicved by voluntary contributions. Judge Dlack. fone obierves, that till the flatute 26 Hen . VIII. cilp. 26. he fiads no compulfory method for providing for the poor; but upon the total difililution of the nionaferies, abundance of fa:utes were made in the reign of King Henry VIII. Edward VI. and Elizabeth, which at lat eftablifhed the
Poor's Rate, or legal affefment for the fupport of the poor in England. The fums that had been appropriated for charitable ufes before the reformation were immenfe, and the wealth that had been accumulated through a fucceffion of ages by mendicant orders of religious ferfons was inconceivably great; nor was it in the power of any laws to confine men who were in the poffeffion of fuch wealth from gratifying thofe defires which money can fo eafily find means of liupplying. Yct among the various abufes to which this opulence had given rife, thefe religious orders had never fo far loft fight of their original inftitution as ever to neglest the poor. Thefe were indeed provided for by them with an indifcriminate profufion of largeffe, better proportioned to their owa opulence than to the wants of the clamants, who were to often, without examination, all equally ferved, whether deferving or undeferving of that bounty which they claimed.
When the roligious hoyfis, as they were called, were entirely fupprefled at the eformation, and the weald that belonged to them was diverted into other channiels, the poor, who had been in ufe to receive their fupport from thence, were of courie left entirely deititute; and this foon became a grievance fo intolerable not only to the poor themfeives, but to the whole nation, as tu excite an univerfal cefire to have it remedied. Accord. ingly, by the 14 Eliz. cap. 5 . power was given to the jullices to lay a general affeflincyt; and this tatle curntinued ever fince. For by 43 Eliz. cap. 2. the churchwardens and overfeers of the poor of every parith, or the greater part of them (with the confent of two jur. tices, one of whom is of the quorum, dwelling ia or near the parifh), are empowercd to raife weekly, or otherwife, by tayation of every inhabiant, parfon, vicar, and other, and of every occupier of lands, houfes, \&c. materials for employing the poor, and competent fums for their relief. Notice thall be given in church of every fuch rate the next Sunday after it is allowed, which may be infpected by every inhabitant, paying is. and copies of it granted on demand, 6 d . being paid for every $2+$ names; and a cinachwarden or overfeer refufing, fhall forfeit 201 . to the party aggrieved. The

- Fiy.?

rate is to be levied by diftrefs on thofe who refufe to pay it ; and, by 17 Geo. 1I. cap. 2. cap. 38 . appeals againlt it are alluwed.

If the jultiess find that the inhabitants of any paifh are not abic to levy among themfelves fufficient fums for the purpofes fpecified in the act, they may alfefs any other parilh within the hundred; and if the hundred be unable to grant neceflary relicf, they may rate and affefs any parifls within the county. 43 Eli\%. cap. 2 .

In order to compel hufbands and parents to maintain their own families, the law hath provided, that all perfons running away out of their parilhes, and leaving licir familics upon the paifh, flall be deemed and fuf. fier as incorigible rogues ( 7 Jac, cap. 4.) And if a perfon merely threatens to run away and leave his wife and children upon the parifh, he llall upon convicion, before une juftice by confellion, or oath of one witnefs, be committed to the houfe of correction for any time rot excceding one month ( 17 Geo. II. cap. 5.) For the farther mamenance of the poor, there aremany fines and forfeitures payable to their ufe; as for fwearing, drunke:1nefs, deflroying the game, \&ic. And allo parts of waftes, woods, and paltures, may be enclofed for the growth and pefcrvation of timber and underwood for their relief. Sce Wors-Houle.

The famous flatute of the 43 d of Elizabeth, which is the bafis of all the poor-laws in England, was conftructed with a cautious forethonght that can perhaps be equalled by few laws that ever were enacted; and if profpective reafoning alone were to be relied on in matters of legiflation, it feemed impoffible to amend it : yet experience has now proved, with a moft demonftrative certainty, that it is not fo falutary as was undoubtedly eapected.

The perfons who compofed that law had before their eyes fuch a recent proof of the abufe that had been made of the charitable benificence of individuals, that they feem to have been chiefly folicitous to obviate fimilar abofes in future ; and to guard againlt that partial kind of feduction, they rather choole to eftablifla a defpotic power which fhould be authorized to wreft from every individual in the mation whatever fums it might think proper to call for, trufting to a few feeble devices which they contrived, for curbing that power which was virtually armed with force fufficient to fet all thefe afide whenever it pleafed. The confequerce has been, that the fums levied for the relief of the poor, which were at firit but fmall are now enormous, and that the demands are increafing in fuch a rapid manner as to give rife to the moft ferious and well-grounded apprehenfions. In the year $177 \frac{1}{\text {, parliament inftitu- }}$ ted an inquiry into the amount of the poor's-yates in England and Wales, and again in $17 S_{3}$ On comparing thele together, the rife during that fhort period was found to be in England upwards of 850,000 l. per annum, being nearly in the proportion of one-third of the rate at the firf period. In Wales, during the fame period of time, the rates were more than doubled. Nor was this a temporary fart, but a part only of a gradual progreflion. Mr Wenderdon, in his View of England, obferves, that " in the year 1630 the poor's-rates produced no more than 665,390 l. in 3764 they flood at $1,200,000$ l. and in 1773 they were eflimated at 3,000,000 l." It is a known fact (fays Mr Beaufoy, in the debate on Mr Gilbert's poor bill, Apil 17 th
1788), that withat the lat nine years, the poor'i-:ates have increafed one-third, and fhould they continue increafing in the fame proportion for 50 or 53 years the? would annount to the enormous fum of $11,230,0001$. it burden which the country could not peablyly bear. It was therefore, he added, highly neceflary th if fomething; fhould be attempted to prevent this aloming addition, if not to ammilate the prefent glaring mifonduct in the management of the poor."

Such has been the fate of England with regard to peor lavs.

In Scotland, the reformation having been canried forward with a ftill more violent precipitancy than in Ensland, and the funds of the regular clegy being moic entirely alienated, the cafe of the poor there became fill more feemingly defperate, and the clamours were alfo there confiderable at that time. Then alfo it was that the Scottilh court, imitating as ufual at that time the practice of England, made feveral fechle attempts to introduce a fyitem of compulfory poor's-rates into that country, but never digefted the fyttem fo thoroughly as to form a law that conld in any cafe be carried into effect. Many crude laws on this head were indeed enated; but all of them fo evidently inadequate for the purpofe, that they never were, even in one infance that we have heard of, attempted at the time to be carried into effect. Indeed it feems to have been impolible to carry them into effect ; for they are all io abfurd and contradictory to each other, that hardly a fingle claufe of any one of them can be obeyed without tranfgrelling others of equal importance.

The laft ftatute which in Scotland was enated on this fubjett bears date September ift 169 r , William and Mary, parl. 1. feff. 7. chap. 2 r. and it "ratifies and approves $a: l$ former acts of parliament and proclimations of council for reprefling of beggars, and maintaining and employing the poor." If this law therefore were now in force, and it never was repealed, no perfon could with impunity countervail any one of thofe ftatutes which it ratioies; but to be convinced how impolible it is to obferve them all, the attentive reader needs only to confider thofe litws and proclamations with refpect to the following particulars, viz.

1. The perfons appointed to make up the poor's rell. By the act 1579 this duty is entrufted to the provolt and bailies within burgh, and the judge conllitute be the king's commiffion in paroches to landwart. By act 1663 , it is the heritors of each parilh. By at 1672, it is the minifters and elders of each parill who are to make np this lift. By the proclamation of 1692 , it is the heritors, minifters, and elders of every parilh. By that of 1693 , it is the magifuates of royal burghs, and the hevitors of vacant [country] parihes; in both cafes without either minifter or elders. Among this chaos of contradictions how it is polible to act without tranlo grefling fome law.
2. Nut lefs contradiftory are the enactments in regard to the perfons who are to pay, and the mode of apportioning the fums among them. liy act 1579, the haill inhabitants of the parchin thall be taxed and Atented according to the eftimation of their fubfance, withous exception of perfons. By that of $166_{3}$, the one-half is to be paid by the heritors, and the other half by the tcnants and poffefors, according to their means and fubfance. By the proclamation of 1622 , the one-half is

$\cdots$

Poor. to be paid hy the heritors, the other by the houfeholders of the parifh. By that of 1693 , in burghs royal, the magiflrates are to ftent themfelves, conform to fuch order and cuftom ufed and wont in laying on Itents, annuities, or other public burdens, in the refpective burgh, as may be moolt effectual to reach all the inhabitants; and the heritors of feveral vacant [landwart] parifhes to ftent themfclves for the maintenance of the refpective poor.
3. A fill greater diverfity takes place in regard to the apjlication of the funis fo fiented. By the aet 1570, it would feem that the whole of the moncy affelled was to be applied to the ufe of the helplefs poor alone, and no part of it for the relief of thofe who were capable of working. By the att toriz, on the contrary, the whole of this aftelfment is to be applied for the lipport of thoie ouly awho are alle to suork. This is fill more fpecially provided for by the aft 1672 ; where the foor who are unable to work are to be fupported by the weekly collections at the kirk doors; and the ftented affefliments to be applied to the fupport of thofe in the corrction houfes.

It would be tirefome to enumerate all the contradicfions that thefe laws authorife. In regrard to the perfous whlo are required to carry thefe acts into exrecution, it is at different times the chancellor; magiltrates; commillioners of excife; theriffs; jultices of the peace; minillers and elders; the prefbyteries; heritors, minifers, and elders; heritors alone ; committioners nominated by prefoytcries and appointed by the king; the lords of the privy council: in fhort, no two laws can be found that do not vary from each other in this refpect one way or other.

The fame variations take place with regard to the building of correction-houfes, coninement and puniftsment of vagrants, application of their work, awarding their fervices and thofe of children. In fhort, there is not one particular in which thefe laws do not vary from and contradist each other ; fo that, let any perfon try to act in virtue of any one of them, it is impoffible for him to avoid going in direct oppofition to the enactments of fome other law which is of equal force with that he hats chofen for his guide. In thefe circumflances it is fo far from being furprifing that thefe acts have been fuffered to remain in perpetual defuetude, that it would have been trnly wonderful if this had not been the cafe. They have, however, been permitted to remain on the flatutebook ats a difgrate to the times when they were formed, and as a flumbling-block to thofe that were to follow. That not one of them is now in force was lately proved by a learned and publicipirited gentleman, to whom his country is on that and many other accounts deeply indebted. Refufing to pay the poor's tax, with which he was affelfed by the overficers of the parifh in which he happened to refide, he thood an action in the court of feffion, and prevailed, upon the broad ground, that there is 120 lave in force in Scolland by rubich an involuntary poor's rate can be cfallifhed in any parifh.

Eut how, it will be afked by our readers, are the poor in Scolland really maintained? We antwer, by the private alms of individuals, and by certain funds mder the management of the kirk-fefious (fee Presbytertans). It is the univerfal practice, cach Lord's dujo in every parifi, for fuch ot the audience as are in
eafy circumfances, to give to the poor fuch an offering of alms as they thall deem proper. This offering is generally dropped into a bafon placed at the church-donr, and under the immediate care of an elder. When the fervice is begun, the elder removes with the bafon, which he keeps muder his charge till the congregation be difmiffed. The feflion then meets, and the money is told over, its amount marked down in the feffion account book, and depofited in a box kept for that purpofe. This box has ufually a fmall flit in the top, through which the pieces of money can be dropped without opening it; and it is clofed with two locks, the key of one of which is ufually kept by the miniter and the other by the kirk-treafurer, fo that it can never be opened but in the prefence of thefe two at leaft.

A kirk-feffion, when regularly confituted, muft al. ways conlift of the miniter, elders, feflion-clerk, and kirk-treafurer. None of thefe ever receive any falary except the feffinn-clerk, who is ufualiy the fchoolmalter of the parith, and has a fmall falary allowed for minuting the tranfactions. The kirk-treafurer is for the molt part one of the elders; and he is an important member of this court. Wirhout his intervention no diltribution of the poor's funds is decmed legat; nor can any payments be made, receipis granted, or money transferred, but by him ; the minifter and fetlion being perfonally liable to make good all money that may otherwife be given away, fhould it ever afterwards be challenged by any heritor in the parifh.

The precautions taken for the diftribution of the poor's funds are likewife fimple and excellent, and are as follow.

No money can be legally ifued from the poor's funds even by the treafurer and feflion, unlefs legal proof cant be brought that public intimation has been given from the pulpit immediately after divine fervice, and before the congregation has difperfed, that a diftribution of poor's money is to be made by the feffion, at fuch a time and place, pecifying the fame, and inviting all who lave interef in the cafe to attend if they fhall incline. This intimation mult be male a full fortnight before the time of diftribution; and as every heritor (owner of landed property) in the parifh has a right to vote in the diftribution of the poor's funds, they may all, if they fo incline, then atterd and exercife that right: but if none of them fhould attend, which is often the cafe, the fellion has then a tight to proceed; and whatever they flall thus do, is deemed ftrictly legal, and is liable to no challenge. But fionld they proceed without having given this previous intimation, they may, if the heritors thould afterwards challenge it, be made to repay out of their ovia pockets every fhilling they flall have fo iffued. It fometimes happens, that young minifters, through heedleflinets in this refpect, expole themfelves and families to confiderable trouble and lofs, which by attention might be eafily avoided. In the fame way, thould a minitter and feffion, without the intervention of a treafurer regulaty comfinted, lend upon bond or otherwife any of the poor's funds, and fhould the perfon fo borrowing afterwards fail, theie lenders are perfonally liable to make good the whole, and any heritor in the parifh who chooles it can compel him to do fo.

The members of the feffion are alfo liable to pay all lofes, and to account for all fums that it can be inAtructed

## POO [ 375 ] OP

fructed they reccived, if they neglect to keep regular books, in which every trantation fhall be entered: Or, if thefe books have not been revifed and approsed of by the prefoytery (A) ; but if they fall have been fo revifed, they cannot be challenged for omifion of forms, and can only be made to account for crrors, or frauds, or evident dilapidations.

Under this wife and economical fyftem of management, it has been found by the experience of more than 200 years, that in the low parts of the country, where the parithes are in general of fuch moderate extent as to admit of the pcople of every part of the parifh generally to attend divine fervice every Lord's day, the ordinary funds have been amply fufficient to fupply all the real demands of the poor, and in moft parifhes a fund has been accumulated from the favings of ordinary years to help the deficiencies that may arife in years of uncommon fearcity.

Befides the weekly collections, the extra offerings at the adminiftration of the Lord's fupper, the pious donations of charitable individuals, which are allvoluntary, together with fome fmall fees paid for the ufe of a mortcloth (a black velvet pall) at funerals, which is generally purchafed with the poor's money, go to make up this parochial fund. Nor mult any one believe that the money which comes through the hands of the adminiftrators of the poor's funds is all that is beltowed upon the poor in Scotland; far from it: there are a thoufand other channels through which the indigent derive confolation and fupport, all of them tending to produce the happieft effects upon fociety. A fon feels himfelf afhamed to think that his parents fhould require the affiftance of another to fupport them; he therefore ftrains cvery nerve when in the vigour of life to fpare a little of his earning to render their old age more eafy than it might have been; and fweet to a parent is the bread that is given by the pious attention of a child. If there are feveral children, they become emulous who fhall difcovermoft kindnefs. It is a pious contention which ferves to unite them the clofer to each other, by commanding their mutual efteem.

Directly contrary to this is the effect of the poor laws of England, where, in London at leaft, it is not uncommon to fee men in good bufmefs neglecting their aged and difeafed parents for no better reafon than that the parilh is bound to find them bread. Theie laws lave other pernicious comfequences; for they are obvioufly fubverfive of indutry as well as morality among the lower orders of the people. "This is a heavy' charge, but no lefs true than heavy. Fear of want is the only effectual motive to induftry with the labouring poor: remove that fear, and they ceafe to be induftrious. The ruling pallion of thofe who live by bodily labour, is to fave a pittance for their children, and for fupporting themfelves in old age. Stimulated by defire of accomplithing thofe ends, they are frugal and induf-
trious; and the profpect of fuccefs is a continual feart to them. Now, what worfe can malice invent aganft fuch a man, under colour of fricndfip, than to lecure bread to him and his chiklren whenever he talies a dif. like to work; which effectually deadens his fole ambition, and with it his honeft induftry? Relying on the certainty of a provifion egainft want, he relaxes gradually till he finks into idlenefs; idlenefs leads to piofligacy ; profligacy begets difeafes; and the wretch becomes an object of public charity before he has run hali his courfe. Wifely therefore is it ordered by Providence, that charity fhould in every infance be voluntary, to prevent the idle and profligate from depending on it for fupport. During the reign of Elizabeth, when the monafteries were recently fuppreffed, and all their revenues fquandered, fome compulfion might be neceffary to prevent the poor from farving. A temporary provifion for this purpofe, fo contrived as not to fuperfede voluntary charity, but rather to promote it, would have been a meafure extremely proper. Unlucky it is for England that fuch a meafure was overlooked; but the queen and her parliaments had not the talent of forefeeing confequences without the aid of experience. A perpetual tax for the poor was impofed, the molt pernicious tax, fays Lord Kames (B), that ever was impofed in any country."

POPA-madre, is a town of South America, in Terra Firma. In this place there is a convent and chapel dedicated to the Virgin Mary, to whofe image the Spaniards in thofe parts go in pilgrimage, particularly thofe who have been at fea. It is feated on a high mountain, 50 miles eaft of Carthagena. W. Long. 74. 32، N. Lat. Io. 15.

POPIE. See Victimarius.
POPAYAN, a province of South America, in the kingdom of New Granada, between the audience of $\mathrm{Pa}_{\mathrm{a}}$ nama, that of Quito, and the South Sea; 400 miles in length, and 300 in breadth. A chain of barren monntains rums through the country from north to fouth; and near the fea the foil is fo foaked with almolt continual rains, that few care to refide there, except for the fake of the gold that is met with in great plenty in the fands of thie rivulets. This bewitching metal brings many in fearch of it, though it is a great doubt whether they ever return back alive or not. For this reafon the favage Americans are lill maters of a great part of it, and continually annoy the Spaniards.

Popavan, the capital town of a province of that name in South America, with a biftop's lee, a Spanith governor, and where the courts of juftice are held. The inhiabitants are almoft all Creoles. It is 220 miles north-ealt of Quito. W. Long. 75. 55. N. Lat. 2. 35.
POPE, an name which comes from the Greek word $\Pi \varkappa \pi a$, and lignifies Father. In the ealt this appellation is given to all Chriftian prietts; and in the weft, bifhops were called by it in ancient times: but now for
(A) The pr-fytery is by law appointed auditor of the poor's accounts of the feveral parifhes within its bounds; andif they find any difficult cafe occur in the difcharge of this duty, they may lay it before the fyn od for advice.
(в) See Sbetches of Man, bookii. Kketch 10. where many other arguments equally forcible are urged againt all involuntary poor-rates, and where many ingenioas expedients are propofed for gradually abolifhing them where they are eftab:ilhed.
many centuries it has been appropriated to the bifiop of Rome, whom the Roman Catholics look upon as the common father of all Chrifians.
Much has been fad, much written, and many warm difputes have been carried on concerning the pope, and the power belonging to him, within the fe two or three lan centurics. We thill here, without entering into controversy, lay down difinelly, from the be f autherity, what the Roman Catholics really believe concerning the pope, after having deferibed the manner of his alecsion; and we hail give forme other particulars relating to this fubjet that fem to deferve notice, and are ins this country not generally known.

All in communion with the fee of Rome unamimouny hold, that our Saviour Jefus Chrift confitures St Peter the apofle chief patter under himself, to watch over his whole flock here on earth, and to preferve the unity of it ; giving him the power requifite for there ends. They also believe, that our Saviour ordained, that St Peter flould have fuccefiors with the like charge and power, to the end of time. Now, as St Peter refiled at Rome for many years, and fuffered martyrdom there, they confiver the biflops of Rome as his fucceRors in the dignite and office of the univerfal patter of the whole Cittholic church. There have been fore varieties in the manner of choofing the bifhop of Rome in different ages, as alterations may be made in difciplinc ; but ail the clergy of Rome have juftly had the chief part in that election: and that clergy is now reprefented by, or in come manner confines of, the carilinals, who have for several centuries been the foll electors of the pope.

Thee cardinals or principal performs of the church of Rome are 70 in number, when the faced college, as it is called, is complete. Of thee fix are cardinal bithops, the bihops of Oftia, of Porto, Albano, Sabino, Tuftloom or Frafcati, and Pranefte or Paleftrina ; which are the fix fuluurticarian churches ; fifty are cardinal priefts, who have all titles from parifh churches in Rome; and fourteen are cardinal deacons, who have their titles from churches in Rome of less note, called Diaconias or Deaconit es. Thife cardinals are created by the pope when there i.appen to te vacancies; and dometimes he names one or two only at a time; but commonly he defers the promotion until there be ten or twelve vacancies or more; and then at every lecond fuck promotion the emperor, the Lines of Spain and France, and of Sritain, when Catholic, are :allowed to profent one each, to be made cardinal, whom the pope always admits if there be not forme very great and evident objection. There cardinals are commonly promoted from among foch clergymen as have bore offices in the Roman court; fore are alfumed from religious orders; amiin nt cocicfiallies of other countries are likewife often honoured with this dignity, as the archbilhops of Toleda and Vienna are at prefent cardinal priefts of Rome. Son :s of Sovereign princes have frequently been members of the faced college; and there ends the direst line of the royal family of Stuart. Their difingive dress is scarlet, to dignify that they ought to be ready to the their blood for the faith and church, when the defence and honour of either require it. They wear a pallet cup and hat: the cap is given to thensby the pope if they are at Rome, and is font to there if they are :abfont; but the hist is never given but by the pope's own hand. Thee cardinals form the pope's standing count-
cia or comflory for the management of the public affairs of church and nate. They are divided into different congregations for the more eafy dispatch of bunime.s; and fume of them have the principal offices in the pontifical court, as that of cardinal-vicut--penitentiary-chin-cellor-camerlingoor chamberlain-perfeer of the fighttare of jultice-perfect of memorials-and fecretary of tate. They have the title given then of eminence and moot anincht. But here we confider them principally as the perfonsentrulted with the choice of the pope. See Cardinal.
On the demife of a pope his pontifical feal is immediately broken by the chamberlain, and all public buffnets is cuterrupted that can be delayed: mefliengers are dispatched to :ll the Catholic fovercigns to acquaint them of the event, that they may take what meafures they think proper; and that the cardinals in their dominions, if any there be, may haften to the future alecton if they clone to attend; whillt the whole attenton of the fared college is turned to the prefervation of tranquillity in the city and fate, and to the neceffary preparations for the future election. The cardinal chamberlin has, during the vacancy of the holy fee, great authority; he coins money with his own arms on it, lodges in the pope's apartments, and is attended by body-guards. He, and the frt cardinal bithop, the frt cardinal pried, and the frt cardinal deacon, have, during that time, the government almoft entirely in their lands. The body of the deceafed pope is carried to St Peter's, where funeral fervice is performed for him with great pomp for nine days, and the cardinals attend there every morning. In the mean time, all necelfary preparations for the election are made; and the place where they affemble for that purpofe, which is called the conclave, is fitted up in that part of the Vatican palace which is neareft to St Peter's church, as this has long been thought the molt convenient fituation. Here is formed by partitions of wood a number of cells or chambers equal to the number of cardinals, with a fall diftance between every two, and a broad gallery before them. A number is put on every cell, and final papers with correfponding numbers are put into a box: every cardinal, or forme one for him, draws ont one of there papers, which determines in what cell he is to lodge. The cells are lined with cloth; and there is a part of each on feparated for the conclavits or attendants, of whom two are allowed to cache cardinal, and three to cardinal princes. They are perinns of forme rank, and generally of great confidence; but they mut carry in their matter's meals, ferve him at table, and perform all the offices of a menial fervant. Two phyficians, two furgeons, an apothecary, and fome other necellary officers, are chosen for the conclave by the cardinals.

On the roth day after the pope's death the cardinals, who are then at Rome, and in a competent fate of health, meet in the chapel of St Peter's, which is called the Gregorian chaser l, where a fermion on the choice of a pope is preached to them, and mats is fail for invoking the grace of the Holy Goof. Then the cardinals proceed to the conclave in proceffion two by two, and take up their abode. When all is properly fettled, the conclave is flux up, having boxed subsets or places of communication in convenient quarters : there are alpo Atone guard plead all around. When any
foreign

## POP [379] POM

foreign cardinal arrives after the inclofure, the conclave is opened for his admilfion. In the beginning cvery cardinal figns a paper, containing an objigation, that if he thall be raifed to the papal chair he will not alienate any part of the pontifical doninion; that he will not be prodigal to his reations; and any other fuch ftipulations as may have been fetted in former times or framed for that occafinn.

We come now to the election itfelf; and that this mult be effeciulal, two thirds of the cardinals prefent muft rote for the fame perfon. As this is often not eafily obtained, they fometimes remain whole months in the conclave. They meet in the chapel twice every day for giving their votes; and the clection may be effectual by foratiny, acceffion, or acclamation. Scrutiny is the ordinary method; and conlifts in this : every cardinal wites his own name on the inner part of a piece of paper, and this is folded up and fealed; on a fecond fold of the fame paper a conclavit writes the name of the perfon for whom his matter votes. This, according to argreements obferved for fome centuries, muft be one of the facred college. On the outer fide of the paper is written a fentence at random, which the yoter mult well remember. Evcry cardinal, on entering into the chapel, goes to the altar and puts his paper into a large chaiice.

When all are convened, two cardinals number the votes; and if there are noore or lefs than the number of cardinals prefent, the roting muft be repeated. When that is not the cafe, the cardinal appointed for the purpofe reads the onter fentence, and the name of the cardialal under it, fo that each voter hearing his own fentence and the name joined with it, knows that there is no mittake. The names of all the cardinals that are voted for are taken down in writing, with the number of votes for each; and when it appears that any one bas two-thirds of the number prefent in his favour the election is over: but when this does not happen, the voting papers are all immediately burnt withont opening up the inner part. When feveral trials of coming to a conclufion by this method of forutiny have been made in vain, recourfe is fometimes had to what is called accufion. By it, when a cardinal perceives that one or very few votes are wanting to any one for whom he had not voted at that time, he may fay that he accedes to the one who las near the number of votes requifite; and if his one vote fuffices to make up the two-thirds, nr if he is followed by a fulficient number of acieders or new voters for the faid cardinal, the elecion is accomplifhed. Lafly, a pope is fometimes eleated by accla--nation; and that is, when a cardinal, being pretty fure that he will be joined by a number fufficient, cries out in the open chapel, that fuch an one fhall be pope. If be is fupported properly, the election becomes unanimous; thofe who wh uld perhaps oppofe it forefeeing that their orpurition would be frutitef, and rather hurtful to themelves. It is to be oberved, that the empetor of Germany and the kings of France and Spain claim a tight of excluding one cardinal from being pope at every eleation. Hence, when the ambaffador at Rome of any of thefe fuvereigns perceives that any cardinal, difagreeable to his matter, according to the inftructions he has received, is like to be made popc, he demands nn audience of the $c$ nclave, is adnitited, and there declares his mafter's will, which is always attended to for Vol. XV.
the common good. Fut each of thofe fovereigns is allowed thus to exclide only one at one time; and they unwillingly and feldem put this right in execution.

When a pope is chofen in any of the three abovementioned ways, the elchion is immediately arnounced from the balcony in the front of St Peter's, homage is paid to the new pontiff, and couricrs are fent off with the news to all parts of Chrifendom. The pope ap. points a day for his coronation at St Peter's, and for his taking puffeflion of the patriarchal church of St John Latcran; ;ill which is perlormed with great folemnity. He is addreffed by the expreflion of IIslings, and migh boly Faiber.

Let us now proceed to fee what authority Roman Catholics attribute to the pope thus chofen. They believe, then, thit the bithop of Rome is, under Chrif, fupreme pafter of the whole church; and as fuch is not ouly the firt bithop in order and dignity, buc has alfo a power and jurifdiction over all Chritians, in order to prcferve unity and purity of faith and moral coatrine, and to maintain order and regularity in :lll churches. Wherefore they $h \mathrm{ld}$, that when the pope underfands that any crror has been broacled againt faith or manners, or that any confiderable difference on fuch fubjects has arieen in any pert of Chriftendom, it I, clongs to him, after due deliberation and confultation, to iffive out his patt ral decree, condemning the error, clearing up the doubt, and declaring what has been delivered down, and what is $t$ be believed. Some Catholic divines are of opinion that the pope cannot err, when he thes addreffes himfelf to all the faithful on matters of dostrine. They well know, that as a private do?or he may fall into miftakes as well as any other man ; but they think, that when he teaches the whole church Providence muft preferve him trom error; and they apprehend, that this may be deduced from the promifes of Chritt to St Peter, and from the writings of the ancient fathers. How ever, this infallibility of the pope, even when he pronounces in the moft fulemn manner, is only an opinion, and not an article of Roman Catholic faith. Wherefore, when he fends for the doctrinal decrees, the other bifhops, who are alfo guardians of the faith in an inferior degree, may, with duc refpect, examine thefe decrees; and if they fee them agree with what has been always taught, they either formally fignify their accep. tance, or they tacitly acquiefce, which, confidering their duty, is equivalent to a formal approbation. When the acceptation of the generality of the bifhops has beens obtained, either immediately or after fome mutual correfpondence and explanation, the decrees of the pope thus accepted come to be the fentence of the whole church, and are believed to be beyond the polfibility of erros!

Sornetimes it may happen that the difputes and difference may he fo great and intricate, that to the end it may be feen more clearly what has really been delivered down; and to give all pollible fatisfanaion, it may appear proper to convente all the bifhops who can conveniently attenal to one place, to learn from them more diftinclly what has been taught and held in their refpective churches. Roman Catholics believe that it belongs :o the pope to call fuch general councils, and to prefide in them in perfon or by his legates. They likewife hald, that when the pope has approved the decrees of fuch conncils concerning faitio or manners,
fut th

fuch decrees are then final, and mult te received as fuch by all Catholics. In all this they believe, that the particular affifance of the Holy Ghoft is with the paftors of the church, that fo the gates of bell may never prevailagainf her.

The iee of Rome, according to Roman Catholics, is the cantre of Catholic unity. All their bifhops communicate with the pope, and by his means with one arlother, and fo furm one body. However diftant their particular churches may be, they all meet at Rome either in perfon or by their delegates, or at leaft by their letters. And, according to the difcipline of the latter ages, though they are prefented to the pope for their office from their refpedive countrics, yet from him they mult receive their bulls of confecration before they can take polfifition of their fees.

In maters of church difcipline, the pope, as chief paftor, not only ought to take care that the canons actually in force be obferved in all churches, but he may alfo make new canons and regulations when he fees it necefliary or expedient for the firitual benefit of the faithful, according to imes and circumftances. But in doing this he mult not infringe the eftablithed rights or cuftoms with injury to any perfon; which if, through mitake or wrong information, he fhould ever d 0 , the perfons who think themfelves aggrieved may remonfirate with refpect and fue for redrefs. He may eitablifh new epifcopal fees, where there have been none before; and he may alter the limits of former diocefes; but in fuch alterations he always of courfe confults the temporal fovereign, if in communion with him. He tends paftors to preach the gofpel to all countries where Whe Catholic religion is not by law ctablifhed; and to him appeals may be made from all parts of Chriftendom 13 ecclefiafical caufes of great importance.
'Xhe pope may difpenfe with the obfervation of ecelefiafticel canons when there are junt reafons for it, as may frequently happen; he mayalfo difpenfe with vows when they are made with that exprefs or tacit condition (A) that he really may difpenfe with them; he may alfo on fome occafions declare that obligations have really ceafed when that is truly the cafe, from a great alteration of circumftances: But he can never grant any difpenfation, to the iujury of any third perdon, and can never allow any one to do what is unjuft, or to fay what he knows to be falle, whatever advantage might be expectel from it.

The pope is aifo a temperal prince, and poffefies conliderable dominions in the middle part of Italy, befides Avignon, which the French have lately taken from him, and the duchy of Benevento inclofed within the kingdom of Naples. It is alfo fuppofed that the king. dom of Naples and Sicily, and the duchies of Parma and Placentia, are ftill held of him in fief as they were before. His predeceffors have acquired thefe poffefions at different times and on different occalions, by various donations, conceffions, treaties, and agreements, in like manner as has happened with regard to the eftabliflment of other fovereignties; and his title to them is like to that of other potentates to their refpective por. feffions. The revenue arifing from this eftate, and
what he receives for various reafons fiom Catholic countries, which is now much reduced, is employed for the fupport of government, in falaries to the officers of his court, for the education of clergymen, and for the maintaining of miffionarics in infidel countries. Great fums are particularly expended for the propagation of the Chriftian faich in different parts of Afra, efpecially in Armenia, Syria, and China. Nor is it much to be wondered at, if the families, of which the fovereign pontiffs happen to have been born, acquire greater riches and fiplendor from that connection. The princely fanilies of Barberini, Borghefe, Chigi, Corfini, Albani, are examples of this kind: but regulations have been made in later times to prevent exceflive neputifm. Beyond the limits of his own temporal dominions the pope has no temporal power or jurifliction, excepting what any nation may be pleated to allow him: when any thing of that kind has been granted or brought in by cultom, it is evident that it ought not to be taken away rafbly nor without jutt reafon. But, as chicf paftor of the church, he has no right to any remporal jurifdition over his flock. As fuch, his power is entirely fpiritual, and has no means of coercion originally or neceffarily connected with it, but only ecclefiafical cenfures. It mult be owned, that the popes, in fome ages, fometimes imagining that they could do much good, fometimes by the confent, or even at the defire, of the fovereigns, and fometimes no doubt out of ambitious views, have interfered a great deal in the temporal affairs of the different kingdoms of Europe, which has frequently given fcandal and done harm to religion. But it is known to thofe moft verfant in hiftory, that their faults of this kind have been exaggerated, and their conduat often mifundertood or mifreprefented. However, in this a Roman Catholic is not obliged to approve what they have done; nay, without acting contrary to his religion, he may judge of them freely, and blame them if he think they deferve it; only thewill do it with refpeet and regret. Thus a Roman Catholic may either apologife, if he think he can do it, for the conduet of Innocent III. in depofing king John of England; or, without being guilty of any offence againtt his religion, he may blame the pontiff for what he did on that occafion; bccaufe the power of the pope to depofe princes, or to abfolve fubjects from their allegiance, was never propofed as an article of faith, or made a term of communion with the church of Rome. Some Catholic divines, indeed, efpecially among the Jefuits, are univerfally known to have held this extravagant and dangerous opinion; but by far the greater pait of them condemn and abhor it as abfurd and impious: and furely it is but fair and juft to allow them to know beft what they themfelves believe. And here, to conclude, we fhall add, that it is very defirable that Chriftians of all denominations endeavour to underfand one another better than they have often done; and inftad of fuppofing imaginary differences, frive to remove real ones, for the general good of mankind, for the glory of God, and honour of religion; and that all vie with. one another to excel in juft and charitable fentiments, language, and bchaviour.

## POP

The rea ier, who withes to know what can be urged for and againt the fupremacy of pope, and who is fitted by his knowledge of ecclefialtieal hiltory to underltand the nature of the queftion at iffue, may confult, on the one hand, the works of Bellarmine, together with a finall trad lately publifhed in Engliih, under the title of The Divine Economy of Chrifl in his king dom or Charch; :md on the other, Barrow's treatife on the Pupe's Subremacy, together with Chillingworth's Religron of i"rot ficuns, \&c.
: Pope (Alexinder), a celebrated Englifl poct, was deliended from gool families, and born the 8 th of Junc 1688, at London, where his father was then a contiderable morchant. He was taught to read very early by an aunt ; and learned to write without any affillaoce, by copying printed books. The family being of the Romifh religion, he was put, at eight years of age, under one Traverner, a prielt, who taught him the rudiments of the Latin and Greek tongues together; and foon after was fent to a Popilh feminary at Winchefter, from whence he was removed to a fchool at Hyde-Park Corner. He difcovered early an inclination to verfifying; and the tranflations of Ogilby and Sandyss from Virgil and Ovid firlt falling in his way, they were lis favourite authors. At twelve he retired with his parents to Binfield, in Windfor Foreft; and there bccame acquainted with the writings of Spenfer, Wal. ler, and Dryden. Dryden ftruck him moft, probably becaufe the calt of that poet was moft congenial with lis own; and therefore he not only ftudied his works intenfely, but ever after mentioned him with a kind of rapturous veneration. He once obtained a fight of him at a coffee-houle, but never was known to him: a misfortune which he laments in thefe thort but expreffive words, Virgilium tantum vidi. Though Pope had been under more tuiors than one, yet it feems they were fo infufficient fir the purpofe of teaching, that he had learned very little from them; fo that, being obliged ofterwards to begin all over again, he may juftly be corfidered as one of the zurosidxurot or folf-taught. At fifteen he had ac. quired a readinefs in the two learned languares; to which he foon after added the French and Italian. He hall already fribbled a great deal of poetry in varicus ways; and this year fet about an epic poem called Alcander. He long after communicated it to Atterbury, with a declared intention to burn it; and that friend concurred with him: "Though (adds he) I would have interceded for the firt page, and put it, with your leave, among my curiofities." What the poet himfelf obferves upon thefe early picces is agreeable enough; and fhows, that though at firt a little intoxicated with the waters of Helicon, he afterwards arrived to great fobriety of thinking. "I confefs (fays he) there was a time when I was in love with niyfelf; ar my firft productions where the chikdren of Selflove upon Innocence. I had made an epic poem, and panegyrics on all the princes; and I thought myfelf the greateft genius that ever was. I cannot but regret thefe delightfill vifions of my childhood, which like the fine colours we fee when our eyes are fhut, are vanifhed for ever." His paftorals, begun in 1704, firf introduced hinn to the wits of the time ; among which were Wycherly and Walh. This laft gentleman proved a fincere friend to tim; and foon diferning that his talent lay, not fo much in Ariking out new thoughts of his own, as in
improving thofe of other men, and i:1 an cafy renfficetion, told him, among other things, that there was on: why left open for him to excel his predecelfors in, which was correctnefs: obferving, that though we had feveral great pocts, yet none of them were corref. Pupe took the hint, and turned it Ln good account ; for no doubt the diltinguining harmony of his numbers was in a great meafure owing to it. The fame year, 1504, he wrete the firlt part of his Windfor Foreft, though the whole was not publiflad till $17 \mathrm{I}_{10}$. In 1708 , he wrote the Efliay on Criticiim: whicls production was juftly eftemed a mallerpiece in its kind, and howed not only the peculiar turn of his talents, but that thore talents, young as he was, were ripened into perfettion. He was not yet twenty years old ; and yet the maturity of judgment, the knowledge of the world, and the penetration into human nature, difplayed in that piece, were fuch as would have done honour to the greatelt abilities and experience. But whatever may be the merit of the Eliay on Criticifn, it was Rill furpoffed, in a poetical view, by the Rape of the Lock, firld completely publifhed in 1712 . The former excelled in the didactic way, for which he was peculiarly formed; a clear head, ftrong fenie, and a found judgment, being his characteriftical qualities ; but it is the creative power of the imagination that conflitutes what is properly called $x$ poet; and therefore it is in the Rape of the Lock that Pope principally appears one, there being more vis imaginandi difplayed io this poem than perhaps in all his other works put together. In 1713, he gave out propofals for publifhing a tranflation of Homer's Iliad, by fubfeription; in which all parties concurred to heartily, that he acquired a confiderable fortune by it. The fulffription amounted to 60001 . befides $12 c 01$. which Lintot the bookfeller gave him for the cop!: Pope's finances being now in gond condition, he furchafed a houfe at Trwickenham, whither he removed with his father and mother in 1715: where the former died about two years after. As he was a Papif, he could not purchafe, nor put his money to intereft on real fecurity; and as he adhered to the caufe of King James, he made it a point of confcience not to lend it to the new government ; fo that, though he was worth near 20,0001 . when he laid afide bufinef's, yet, living afterwards upon the quick fock, he left but a flender fubfiftance to his family. Our poet, however, did not fail to improve it to the utmoft : he had already acquired much by his publications, and he was all attention to acquire more. In 1717, he publifhed a collection of all he had printed feparately ; and proceeded to give a new edition of Shakefpeare; which, being publifhed in 1721 , difcovered that he had confulted his fortune more than his fame in that undertaking. The Iliad being finifhed, he engaged upon the lite footing to undertake the Odyfley. Mr Broome and Mr Fenton did part of it, and received 5001. of Mir Pope for their labours. It was publithed in the fame manner, and on the fame conditions to Lintor; excepting that, inftead of 12001 . he had but 6001 . for the copy. This work being finithed in 1725 , he was afterwards employed with Swift and Arbuthnt in printing fome volumes of Mifcellanies. About this time he narrowly ercaped lofing his life, as he was returning home in a friend's chan iot; which, on pafing a bridge, happened to be overturned, and thrown with the horles into the river.

The glaffes were np, and he was not able to break them: fo that he had immediately been drowned, if the poftillion had not broke them, and dragged him out to the bank. A fragment of the glafs, however, cut him fo defperately, that he evet after loft the ufe of two of his fingers. In 1727 his Dunciad appeared in Ireland; and the year after in England, with notes by Swift, under the name of Scrillerus. This edition was prefented to the king and queen by Sir Robert Walpole ; who, probably about this time, offered to procure Pope a penfion, which however he refufed, as he had formerly done a propofal of the fame kind made him by Lord Halifax. He greatly cultivated the fpirit of in. dependency; and "Unplac'd, unpenfion'd, no man's heir or flave," was frequently his boalt. He fomewhere obferves, that the life of an author is a fate of warfare: he has thown himfelf a complete general in this way of warring. He bore the infults and injuries of his enemies long ; but at length, in the Dunciad, made an abfolutely univerfal flaughter of them: for even Cibber, who afterwards advanced to be the hero of it, could not forbear owning, that nothing was ever more perfect and finifled in its kind than this prem. In 1729 , by the advice of Lord Bolinghroke, he turned his pen to fubjects of morality; and accordingly we find him, with the affiftance of that noble friend, who furnilhed him with the materials, at work this year upon the Elfay on Man. The following extrat uf a lecter to Swift difcovers the reafon of his, Lordhhip's advice: "Bid him (fays Bolingbroke) talt to you of the work he is about, I hope in good earneft ; it is a tine one, and will be, in his hands, an origimal. His fale complant is, that he finds it too ealy in the exesution. This flatters his laziness : it flatiers my judgement; who always thought, that, univerfal as his talents are, this is eminently and peculiarly his, above all the writers I know, living or dead; I do not except Horace." Pope tells the dean in the next letter, that "the work Lord Bolingbroke fieaks of with firch abundant partiality, is a fyttem of ethics, in the Hosation way." In purfuing the fame defign, he wrote Lis Ethic Epiftes: the fourth of which, upon Tafte, giving great offence, as he was fuppofed to ridicule the Trike of Chandos under the character of Timon, is faid to have put him upon writing fatires, which he enontinued till 1739. He ventmed io attack perfons of the higheft rank, and fet no bounds to has fatirical rage. A genuine collection of his letters was publifhed in 1737 . In 1738 , a French trantlation of the Elty on Man, by the Abbé Refnel, was printed at Paris; and Mr Croufar, a German profefior, animadverted upon this fyllem of ethics, which he reprefented as nothing clic but a fyltem of naturalifm. Mr Warburton, afterwards bithop of Gloucciter, wrote a commentary upon the Eflisy; in which he detcnds it agoinft Crou. faz, whofe objections he fuppofes owing to the faultinefs of the Abbé Refinel'stranflation. The poem was republithed in ij4c, with the commentary. Our author now added a fourth book to the Dnncidd, which was firft printed feparately in 1742 : but the year after, the whole poem came out ingether, as a fecimen of a more correct edition of his works. He had made fome progrefs in that defign, but did not live to complete it. He had all his life $1 . \mathrm{ng}$ been fubject to the head ach; and that complaint ${ }_{2}$ which he detived from
his mother, was now greatly increafed by a dropiy in his breatt, under which he expired the 3oth of May 1744, in the 56 th year of his age. In his will, dated December 12. 1743, Mifs Blount, a lady to whom he was always devoted, wats made his heir during her life: and among other legacies, he bequeathed to Mr War. burton the property of all furch of his works, already. printed, as he had written, or fhould write commentaries upon, and which had not otherwife been difpofed of or alienated; with this condition, that they were publifhed without future alterations. In difcharge of thit trult, that gentleman gave a complete edition of all Mr Pcpe's works, 7751 , in 9 vols, 8 vo. A work, entitled, An Effiy on the Writings and Genius of Pope, by Mr Warton, 2 vols 8 vo, will be read with pleafure by thofe who defite to know more of the perfon, charac. ter, and witing of this excellent poet. Lord Orrery's account of him is very flattering: "If we may judge of him by his works (fays this noble author), his chief aim was to be eftcemed a man of virtue. His letters are witten in that fyle; his laft volumes are all of the moral kind; he has avoided trifles, and confequently has efcaped a rock which has proved very injurious to Swift's reputation. He has given his imagination fill fcope, and yet has preferved a perpetual guard upon his conduct. The conititution of his body and mind might really incline him to the habits of caution and referve. The treatment which he met with afterwards, from an innumerable tribe of :ddverfaries, confirmed this habit; and made him flower than the dean in pronouncing his judgment upon perfons and things. His profewritings are little lefs harmonious than his verfe; and his voice, in common converfation was fo naturally mufical, that 1 remember honef Fom Southern ufed to call him the little mightingale. His manners were delicate, eafy, and engaging; and he tteated his friends with a politenefs that charmed, and a generofity that was much to his honour. Every gueft was made happy within his doors; pleafure dwelt under his roof, and clegance prefided at his table."

Yet, from Dr Johnfon's account of his domeftic habits, we have realon to doubt the latter part of this charaser. His parfimony (he informs us) appeared in very petty matters, fuch as writing his compolitions on the backs of letters, or in a niggardly reception of his friends, and a feantinefs of entertainment-as the fetting a fingle pint on the table to two friends, when, having himfelf taken two fmall glaffes, he winld retire, faying, I leave you to gour wine. He fometimes, however, the Docter acknowledges, made a fplendiu dianer ; but this happened fellom. He was very full of his fortune, and frequently ridiculed poverty; and he feems to have been of an opinion not very uncommon in the world, that to want money is to want every thing. He was almoft equally proud of his connection with the great, and often boalted that he obtained their notice by no meanoefs or fervility. This admiration of the great increafed in the advance of life; yet we muft acknowledge, that he could derive but little honour from the notice of Cobham, Burlington, or Bolingbroke.

By natural deformity, or accidental difortion, his. vital functions were fo much difordered, that his life was a long difeafe ; and trom this canfe arofe many of his peculiarities and weakntifes. Ife food conftantly

## POP [ $\left.3^{81}\right] \quad$ POP

in need of female attendance; and to avoid cold, of which he was very fenfible, he wore a fur doubler under his thirt, \&c. The indulgence and acoommodation whicla his ficknefs required, had taught him all the unpleafing and unfocial qualitics of:a valetudinary man.When he wanted to fleep, he nodded in company; and once flumbered at his own tible when the prince of Wales was talking of pnetry. He was extremely troubleticme to fuch of his friends as alked him out, which many of them irequently did, and plagued the fervants bevond detcription. His love of eating is another fault to which he is faid to have fatlen a lacrifice. In all his intercou: fe with mankind, he had great delight in artifice, and endeavcured to attain all his purpofes by indirect and unfufpected methods.
In faniliar converfation it is faid he never excelled; and he was fo fretful and fo eafily difpleafed, that $h=$ would fometimes leave Lord Oxford's filently without any apparent reafon, and was to be courted back by more letters and meffages than the fervants were willing to carry.

Dr Joinfon alfo gives a view of the intellectual characier of Pope, and draws a parallel between Drgden and him. For particulars, however, we mult refer our readers to Fobnjon's Lives of the Poets.

Popr's Dominions, or Ecclefiafical States, a country of Italy, bounded on the north by the gulph of Venice and the Venerian dominions, on the fouth by the Mediterranean, on the eaft by the king dom of Naples and the Adriatic, and on the weit by Tufcany and Modena. It is 400 miles long on the coaft of the Adriatic from Naples to the Venetian territory. It is but narrow, however, from north to fouth, not being more than So miles broad from the gulph of Venice to the Tufcan fer.
The fuil, in general, of the pope's dimminions is very fertile, but ill cultivated; and there are many fens and marfhy grounds which are very prejudicial to the air. That the lands are badly cutivated and inhabited, the air bad, and the inhabitants poor, idle, lazy, and कrofly fuperftitious, is owing to a variety of caufes. With: refpea to the accommodations of life, this country is but in a very indifferent condition; for, notwithftanding the fertility of its foil, its advantageous fituation for traffic, the large fums feent in it b;- travellers, or remitted to it from fore:gn countries, and its having, for its ruler, the fucceffor of ist Petcr, the prince of the apofles, and the vicar of Jefus Chrift; yet it is poor and thin of inhabitants, ill caltivated, and without trade and mannfuctures. This is partly owing to the great number of holidays, of furdy begrars called pillrims, and of hofpi a's and convents, with the amazing but perhaps ufelefs wealth of churches and convents, and the inquifition: but the chisf caufe is the feverity of the government, 2nd the grievious exactions and hardhips to which the fibjects are expefed. The legates, though motly clergymen, whofe thrughts fhould be chiefly employed ahout laying up treafures in heaven, and who oughe to fut an example to the laity of difintereftednefs and a contempt of this world, too often, it is faid, feruple no kind of rapacinufnefs : even the holy father himfelf, and the cardinals, frequently make the enriching of their nerhews and other relations, and the argrandizing their fumilies, too much the bufinefs of their lives. The extenfive ctaims and great pretenfons of the pope are wall
known, and by a large part of Chriftendom, are now treated with contempt and mockery. The Reformation gave a great blove to his fpiritu.1) power; and the French revolution has lefiened it fill more. His temporal dominions, hovever, flill continue much the fame; thongh how long this may be the cafe, confadering ho:v much he hath toil, and is daily lofing, of his ghatty empire, and the veneration in which he was formerly held, it is dillicult to fay. See Pope, p. 378 . col. y- The Campania of Rome is under the pope's immediate government; but the other provinces are governed by legates and vice legates, and there is a commander in chief of the pope's forces in every province. The pope is chofen by the cardinals in the conclave: See this particulaly defcribed under Pope. Tli:e pope holds a confiftory of cardinals on ecclefiaftical atrairs; but the catdinals do not meddle with his civil government. The pope's chief mi-iter is the cardinalpation, ufually lis nephew, who amaffes an immenfe eftate, if the reign be of any long duration. The cardimal that is chofen pope muft generally be an Italian, and at leaft 55 years of age. The fpiritual power of the pope, though far fhort of what it was before the Roformation, is fill confiderable. It is computed that the monks and regular clergy, who are abfolutely at lis devotion, do not amount to lefs than $2,000,000$ of people, difperfed through all the Roman Cathoiic countries, to alfert his fupremacy over princes, and promote the interef of the church. The revenues of thefe monks do not fall flert of L. 20,000,000 Sterling, befides the cafual profits arifing from offerings, and the people's bounty to the church, who are taught that their falvation depends on this kind of benerolence.
I'he pope's reventes, as a temporal prince, may a. mount to about L. $1,000,000$ Sterling per ainum, arifing chiefly from the moncpoly of corn, the duties on wine and other provifions. Over and above thefe, valt fums are continually flowing into the papal treafury from all the Roman Catholic countries, for difpenfations, i:ldulgences, canonizations, annates, the pallia, and invefitures of archbifhops, bifhops, \&ic.
The pope has a confiderable body of regular forces, well clothed and paid; but his ficet confifts only of a few galleys. His life-guards are 40 Switzers, 75 cuiraffiers, and as many light horfe. Since the beginning of this war, we are told, he has likewife had a guard of Englith horfe.

POPERY, in ecclefiafical hifory, comprehends the religions doatrines and practices adopted and maintained by the church of Rome. The following fummary, extracted chiefly from the decrees of the council of Trent, continued under Paul 11I. Julius IIt. and Pius IV. from the year 1545 to 1563, by fuccefive feffions. and the creed of pope Pins IV. fulinnined to it, and bearing date November 156.4, may not be nnacceptable to the reader. One of the fundamental teness, frenuously maintained by popith writers, is the infallibility of the church of Rome; thougls they are not agreed whether this frivilege belongs to the pope or a general council, or to both uaited; but they pretend that an infallible living judge is abfolutely necefiary to determine controverfies, and to focnue peace in the Chritian church. However, Proteftants allege, that the claim of infallibility in any church is not juftified

Pope,
Papery.

## $\mathrm{POP} \quad\left[\begin{array}{ll}302 & 1\end{array}\right]$

P: vumry. by the authority of Sciptnre; much lefs does it pertain to the ehurch of Rome; and that it is inconfitent with the nature of religion, and the perfonal obligations of its profelfors; and that it has proved ineffectual to the end for which it is fuppofed to be granted, fince popes and councilis liave difagreed in matters of importance, and they have been inc:apable, wi:h the advantuge of this pretended infallibility, of maintaining union and peace.

Another effential article of the popifh creed is the fupremicy of the fope, or his fovereign power over the univerfal church. Sce Pope.

Firther, the doctrine of the feven facraments is a peculiar and diftinguihing doarine of the church of Rome: thefe are baptifm, confirmation, the eucharill, penance, extreme unction, orders, and matrimony.

The council of Trent (feff. 7. can. 1.) proncunces an anathema oa thofe who fay, that the facraments are more or fewer than feven, or that any one of the above number is not truly and properly a facrament. And yet it does not appear that they amounted to this number before the 12 th century, when Hugo de St Victore and Peter Lombard, about the year 1144 , taught that there were feven facraments. The council of Florence, held in ${ }^{1} 438$, was the firt conncil that determined this number. Thefe facraments confer grace, according to the decree of the council of Trent (fef. 7. can. 8.) ex opere operato, by the mere adminiftration of them: three of them, viz. baptifm, confirmation, and orders, are faid (can. 9.) to imprefs an indelible character, fo that they camot be repeated without facrilege; and the efficacy of every facrament depends on the intention of the prieft by whom it is adminiftered (can. 11.) Pope Pius exprefly enjoins, that all thefe facraments fhould be adminittered according to the received and approved rites of the Catholic church. With regard to the eucharif in particular, we may bere obferve, that the church of Rome holds the doatrine of tranfubfantiation; the neceffity of paying divine worflip to Chrift mader the form of the confecrated bread, or hoft ; the propitiatery facrifice of the mafs, according to their ideas of which Chrilt is truly and properly offered as a facrifice as often as the priett fays mafs; it practifes likewife folitary mafs, in which the prieft alone, who confecrates, communicates, and allows communion only in one kind, viz, the bread, to the laity. Self. 14.

The doatrine of merits is another diftinguifhing tenet of popery; with regard to which the conncil of Trent las exprefsly decreed (fefl. 6. can. $3^{22}$ ) that the good works of juntified perfons are truly meritorious; deferving not only an increafe of grace, but eternal lite, and an increafe of glory; and it has anathematized all who deny this dofrine. Or the fame kind is the doctrine of fatisfactions; which fur pofes that penitents may truly fatisfy, by the affliations they endure under the difpenfaticns of Providence, or by voluntary penances to which they fubmit, for the temporal penalties of fin, to which they are fubjeet, even after the remiffion of their eternal punithment. Sefl. 6 . can 3c. and felf. 14. can. 8. and 9. In this conncction we may mention the popifh diatinction of venial and mortal fins: the greatelt evils arifing from the former are the temporary pains of purgatory ; but no man, it is faid, can obtain the pardon of the latier without
confefing to a prien, and performing the penances which he impotes.

The council of Trent (feff. 14. can. 1.) has exprefsly decreed, that every one is accurfed, who thall affirm that penance is not truly and properly a facrament, inftituted by Chrift in the univerfal church, for reconciling thole Chriltims to the divine majefly, who have fallen into fin after baptifm : and this faciament, it is declared, confilts of two parts, the matter and the form ; the matter is the aft of the penitent, including contrition, confelion, and fatisfaction; the form of it is the aft of abfolution on the part of the prielt. Accordingly it is cnjoined, that it is the duty of every man, who hath fallen alter baptifm, to confefs his fins once a year, at leaft, to a prieft : that this confeffion is to be fecret; for public confeffion is neither commanded nor expedient: and that it mult be exact and particular, including every kind and act of fin, with all the circumftances attending it. When the penitent has fo done, the prief pronounces an abfolution; which is not conditional or declarative only, but abfolute and judicial. This fecret, or auricular confeffion, was firt decreed and eftablinied in the fuurth council of Lateran, under Innocent III. in 1215, (c.1p. 21.) And the decree of this council was afterwards confirmed and enlarged in the council of Florence, and in that of Trent; which ordains, that confeffion was inftituted by Chrift, that by the law of God it is neceflary to falvation, and that it has been always pranifed in the Chriltian church. As for the penances impofed on the penitent by way of fatisfaction, they have been commonly the repetition of certain forms of devotion, as pater-nofers, or ave-marias, the payment of Ripulated fums, pilgrimages, falts, or various fpecies of corporal difcipline. But the moft furmidab?e penance, in the ellimation of many who have belonged to the Romifh communion, has been the temporary pains of purgatory. Dut under all the penalties which are inflited or threatened in the Romifh church, it hats provided relief by its indulgences, and by its prayers or maffes for the dead, performed profefledly for relieving and refcuing the fouls that are detained in purgatory.

Another article that has been long authoritatively enjoined and obferved in the church of Rome, is the celibacy of her clergy. This was firt enjoined at Rome by Gregnry VII. about the year 1074, and eftablifhed in England by Anfelm archbifhop of Canterbury about the year 1175 ; though his predeceffor Lanfranc had impofed it upon the prebendaries and clergy that lived in towns. And though the council of trent was repeatedly petitioned by feveral princes and fates to abolifh chis reftraint, the obligation of celibacy was rather eftablifhed than relaxed by this council; for they decreed, that marriage contrakied after a vow of costinence, is neither lawful nor valid; and thus deprived the church of the polibility of ever reforing marriage to the clergy. For if marriage, after a vow, be in itfelf unlawful, the greatelt authority upon earth cannot difpenfe with it, nor permit marriage to the clergy, who have aiready vowed continence.

To the doctrines and practices above recited may be farther added the worlhip of images, of which Proteftants accufe the Papilfs. But to this accufation the Papitt replies, that he keeps images by him to preferve

## $1 \circ \mathrm{P} \quad[333] \quad \mathrm{O} \mathrm{P}$

ry. in lis mind the nemory of the perfons reprefented by them; as penfle anc wont to prelerve the meniory of their deccaided friends by kecping their pietures. He is taught (he fays) to ufe them fo as to caft his eyes upon the pietures or imanges, and thence to raife his heart to the things reprefented, and there to employ it in meditation, love, and thankfriving, defre of imitation, \&ic. is the object requires.
'Thefe pionues or images lave this advantage, that they inform the mind by one glance of what in reading mirbt require a whole chapter. There being no other difference between them, than that reading repiefents leifurely and by degrees; and a pifture, all at once. Hence he finds it convenience in faying his prayera with fone devout pictures before him, he being no froner difu:teted, but the light of thefe recals his wandering thoughts to the right object; and as certainly bings fomething gocd into his mind, as an immodeß̂ picture difturbs his heart with filthy thoughts. And becaule he is fenfible that thefe holy pietures and images reprefent and bring to his mind fuch objects as in his heart he loves, honours, and venerates; he cannot but apon that account love, honour, and reipect, the images themfelves.

The council of Trent likewife decreed, that all bifhops and paltors who have the cure of fouls, do dilirently inftruet their flocks, that it is good and profitable in difire the interceffron of fainis raigning quith Cbrigl in bravers. And this decree the Papifts endeavour to defend by tle following obfervations. They confefs that we have but one Mediator of redemption ; but affirm that it is acceptable to God that we fhould have many mediators of interceflion. Nofes (fay they) was luch a mediator for the Ifraclites; Job for his three friends; Stephen for his perfecutors. 'The Romans were thus defired by St Paul to be his mediators ; fo were the Corinthians, fo the Ephefians, Ep. ad Rom. Cor. Eph. fo almof every fick man defues the congregation to be his mediaters, by remembering him in their prayers. And fo the Papitt defires the blefled in heaven to be his mediators; that is, that they would pray to God for him. But between thefe living and dead nmediators there is no fimilarity: the living mediator is prefent, and certainly luears the requelt of thofe who defire him to intercede for them; the dend mediator is as certainly abfent, and cannot polibly hear the requefts of all thofe who at the fame intant may be begging him to intercede for them, unlefs he be poffelfed of the divine attribute of omniprefence; and he who gives that attribute to any creature is unqueftionably guilty of idolatry. And as this decree is contrary to one of the firft principles of natural religion, fo does it receive no countenance from Scripture, or any Chriftian writer of the three firlt cellturics. Otler practices peculiar to the Papifs are the religious honour and refpect that they pay to facred relicks; by which they underland not only the bodies and parts of the bodies of the faints, but any of thofe thines that appertained to them, and which they touched; and the eelebrition of divine fervice in an unk nown tongue: to which purpofe the council of Trent hath denoinnced an anathema on any one wlo fhall fay that mafs ourght to be celebrated only in the vulgar tongrue; feff. 25. and feff. 22. can. 9. 'Though the council of Lateran under Innocent III. in 1215 (can. 9.) hid exprefsly decrecd, that becaufe in many

Parts witl:in the fame city ind diocefe there are many people of different manners and rites mixed togebler, but of one fath, the bithops of fucls cities or diocefes flould provide fit men for celebrating divine offices, according to the diverfity of tongues and rites, and for adminifering the facraments.

We thill only add, that the chureh of Rome maintains, that unwritten traditions ols rht to be adred to the holy Scriptunes, in order to fupjly their delect, and to be regarded as of equal antlocrity; that the book. of the Apociypha are canonical feripture; rhat the val. gate edition of the Bible is to be deemed atuthentic: and thint the Serip:ures are to be received and interpret. ed according to that lenfe which the boly mothe: church, to whom it beloners to judgre of the true fenfe, hath held, and dotb bold, and according to the unni. mons confont of the fathers.

Such are the principal and diltinguifhing doctrines of Popery, molt of which have received the fanction of the council of Trent, and that of the creed of pope Pius IV. which is received, profelled, and fworn to by every one who enters into holy orders in the churche of Rome; and at the clofe of this crecd, we are told that the faith contained in it is fo abfolutely and indifpenfably neceffary, that no man can be faved without it.

Many of the ductrines of Popery were relaxed, and. very favourably interpreted by M. de Meaux, bithop. of Condom, in his Expofition of the Doetrine of the Catholic Church, firf printed in the year 1671 : but this edition, which was charged with perverting, in endeavouring to palliate, the doctrine of the church, was cenfured by the doctors of the Sorbonne, and actually fuppreffed; nor does it appear that they everteftified their approbation in the ulual form of fuble. quent and altered editions. It has, however, been lately publifhed in Englaud; by a clergyman of the Romilh church, whofe integrity, piety, and benevolence, would do honour to any communion.

POPHAM (Sir John), lord chief juftice of the common pleas in the reign of Queen Elizabeth, was. the eldeft fon of Edward Popham, Efq; of Huntworth in Somerfetfine, and born in the year 1531. He was fome time a ftudent of Baliol college in Oxford; "being then (fays Ant. Wood) given at leifure lours. to many fports and exercifes." After quitting the univerfity, he fixed in the Middle Temple; where, during his noviciate, he is faid to have indulged in that kind of diffipation to which youth and a vigorous confitution more naturally incline than to the Audy of volumnious reports: but, fatiated at length with what are called the pleafures of the toan, he applied fedulounly to the fudy of his profelion, was called to thebar, and in 1568 became fummer or sutumn reader. He was foon after made ferjeant at law, and fulicitor. general in 579. In 158 r , he was appointed attor. ney-general, and treafurer of the Middle temple. In 1592, he was made lord chief juftice of the king's bench, and the fame year received the honour of knighthood. In the year igoI, his lorddaip was one of the council detained by the unfortunate earl of Erfex, when he formed the ridiculous project of defend. ing himfelf in his houfe: and, on the earl's trial, he E:xe cvidence againf him relative to their detention. FIc died in the yoar 1 (3o7, aged 76 ; and was buric3

Popar in the fouth aille of the church at Wellington in So. morfethire, where lie generally refided as ofien as it ropulus. was in his power to retire. He was thought fome- what fevere in the execution of the law againt capital effenders: but his leverity had the happy cifect of reducing the number of highway robbers. He wrote, 1. Reports and cates adjudged in the time of Qucen Elizabeth. 2. Refolutions and judgments upon cafes and matters agitated in all the courts at Weltminfter in the latter end of Queen Elizabeth's reign.

POPLAR, in botany. See Fopulus.
POPL,I'I庭US, in anatomy, a Imall mutcle ebliquely pyramidal, fituated under the ham. See Anatomy, Table of the Mufcles.

POPPY, in botany. Sce Opium and Papaver.
POPULAR, fomething that relates to the common people.

POPLLATION, means the fate of a country with refpect to the number of people. See Bills of Murtalitr and Political-Arillmetic.

The queftion concerning the number of men exifting upon earth, has been varioully determined by different writers. Riccioli ltates the population of the globe at 1000 millions, Voflus at 500 ; the Journalifts of Trevoux at 720 ; and the editor (Xavier de Feller) of the fmall Geographical Dictionary of Vofgien, reprinted ot Paris in 1778 , at 370 millions. This laft eftimate is perhaps too low, although the writer profefies to have taken confiderable pains to afcertain the point with as moch accuracy as the nature of the rubject will admit. It may, perhaps, not be deemed unworthy the attention of the curions fpeculatift to oblerve, that alfuming the more prohable fatement of the learned Jefuits of Trevoux, and that the werld has exilted about 6006 years in its prefent fate of population, then the whole number of perfons who have ever exifted upon earth fince the days of Adam amounts only to about one hundred and thirty thoufand millions; bccaufe $720,000,000 \times 182$ (the number of generations in 6006 years $)=131,0,10,000,000$. See on this fubject the aulthers abovementioned, as likewife Beaufobre's Eiude de Ia Politique.

With regard to the population of England, the reader may confilt, together with our article PoliticalArithmaic, An inquiry into the prefent State of Population, \&c. by W. Wales, F. R. S. and Mr Howletu's Examination of Dr Price's Effay, on the fame fubjest.

POPULUS, the Poplar: A genus of the octandria order, belonging to the diocia clafs of plants; and in the matural method ranking under the 50th order, Anensaied. The calyx of the amentum is a lacerated, oblong, and fquamous ieaf; the corolla is turbinated, oblique, and entire. The female has the calya of the amentum and corolla the fame as in the male; the figma is quadrifid; the capfule bilocular, with many pappous feeds.

The poplar, one of the mof beautiful of the aquatic trces, has frequently been introduced into the poctical defcriptions of the ancients; as by Virgil, Ecl. vii. 66. ix. 41. Genrg. ii. 66. iv. 511. AEr, viii. 31. 276 . by Ovid, Amon. Parid. 27. by Horace, Carm. ii. 3. and by Catulus, Nupt. Pil. et Thet. 290. \&c. \&c.

Species. 1. The alba, or abele-nee, grows natural. ly in the temperate parts of Europe. Its leaves are
large, and divided into three, four, or five lobes, indented on their edges, nif a very dark coluur on their up.per fide, but very white and downy on the under fide; fanding upon fouttalks an inch long. The young branches have a purple bark, and are covered with a white down; but the bark of the tten and older branches is grey. In the begimning of Aptil, the mate flowers or catkins appear, whic!: are cylindrical. and about thrce inches long. About a week after come out the female flowers or cathins, which have no ftamina like thofe of the male. Soon after thete come out, the male catkins fall off and in five or fix weeks after the female flowers will have ripe feeds inclofed in a hairy covering. The catkins will then drop, and the feeds be wafted by the winds to a great difance. 2. 'I he major, or white poplar, has its leaves rounder than the firft, and not much above half their fize: they are indented on their edges, and are downy on their under fide, but not fo white as thofe of the former, nor are their upper furfaces of fuch a deep green colour. 3 The nigra, or black peplar, has oval heart-fhaped leaves, fightly crenated on their edges; they are fmooth on both fides, and of a light green colour. 4. The tremula, or afpen-tree, has romudifh, angularly indented icaves: they are fmooth on both fides, and ftand on long footitalks, and fo are haken by the leatt. wind; from whence it has the title of the nembiing pop. lar, or afpen-tre. 5. The balfamifera, or Carohna poplar, is a native of Carnlina, where it becomes a large tree. The thoots of this fort grow very ftrong in Britain, and are generally angular; with alight green bark like the willow. The leaves on young trees, and alfo thofe on the lower fhoots, are very large, almof heartfhaped, and crenated; but thofe upon the older trees are fmaller: as the trees advance, their bark becomes lighter, approaching to a greyilh colour. 6. The lacamahaca, grows naturally in Canada and other parts of North America. This is a tree of a middling growth, fending out on every fide many thort thick fhoots, which are covered with a light brown bark, garnithed with leaves differing from one another in thape and fize; moft of them are almoft heart-fhaped ; but fomeare oval, and others nearly fpear-fhaped; they are whitith on their under fide, but gieen on their upper.

Cullure. Thefe trees may be propagated either by layers or cuttings, as alfo from fuckers which the white poplars fend up from their roots in great pienty. The beit time for tranfplanting thefe fuckers is in October, when their leaves begin to decay. Thefe may be pla* ced in a nurfery for two or three years, to get ftrength before they are planted out where they are deligned to remain ; but if they arc propagated from cuttings, it is better to dcfer the doing of that matil Fcbruary, at which time truncheons of two or three feet long fhould be tiruft about a foet and a half into the ground.Thefe will readily take root; and if the foil in which they are planted be moift, they will arrive at a confiderable bulk in a few years. The black poplar is lefs apt to take root from large truncheons; therefore it is a better method to plant cuttings of it about a foot and a half in length, thruting them a foot deen in the ground. This fort will grow almof on any foil, but wiil thrive beft in mott places. The Carolina poplar may alfo be propacrated by cuttings or layers; but the laft is tie method generally practifed, and the plints raifed

## 1 O P

raifed by it are lefs moift than others. The floots of thistree, while young, are frequently killed down to at conliderable length by the froll in winter; bit as the trees grow older, their fhoots are not fo vigorous, and become more ligncous, fo are not liable to the fame difafler. But the trees fhould be planted in a fheltered fituation: for as their le.ves are very large, the wind has great power over then ; and the branches being tender, Lhey are trequently broken or fplit by the winds in fummer, when they are much expofed. The tacamahacia fonds up a great number of fuckers from its roots, by which it multiplies in plenty; and every cutting which is planted will take roit.

Ufis. The wood of thefe trees, efpecially of the abele, is goed for laying floors, where it will laft for many years; and on account of its extreme whitenefs is by many preferred to oak; yet, on account of its foft contexture, bcing very fubjest to take the impref: finn of nails, \&c. it is lefs proper on this aiccunt than the harder woods. The abele likewife deferves particular notice, on account of the vitue of its bark in curing intermitting fevers. The Reverend Mr Stone, in Phul. Tranf. vol. LIII. p. 195. tells us, that he gathers the bark in fummer when it is full of fap, and having dried it by a gentle heat, gives a dram powdered every four hours betwixt the fits. In a few obftinate cafes, he mixed one-fith part of Peruvian bark with it. It is remarkable how nature has adapted remedies to difeafes. Intermitting fevers are moft prevalent in wet countries; and this tree grows naturally in fuch fituations. The bark of it is an object well worthy the attention of plyficians; and if its fuccefs upon a more enlarged fcale of praftice prove equal to Mr Stone's experiments, the world will be much indebted to him for communicating them. This bark will alfo tan leather.

The inner bark of the black poplar is ufed by the inhabitants of Kamfchatka as a material for bread; and paper has fometimes been made of the cottony down of the feeds. The roots have been obferved to diffolve into a kind of gelatinous fubftance, and to be coated over with a tubular cruttaceons fpar, called by naturalifts ofteocolla; , formerly imagined to have fome virtue in producing the callus of a fractured bone. The buds of the fixth fpecies are covered with a glutinous refin, which fmells very ftring, and is the gum tacamahaca of the flops: The beft, called, from its being collected in a kind of gourd fiells, tacamabaca in foell., is fomewhat unctuous and foftifh, of a pale yellowifh or greenith colour, an aromatic tafte, and a fragrant delighteful fmell, approaching to that of lavender or ambergrife. This fort is very rare; that commonly found in the lhops is in femittanfparent globes or grains, of a whitifh, yellowifh, brownilh, or greeninth colour, of a lef's grateful fmell than the foregoing. This refin is faid to be employed exterrally by the Indians for difcufling and maturating tumours, and abating pains in the limbs. It is an ingredien in fome anodyne, hytteric, cephalic and Itomachic plafters; but the fragance of the finer fort fufficiently points ont its utility in other refreets.
11. Fougeroux de Dondaroy, from a fet of experiments Vol. XV.
on the fubjea, gives an account of the ufes of the fre- Purphe veral kinds of poplar, the fubtance of which is as fullows: He finds that the wood of the black poplar is grod and ufeful for many purpofes; that the Lombardy poplar, populus fafitigata, is of very litele value: that the Virginia peplar, populus Iiroimiann, affords a wood of excellent quality, that may be applicd to many ufes. The Carolina pophar, populus Caroinenfis-laciroftilla, (Linn.) is a very guick grower; beantulul when found, but liable to be hurt ly cold. Its wond appeared to M. de Bondaroy to be of little value; but M. Maletherbes, who cut down a large tree of this fort. was alfured by his carpenter that the wood was very good.-That the tacaniahaca, populus tacamabaca lalfamifera, is a dwarfilh plant (A), of litle value. - That the liard, populus Canadenfis, is a large tree, the wrod light, not eafy to be fplit, and fit for feveral ufes - That the white poplar, fopulus alba, is a large growing trce, atfording a wood of excellent quality, and is among the moll valuable of this fpecies.- That the trembling poplar, populus tremu'a, (Linn.) is neither fo large a tree nor aftords fuch wood as the former. Thefe are in few words the principal refult of the experiments of this gentleman on this clafs of plants. A few other forts are mentioned, butnothing decifive with regard to them is determined.

From fome experiments made by M. Dambourney, it appears that the poplar may be ufefully employed in dyeing. The Italian poplar gives a dye of as fine a luitre, and equally durable, as that of the fineft yellor wood, and its colour is more eafily cxtracted. It is likewife very apt to unite with other colours in compofition. Belides the populus fafigata, M. Dambourncy tried alfo the black poplar, the Virginian ditto, the balfam ditto or liard, the white dilto, and the trembling poplar; and found that all thefe dyed wool of a nut-colour, fawn-colour (vigagne), Nankin, mulk, and other grave fhades, according to the quantity of wood employed, and the length of time it was boiled.

POQUELIN or Pocquelin (John Baptit.) See Moliere.

PORANA, in botany ; a genus of the monogynia order, belonging to the pentandria clafs of plants. The corolla is campanulated; the calyx is quinquefid, and larger than the fruit; the fyle femibifid, long, and permanent; the ftigmata globular; the perianthium bivalved.
PORCELAIN, a fine kind of earthen ware, chicf- what is ly manufactured in China, and thence called China- culledp sware. All earthen wares which are white and femi- celain. tranfparent are generally called forcolains: but amongit thefe, fo great differences may be obferved, that, notwithftanding the fimilarity of their external appearance, they cannot be confidered as matters of the fame kind. There differences are fo evident, that even perfons who are not connoiffeurs in this way prefer much the porcelain of fome countries to that of others.

The word porcelain is of European derivation; none origin of of the fyllables which compofe it can even be pronoun- the name. ced or written by the Chinefe, whofe language com-

3 C
prehends

Poortisin. prehends no fuch foundc. It is probable that we are indebted to the Portuguefe for it: the word porcellana, Howceer, in their language, fignifies pruperly a cup or dith; and they themfelves datinguith all works of porcelain by the gener.ll name of loca. Porcelain is called in China ijcki.
Art of ma-
The art of making porcelain is one of thofe in which king it in greater. yerfection in the Eaft than in Entuper

6

Europe has been excelled by oriental nations. The firft porcelain that was feen in Europe was brought from Japan and China. The whitenels, tranfparency, finencfs, neatnets, elegance, and even the magnificence of this pottery, which foon became the ornament of fumptuous tables, did not fail to excite the admiration and indull ry of Europeans; and their attempts have fucceeded fo well, that in different parts of Europe earthen wares have been made fo like the oriental, that they lave acquired the name of porce:ain. The firt European porcelaits were made in Saxony and in France ; and afterwards in England, Germany, and Italy : but as all thefe were different from the Japancfe, fo each of them had its peculiar character.
The fineft and beft porcelain of China is made in a village called King-te-tching, in the province of Kiang-fi. This celebrated village is a league and a half in length, and we are affured that it contains a million of inhabitants. The workmen of King.te-tching, invited by the attracting allurements of the European trade, have eftablifhed manufactories alfo in the provinces of Fokien and Canton ; but this parcelain is not efteemed.The emperor King hi was defirous of having fome made under his own infpection at Pe-king. For this purpofe he colleftecl workmen, together with tools, and all materials neceffary; furnaces were alfo erected, but the atterript mifcarried. The village of King-te-tching aill continues the moft celebrated place in the empire for beautiful porcelain, which is tranfported to all parts of the world, and even to Japan.

We are unable to difcover who firtt found out the art of making porcelain, nor is it known whether the Chinefe were indebted to chance for it, or to the repeated efforts of inventive genius; we cannot even determine its antiquity with precifion; we know only from the annals of Fenu-leang, a city in the diftrict to which King-te-tching belongs, that, fince the year $44^{2}$ of our era, the workmen of this village have always lurnifhed the emperors with porcelain; and that one or two mandarins were fent from court to infpect their labours. It is, however, fuppofed that the invention of porcelain is much older than that epocha.

We are indebted to Father d'Entrecolles, a Rominh miffionary, for a very accurate account of the manner in which porcelain is made in China; and as he lived in King-te-tching, his information muft bave been the very beft poffible. We thall therefore give his account of the Chinefe manner of making it, as abridged by Grofier in his General Defoription of Cibina. The principal ingredients of the fine porcelain are pe-fun-tfe and kao-lin, two kinds if earth fiom the mixture of which the paite is produced. The lao-lin is intermixed with fmall hining particles; the other is purely white, and very fine to the touch. Thefe firl materials are carried to the manafactories in the thape of bricks. The pe-tur-ife, which is fo fine, is nothing elfe but fragments of rock taken from certain quarries, and reduced to powder. Every Lied of Aone is not fit for this purpofe. The colour
of that which is good, fay the Clinefe, ought to incline Pore a little towards green. A large iron club is ufed for breaking thefe pieces of tock: they are afterwards put into mortars; and, by neans of levers headed wi h fone bound round with iron, they are reduced to a very fine powder. Thefe levets are put in artion ei her by the labour of men, or by water, in the fame manner as the lammers of our paper-mills. The duft afterwards colletcd is thrown into a large vefiel full of water, which is ftrongly firred with an iron fhovel. When it has been left to fettle for fume time, a kind of cream rifes on the top, about four inches in thicknefs, which is flimmed off, and poured into another veffel filled with watcr: the water in the firft vcflel is firred feveral times; and the cream which arifes is ftill collected, until nothing remains but the coarfe dregs, which, by their own weight, precipitate to the bottom : thefe dregs are carefully collected, and pounded anew.

With regard to what is taken from the firlt veffel, it is fuffered to remain in the fecond until it is formed into a kind of cruft at the bottom. When the water above it feems quite clear, it is poured off by gently inclining the veffel, that the fediment may not be difurbed; and the pafte is thrown into large moulds proper for drying it. Before it is entirely hard, it is divided into fmall fquare cakes, which are fold by the hundred. The colour of this pafte, and its form, have occafioned it to receive the name of pe-tun tfe.

The koa-lin. which is ufed in the compofition of porcelain, requires lefs labous than the pe-tun-tfe. Nature has a greater thare in the preparation of it. There are large mines of it in the bofoms of certain mustains, the exterior Atrata of which confift of a hind of red earth: Thefe mines are very deep, and the kao-lin is found in fmall lumps, that are fermed into bricks a ter having gone through the fame procefs as the pe-tun-tie. Father d'Entrecolles thinks, that the earth called terre de Malle, or St Paul's earth, has much affinity to the kaolin, although thofe fmall fining particle, are not obferved in it which are interfperfed in the latter.

It is from the kao. lin that fine $p$ rcelain derives all its Atength; if we may be allowed the exprefion, it fands it inflead of nerves. It is very extra'rdinary, that a foft earth hould give ftrength and confiftency to the pe-tun-tie, which is procured from the hardeft ricks. A rich Chinefe merchant told F. d'Entrecolles, that the Englith and Dutch had furchafed fome of the pe-tun-tfe, which they tramported to Europe with a defign of making porcelain; but having carried with them none of the kao-lin, their attempt proved abr rtive, as they have fince acknowledged. "They wanted (faid this Chinefe, laughing) to form a body, the fleft of which would fupport itfelf without bones."

The Chinefe have difcuvered, within there few years, Ane a new fubitance proper to be employed in the compofi fanc tion of porcelain. It is a flune, or rather fpecies of cove chalk, called hoa-clue, from whi. h the phyficians prepare and a kind of draught that is faid to be deterfive, aperient, ${ }^{\text {ne }}$, and cooling. The manufacturers of porcelian have thought proper to employ this Anne inftead of kao-lin. It is called hoa, becaufc it is glutinous, and has a great refemblance to foap. Purcelain made with hoarche is very rare, and much dearer than any nther. It has an exceeding fine grain, and, with regard to the painting, if it be compared with that of the common purcclain,

## POR

ain. it appears to furpafs it as much as vellun does paper. This porcelain is, befides, fo light, that it furprifes thofe who are accuforned to handle other kinds; it is alfo much more brittle; and it is wery difficult to hit upon the proper degree of tempering it.

Hoa-che is teldom ofed in forming the body of the work; the artift is contented fometimes wilh making it into a very fine fize, in which the veffel is plunged when dry, in order that it may receive a coat before it is painted and varnithed : by thefe means it acquires a fuperior degree of beauty.

When hoacche is taken from the mine, it is wathed ii) rain or river water, to feparate it from a kind of yellow carth which adheres to it. It is then pounded, put into a tub filled with water to difolve it, and afterwards formed into cakes like kao-lin. We are aftured that hoa-che, when prepared in this manner, without the mixture of any other earth, is alone fufficient to make porcelain. It ferves inftead of kao-lin ; but it is much dearer. Kao-lin coRs only ten-pence Sterling ; the price of hoa-che is half-a-crown : this difference, therefore, greatly enhances the value of porcelain made with the latter.

To pe-tun-tfe and kao-lin, the two principal elements, mutt be added the oil or varnifh from which it derives its fplendor and whitenefs. This oil is of a whitifh colour, and is extracted from the fame kind of fone which produces the pe-tun-tre, but the whiteft is always choor fen, and that which has the greeneit fpots. The oil is obtained from it by the fame procefs ufed in making the pe-tun-tife: the flone is firlt wafhed and pulverized; it is then thrown into water, and after it has been purified it throws up a kind of cream. To 100 pounds of this cream is added one pound of che-kao, a mineral fomething like alum, which is put into the fire till it becomes red-hot and then pounded. This mineral is a kind of runnet, and gives a confiftence to the oil, which is however carefully preferved in its flate of fluidity. The oil thus prepared is never employed alone, andther oil muft be m:xed with it, which is extracted from lime and fern aftes, to 100 pounds of which is alio added a pound of che-kao. When theie two oils are mixed, they mult be equally thick ; and in order to afccrtain this, the workmen dip into each of them fome cakes of the pe-tun-tie, and by infeeting their furfaces clofely after they are drawn out, thence judge of the thicknefs of the liquers. With regard to the quantity necelfary to be employed, it is ufual to mix 10 meafures of fone- il with one meafure of the oil made from lime and fern athes,

The finf labour confiuts in again purifying the pede tun-ife and the kao-lin. The workmen then proceed to mix thefe two fubfances together. For nne porcelain they put an equal quantity of the kao-lin and the pe-tun-lfe; for the middling fert they ufe four parts of the hao. lin and fix of the pe-tun-tfe. The lealt quantity put of the former is one part to three of the pe-tun-tie. When this misture is finifhed, the mafs is thown into a large fit, well paved and cemented in every pa:t ; it is then trod upon, and kneaded until it becomes hard. This labour is io much the more fatigung, as it mun be costinued with ut intermifion : were it interrupted, :ll the other labourers would remain memployed. From this maf, thus preparcd, the workmen detach different pieces, which they fipsead out
upon large flates, where they knead and roll them in Poreldin. every direstion, carcfully obferving to leave no vacuum in them, and to keep them frec from the mixture of any extraneous body. A hair or a grain of fand would fpoil the whole work. When this pate has not been properly prepared, the porcelain cracks, and melts or becomes warped.

All plain works are farhioned with the wheel. When ind of $f_{s}$. a cup las undergone this operation, the outlide of its fioning botom is quite round. The workman firld gives it the the work. requifite height and diameter, and it comes from his hands almolt the moment he has reccived it. He is under the necefliy of ufing expedition, as he is paid not quite a farthing per board, and each board contains 26 pieces. This cup palfes then to a fecond worknian, who forms its bafe. A litele after it is delisered to a third, who applies it to his mould, and gives it a proper form; when he takes it off the mould, he mult turn it very foftly, and be careful not to prefs it more oa one tide than on another; without this precaution it would become warped or disfigured. A fourch workman polifhes it with a chififel, efpecially around the edges, and diminifhes its thicknefs, in order to give it a certain degree of tranfparency. At length, atter baving paffed through all the hands neceffary for giving it all its ornaments, it is received, when dry, by the laft workman, who fathions its bottom with a chiffel. It is aftonifhing to fee with what dexterity and expedition the workmen convey thefe vafes from one to another. We are allured, that a piece of porcelain, before it is finifhed, muft pafs through the hands of 70 perions.

Large works are executed in parts which are falhion. Large ed feparately. When all the pieces are finifhed, and all. works ern. moft dry, they are put together and cemented with pafte cuted in made of the fame fubtance, and foftened with water parts and Some time after, the feams are polithed with a knife, both without and within; and when the veffel is covered with varnifh, it entirely conceals then, fo that the leaf trace of them is not to be feen. It is in this manner that fpouts, handles, rings, and other parts of the fame nature, are added. This is the cafe, particularly in thofe pieces which are faftioned upon moulds or modelled with the lands, fuch as embolfed works, grotefque images, idols, figures of trees or animals, and bults, which the Europeans order. All thefe are formed of four or five pieces joined together, which are afterwards brought to perfection with inftruments proper for carving, polithing, and finihihg, the different traces which the mould has left imperfect. Witla regard to thofe flowers and ornaments which are not in relief, they are either engraven or imprinted with a famp. Ornaments in relief preparcd feparately, are alfo added to pieces of porcelain, almof in the fame manner as lace is put upon a coat.

13
After a piece of porcelain has been properly faftion. The irinaned, it then paffes into the hands of the painters. Thefe ner of hoa-pei, or painters in porcelain, are equally indigent as painting the other workmen; they follow no certain plan in their porctain; art, nor are they acquainted with any of the rules of drawing; all their knowledge is the efiect of rrattice, affifed by a whimfical imagination. Some of them, however, fhow no inconliderable fhare of tafte in painting flowers, animals, and landfafes, on porcelin, as woll as upon the paper of fans, and the filk ufed for filling up the fquares of lanterns. The labour of paiming,

## 1 OR

Porectain. in the manufagories of which we have fooken, is diof oue is entirely confined to tracing out the firft co1 Hured circle, which ornaments the brims of the veficl; another defigns the flowers, and a third paints them; one delineates waters and mountains, and another birds and other animals: human figures are generally the worit executect.
The tfou-you, which is a kind of oil procured from white flint, has the peculiar property of making thofe pieces of porcelain upon which it is laid appear to be covered with an infinitude of veins in every direction; at a diftance one would take them for cracked vafes, the fragments of which have not been difplaced. The colour communicated by this oil is a white, fomewhat inclining to that of afhes. If it be laid upon porcelain, entirely of an azure blue, it will appear in the fame manner to be variegated with heautiful veins. This kind of por celain is called tooui-ki.

The Chinefe make vafes alfo ornamented with a kind of fret-work, perforated in fuch a manner as to refemble very fine lace. In the middle is placed a cup proper for holding any liquid; and this cup makes only one body with the former, which appears like lace wrapped round it. The Chinefe workmen had formerly the fecret of making a ftill more fingular kind of porcelain: they painted upon the fides of the veffel filhes, infects, and other animals, which could not be perceived until it was filled with water. This fecret is in a great meafure loft: the following part of the procefs is, however, pieferved. The porcelain, which the workman intends to paint in this manner, muft be extremely thin and delicate. When it is dry the colour is laid on pretty thick, not on the outlide, as is generally done, but on the infide. The figures painted upon it, for the mott part, are fiftes, as being more analogous to the water with which the vefiel is filled. When the colour is thoroughly dry, it is coated over with a kind of fize, anade from porcelain-earth; fo that the azure is entire1 y inclofed between two laminæ of earth. When the fize becomes dry, the workmen pours fome oil into the veffel, and afterwards puts it upon a mould and applies it so the lath. As this piece of porcelain has received its confiftence and body within, it is made as thin on the outfide as poffible, without pcuetrating to the colour ; its exterior furface is then dipped in oil, and when dry it is baked in a common furnace. The art of making thefe vafes requires the moft delicate care, and a dexterity which the Chinefe perhaps do not at prefent poffefs. They have, however, from time to time made feveral attempts to revive the fecret of this magic painting, but their fucceis has been very imperfect. This kind of porcelain is known by the name of kia-fing, " picfled azure."

After the forcelain has received its proper form, its colours, and all the intended ornaments, it is tranfported from the manufatery to the furnace, which is fituated fometimes at the other end of King te-tcling. In a kind of portico, which is erefted before it, may be feen heaps of boxes and cafes made of easth, for the purpofe of incloling the porcelain. Each piece, however inconfiderable it may be, has its cilfe; and the Chinefe workman, by this procedure, imitates nature, which, in order to bring the fruits of the earch to proper maiarity, athes them in a covering, to defend them from the
exceffive heat of the fun during the day, and from the force feverity of the cold during the night.

In the bottom of thefe boxes is put a layer of fine fand, which is covered over with powder of the kao-lin, to prevent the fand from adhening too clofely to the bottom of the vefiel. The piece of porcelain is then placed upon this bed of fand, and prefled gently down, in order that the fand may take the form of the bittom of the veffel, which does not tonch the fides of its cafe: the cafe has no cover. A fecond, prepared in the fame manner, and containing its veffel, is fitted into the firft, fo that it entirely hhuts it, withnut touching the porcelain which is helow; and thus the furnace is filled with piles of cafes, which defend the pieces they contain from the too direct acti $n$ of the fire.

With regard to fmall pieces of porcelain, fuch as tea-cups, they are inclofed in common cafe, about four inches in height. Each piece is placed upon a faucer of earth about twice as thick as a crown piece, and equal in breadth to its bottom. Thefe 1 mall bafes are alfo fprinkled over with the duft of the kao-lin. When the cafes are large, the porcelain is not placed in the middle, becaufe it would be ton far removed from the fides, and confequently from the action of the fire.
Thefe piles of cafes are pur into the furnace, and placed upon a bed of coarfe $f_{A}$ nd, half a foot in thicknefs; thofe which nccupy the midule fpace are at leaft feven feet high. The two boxes, which are at the bottom of each pile remain empty, becanie the fire ats too feebly upon them, and becaufe they are partly co vered by the fand. For the fame reafon, the cafe placed at the top of each pile is allo fuffered to be empty. The piles which contain the finelt porcel in are placed in the middle part of the furnace, the coarfelt are put at its farther extremity; and thofe pieces which have the moft body and the ftrongeft colouring are near its mouth.

Thefe differeat piles are placed very clofely in the furnace; they fapport each other mutually by pieces of earth, which bind them at the top, bottom, and middle; but in fuch a manner that a free palfage is left for the flame to infinuate itfelf everywhere alound them.

Before each of thefe furnaces for baking porcelain Natur there is a long porch, which conveys air, and fupplies theirf in certain refpects the place of a bellows. It derves for naceso the fane purpofes as the arch of a glaishoufe. "Thefe furnaces (fays Father d'Encrecolles), which were formerly only fix feet in height and the fame in length, are conttructed now upon a much larger plan: at prefent they are two fathoms in height, and aim of four in breadth ; and the fides and roof are fo thick, that one may lay the hand upun them without being incommoded by the heal. The dome or roof is llaped like a fuunel, and has a large aperture at the top, through which clouds of flame and fmoke incelfantly iffies. Befides this principal aperture, there are five others fmaller, which dre covered with broken pots, but in fuch a manner that the workman can iucreafe or diminith the heat according as it may be found molt convenient : through heie alfo he is enabled to difoover when the porceiain is fufficiendy baked. Having uncorcred that hole which is nearelt the principal dy erture, he takes a pair of pincers, and opens one of the calfes: if he obderves a bright fire in the furnace, if all the cafes be red-

## POR

J bo atir compod
it may be entirely compofed of vitrifiable er fufble borcetain. maters; and in this cafe, by expofing it to the attion of fire, it will be actually melted or vitrified, if the heat be fufficiently frong and long continued. But as this change is not made inftantly clpecially when the heat is not very violent; and as it paffes through different ftages or degrecs, which may be more ealily obierved as the heat is better managed : hence, by fopping in proper time the appliction of hat to porcelain made in this manner, we may obtain it in an intermediate fate betwixt tho e of crude earths and of completely vitrified fubftances, and alfo poffefied of the femitraniparency and of the other fenlible qualities of porcelain. We know alfo, that if fuch porcelain be expofed to a ftronger degrec of heat, it will then be completely fuied and entirely vitrified. But the European porcelains tried by Mr Reaumur had this fulibility; from which he concluded, that their compolition is founded upon the abovementioned principle.

In the fecond place in patte of porcelain may be compofed of fulible and vitrifable matter, mixed with a certain proportion of another matter wlich is abfolutely unfulible in the fires of our furnaces. We may eafily perceive, that if fuch a mixture be expofed to a heat fufficient to melt entirely the vitrifiable ingredient, that this matter will actually melc: but as it is intermixed with another matter which does not melt, and which confequently preierves its confittency and opacity, the whole mult form a componnd partly opaque and pat tly tranfparent, or rather a fenitt an parent mafs; that is, a femivitrified fubltance or porcelain, but of a kind very different frum the former; tor as the fufible part of this latter has produced all its effect, a d as it has been as much fufed as it can be during the baking of the porcelain, the compound may be expofed a fecond time to a more violent fire, without approaching nearer to a complete vitrification, or without departing from its ftate of porcelain. But as oriental porcelain has precifely thefe appearances and properties, Mr Reanniur concludes with reafon, that it is compoled upon this principle; and be aftervards confirmed his opinion by undeniable facts.

Mr Reaumur examind the pe-tun-tie and kao-lin of the Chinefe, and having expoted them feparately to a violent fire, he difcovered that the pe-tun-tfe had fufed without addition, and that the kao-lin had given no fign of fufibility. He aften wards mixed thefe matters, and formed cakes of them, which by baking were converted into porcelain fimilar to that of China. Mr Reaumur eafily found, that the pe tun-tfe of the Chinefe was a hard tone of the kiild called vilififable, but much more fufible than any of the fe which were known in Europe ; and that the kao-lin was a talky matter, reduced to a very fine powder. From that time hehoped to nrake a porcelain of the fame kind as the Chinete with materials found in France. Whether he could not find any materals equal to thofe of China, particularly that material an:alogous to the pe-tun-tfe of the Chinete, or becaufe other occupations prevented the continuance of his refearches, we do not know; but we find, from his fecond memoir upon porcelain that he afterwards attempted to make an artificial pc-tun tfe, by mising our vitrifiable fones with falts capable of rendering them fufible, or even by fubftituting for it glafs ready formed, and by adding to thefe fuch fub-
frapces
rate the qualities which conftitute the excellence of por-: celain. The fubject of Mr Reaumur's fecond error, or at lealt that which he has not fufficiently explained, is the kao-lin of Clina. According to him, this matter is a fine talky powder, from the mixture of which with pe-tun-tfe the oriental porcelain is formed. Poffibly a very finely ground talky fubfance mixed with pe-tuntfe might form a porcelain fimilar to the oriental ; but perions acquainted with the manulacture of any porcelain mult perceive the impolibility of forming veflels, unlefs the palte of which they are made be fo ductile and tenacious tiat it may be worked upon a potter's lathe, or at leaft that it may be moulded. But talks, or any kinds of ftones, however finely ground, cannot acquire the requifite tenacity, which clays only, of all known earthy fubftances, poffefs. The Chinefe porcelain veffels evidently appear to be turned upon the lathe, fince they retain the marks of it: hence they mult have been formed of a very tenacious pafte, and confequently the kao-lin is not a purely talky matter, but is mixed with clay; or elfe the pe-tun-tfe and kao-lin are not, as Mr Reaumur fuppofes, the only ingredients of which Chinefe porcelain is formed, but a fufficient quantity of fome binding matter, unknown to Father d'Entrecolles and Mr Reaumur, mult be alfo added.

Although, fince Mr Reaumur, no fcientific perfen Manu ${ }^{2}$ has written concerning porcelain, many have attempted to make it. Manufactories have been eftablifhed in almoft all the ftates of Europe. Befides that of Saxony, which has been long eftablifhed, porcelain is alfo made at Vienna, at Frankendal, and lately in the neighbourhood of Berlin. All thefe German porcelains are fimilar to the Saxon; and are made of materials of the fame kind, although they differ fomewhat from each other. England and Italy alfo have their porcelains, the chief of which are thofe of Chelfea and of Naples. M. de la Condamine, in his laf journey into Italy, vifited a manufacture of porcelain eftablifhed at Florence by the marquis de la Ginori, then governor of Leghorn. M. de la Condamine obferved particularly the large fize of fome pieces of this porcelain. He fays he faw fatues and groups half as large as nature, modelled from fome of the fineft antiques. The furnaces in which the porcelain was baked were conftucted with much art, and lined with bricks made of the porcelain materials. The pafte of this porcelain is very beatiful; and from the grain of broken pieces, it appears to have all the qualities of the beft Chinefe porcelain. A whiter glazing would be defirable, which they might probably attain, if the Marquis Ginori was not determined to ufe thofe materials only which were found in that country.

But in no Rate of Europe h:ave fuch attemprs been made to difcover porcelain, or fo many manufactories of it been cftablifhed, as in France. Before even Mr Reaumur lad publifhed on this fubject, porcelain was made at St Cloud, and in the fuburb of St Antoine at Paris, which was of the vitreous and fuhble kind, but confiderably beautiful. Since that time, confiderable manufactorics of it have been efablifhed, at Chantilly, at Villcroi, and at Orleans ; the porcelains of which have a diftiguifhed merit. But tice porcelain produced in the mannfacture at Sevres holds at prefent the firlt rank from its fhining white, is beaniful glazing, and coloured gounds, in which no porcelain

## POR

has ever equalled it. The magniticence of the gild ding, the regulatity and elegance of its forms, lurpaifs every thing of the kind.

Mr Guettard has publifhed an account of his difonerics on this fubject, in the Memnirs of the Academy of Sciences for ti:e jcar 1765. 'The kao-lin which he employed wars at white an gillaceous e.rth, filled wih mica, which he found in the ncighbourhond of Alençon; and his pe-tur. tie is a lard, quartzofe, grit flone, found abundantly in the fame country, with which the flreets of Alençon ate paved. We alfo know that Mr Guctard had begun to make his experiments on poreelain with thefenaiterials in the year 1751, together with the then Duke of Orleans, to whom he was attached. The Count de Luraguais, of the Academy of Eciences, engaged in the purtuit of porcelain for feveral years with uncom. monarduur and conftan:y. He fpared no trouble unr expence to attd'n his purpofe, whe ich was to make porcelain equal in all refpests to that of China and Japan. He fhowed fome pieces made by him in the year 1766 to the members of the Academy of Sciences. The perfons appointed by them to examine it gave their opinion, "that of all the porcelains made in the country, that of the Count de Lauraguais molt refembles the porcelain of China and Japan in folidity, grain, and unfulibility." It were to be withed that it poffefled equally the other qualities effential to the excellence of purcelain, namely, the whitenefs and luftre oblervable in the ancient Japanefe porceld 11 .

We fhall now thow what thofe qualities are which coniliture the perfection of porcelain. We muft firft caretully diltinguith the qualities which only contribute to the beauty and external appearance, from the metrinfic and effential properties in wh ch the goodnefs and folidity of porcel.ain confit. All perions who have made experime ts in this way have foon difcovered the polfibility of making compounds very white, beautitully femi.tranfparent, and covered with a fhning glazing; but which cannot be worked for want of tenacity, are not fufficiently comp.ict, are effentially fufible, are fubject to break by fudden application of heat and cold; anid, laftly, the glaving of which cracks, becomes rough, and conlequently luies its luftre by ufe, becaufe it is too foft.

On the other fide, we fhall alfo find it not difficult to compore very tenacious paftes which thall be capable of being eatily worked and well baked; which in the baking tha. a a quire the defirable hardneis and denfity; which are unfulible, and capable of futtaining very well the fudden change of heat and cold; and, in a word, which thall have all the qualities of the moft excellent porcelain excepting whitencfs and beauty. We fhall foon fee that the materials fit for the compofition of fuch porcelains may be found abundantly in every country. The only difficulty, th:n, in this inquiry concerning pi reclain, is to unite beauty and goodnefs in one compofition; and indeed nature feems to be very fparing of naterials fit for this purpofe, and thenefore perfea purcelan will always be a dear and valuable commodi. 9 :

Thofe potteries which we call fone-ruare are not of modern invention, and have all the effential qualities of the bell Japanefe. For if we except whitenefs, on which alone the femi-tranfparency depends, and compare all the propertics of Japancie porcelain with thofe of the

## I OR

Aone-ware, no difference can be found betwixt them. Poreciaiu, The fame grain appears internally in both; the fane found is produced by friking them when properly furpended; the fame denlity, the fame hardnefs by which they frike fire with feel, the fame faculty of futtaining the heat of hoiling liquors without breaking, and the fame unfulibility in fire, are obfervable. Lattly, if the carths of which fone-ware is made were free from heteingeneous colsuring matters, which prevent their whitcnctis and femi-tratuparency; if velfels were carefully formed; if all the proper attentions were given; and if thefc veffels were covered over with a fine glatring-they would be as perfect porcelain as that of Japan. The mon perfeet porcelain, therefore, is nothing clfe than a fine wiste Itonc-ware.

Earths of this kind are probably more rare in Europe than in Japan and China. And probably alfo the want of thefe carths was the caufe that the firlt makers of porcelain in Britain confined themfelves to an external imitation, by employing nothing but vierifiable matters with fulible falts and a fmall quantity of white eath, from whic's fufible and vitreous poreelains were compofed, which might be called fulfe porce'ains. But Gewind things aie much changred fince thefe firt attempts. Be porcelain fides the difcuveries of the Count de Lauraguais and of made in Mr Guettard, genuine white porcelains have been made fome coura a long time ago in Germany, efpecially in S.ixony and at Frankendal.

Thele porcelains are not inferior in any refpect to the oriental; they are even much fuperior in benuty and whitenefs to the modern oriental po celain, which has much degenerated in thefe refpects; they feem even to excel the oriental in the molt valuable quality of porcelain, namely, the pr.perty of fuftainin the fudden change of heat and culd. We cannot judze of the quality of porcelain by a flight trial : for fo many circumitances concur to make a piece of porcel in capable or incapable of fuftuning the fudden application of heat and of cold, that if at the fame time brilins water be poured int, two veffels, one ,f which is go d porcelain and the other bad, the former may poffibly break and the latter remain entire. The only true method of difcovering good porcelain in this relpeat $i$ s, to examine feveral pieces of it which are daily ufed; for inftance, a fet ot coffec-cups. But it has been obferved, that in many fuch pieces of oriental porcelain, which have been long and daily ufed, crac. $s$ in the direaion of their hioght may be always perceived, which are never feen in the good European prircelains.

Every one talks of porcelain, and yet few are con- Exeeliency noiffeurs of it. None can be confidered as fuch but thofe of the anwho have ling made it an object of their inquiries. cient JapaThat the ancient Japanele purcchain is the molt pertect nefe rorce. is a general opinion. This porcelain is indeed very beau- ${ }^{\text {Linin, }}$ tiful, and we mult alfo acknowledge that its quality is excelient. It has been the Britill model, and has 1 ng been the sbject of their admiration and emulation; but which ihey have been never able to equal, and which many perions believe never can be equalled. Some perfons even decry the Saxon porcclain for a quality which really gives it a finperiority to the Japanefe, namely, the greater fmoothnefs, lultre, and lefs granulous appearance of is internal furlace than the oriental. The refem. blance of this furface to that of glafs has cvidently fuggelted this notion; and it would be well founded if the
denfity
POR

Porcelain. denfity and luftre of this porcelain proceeded only from a fufible and vitreous quality ; but as they do not, and as this porcelain is as fixed and as unfufible as the Japanefe, its denfity, fo far from being a fault, is a valuable quality: for we muft allow, that of porcelains equal in other refpects, thofe are belt which are moft firm and compact. Hence the interior fubitance of the Japancfe porcelain is cfeemed for its greater denfity, compaennefs, and luftre, than the vitreous fand or fritt porcelains; becaufe thefe qualities indicate greater cohefion, and more intimate incorporation of its parts. For the fame reafon alfo the fuperior denfity of the Saxon porcelain ought to give it the preference to the Japanefe. Befides, nothing would be eafier than to give the Saxon porcelain the granulous texture of the Japanefe, by mixing with the pafte a certain quantity of fand. But the perfons who perfected that manufucture were certainly fendible that fuch a conformity to the Japanefe porcelain would leffen the merit of theirs: for we know, that in general porcelains are better in proportion as they contain a larger proportion of clay or earth, and lefs of fand, flints, or other matters of that kind.

What we have faid concerning porcelain in general, and the principal kinds of it, feem fufficient to give juf notions of it, if not to perfons who without confi. dering the fubject are determined to prefer the molt ancient, to thofe, at lealt, who have made experiments on this fubject, or who, having a fufficient knowledge of chemiftry, are capable of itudying and examining it thoroughly. We thall finifh this atticle by giving a fhort defcription of the method of manufacturing por-
fritt ' which, or falfe porcting a mixture of find a of pow whe is nothing elle than a mixt to fufion, and of giving them a great whitenefs by means of a fufficient heat. This fritt is to be then mixed with as much, and no more, of a white tenacious earth of an argillaceous or marly nature, than is fufficient to make it capable of being worked upon the wheel. The whole mixture is to be well ground together in a mill, and made into at patte, which is to be formed, either upon the wheel or in moulds, into pieces of fuch forms as are required.

Each of thefe pieces, when dry, is to be put into a cafe made of earthen ware (A); which cales are to be sanged in piles one upon another, in a furnace or kiln, which is to befilled with thefe to the roof. The furnaces are chambers or cavities of various forms and fizes ; and are fo difpofed, that their fire-piace is placed on the outfide oppofite to one or more openings, which communicate within the furnace. The flume of the fuel is drawn within the furnace, the air of which rarefying, determines a current of air from without inwards, as in all furnaces. At firft a very little fire is in ade, that the furnace may be heated graduatly, and is to be increafed
more and more till the porcelain is baked, that is, till Por it has acquired its proper hardnefs and tranfparency ; which is known by taking out of the furnace from time to time, and examining, fmall pieces of porcelain, placed for that purpofe in cafes which have lateral openings. When thefe pieces thow that the porcelain is fufficiently baked, the bift is no longer to be fupplied with fuel, the furnace is to be cooled, and the porcelain taken out, which in this thate refembles white marble not having a fhining furface, which is afterwards to be given by covering them with a vitreous compafition called the glazing.

The porcelain when baked and not glazed is called Por bifcuit, which is more or lefs beautiful acco:ding to the fou nature of the porcelain. The manufacture of Sévres excels all others in this refpect, and it is therefore the only one which can produce very rine pieces of fculpture ; that is, in which all the tinenefs of the workmanfip is preferved, and which are preferable in fmoothnels and whitenefs to the fineft marble in Italy.

As no piece of fculpture of this kind can preferve all the delicacy of its workmanfhip when covesed with a glazing, and as fculptors avoid polithing their marble figures, becaufe the luftre of the polifh is difadvantageous; therefore, in the manufactures of Sévres, all figures or lit.le ftatues, and even fome ornamental vafes, are left in the ftate of bifcuit. The other pieces of porcelain are to be glazed in the following manner.

A glafs is firft to be compofed fuited to the nature Me of the porcelain to which it is to be applied; for every gla glals is not fit for this purpofe. We frequently find col that a glats which makes a line glazing for one porce. por lain thall make 2 very bad glazing for another porcelain; fhall crack in many places, thall have no luftre, or fhall contain bubbles. The glazing, then, muft be appropriated to each porcelain, that is, to the hardnefs and denfity of the ware, and to the ingredients of its compofition, \&c.

Thefe glazings are prepared by previounly fufing together all the fubftances of whicla they confift, fo as to form vitreous malfes. Thefe maffes are to be ground very innely in a mill. This vitreous powder is to be mixed with a fufficient quantity of water, or other proper liquor, fo that the mixture thall have the confiftence of cream of milk. The pieces of porcelain are to be covered with a thin flratum of this matter; and when very dry, they are to be again put into the furnace in the fame manner as before for the forming of the bifenit, and to be continued there till the glazing be well fufed. The necelfary degree of fire for iuling the glazing is much lefs than that for baking the pafte.
'The pieces of porcelain which are intended to remain white are now finithed; but thofe which are to be painted and gilded mult undergo further operations. 'The colours to be applied are the fame as thofe ufed for enamel painting. They all confitt of metallic calces bruifed and incorporated with a very fufible glats. Cro-
(A) The cafes are called by Englih potters fegsars. They are generally formed of coarfer clays, but which mutt be alfo capable of fuftaining the heat required without fution. By means of thefe cales the contained porcelan is prefersed from the fmoke of the burning fuei. The whitenefs of the porcelain depends much on their compathefs of texture, by which the fmoke is excluded, and on the purity of the chity of which they are made.

POR
cus of iron furnifnes a red colour; gold * precipitated by tin makes the purple and violet; copper calcined by acids and precipitated by an alkali gives a fine green ; zaffe makes the blue: carths tlighitly ferruginous produce a yellow ; and, lafly, brown and black colours are produced by calcined iron, together with a deep blue of \%atire. Thefe colours being ground with gum-water, or with oil of frike, are to be employed for the painting of the porcelain with defigns of flowers and other ligures. For gilding, a powder or cals of gold is to be applied in the fame manncr as the coloured enamcls. The painted and gilded porelains ane to be then expoled to at fire capable of fufing the glafs, with which the metallic colcurs are mixed. Thus the colours are nade to adhers, and at the fame time acquire a glofs cyual to that of the glawing. The gold alone has not then a fisining anpearance, which nuft be afterwards given to it by burnithing with a bloodfone.
The operations for the unfuffle porcelains, and alfo for fuch as are of the nature of itone-ware, are fomewhat more fimple. Tiee fomds and fones which enter into their compolition are to be ground in a mill : the earths or clays are to be wafhed: the materials are to be well mixed, and formed into a pafte: the pieces are firt rudely formed upoa a potter's wheel; and when dry, or half dry, they are turned again upon the wheel, and their form is made more perfes: they are then placed in the furnace; not to bake them, but only to apply a fulicient heat to give them fuch a folidity that they may bc handled without breaking, and may reccive the
 leat are very dry, they imbibe water rendily. This dipofition affits the application of the glazing. The ritrifiable or vitrified matter of this glazing, which has seen previoufly ground in a mill, is to b= mixed with uch a quantity of water, that the liquor hall have the :onfiftence of milk. The picces of porceluin are haftily lipt in this liquor, the water of which they imbibe, ind thus on thcir furface is left an uniform covering of he glazing materials. This covering, which ought to every thin, will foon become fo dry, that it cannot lick to the fingers when the pieces are handled.
The pieces of this porcelain are then put into the iurnace to be perfectly baked. The heat is to be raied to fuch a height, that all within the furnace fhall white, and the cafes fhall be undiftinguifhable from he flame. When, by taking out fmall pieces, the porelain is known to be fufficiently baked, the fire is difontinued, and the furnace cooled. If the baking has een well performed, the pieces of porcelain will be nund by this fingle operation to be rendered compact, onornus, clofe-grained, moderately gloffy, and covered aternally with a fine glazing. The painting and gildng of this porcclain are to be executed in a manner milar to that already defcribed.

## Purcelatn-Sbell, a pecies of Ciprea.

PORCH, in architecture, a kind of veflibule fup. ortul by columns; much ufed at the entrance of the ncient temples, halls, cturches, âc.
A purch, in the ancient architecture, was a veftibule, r a difofition of infulated columns ufually crowned rith a pedincut, forming a covert place before the rincipal donr of a temple or court of juftice. Such is hat: beiore the door of St Pan's, Covent-Garden, the rork of Inign Jones. When a porch had four colunns

[^2]in front, it was called a tetrafyle; when fix, bexcfyle; whan cight, oirofigle, Esc.

Porch, in Greek orca, a public portico in Athens adorned with the pistures of Pelygnotus and uther eminent painters. It was in this portico that Zeno the philofopher tanght ; and hence h.is followers wete called Stoics. See Sitnics and Zeno.

PORCUPINE, in zoology. See ITVstaix.
Porcurtne-Mlun, the name by which o:e Edward Lambert, who had a dffempered Prin, went in London. We have the following account of him in the Philofophical Tranfactions for 1755 , by Mr Ifenry Bakcr, F. R. S. "He is now (fiys he) 40 years of age, and it is 2. years fince he was firft fhown to the fociety. The ik in of this man, except on his head and face, the falms of his lands, and the foles of his feet, is covered with cacrefences that refemble an irnumerable company of warts, of a brown colour and cylindrical figure; all rifing to an equal height, which is about an inch, and growing as clofe as poffible to cach other at their bafis; but fo fliff and elaftic as to make a rutling noife when the hand is drawn over them. Theefe excrefcences are annually fhed, and renewed in forme of the autumn or winter months. The new ones, which are of a paler colour, gradually rife up from beneath as the old ones fall off; and at this time it has been found neceffaty for hins to lofe a little blood, to prevent a fight ficknefs which he had been ufed to fuffer before this pre. caution was taken. He has had the fmallpox, and he has been trice falivated, in hopes to get rid of this difagreeable covering; but though juft when the putules of the fmallpos had fraled off, and immediately after lis falivations, his flin appeared white and fmooth, yet the excrefcences foon returned by a gradual increafe, and hisIkin became as it was before. His health, during his whole life, has been remarkably gnod: but there is one particular of this cafe more extraurdinary than all the reft; this man has had fix children, and all of them had the fame rusged covering as himfelf, which came oa like his own about nine weeks after the birth. Of thefe children only one is now living, a pretty boy, wha was fhewn with his father. It appears, therefore, as Mr Baker remarks, that a race of people might be propagated by this man, as different from other men as an African is from an Englifhman; and that if this hoould have happened in any former age, and the accidental original have been forgotten, there would be the fame objections againf their being derived from the fame common fock with others: it muft therefore be admitted poffile, that the differences now fubfifting between one part of nankind and another may have been produced by fome fuch accidental caufe long after the earth has been peopled by one common progenitor."

PORE, in anatomy, a little interflice or fpace between the parts of the flin, ferving for perfpiration.

PORELLA, in botany; a genus of the natural order of mulci, belonging to the cryptogamia clafs of plants. The anthera are multilocular, full of natural pores, with an operculum ; there is no calypura, ior pedicle; the capfules contain a powder like thofe of the other mofles; and their manner of fhedding this powder is not by feparating into two parts, like thofe of the felagu and lycopodium, but by opening into feveral holes on all fides.

1*orentra. PORENTRU, is a town of Swifferland, in Eliggaw, borifn. and capital of the territory of the bilhop of Bafle. It has
a good caftle, where he refides. It has in it, however, nothing elfe worth taking notice of, except the cathedral. The bifhop is a prince of the empire. It is featcd on the river Halle, near mount Jura, 22 miles fouth of Bafle. E. Long. 7: 2. N. Lat. 47. 34 .

PORISM, in geometry, is a name given by the ancient geometers to two claffes of mathematical propofitions. Euclid gives this name to propofitions which are involved in others which he is profeffedly inveftigating, and which, although not his principal objeft, are yet obtained along with it, as is expreffed by their name forifnata, "acquifitions." Such propofitions are now catled corollaries. But he gives the fame name, by way of eminence, to a particular clafs of propofitions which he collected in the courfe of his refearches, and feleted frons among many others on account of their great fub. ferviency to the bufinefs of geometrical inveftigation in general. Thefe propofitions were fo mamed by him, either from the way in which hedifcovered them, while he was inveltigating fomething elfe, by which means they might be conlidered as gains or acquifitions, or from their utility in acquiring farther knowledge as fteps in the inveftigation. In this fenfe they are porifmata; for Goo! $\xi_{\infty}$ fignifies both to invenigate and to acquire by inveltimation. Thefe propofitions formed a collection, which was familiarly known to the ancient geometers by the name of Euclid's porifmes; and Pappus of Alexandria fays, that it was is moft ingenious collection of many things conducive to the analy fis or folution of the moit difficult problems, and which afforded great delight to thofe who were able to underfand and to inveftigate them.

Unfortunately for mathematical fcience, however, this valuable collection is now loft, and it Aill remains a doubtful queftion in what manner the ancients conducted their refearches upon this curious fubject. We have, however, reafon to believe that their method was excellent both in principle and extent, for their analyfis led them to many profound difcoveries, and was reftrifted by the fevereft logic. The only account we have of this clafs :f geometrical propofitions, is in a fragment of Pappus, in which he attempts a general defintion of them as a jet of mathernatical propofitions diftinguifhable in kind from all others; but of this diftinction nothing remains, except a criticifm on a definition of them given by fome teome:ers, and with which he finds fault, as defining them only by an aecidental circumftance, "Porifna if quod deficit hypothefi a theorenate locali,"

Yappus then proceeds to give an account of Euclid's norims; but the enunciations are fo extremely defecfive, at the fame time that they refer to a figure now loft, that Dr Ifalley confeffes the fragment in queftion to be beyond his comprehenfion.

The high encumiums given by Pappus to thefe propofitions have excited the curiofity of the greatelt geometers of medern times, who have attenpted to dif. rover their mature and nanner of inveftigation. M.
Fermat, a French mathematician of the laft century, attaching himfelf to the definition which Pappus criticiles, publifhed an introduction (for this is its modeft titlc) to this fubjeet, which many others tried to elucifate in vain. At length Dr Simfon of Glafgow, by pationt inquiry and fome lucky thoughts, obtained a
reftoration of the porifins of Euclid, which has all the appearance of being juft. It precifely correfponds to Pappus's defcription of them. All the lemmas which Pappus has given for the better underftanding of Euclid's propolitions are equally applicable to thofe of Dr Simfon, which are found to differ from local thecrems precifely as Pappus affirms thofe of Euclid to have done. They require a particular mode of analy tis, and are of immenfe fervice in geometrical inveftigation; on which account they may jufly claim our attention.
While Dr Simfon was employed in this inquiry, he carried on a correfpondence upon the fubject with the late Dr M. Stewart, profeffor of mathematics in the univerfity of Edinburgh; who, befides entering into Dr $S$ mfon's views, and communicating to him many curious porifms, purfued the fame fubject in a new and very different direction. He publifhed the refult of his inquiries in 1746 , under the title of General Theorems, not caring to give them any other name, leat he might appear to anticipate the labours of his friend and former preceptor. The greater part of the propofitions contained in that work are porifms, but without demonftrations; therefore, whoever wifhes to inveltigate one of the moft curious finbjects in geometry, will there find abundance of materials, and an ample field for dif. cuftion.

Dr Simfon defines a porifn to be "a propofition, in which it is propofed to demonftrate, that one or more things are given, between which, and every one of innumerable other things not given, but affumed accord. ing to a given law, a certain relation defcribed in the propofition is fhown to take place."

This definition is not a little obfcure, but will he plainer if expreffed thus: "A porifm is a propofition affirming the poffibility of finding fuch conditions as will render a certain problem indeterminate, or capable of innumerable folutions." This definition agrees with Pappus's idea of thefe propofitions, fo far at lealt as they can be underfood from the fragment already mentioned; for the propofitions here clefined, like thof which he defribes, are, fristly fpeaking, neither theorems nor problems, but of an intermediate nature between both; for they neither fimply enunciate a truth to be demonfrated, nor propofe a queftion to be refoived, but are affirmations of a trath in which the dctermination of an unknown quantity is involved. In as far, therefore, as they affert that a certain problem may become indeterminate, they are of the nature of theorems; and, in as far as they feek to difcover the conditions by which that is brought about, they are of the nature of problems.

We fhall endeayour to make our readers underfand this fubject, dininetly, by confidering them in the way in which it is probable they occurred to the ancient geometers in the courfe of their refearches: this will at the fame time fhow the nature of the analyfis peculiar to them, and their great ufe in the folution of problems.

It appears to be certain, that it has been the folution of problems which, in all Atates of the mathematical fciences, has led to the difoovery of geometrical truths: the firt mathematical inquiries, in particular, mult have occurred in the form of queftions, where fomething was given, and fomething required to be dene; and by the reafoning

## ror

reafrning neceffary to anfwer thefe quefions, or to difcover the relation between the things given and thofe to be found, many truths were fuggefted, which came afterwards to be the fubject of teparate demonfrations.

The number of thefe was the greater, becaufe the ancient geometers always undertook the folution of problems, with a fcrupulous and minute attention, infomuch that they would fearecly fuffer any of the collateral teyths to efcape their obfervation.
Now, as this cautious manner of proceeding gave an opportunity of laying hold of every collateral truth connected with the nain objec: of inquiry, thefe geometers foon perceised, that there were many problems which in certain cafes would admit of no folution whatever, in coniequence of a particular relation taking place among the quantities which were given. Such problems were faid to become impollible: and it was foon perceived, that this always happened when one of the conditions of the problem was inconfiftent with the red. Thus, when it was required to divide a line, fo that the rectangle contained by its fegments might be equal to a given fpace, it is evident that this was poffible only when the given fpace was lefs than the fquare of half the line; for when it was otherwife, the two conditions defining, the ore the magnitude of the line, and the other the rectangle of its fegments, were inconfiftent with each other. Such cafes would occur in the folution of the moft fimple problems ; but if they were more complicated, it mult have been remarked, that the conftruetions would fometimes fail, for a reafon direcly contrary to that juft now alfigned. Cafes would occur, where the lines, which by their interfegtion were to determine the thing fought, inftead of interfecting each other as they did commonly, or of not meeting at all as in the abovementioned cafe of impoliblity, would coincide with one another entirely, and of courfe leave the problem unrefolved. It would appear to geometers upon a little refection, that fince, in the cafe of determinate problems, the thing required was determined by the interiection of the two lines already mentioned, that is, by the points common to both; fo in the cafe of their coincidence, as all their parts were in common, every one of thefe points mult give a folution, or, in other words, the folutions mist be indefinite in number.

Upos inquiry, it would be found that this proceeded from fome condition of the problem having been inwolved in another, fo that, in fact, there was but one, which did not leave a fufficient number of independent conditions to limit the problem to a fingle or any determinate number of folutions. It would foun be perceiv. ed, that thefe cafes formed very curious propofitions of an intermediate nature between problems and theorems ; and that they admitted of being enunciated in a manner peculiarly clegant and concile. It was to fuch propofitions that the ancients gave the name of porifms. This dednstion requires to be illuftrated by an example : fi:profe, therefore, that it were required to refolve the following problem.
$A$ circle $A B C$ (fig. 1.), a fraight line $D E$, and a point $F$, tcing given in pofition, to find a point $G$ in the traight line DE fuch, that GF, the line drawn from it to the given point, flall be equal to GB, the line drawn from it touching the given circle.
S:?ppofe $G$ to be found, and GB to be drawn teuctr-
ing the given circle ABC in $B$, let $H$ be its centre, join HB, and let $H 1$ ) be perpendicular to 12 E . From ID draw DL, touching the circle $A B C$ in L, and join HI, ; alfo from the centre $G$, with the diftarice $G B$ or $C F$. deferibe the circle 13KF, mecting H1) in the points K and K. Then HD and DL are given in pofition and magnitude; and becaufe G13 touches the circle AliC. HBG is a right angle ; and fince $G$ is the centre of the circle BKF, therefore HB touches the circle BKF, and $\mathrm{HBl}^{2}=$ the redangle K HK ; which reangle $+1 \mathrm{~K}^{2}$ $=\mathrm{HD}^{2}$, becaufe $\mathrm{K}^{\prime} \mathrm{K}$ is biffeted in 1), the cfore $\mathrm{HL}^{2}+\mathrm{KD}^{2}=\mathrm{DH}^{2}=\mathrm{HL} \mathrm{L}^{2}$ and $=\mathrm{LD}^{2}$; thet core $\mathrm{D} / \mathrm{F}^{\circ}$ $=\mathrm{DL}^{2}$, and $\mathrm{DK}=\mathrm{DL}$; and fince DL is given in maknitude, DK is alfo given, and $K$ is a given point : for th: fame reaton $\mathrm{K}^{\prime}$ is a given point, and the poist F beira given by hypothetis, the circle BKP is given by polition. The point $G$, the centre of the circle, is therefore 8 . ven, which was to be found. Hence the conferuction:

Having drawn HD perpendicular to DE, aiad DI, touching the circle ABC, make DK and D $\mathrm{N}^{-1}$ eadt equal to DL, and find G the centre of the circle defcribed through the points K'FK; that is, let $\mathrm{I}^{\prime} K^{\prime}$ be joined and bifeged at iight angles by M1N, which neet. DE in G, Cr will be the point requited; that is, if GB be drawn touching the cirele ABC, and GF to the given point, GL is equal to GF.

The fynthetical demonftration is eafily derived from the preceding analy fis ; but it muft be remarked, that in fome cafes this conftruation fails. For, firf, il F fall anywhere in 1 H , as at $\mathrm{F}^{\prime}$ the line MN becomes parallel to DE , and the point $G$ is nowhere to be found; or, in other words, it is at an infinite diftance from D. 'This is true in general; but if the given point F coincides with K , then MN evidently coincides with DE; fo that, agreeabie to a remark already made, every poirt of the line $D E$ may be taken for $G$, and will fatisfy the conditions of the problem; that is to fay, GB will be equal to GK, wherever the point $G$ be taken in the line DE, the fame is true if $F$ coincide with K . Thus we have an inftance of a problem, and that too a very fimple one, which in general, admits of but one folution; but which, in one particular cafe, when a certais relation takes place among the things given, becomes indefinite, and admits of innumerable folutions. The propolition which refnlts from this cafe of the problem is a porifm, and may be thus enunciated:
"A circle $A B C$ being given by pofition, and alro a Atraight line DE , which does not cut the circle, a point K may be found, fuch, that if G be any point whatever in DE, the fraight line drawn from $G$ to the point K flall be equal to the fraight line drawn from G touching the given circ'e ABC ."

The prublens which follows appears to Imve led to the difcovery of many porifms.

A circle ABC (fig. 2.) and two points D, E, in a diameter of it being given, to find a point $F$ in the circumference of the given circle; from which, if fraight lines be drawn to the given points $\mathrm{E}, \mathrm{D}$, hafe ftraight lines fhall have to one arsother the given ratio of a to F , which is fuppofed to be that of a greater to a lefs. Suppofe the problem refolved, and that F is found, fo that FE has to TD the given ratio of $\alpha$ to 2 , produce EF towards B, bilect the angle EFD by FL, and DFB by FM: therefore EL,:LD: : EF : FU, that is in a given ratio, and lince ED is given, cach of tioug-

Porifm, $\underbrace{\text { Porim. }}$ ments $\mathrm{EL}, \mathrm{LD}$, is given, and the point $L$ is alfo given; becaure DIB is bifcted ly FM, EM: MD: :EF:FD, that $i s$, in a given ratio, and therefore $M$ is given. Since DFL is half of DFE, and DFM balf of DFB, therefore LFM is half of (DFE +DFB), therefore LFM is a riglit angle; and fince the points $\mathrm{L}, \mathrm{M}$, are given, the point $F$ is in the circumference of a circle defcribed upon IM as a diameter, and thenefore given in pofition. Now the point $F$ is alfo in the circumfercnce of the given circle $A B C$, therefore it is in the interfection of the two given circumferences, and therefore is found. Hence this conftruction : Divide ED in L, fo that EL may be to I.D in the given ra$t$ io of a to $\beta$, and produce ED alin to M, fo that EM may be to MD in the fame given ratio of a to $\xi^{2}$; bifeat LM in $N$, and from the centre $N$, with the diftance NL, defribe the femicircle LFM; and the point $F$, in which it interfeats the circle $A B C$, is the point required.

The fynthetical demonfration is eafily derived from the preceding analyfis. It muft, however, be remarked, that the conllruation fails when the circle LFM falls either wholly within or wholly without the circie ABC, fo that the circumferences do not interfect; and in thefe cafes the problem cannct be folved. It is alfo cbvious that the conftruction will fail in another cafe, viz. when the two circumferences LFM, ABC, entirely coincide. In this cafe, it is farther evident, that every point in the circumference $A B C$ will anfwer the conditions of the problem, which is therefore capable of numberlefs folutions, and may, as in the former inflances, be converted into a porifm. We now inquire, therefore, in what circumfances the point $L$ will coincide with A , and alfo the point M with C , and of confequence the circumference LFM with ABC. If we fuppofe that they coincide EA : AD : : $\alpha: \beta:: \mathrm{EC}$ : CD, and EA : EC: : AD : CD, or by converfion EA :AC : : AD :CD-AD : :AD : 2 DO , $O$ being the centre of the circle ABC ; therefore, alfo, EA:AO:: AD : DO, and by compolition EO : AO: : AO:DO, therefore $E O \times O D=\mathrm{AO}^{3}$. Hence, if the given points
Platc E and D (fig. 3.) be fo fituated, that $\mathrm{EO} \times \mathrm{OD}=$ OCCexiII $\mathrm{AO}^{2}$, and at the fame time $\alpha: \beta:: \mathrm{EA}: \mathrm{AD}:: \mathrm{EC}$ : CD, the problem admits of numberlefs folutions; and if either of the points $D$ or $E$ be given, the other foint, ard alfo the ratio which will render the problcm indeterminate, may be fuund. Hence we have this porifm:
"A circle ABC, and alfo a point D being given, another point E may be found, fuch that the two lines inflefed from thefe points to any point in the circumference $A B C$, fhall have to each other a given ratio, which ratio is allo to be fourd." Hence alfo we have an example of the derivation of porifnis from one another, for the circle ADC, and the points D and E reravining as before (fig. 3.), if, through $D$, we draw any line whatever HID13, meeting the circle in $B$ and H ; and if the lines EB, EH, be alfo drawn, thefe lines wi.l cut off equal circumferences BF, HG. Let FC be cravi, and it is plain from the foregoing analyfis, that the angles DFC, CFB, are cqual; therefore if CG, OB, be drawn, the angles $\mathrm{BOC}, \mathrm{COG}$, ate alfo erpual ; and confequently the angles DOB, DOG. In the fame manner, by joining $A \bar{D}$, the angle DBE bebug bifected by BA, it is evident that the angle AOF
is equal to $\triangle O H$, and therefore the angle FOB to HOG, that is, the arch FB to the arch HG. This propofition appears to have been the laft but one in the third book of Euclid's Porifms, and the manner of its enunciation in the porifmatic form is obvious.

The preceding propofition alfo affords an illuftration of the remark, that the conditions of a problem are in. volved in one another in the porifmatic or indefinite cafe; for here feveral independent conditions are laid down, by the help of which the problem is to be refolved. Two points D and E are given, frum which two lines are to be inflected, and a circumference ABC, in which thefe lines are to meet, as alfo a ratio which thefe lines are to have to each other. Now thefe conditions are all independent on one another, fo that any one may be changed without any change whatever in the ref. This is true in general; but yet in one cafe, viz. when the points are fo related to one another that their rectangle under their diftances from the centre is equal to the fquare of the radius of the circle; it follows from the preceding analyfis, that the ratio of the inflected lines is no longer a matter of choice, but a neceffary confequence of this difpofition of the points.
From what has been already faid, we may trace the imperfect definition of a porifm which Pappus afcribes to the later geometers, viz. that it differs from a local theorem, by wanting the hypothefis affumed in that theorem.-Now, to underftand this, it muft be obferved, that if we take one of the propofitions called loci, and make the cenftruction of the figure a part of the hypothefis, we get what was called by the ancient geometers a local theorem. If, again, in the enenciation of the theorem, that part of the hypothefis which contains the conftruction be fuppreffed, the propofition thence arifing will be a porifm, for it will enunciate a truth, and will require to the full underfanding and inveftigation of that truth, that fomething fhould be found, viz. the circumftances in the conftruction fuppofed to be omitted.

Thus, when we fay, if from two given points $\mathrm{E}, \mathrm{D}$, (fig. 3.) two ftraight lines EF, FD, are inflected to a third point F, fo as to be to one annther in a given ratio, the point F is in the circumference of a given circle, we have a locus. But whea converfely it is faid, if a circle ABC , of which the centre is O , be given by pofition, as alfo a point E; and if $D$ be taken in the line EO , $f$ o that $\mathrm{EO} \times O \mathrm{D}=\mathrm{AO}^{2}$; and if from $E$ and $D$ the lines EF, DF be infected to any point of the circumference ABC, the ratio of EF to DF will be given, viz. the fame with that of EA to AD, we have a local theorem.

Latly, when it is faid, if a circle $A B C$ be given by polition, and alfo a point E , a point D may he found, fuch that if EF, FD be inflected fiom E ard D to any point $F$ in the circumference $A B C$, thefe lines thall have a given ratio to one another, the propofition becomes a porifm, and is the fame that has jult now been inveftigated.

Heuce it is evident, that the local theorem is chanmed into a porifm, by leaving out what relates to the determination of $D$, and of the given ratio. But though all propofitions formed in this way from the converlion of loci, are porifms, yet all porifms are not formed from the converfion of loci ; the frit, fur inftance, of the preceding cannot by converfion be changed into a locus;
thereforc

## POR

therefore Fermat's idea of poritms, founded upon this circumftance, could not fail to be imperfect.

To confirm the truth of the preceding theory, it may be added, that profefior Dr Stewart, in a paper read a confiderable time ago before the Plilofophical Society of Edinburgh, defines a porifm to be "A propofition affirming the poffibility of finding one or more conditions of an indeterminate theorent;" where, by" an indeterminate theorem, he meant one which exprefles a relation between certain quantities that are determinate and certain others that are indeterminate; a definition which evidentlyagrees with the explanations which have bcen here given.

If the idea which we have given of thefe propofitions be juft, it follows, that they are to be difcovered by confidering thofe cales in which the conftruction of a problem fails, in confequence of the lines which by their interfection, or the points which by their pofition, were to determine the problem required, happening to coincide with one another. A porifm may therelore be deduced from the problem to which it belongs, juft as propofitions concerning the maxima and minima of quantities are deduced from the problems of which they form limitations; and fuch is the molt natural and obvious analyfis of which this clafs of propofitions admits.

The following porifm is the firf of Euclid's, and the firt alio which was reftored. It is given here to exentplify the advantage which, in invertigations of this kind, may be derived from ensploying the law of continuity in its utmoft extent, and purfuing porifms to thofe extreme cafes where the indeterminate magnitudes increafe al infinium.

This porifm may be confidered as having occurred in the folution of the following problen: Two points A, B, (fig. 4.) and alfo three ftraight lines DE, FK, KL, being given in pofition, together with two points H and M in two of theie lines, to inflect from $A$ and $B$ to a point in the third, two lines that fhall cut off from KKF and KL two fegments, adjacent to the given points H and M , haying to one another the given ratio of a to $\beta$. Now, to find whether a porifm be conneeted with this problem, £uppofe that there is, and that the following propofition is true. Two points $A$ and $B$, and two ftraight lines DE, FIK, being given in pofition, :nd alfo it point H in one of them, a live LK may be found, and allo a point in it M, both given in polition, fuch that $A E$ and BE inflected from the points $A$ and $B$ to any point whatever of the line DE , thall cut off from the other lines FK and LK fegments HG and MN adjacent to the given points H and M , having to cne another the given ratio of $\alpha$ to $\beta$.

Firt, let AE', BE', be inflected to the point $\mathrm{E}^{\prime}$, fo that AE ' may be parallel to FK , then fhall $\mathrm{E}^{\prime} \mathrm{B}$ be parallel to KL, the line to be found ; for if it be not parrallel to KL , the point of their interfection mult be at a finite diftance from the point $M$, and therefore ma. king as $\beta$ to $\alpha$; fo - this diftance to a fom th proportional, the 'iftance from $I-$ at which $A E^{\prime}$ interiects $F K$, will be equal to that fourth proportional. Dut AE' does not inseried FK, for they are parallel by confluction; therefore BE ' cannot interfed KL, which is therefore parallel to $\mathrm{BE}^{\prime}$, a line given in pofition. Again, let AE', BE ", be inflected to $\mathrm{E}^{\prime \prime}$, fo that $A E^{\prime}$ may pafs through the given point $H:$ then it is plain that $B E$."
mut pafs through the point to be foand M; for if no:, it may be demonftrated jult as above, that $A E^{\prime \prime}$ does not pafs through H , contraty to the fuppofition. The point to be found is therefore in the line $E \prime B$, which is given in pofition. Now if from li there be drawn l:1 parallel to AE', and ES parallel to BE', BS : SE : : Bl. $: L N=\frac{S E \times B L}{D S}$, and $A P: P E:: A F: F G=\frac{P E \times A I^{\circ}}{A P}$; herefore $F G: L N:: \frac{P E \times A F}{A P}: \frac{S E \times B L}{B S}:: P E \times A F$ $\times \mathrm{BS}: \mathrm{SE} \times \mathrm{BL} \times \mathrm{AP}$; wherefore the ratio of FG to LN is compounded of the ratios of AF to BI, PE $t$, ES, and BS to AP; but PE:SE : : AE' : BE', and BS : AP : : DB : DA for DB : BS : : DF' : E'E: DA : AP; therefore the ratio of TG to $\mathrm{L} N$ is compounded of the ratios of AF to BI, $A E^{\prime}$ to $B^{\prime} E^{\prime}$, and DB to DA. In like manner, becaufe $\mathrm{E}^{\prime \prime}$ is a point in the line DE and AE', BE" are inflested to it, the ratio of FH to LM is compounded of the fame ratios of AF to BL, AE' to $B E^{\prime}$, and DB to DA; there. fore $F H: L M:: F G: N L$ (and confequently) : : HG : MN ; but the ratio of HG to MN is given, being the fame as that of $\alpha$ to $\beta$; the ratio of FH to $I M$ is therefore alfo given, and FH being given, LM is given in magnitude. Now LM is parallel to BE , a line given in pofition ; therefore $M$ is in a line $Q M$, parallel to $A B$, and given in pofition; therefore the point $M$, and alfo the line KLM, drawn through it parallel to 13E', are given in pofition, which were to be found. Hence this conftruction: From A draw AE' parallel to FI , fo as to meet $D E$ in $\mathrm{E}^{\prime}$; join BE , and take in it $B Q$, fo that $\alpha: \beta:: H E: B Q$, and through $Q$ dram QM parallel to $A B$. Let HA be drawn, and pioduced till it meet DE in $\mathrm{E}^{\prime \prime}$, and draw $\mathrm{BE}{ }^{\prime \prime}$, meeting QM in M ; through M draw KML parallel to BE ', then is KML the line and M the point which were to be found. There are two lines which will anfwer the conditions of this porifm; for if in $Q B$, produced on the other fide of B , there be taken $\mathrm{l} q=\mathrm{BO}$, and if $q$ in be drawn parallel to $A B$, cutting $M 13$ in $m$; and if $m \lambda$ be dravn parallel to BQ , the part $m i$, cut of by EB produced, will be equal to MN , and have to HG the ratio required. It is plain, that whatever be the ratiof \& to 6 , and whatever be the magnitude of FH , if the other things given remain the fame, the lines found will be all parallel to BE!. But if the ratio of $\alpha$ to 8 re main the fame likewife, and if only the point 11 vary, the polition of IK L will remain the fame, and the point M will vary.

Another general remarls which may be made on the analyfis of porifms is, that it often happens, as in the laft example, that the magnitude required may all, or a part of them, te found by confidering the extreme cafes; but for the difcovery of the relation between them, and the indcfinie magnitudes, we muft have recoulfe to the hypothefis of the porifm in its mon gencral or indefinite form ; and mut endeavour fo to conduct the reafoning, thit the indefinice magnitudes may at length totally difappear, and leave a propofition af ferting the relation between determinate magnitudes only.

For this purpofe Dr Simfon frequently employs two natements of the general hypothefis, which he compares together. As for inttance, ig, his analyfis of the latt po.

- $A D$; and for the fame reafon $D E^{2}=\frac{A I}{N} \cdot B D$; but, Forifm. by the preceding lemma, $\frac{L B}{N} \cdot A D^{2}+\frac{A L}{N} \cdot B D \cdot=\frac{L D}{N}$ $\cdot A L^{\prime}+\frac{A L}{N} \cdot B L \cdot+\frac{A B}{N} \cdot L^{2}$; that is, $D E \cdot+D F^{\prime}=$ $\mathrm{LO}^{2}+\mathrm{LM}+\frac{\mathrm{AB}}{\mathrm{N}} \cdot \mathrm{DL}$. Join LG then by hypothefis $\mathrm{LO}^{2}+\mathrm{LM}^{2}$, as to $\mathrm{LG}^{2}$, the fame ratio as $\mathrm{DF}^{2}+$ $\mathrm{DE}^{2}$ has $10 \mathrm{DG}^{2}$; let it be that of $R$ to N , then $\mathrm{LO}^{*} \neq$ $\mathrm{LM}=\frac{\mathrm{R}}{\mathrm{N}} \cdot \mathrm{LG}^{2}$; and therefore $\mathrm{DE}^{\prime}+\mathrm{DF} \cdot \equiv \frac{\mathrm{R}}{\mathrm{N}} \cdot \mathrm{LG}^{\prime}+$ $\frac{\mathrm{AB}}{\mathrm{N}} \cdot \mathrm{DL} \cdot ;$ but $\mathrm{DE} \dot{E}^{2}+\mathrm{DF}^{2}=\frac{\mathrm{R}}{\mathrm{N}} \cdot \mathrm{DG}^{2}$; therefore, $\frac{R}{\mathrm{~N}}$ $\cdot L G^{*}+\frac{B A}{N} \cdot \mathrm{DL}^{\cdot}=\frac{R}{N} \cdot \mathrm{DG}^{\prime}$, and $\frac{\mathrm{AB}}{\mathrm{N}} \cdot \mathrm{DL}^{\cdot}=\frac{R}{\mathrm{~N}}\left(\mathrm{DG}^{\cdot}-\right.$ LG.) ; therefore $\mathrm{DG}{ }^{3}-\mathrm{LG}^{2}$ has to DL ;ia constant ratio, viz. that of $A B$ to $R$. The angle DLG is therefore a right angle, and the ratio of $A B$ to $R$ that of equality, otherwife LD would be given in magnitude, contrary to the fuppolition. LG is therefore given in potition: and fince $\mathrm{R}: \mathrm{N}:: \mathrm{AB}: \mathrm{N}:: \mathrm{LO},+\mathrm{LM}{ }^{2}:$ $1 . \mathrm{G}^{2}$; therefore the fquare of LG, and confequently LG, is given in magnitude. The point $G$ is therefore given, and allo the ratio of $\mathrm{DE}^{\prime}+\mathrm{DF}^{2}$ to $\mathrm{DG}^{\prime}$ ) which is the fame with that of AB -to N .

The conftruction eafily follows from the analy fis, but it may be rendered more fimple; for fince $A H^{\prime}: A B^{\prime}$ $:: A L: N$, and $B K^{2}: A B^{2}:: B L: N$; therefore $A H$. $+B K^{2}: A B^{2}: A B: N$. Likewife, if $A G, B G$, be joined, $A B: N:: A H^{\prime}: A G^{2}$, and $A B: N:: B K^{\prime}:$ $B G^{2}$; wherefore $A B: N:: A K^{2}+B K^{2}: A G^{2}+B G^{\circ}$ and $A G^{2}+B G^{2}=A B^{2}$; therefore the angle $A G B$ is a right one, and $A L: L G:: L G: L E$. If therefore AB be divided in $\mathrm{I}_{\text {, }}$, io that $\mathrm{AL}: \mathrm{LB}:: \mathrm{AH}^{3}: \mathrm{BI}^{\prime}$; and if LG, a mean proportional between $A L$ and $L B$ be placed perpendicular to $A B, G$ will be the point: itequired.

The feep in the analydis, by which a fecond introduction of the generd hypothefis is avoided, is that in which the angle GLD is coneluded to be a right angle ; which follows" from $D \mathrm{G}^{2}-\mathrm{GL}^{2}$, having a given ratio to $\mathrm{LD}^{2}$, at the fime ${ }^{-T}$ time that LD is of no determinate magnitude. For, if polible, let GLD be obtule (fig. 6,) and let the perpendicular from $G$ to $A B$ meet it in $V$, thereiore $V$ is given: and fince $G D \cdot-L G \cdot=L D^{2}+$ $2 \mathrm{DL} \times \mathrm{LV}$; therefore, by the fuppolition, $\left.1 . \mathrm{D}^{2}+2 \mathrm{D}\right) \mathrm{L}$ $\times \mathrm{L} V$ mut have a given ratio to LD ' ; therefore the ratio of $L D^{2}$ to $D L \times V L$, that is, of $L D$ to $V L$, is given, fo that VL being given in magnitude, $L D$ is alto given. But this is contrary to the fuppotition ; for L.D is indefinite by hypothelis, and therefore GLD c.mnot be obtufe, nor any other than a right angle. The conclufion here drawn immediately from the indetemmation of LD would be deduced aecording to Dr Simfon's neethod, by aftuming another point $\mathrm{D}^{\prime}$ and how, and from the fuppufition that GD'-GL: $\mathrm{LD} \mathrm{D}^{\prime 8}:: G D^{\prime}-\mathrm{GL}^{2}: \mathrm{LD}^{2}$, it would eafily appear that CLD muft be a right angle, and the satio that of equality.

Thefe porifms facilitate the fulution of the general problems from which they are derived. For example, let thece laraght lines $A B, A C, L C$ (fig. 5.), be given in

Werchintre fir divininu Poonds without disturting the Afrut.

fubject is taken. He has there promifed a fecond part undertood. Mof of the roads and fields are fo fteep, to his paper, in which the algelraical inveftigation of porifms is to be confidered. This will no doubt throw confiderable light upon the fubjeat, as we may readily judge from that gentleman's known abilities, and from the fpecimen he has already given us in the firt part.

PORK, the flefl of fwinc killed for the purpofes of food. Sec Sus.

The hog is the only domeftic animal that we know of no ufe to man when adive, and thee efore feems properly deligned for food. Befides, as loathfome and ugly to every human eye, it is killed withont reluctance. The Pythagoreans, whether to preferve healih, of on account of compafion, generally furbade the ule of animal food ; and yet it is alloged that Pythagoras referved the nfe of hog's fleth for himfelf. The Jews, the Egyptians, \&c. and other inhabitants of warm countries, and all the Mahometans at prefent, reje?t the ufe of pork. It is dillicult to find a latisfafory reafon fur this, or for the precept given to the Jews refpetting it, though ninqueftionably there was fome good one for it. The Greeks gave great commendations to this focd; and G.alen, thourg indeed that is expected to be from a particular fondncfs, is cvery where full of it. The Romans contidered it as one of their delicacies; and if fome of the irhabitants of the northern climates have taken an averfion to it, that probably arofe from the uncultivated forte of thecir country not being able to rear it. Pork is of a very tender ftrufture; increafed perhaps from a peculiarity in its cconomy, viz. taking on fat more readily than any other animal. Pork is a white meat even in its adult flate, and then gives out a jelly in very great quantity. On account of its little perfirability and tendernefs it is very nutritious, and was given for that intention to the athlet.t. With regard to its alkalefcency, no proper experiments have yet been made; but as it is of a gelatinous and fucculent nature, it is probably lefs fo than many others. Upon the whole, it appears to be a very valuable nutriment; and the reafoa is net very obvious why it was in fome countries forbidden. It is faid that this animal is apt to be difeafed ; but why were not inconveniences felt on that account in Greece ? Again, it has been alleged, that as Palefline vould not rear thefe animals, and as the Jews liad learned the ufe of them in Egypt, it was necellary they flould have a precept to avoid them. But the Egyptians themfelves did not ufe this meat ; and this religions precept, indced, as well as many others, feems to have been borrowed from then. Poffilly, as pork is not very perfpirable, it might increalf the leprofy, which was faid to be epideniic in Palelline; though this is far from being certain.

PORLOCLI, in the county of Somcrfet in England, is a fmall fea-port town fix miles weft from Minehead. This whole parifh, ialuding hamets, contins about $1: 0$ Iomfes, and nearly 600 inhabitants. The fituation of the town is very romantic, being nearly furrounded on ail fides, except toward the fea, by feep and lofty hills, interfeded by deep vales and hollow glens. Some of the hills are beantifully wooded, and contain numbers of wild deer. The valleys are very deep and picturefque; the hises being flecp, farted with wild rocks, and patched with woods and foreft fhrubs. Some of them are well cultivaled and ihuded with villages or fingle farms and cutafes, ahough agriculture here is very imperfectly
that no carriages of any kind can be ufed; all the crops are therefure carried in with crooks on loorfes, and the manure in wooden pots called doffels. Niany of the poor are employed in fpiming yarn for the Dunfter manufactory. W. Long. 3. 32 . N. Lat. 51.14. poro. Sec Calauria.

## PORPESSE, in ichthyology. See Delphinus.

PORPHYRIUS, a famous Platonic philofupher, was born at Tyre in 233, in the reign of Alesander Severus. He was the difciple of Longinus, and becane the ornament of his fchool at Athens; from thence he went to Rome, and attended Plotinus, with whom he lived fix years. After Plotinus's death he taught philofophy at Rome with great applaule; and became well filled in polite literdture, geography, aitronomy, and mufic. He lived till the chid of the third century, and died in the reign of Dioclefian. There are Rill extant his book on the Categories of Aritotle; a Treatife on Abtinencc from Fielh; and feveral other pieces in Greek. Hc alfo compofed a large treatife againft the Chriftian religion, which is loft. That work was anfwered by Merhodius bifhop of Tyrc, and alfo by Eufebius, Apollinarius, St Augutin, St Jerome, St Cyril, and Theodoret. The emperor Theodofius the Great caufed l'orphytias's book to be burned in $33^{8}$. Thofe of his works that are fill extant were printed at Cambridge in $1655,8 \mathrm{vo}$, with a Latin verfion.
"Porphyrius (fays Dr Enfield) was, it mutt be owned, a writer of deep erudition; and had his judgement and integrity been equal to his learning, he would have deferved a difinguifhed place among the ancients. But ncither the iplendor of his diction, nor the variety of his reading, can atone for the credulity or the dithonefty which filled the narrative parts of his works with fo many extravagant tales, or interef the judicious reader in the abftrufe fubtelties and myftical flights of his philofophical writings."

PORPHYRY, a genus of ttones belonging to the order of faxa. It is found of feveral different colours, as green, deep-red, purple, black, dark-brown, and grey. Under the name of porphyry, Mr Kirwan and M. de Sauflure include thofe fones which contain either felt-fpar, fcherl, quartz, or mica, with other fpecies of cryftalized fone on a filiceous or calcareous ground. There are a great many different kinds. M. Ferber defrribes 20 varieties under four fecies, but in general it is confidered with relation to its ground, which is met with of the colours already mentiuned. When the ground is of jafeer, the porphyry is commonly very hard; the red generally contains felt-fpar in fmall white dots or fpecks; and frequently, together with thefe, black frots of fchoerl. The green is often magnetic, and is either a jufper or fchocil, with fpots of quartz. Sometimes a prophyry of one colour contains a fratyment of annther of a different colrur. Thofe that have chert for their ground are fufille per fo. The calcareons porp yry conlifs of quartz, felt-ipar, and mica, in feparate grains, united by a calcareons cement; and, lattly, the micaceous porplyyry confits of a greenith grey micaceons ground, in which red felt-fipar and greenith foap-rock are inferted.

The porphyry of the ancients is a mof elegant mars of an c:tremely firm and compace ftrueture, remankably heavy, and of a finc flong purplc, variegate. more ir

## I OR

yry. lefs with palc red and white ; its purple is of all degrees, from the claret-colour to thit of the violet; and its ririega ions are rarely difpofed in veins, but foots, fometimes very fmall, and at others:unning into large blotches. It is lefs fine than many of the ordinary marbles; but it excel; them all in hardnefs, and is capable of a molt elegant rolith. It is llill foumd in immende ltrata in Egypt. 'lhe hard red-lead coloured porphyry, variegrated with back, white, and green, is a mof beautiful and valuable fubstance. It has the hardnefs and all the other characters of the oriental porphyry; and even greatly excels it in brightnefs, and in the betuty and variegation of its colours. It is found in great plenty in the ifland of Minorea; and is well worth importing, being greatly fuperior to all the Italian matries. The hard, pale red porphyry, variegated with black, white, and green is of a pale flefh-colour ; ofren approaching to white. It is variegated in blotches from halfaninch to an inch broad. It takes a high polith, and emulates all the qualities of the oriontal porphyry. It is found in immenfe flrata in Arabia Petrwa, and in the Upper Egypt; and in feparate nodules in Germany, England, and Ircland.
licoroni takes notice of two exquifitely fine columns of black porpliyry in a church at Rome. In Egypt there are thrce celebrated obeliks or pillars of porphy. ry, one near Cairo and two at Alexandria. The French call them aguglias, and in England they are called Gloopatra's med s.

The a:t of cutting porphyry, fratifed by the ancients, appears now to be loft. Indeed it is dificult to conceive what tools they ufed for falhioning thofe huge columns and oher porphyry works in fome of the ancient buildings in Rome. One of the molt conflderable of theic, Itill entire, is a tomb of Conftantia, the emperor Conflantine's daughter. It is in the church of St Agnes, and is commonly called the tomb of Bacchus. In the palace of the Thuilleries there is alio a bult of Apollo and of twelve emperors, all in porphyry. Some ancient pieces feem to have been wrought with the chiffel, others with the faw, others with wheels, and others gradually ground down with emery. Yet modern tools will fcarce touch perphyry. Dr Leifter therefore thinks*, that the ancients had the fecret of tempering feel better than we; and not, as fome inagine, that they had the art of foftening the porphyry; theugh it is probable that time and air have contributed to increafe its hardnefs. Mir Addifon lays, he faw a workman at Rome cutting porphyry; but his advances werc extremely tlow and almult infenfible. The Italian feulptors work the pieces of old porphyry columns thill remaining (for the porphyry quarries are long fince loft) with a bafs faw without teeth. With this faw, emery, and water, they wh and wear the ftone with infinite patience. Many perions have endcavoured to retrieve the ancient art, ind farticutaly Leon Baptifa Alberti; who, fearchirg for the noceffiry materials for temper, fays, he fonnd goats blood the beft of any: but even this availed not much; for in working with chilfels tempered with it, fparks of fire came much more plentifully than pieces of the tone. Thac foulptors were thus, however, able to make a flat or oval form; but could never attain to any thing like a figure.

In the year 1555, Cofmo de Medicis is faid to heve difilled a wate: from certaiu herbs, with which his feulpVOL, XIV.
tor Franecfeo Tadda gave his tools fuch an admirable rophary hardnels and fo fine at temper, that he performed fome very exquilite works with them; particularly our So viour's head in demi.relievo, and Cufmo's head and his duchefs's. The very hair and beard, how diffenlt foever, are here well conducted; and there is nothing of the kind fuperior to it in all the works of the ancients; but the focret appears to have ded with him. 'Ille French have difcovered amother mode of cutting porphyre, viz, with an ircon liw: withont teeth, and dre, a kind of free fone puiverized, and water. The attthors of this irvention fay, that they eonld form tive whole contour of a column hereby if they had mitter to work on. Others have propofed to harden tools fo as to cut porphyry, by fteeping them in the juice of the plant called bcar's beeh or brankurfine. See Dirch's ITif. R. S. vol. i. p. 238. vol. ii. p. 73, \&c. Mr Boyle fays, that he cauled porphyry to be cut by means of emery, fteel faws, and water; and oblerves, that in his time the Englifh workmen were ignorant of the manner of working porphyry, and that none of them would undertake to cut or polifh it. Sce his Works abr. vol. i. p. 11I.

Da Cofta fuppofes, and perlaps with reafon, that the method ufed by the ancients in cutting and engra. ving porphyry was extremely fimple, and that it was perionmed without the aid of any feientific means that are now loft. He imagines, that, by unwearied diligence, and with numbers of common tools at great cxpence, they rudely hewed or broke the ftone into the intended figure, and by continued application reduced them into more regular defigns; and that they completed the work by polifhing it with great labour, by the aid of particular hard finds found in Egypt. And he thinks, that in the porphyry quarrics there were layers of grit or loofe difunited particles, analogous to the porphyry, which they carefully fought for, and ufed for this work. See Nat. Hil. of Foffls, p. 285.

Porpurrr-Sbell, a fpecies of Murex.
PORPITES, the Halr-button-stone, in natural hiftory, a name given by authors to a fimall fpecies of foffil coral; which is ufually of a rounded figure conSiderably flatted, and friated from the centre everyway to the circumference. Thefe are of different fizes and of different colours, as greyifh, whitifh, brownifh, cr bluifh, and are ufually found immerfed in ftone. Sce Plate CC.

PORRUM, the LEEK; a fpecies of plants, belonging to the genus of Allium.

PORT, a harbour, river, or haven, formed either by nature or art to reccive and fheiter hhipping from the floms and waves of the open fea.

Artificial ports are thofe which are either formed by throwing a lirong mound or rampire acrofs the harbour's mouth to funie inland or rock, or erecting two long barriers, which fretch from the land on eacla fide libe arms or the horns of a crefcent, and nearly inclofe the haven; the former of thefe are called mole-baals and the latter fi rs.

Port, is alfo a name given on fome occafions to the larboard or left fide of the thip, as in the following infances. Thus it is faid, "the fhip heels to port," i. $e_{\text {. }}$ ftoops or inclines to the larboard-lide. "Top the yard to port!" the order to make the larboard extremity of a yard higher than the other. "Port the helm!" the
ordes.
vefiel. In ail thefe fenfes this pirrafe appears intended to prevent any mittakes happening from the fimilarity of founds in the words furboard and larboard, particularly when they rclate to the helm, where a mifapprehenfion might be attended with very dangerous confequences.

Ports, the embrafures or openings in the fide of a flip, of war, wherein the artillery is ranged in battery upon the decks above and below.

The ports are formed of a fufficient extent to point and fire the cannon, without injuring the fhip's fide by the recoil; and as it ferves no end to enlarge them beyond what is necellary for that purpofe, the thipiprights have eftablifhed certain dimenfions, by which they are cut in proportion to the fize of the cannon.

The ports are thut in at fea by a fort of hangingdoors call'cd the port-lids; which are faftened by hinges to their upper edges, fo as to let down when the cannon are drawn into the flip. By this means the water is prevented from cntering the lower decks in a turbulent fea. The lower and upper edges of the ports are always parallel to the deck, fo that the guns, when levelled in their carriages, are all equally high above the lower estremity of the ports, which is called the portcell.

Porr, is alfo a ftrong wine brought from Port-aport, and allo called Porto and Oporto.

Port of the Voice, in mufic, the faculty or habit of making the fhakes, pallages, and diminutions, in which the beauty of a fong or piece of mufic confifts.

Port-Crajon, a pencil-cafe, which is ufually four or five inches long, and contrived fo as that the pencil may flicle up and down. lits infide is round, and its ontide is fometimes filed into eight fides or faces, on which are drawn the fector-lines; fometimes it is made round both without-ide and within, and has its length divided into inches and parts of inches.

Porr-Fiie, a compofition for fetting fire to powder, \&c. Port-fires are frequently uied by artillery people in preference to matches; and they are diftinguifhed into wet and dry port-fires. The compofition of the former is faltpetre four, fulphur one, and mealed powder four. When thefe materials are thoroughly mixed and fifted, the whole is to be moifened with a little linfeed oil, and rubbed bctween the hands till all the oil is imbibed by the compofition. The preparation for dry port-fires is faltpetre four, fulphur one, mealed powder two, and antimony one. Thefe compofitions are driven into fmall paper cafes, to be ufed whenever neceffiry.

Port-aux Prune, fo called by the Fronch, is a country on the coalt of Arrica, to the morth of the inand of Madagafcar. It is a rich country, and fertile in rice and pantures; it is inhabited only by the negrocs, who are an induftrions good fort of people, but very fuperfitious. There are no towns, but feveral villages, and they have fome cultoms which feem to incline to Judaifm.

Port Fackjon, in New Holland. See Neru Holland, $n^{\circ}-$ sec.

Posf-Royal, a fea-port town in the inand of Jamaica. It was once a place of the greateft riches and importance in the Weft Indies: but in 16,2 it was deflroyed by an earthyuake, in 1702 by fire, in 1722 by an inundation
of the fea, and in $174+$ it fuffered greatly by a hurricane. It is now reduced to three flreets, a few lanes, and about 200 hcufes. It contains the royal navy-yard for heaving down and refitting the king's flips; the navy-hoipital, and barracks for a reginent of foldiers. The fortifications, which are very extenfive, being in excellent order, and having been lately ftrengthened with many additional works, it may be falid to vie in point of Atrength with any fortrefs in the king's dominions. The larbour is one of the beft in the world, and 1000 thips may ride therein, fecure from every wind that can blow. It is fix miles ealt of Spanifltown, and as much by water fouth.ealt of Kingfton. W. Long. 76. 40. N. Lat. 18. 0.

Porf-Royal, an illand in North Amcrica, on the coaft of Soutlh Carolita, which, with the neighbouring continent, forms one of the molt commodious harbours in the United States. It is 15 miles in length; and the town on the north thore is called Beaufort. W. Long. So. 10. N. Lat. 3 1. 40.

Port-Royal, the name of two monafteries of Cittertian nuns in the dioccefe of Paris; the one near Chevreufe, at the diftance of five leagues from Paris, callcd. Port-Riyal of the Filds; and the other in Paris, in the fuburbs of St James.

The nuns of the former of thefe monafteries proving refractory, were difperfed; when many ecclefiaftics, and others, who were of the f.me fentiments as thefe religious, retired to Port-Royal, took apartments there, and printed many books. Hence the name of PortRoyalifs was given to all their party, and their books were called books of Port-Royal: from hence we fay the witers of Port-Royal, Meffieurs de Port-Royal, and the tranflations and grammars of Port-Royal.
PORTA, or $l_{\text {ena }}^{\text {ena }}$ Port $A$, in anatomy, a large vein diftributed through the liver in the manner of an artery. See Anatomy, in ${ }^{\circ}$ of.

Porta-Angufla (anc. geog.), mentioned only by: Ptolemy; a town of the Vaccai in the Hither Spain; thought by fome to be Torre Quemada, in Old Caftile; by others Los Valvafes, a village between Burgos and Torre Quemada.

PORTA-Romane (anc. geog.), according to Pliny, Romulus left but three, or at mof four, gates of Rome : afterwards, on enlarging the Pomocria, or compafs of the city, they amounted to 37 .

PORTAL, in architecture, a little gate where there are two gates of a different bignefs; alfo a little fquare corner of a room cut off from the reft by the wainfcot, and forming a fhort paffage into the room. The fame name is alfo fometimes given to a kind of arch of join. ers work before a door.

PORTATE, or a Crofs Portatr, in heraldry, a crofs which does not fland upright, as croffes generally do; but lies acrofs the efcutcheon in bend, as if it were carricd on a man's fhoulder.

PORTCULLICE, in fortification, is an affernblage of feveral large pieces of wood, joined acrofs one another like a harrow, and each pointed with iron at the bottom. They are fometimes hung over the gate-way of old fortified towns, ready to let down in cafe of furprife, when the gates conld not be fhut.

PORTER, a kind of malt liquor which differs from ale and pale beer, in its being made with high dried malt. Sce Ale, Beer, amd Brewing.

PORT.

## 1 OR

port-glasgow. See Glasgow, $1^{\circ} 10$.
portgreve, or Portgrafe, was anciently the principal magild rate in ports and oller maritinct towns. The word is formed from the Saxon port, "a port or other town ;" and gerref, "a governor."-It is tometimes allo written port-reve.

Camden obferves, that the chief magifrate of London was anciently called port.greve: inttead of whom, Richard I. ordained two bailiff; and foon afterwards King John granted them at mayor for their yeally magill rate.

PORTICI, a palace of the king of Naples, fix miles from that capital. It has a charming fituation, on the fea-fide, near mount Vefuvins. It is enriched with a valt number of fine flatues, and other remains of antiquity, taken out of the ruins of Herculaneum.

The mufenm contills of 16 romms, in which the different articles are arranged wich very great tafte. The floors are paved with Mofaic, taken from the reeovered towns, and the walls of the court are lined with infcriptions. Befides bufts, flatues, medals, intaglios, lamps, and tripods, there is fearcely an article ufed by the ancients of which a feecimen may not be feen in this mus feum. "But the moft valuable room is the library, from the numerous manufeript rolls which it contains. What a field is herc for conjecture! what room for hope! Among this ineftimable collection, how many great works are there, of which even the names are now unknown! low many unbroken volumes, whofe very fragments, preferved in the writings of the ancient fcholi.ffts, convey to us moral improvement, information, and delight! perhaps all the dramatic pieces of Menander and Plitemon ; fer haps, nar, certainly, the lof Decades of Livy ; for it is impofible to fuppofe, that among fo many rolls, the molt admired hittory of the people who poffeffed them is not to be found : what private library in Britain is without the beft hiftories of England? But how I tremble for their fituation, as Portici is built on the lava that overwhelned Herculaneum! How I tremble too for the indifference of the king of Naples towards this invaluable treafure, in which all the moft enlightened people of Europe are deeply interefted! When I firf faw them, I had no idea of what they were, as they refemble wooden truncheons burnt alnolt to charcoal. They are fo hard and brittle, that the greateft caution muft be ufed in removing them, left they crumble to duft; neverthelefs, an inge. nious friar of Genoa, named Raggio, undertook to un. roll them ; and by a mott curious, though tedious procefs, fo far fucceeded, as to tranffribe three Greek Treatifes on Philofnphy and Mufic; but finding (as I hear) no other encouragement than his falary, which was but little more than you pay f me of your fervants, the work was unhappily difcontimued. Were thefe manuferipts in England, they would not long remain a fecret to the woild."

PORTICO, in architesture, a kind of gallery on the ground; or a piazza encompailed with arches fupported by columne, where people walk under coverc. 'The roof is ufually' vaulted, fometimes flat. The ancients called it lacunar. Tliough the word fortico be dcrived from porta, "gate, door:" yet it is applied to any difpofition of columns which firm a gallery, withont any immediate rel ution to doors or gates. The moft celcbrated porticoes of antiquity were, thofe of So.

## 4031 <br> POR

lomon's temple, which formed the atrium or court, and encompaufed the finctuary; that of $\Lambda$ thens, built for the poople to divert themfelves in, and wherein the philofophers held their difputes and converfations, (fee Porch); and that of Pompey at Rome, raifed merely for magnificence, confiling of feveral rows of columns fupporting a platiorm of valt extent; a draught whereof. Serlio gives us in his antique buildings. Among the modern porticoes, the moll celcbrated is the piaza of St Peter of the Vatican. - That of Covent-Garden, London, the work of Inigo Jones, is alio much admirch.

## PORTII. See Ponpehi.

PORTLAND, a peninfula in Dorfethire, of great flrength both by mature and art, being furrounded with inaccefible rocks, cocept at the landing-place, where there is a frong calle, called Portland cafle, built by king Henry VIII. There is but one church in the in:and: and that flands fo near the fea, that it is often in danger from it. It is now chicfly noted for the freefone which is found there, and which is greatly employed in London, and other parts of England, for building the fineft Aructures. St Paul's church, in particular, was built therewich. W. Long. 2. 35 . N. Lat. 5. 30.

The following cuftom at Portland is worthy of notice. "While 1 was looking over the quarries at Portland (fays Mr Smeaton), and attentively confidering the operations, obferving how foon the quarrymen would cut half a ton of fpawls from an unformed block, and what large pieces flew off at every froke; how feecily their blows followed one another, and how inceffiantly they purfued this labour with a tool of from is to 20 pound weight; I was naturally led to view and confider the figure of the operative agent; and after having obferved, that by far the greateft number of the quarrymen were of a very robult hardy form, in whofe hands the tool I have mentioned feemed a mere play-thing, I at laft broke out with furprife, and inquired of niy guide, Mr Roper, where they could pofibly pick up fucl a fet of fout fellows to handle the kevel, which in their hands feemed nothing? for I obferved, that in the fpace of 15 minutes, they would knock off as much wafte matter from a mafs of fone, as any of that occupation I had ever feen before would do in an hour. Says Roper, ' we do not go to fetch thofe men from a diltance, they are all born upon the inland, and many of them have never been farther upon the main land than to Weymouth.' I told him, I thought the air of that inand muft be very propitious, to furnilh a breed of men of particularly formed for the bulinefs the followed. 'The air (he replied), though very fharp from our clevated fituation, is certainly very healthy to working men; yet if you knew how thefe men are produced, you would wonder the iefs; for all our marriages here are productive of children.' On defining an explanation how this happened, he proceeded: 'Our people here, as they are bred to hard harbour, are very early in a condition to marry and provide for a family ; they intermarry with one another, very rarcly going to the main.land to feek a wife; and it has been the cuitom of the illand, from time immemorial, that they never marry till the woman is pregnant.' But pray (faid I) does not this fubicet you to a great number of b.iftards? Have not your lootlanders the fame hind of ficklenef's

## POR L 404 J POR

rottland. in their attachments that Englifhmen are fubject to? and, in confequence, docs not this produce many inconveniences? ' None at all (replies Roper), for previons to my arrival here, there was but one child on record of the parifh regifter that had been born a baftard in the compafs of 150 years. The mode of courthlip here is, that a young woman never admits of the ferious addreffes of a young man, but on fuppofition of a thorough probation. When the becomes with child, the telis her mother, the mother tells her father, her father tells his father, and he tells his fon, that it is then proper time to be maried.' But fuppofe, Mr Roper, the does not prove to be with child, what happens then? Do they live tngether without marriage? or, if they feparate, is not this fuch an imputation upon her, as to prevent her getting another fuitor? 'The cafe is thus managed (a:riwered my friend), if the woman does not prove with child after a competent time of courtfhip, they conclude they are not deftined by Providence for each other; they therefore feparate ; and as it is an eftablifhed maxim, which the Portland women obferve with great frionels, never to admit a plurality of lovers at one time, their homour is no way tanifhed: fhe jut as foon (after the affair is declared to be brcke oil) gets another fuitor, as if fhe had been left a widow, or that nothing had ever happened, but that the had remained an immaculate viryin.' But pray, Sir, did nothing particular happeas upon your men coming down from London? • Yes (hays he) our men were much fruck, and mightily pleafed will the facility of the Jurtland ladies, ind it was not long before feveral of the women proved with child ; but the men being called upon to marry them, his part of the lefion they were unmfructed in; and on their refufal, the Putland women aro'e to Rone them out of the illand; infomuch, that thofe feev who did not choofe to take their fiwecthearts for lite ter or for ezorfe, after fo fair a trial, were in reality obliged to decanp; and on this occafion fome few batards were born: but fince then matters have gone on according to the ancient cuftom."

PORTLAND vase, a celebrated funeral vafe which was long in pofleffion of the Baberini family; but which was, lately purchared for icco guincus by the Duke of Porthard, from whom it has derived its prefent nams. Its height is about ten inches, and its diameter where broadel lix. There are a varicty of figures upon it of mon exquinte workmanhip, in bas relicf of white opake ghlafs, ralied on a ground of deep blue glafs, which appears black except when held againft the light. It appears to lave been the work of many years, and there are antiquatians who date its production leveral centuries belose the Chiftian cra; fince, as has lieen fais, fenlpture was declining in excellence in the time of Alexander the Creat.

Refipesting the purpefe of this valu, and what the figheses on it were meant to 1 eprefont, there have teen a salisty of coniectures, which it is not our bufinefs to

- Loves of cmomerate. We think wih Dr Darwin" that it was not the douts, mate for the athes of atiy particular perfon deceated; and therefore that the fubject of its cmbellifhments is wot a pliate hifory, but ut a general nature. But we are not fure that be is right ia conjecturing it on reprefent a part of the Elentiman myteries; becaufe that conjefure depends ca Warbuton's cxplanation of the Gha book of the IEncid, wielch docs :ot now command
that refpect which it did when it was firf propofed. We fhall therclore give a fhort account of the feveral figures, without noticing any of the theories or conjectures that have been made abont them.

In one compartment three exquifite figures are placed on a roined column, the capital of which is fallen, and lies at their feet among other disjointed fones: they fit nnder a tree on loore piles of flone. The middle figure is a female in a reclining and dying attitule, with an inverted torch in her left hand, the elbow of which linp. ports her as fhe finks, while the right hand is raifed and thrown over her drooping head. The figure on her right hand is a man, and that on the left a woman, both fupporting the melves on their arms, and apparent1y thinking intenfely. 'Their backs are to the dying figure, and their faces are turned to her, but without an attempt to affil her. On another compartment of the vafe is a figure coming through a portal, and going down with great timility into a darker region, where he is received by a beantiful temale, who ftretches forth her hand to help him: between her knees is a large and playful ferpent. She fits with her feet towarls an aged figure, havisg one foot liak into the earth, and the other raifed on a crlum, with his chin refting on his hand. Above the fem.le figure is a Cupid preceding the firl figure, and beckoning to him to advince. This firt figurc holds a cloke er garment, which he feems anxious to bring with him, but which adheres to the fide of the pertal through which he has palfed. In this compartment there are two trees, one of which bends over the female figure and the other over the aged one. On the botom of the vaie there is another figure on a larger feale thian the one we have already mentioned, but not fo well finthed nor fo elevated. This figure points with its finger to its motth. The drefs appears to be curious and cumberfome, and above there is the foliage of a tree. On the head of the figure there is a Phrygian cap: it is not eafy to fay whether this figure be male or female. On the handles of the vale are reprefented two aged heads with the ears of a quadruped, and from the middle of the forcheald riles a lind of tree without leaves: thefe figures are in all probability mere ornaments, and have no connection with the reit of the fizures, or the flory reprefented on the vale.

PORTLANDIA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolia is elevated :und funnel flaped; the anthere are longitudinal; the capfule pentagonal, and retufe at top; bilocular, and crowned with a pentuphyllous calyx.
There are rwo fpecies, viz. the grandifora and hexandrat the former of which has been particularly deferibed by Dr 13 rowne, who has alfo given a good figure of it. It has frequeatly flowered in the royal garden at Kew, and in Dr Pitcairm's at Iflington.

The external batk is remarkably rough, furrowed, and thick; it has no tatte. The inner bark is very thin, and of a dark brown colour. Its tafte is bitter and aftringent, and its rirtues are the fame as thofe of the Jefuit's bark. Infufed in fipirits or wine with a little orange-peel, it makes an excellent Romachic tincture.
PORT-Iou:s, is a Rrong town of France, in Bre-
tagne, in the diocefe of Vannes, with a citadel and a not chonfing to refide in a place fo extremely unhalthy
good harbour. It was fortified by Louis XIII. from whom it derived its name. It was at Atation for part of the royal navy and the Eaft Indiat fhips belonging to France. It is feated at he mouth of the river blavet, 27 miles weft of Vamnes. W. Long. 3. 18. N. Lat. 47. 40.

Pekt-Mabon. Sec Minorca.
lorto. Sce Oporto.
Porro-Bello, : town of North America, fitnated in N. Lat.9. 3 . W. Long. 79.45. clote to the fe.t, on the declivity of a monatain, which furrounds the whole harhour. This harbour is to hage, deep, and fafe, that Columbis, who firlt dicovered it, gave it the name of Porto-Bicllo, or the "Fine Harbour," which is now commonly ufed to denote the town. The number of the houfes is :bout 130 ; moit of them of wood, large and fpacions, forning one lung freet along the ftrancl, with other fnaller ones croffing it. The governor of the town is always a gentlemsin of the army, fubordinate to the prefi lent of Panama; but having under him the command.unts of the forts that defend the harbour. At the eait end of the town, on the road to Panama, is a phace called Guinea, where all the negroes of both fexes, whether flaves or free, have their habitations. Thlis place is vory much crowded when the galleons are bere, mo! of the inhabitants of the town quitting their houles entirely for the falke of letting them; while others content themfelves with a fmali part, in o:der to make money of the reft. The Mulattoes and other poor fanilies alfo remove either to Guinea, or to cottages already erected near it, or built on the oucafion. Great numbers of artificers likewife who flock to Porto-Dello from Panma to work at their refpestive callings during the fair, lodge in Guirea for cheapnefs. Towards the fea, in a large tratt be1 ween the town and Gloria cafte, barracks are erested, i. molt of which the fhips crews keep ftalls of fweetmeats, and other kinds of eatables, hrought frum Spain; but at the conclufion of the fair, when the fhips put to fea, all thefe buildings are taken down, and the town returns to its former tranquillity and emptinefs. In 1739, the harbour was defended by a caltle and two forts; which were :lll demolifhed loy admiral Vernon, who, with fix fhips only, made himfle mater of this port. The cometry about l'orto-Bello is over-run with mountains and impenctrable foreft, except a fer valleys, in which are iome fa:tered farms. Ameng the nountains that furround the harbour is one ditinguifhed by the name of Cafira, and by its luperior leftinets is a fort or baromete; to the country, by firetelling every change of weather. Its top is always covered with clouds, of a dinfery and darknefs feldom feen in the fe of the a mo!phorc. When thefe clouds thicken, increafe their blackncfs, and fink below their ufinal ftation, it is a fure fign of a tempett ; while, cn the other land, their clearnefs and afcent as certainly indicate the apptoach of fuir weather. Thefe changes are very fidden and frequent here. The fummit of the mountrin is icarce ever clear from clouds; and when it hap. pens, it is only, as it wcre, for an inftant. Except in the time of the fair, all the inhabitants of Porto- Bello do not amount to 3000 ; half of whom are Indians, Mulatiocs, or Negross ; the Scaniards of any fubRance
and fatal even to the lives of the natives. Ullontells us, that the catle brought hither from Panma" of Carthagena, bofe their flelh fo fatt in the bett pallures, as to become fcarce eatible: he aflures us alfo, that neither horfes nor affes are bred here. The heat, indeed, is excefive ; and the torrents of rain are fo dreadful, fudden, and impetuous, that one not accuft med? to them would imagine a lecond deluge was coming. Thefe tortents are :ulfo accompanica with frightful tempefts of thunder and lightang, the awfolners of the fene being heightened by the repercullions from the mountains, and the fhrieks and howlings of multitudes of monkeys of all kiads which inhabit the furrounding woods.
l'refl water pours down in freams from the mountains, fome ruming without the town, and others crelis. ing it. There waters are very light and digellive; qualities which in other countries would be very valuable, but are here pernicious, producing dyfenteries, which the patient feldom furvives. However, thef: rivulets, formed into refervoirs, ferve the purpofus of bathing, which is here found to be very conlucive to health.

As the forefts almolt border on the houres of the fireets, tygers often make incurfions into the ftreets during the night, carrying off fowls, dogs, and cther domettic animals, and tumetimes even children have fallen a prey to them. Befides the fnares ufually haid for them, the Negroes and Mulattoes, who fell wood is the forents of the mountains, are very dexterous in encountering them; and fome, for a flender reward, even feek then in their retreats.

The tuwn of Porto-Bello, which is thinly inhabiteci by reafon of its noxious air, the fcarcity of provifions, and the barrennefs of the foil, becomes, after the arrival of the galleons, one of the molt populcus towns in the world. He who had feen it quite empty, and every place wearing a melıncholy afpect, would be filled with aftonilhment to fee the butling multitudes in the time of the fair, when every houre is crowded, the fquires and fireets encumbered with bales of merchandife and chetts of gold and filver, the harbour full of thips and veffels, fome loaded with provilions from Carthagena, and others with the goods of Peru, as cocoa, Jefuit's bart', Vicuna wool, and bezoar ftones; and this town, at all other times deteled for its deleterious qualities, becomes the ?laple of the riches of th: Oid and New World, and the feene of one of the mort confiderable branches of trade in the univerfe. Formerly the fair was limited to no particular time; but as a loag fay in fuch a fickly place extremely aftesied the health of the traders, his Cathe lie majelty tran:miated and order that the fais fould not la!t above 40 d.eys; and that, if in that time the merchants could not agree on their rates, thofe of Spain theuld be allowed. to carry their goods up the country to Pern: and accordingly, the commodore of the gatleons has orders to re-embark them, and return to Carthagenal ; bus ohlerwife, by virtue of a compast between the merchants of both kingdoms, and ratified by the king, no Spanifh trader is to fead his gools, on his own account, beyond Porto-Bello. The Englifh were furmerly allowed to fend a this anaully to this fuir, which turn-

## POR

Porto,
ed to great account; and, whilit the affiento contract fubfilted, either with the Englifh or the French, one of their principal factories was at Porto-Bello.

Porqo-Farina, a port about 12 miles from Cape Carthage, in the bay of 'Tunis, where formerly the large velfels belonging to the bey were fitted out, and laid up on their return from a cruize. This harbour is fafe from the weather, and opens into a large lake, formed by the Mejerdah, which runs throngh into the fea. The north weft wind, which blows right upon the thore, together with the foil brought down by the river, which has the fame quality as the Nile of overfluwing its banks, has formed a bar, fo that only fmall vellels ean now enter. It is fill the arfenal where the naval fores are kept. E. Long. 10. I6. N. Lat. 37. 12.

Porto-Farraio, a handfome town of Italy, in the ifle of Elba, with a good citadel. It is very ftrong, and feated on a long, ligh, fteep point of land, to the weft of the bay of the fame name, which has two forts. It belongs to the great duke of Tufcany, who always keeps a good garrifon there. E, Long. 10. 37. N. Lat. $4^{8 .} 55$.

Porto Lonzone, a fmall but very ftrong town of Italy, and in the ifle of Elba, with a good hat bour, and a fortrefs upon a rock almoft inacceffible. The king of Naples has a right to put a garrifon therein, though the place belongs to the proce of Piombino. It is feated on the ealt end of the inand, eight miles fouthweft of Piombino. E. Long. Io. Io. N. Lat. 42. $5^{2}$.

Porto-Santo, an ifland of the Atlantic Ocean, on the coatt of Africa, and the leaft of thofe called the Madtiras. It is about 15 miles in circumference, and produces but little corn; however, there are oxen and wild $\log s$, and a valt number of rabbits. There are trees which produce the gum or refin called dragon's blood; and there is likewife a little honey and wax, which are extremely good. It has no harbour, but good mooring in the road. It belongs to the Portuguefe, and is 300 miles wat of the coalt of Africa. W. Long. 16. 20. N. Lat. 32. $5^{8 .}$

Porgo-Seguro, a government of South America, on the ealtern coalt of Brafil; bounded on the north by the government of Rio-dos-Hilios, on the eall by the North Sea, on the fouth by the government of SpirituSanto, and on the weft by the Tupieks. It is a very fertile country, and the capital town is of the fame name. It is built on the top of a rock, at the mouth of a river, on the coalt of the North Sea, and is inhabited by Portuguefc. W. Long. 38. 50. S. Lat. 17. 0.

Porto-Iechio, is a fea-port lown of Corfica, in the Mediteranean Sea, feated on a bay on the eaftern coaft of the ifland. It is 12 miles from Bonifacio, and 40 north of Sardinia. E. Long. 9. 20. N. Lat. 41.42.

Porto Yenereo, is a town of Laly, on the coalt of Cerioa, at the entrance of the gulph of Spetia. It is feated on the fide of a hill, at the top of which there is a fort. It has a very good harbour, and is 45 miles fouth-ealt of Genoa. 1.. Long. 9. 38. N. Lat. 44. 5.
portrait, or Portraiture, in painting, the reprefentation of a perfon, and efpecially of a face, done from the life. In this fenfe we ufe the term portrate painting, in contraditinction to hiffry-pairfing, where a refomblance of perfons is ufually difregarded. Por-
traits, when as large as the life, are ufually painted in oil-colours; fometimes they are painted in miniature with water-colours, crayons, paftils, \&c. Sec Paint$1 \mathrm{NG}, \mathrm{p} .64 \mathrm{I}$.

PORTREE, is a fmall village, containing a church and a very few houfes, with an excellent bay and a good harbour, in the Ifle of Sky. "The entrance of the Knox bay (Mr Knox tells us) reprefents agreeable landfcapes Tour on both fides, with excellent palture.

- The bay of Portree (fays Mackenzie), off the houfes, is an exceeding good harbour for a few fhips of any lize; it is well fleltered, the ground good, the depth from five to 14 fathoms, and nothing to fear coming in but a rock, about half a cable's length from Airderachig Point, on the ftarbord as you enter the anchorage, part of which is always above water.' It is the only pont or harbour to a very confiderable divifion of Sky, on the ealt fide. From this opening to the northern extremity, a courfe of 20 miles, the fhore is one continued line of lofty rocks, where no thip can find refuge in the mildeft weather, and where inevitable danger await the mariners in rough weather.
"James V. of Scotland and Eiveral of his nobility landed here, when they made the tour of the Hebrides in 1535; from which circumftance, this fine bay has got the honourable name of Portree."

Mr Finor tells us, "that the country round this village, thrugh mountainous, is well inhabited; it raifes much grain, and many cattle. Here the late Sir James Macdonald had marked out the lines of a town; and government, it is faid, promifed to affift him in the work with 5001 . ; but the death of that gentleman put an end to thefe promifing appearances, and matters remain in fatu quo."

PORTSMOUTH, a fea-port town in Hampfire, with one of the mof fecure and capacinus harbours in England, being defended by a numerous artillery, botly on the fea and land-fide, and very good fortifications. A great part of the royal navy is built here; and here are fome of the fineft docks, yards, and magazines of naval fores, in Europe. It is feated in the inle of Portfey, being furrounded by the fea except on the north fide, where there is a river which runs from one arm of it to the other. It is much reforted to on account of the royal navy, whofe ufual rendezvous is at Spithead, which is at the ealt end of the ifle of Wight, and oppofite to Portfmouth. There is a draw-bridge over the river, and it has always a good garrifon. It is governed by a mayor, i2 aldermen, and burgeffes, and fends two members to parliament. It has one church, and two chapels, one in the garrifon, and one in the Common, for the ufe of the dock, and others, befides feveral meeting-houfes of the diffenters. The houfes of Portfmouth amount to about 2000, and the inlabitants to about 12,000 . W. Long. I. I. N. Lat. 50. 47.

The town is fuppofed to receive its name from Port, a famous Saxon chieftain, who, A. D. 501. landed here with his two fons. It made a confiderable figure in the time of the Saxnns; and from the utility of its fituation, was highly favoured by all the monarchs of the Norr an line. It was incorporated, and hecame allos at parliamentary borough. In the reign of Edward III. it was in a very fourithing ftate; but, A. D. 1338, in the rery fame reign, was buracd by the French, when

## FOR [ 407 ] FOR

when that monarch, which was afterwards ratified by king Richard II. forgave the inhabit.mts a debt, and remitted their fec-fintm fur 10 years: within which face they fo recovered themfelves, as to equip a fquatdron, which failed into the mouth of the Scine, fumk two flips, and brought away a great booty. The fingular excellence of its port, and the convenience of fitting out fleets from thence in the time of : French war, induced Edward IV. to think of fortifying it, as he actually, in fome meafure, did; which oortifications were farther carried on by Richard III. But king Henry VII, was the firt who fettled a garvifon therein; which was increafed, and the place made fill fronger, in the reign of Henry VIII, who had a great dock there, wherein was built the Henry Grace de Dieu, which was the largent fhip in the navy of his time. The fame monarch, remarkably attentive to the fectuity of ail maritime places, built what is now called Sonth-Sea caflle, for the prutection of this.The improvements made here in the reign of $Q$. Elizalbeth were much fuperior to all thefe. Fing Charles II. after his refloration, directed grear alrerations, eftablihhed new docks and yards, raifed feveral forts, and fortifed them after the modern manner; which works were augmented mader his brother's reign. Notwithftanding this, king William directed likewife frefh alterations and additions; and fucceeding princes, following his example, have, at a large expence, extended theie furtifications, and taken in a vaft deal of ground : fo that it is at prefent, as the importance of the place deferves, the molt regular fortefs in Britain; and, as it cannot be effectually attacked by fea, may be jufly efteemed impregnable.

Portsmouth, the largeft town in the fate of New Hamplhire in North America. It flands on the fouthealt fide of Pifcataqua river, about two miles from the fea, and contains about 600 houtes, and 4400 iuhabitants. The town is handfomely built, and pleafantly fituated. Its public buildings are, a cont houfe, two clurches for CongregationaliRs, one for Epifcopalians, and one other houfe for public worlhip. Its harbour is one of the fineft on the continent, having a fulficient depth of water for veflels of any burthen. It is defended againft forms by the adjacent land, in fuch a manner, as that flips may fecurely ride there in any feafon of the year. Befides, the harbour is fo well fortified by nature, that very little art will be neceflary to render it impregnable. Its vicinity to the fea renders it very convenient for naval trade. A light-houfe, with a fingle light, ftands at the entrance of the harbour.

PORTSOY, is a handfome fea-port town, fituated on a frnall promentory rumning into the fea, on the feuh lide of the Murray Frith, in Scotiand, about fix miles from Cullen, and feven well from Banff. It fends out feveral filling vefiels, particularly for the Hebride white fifhery, and exports a confiderable quantity of grain. A manufature of focking and fewing thread is alfo carried on to a confiderable amount for the London and Nottingham markets. In the neighbouhood is a ftratum of marble, of a dark greenith colour, in which, it is faid, the curious fubfance called Asbestos, or earthflax, has been found. From the afoefos a fort of incumbultible cloth is made, which is purified by throw. ing it into the fire. W. Long 2.5.N. Lat. 57.50.

PORTUGAL, the mont wellurly kingdom of Eu.
rope, bounded on the welt and fouth by the Atlantic Portugal. Ocean, and on the calt and north by Spain; extending See Map of
about 310 miles in length, and 150 in breadth.

By modern writers, we find this country confantly vortugat. Atpled in Latin Luffania; and it is certain, that aneiently a country of Sp:in went by that name; but it Boundarice does not by any means appear that the country ealled by the ancients Layfitarid had the fame boundaries with the modern kingdom of Portugal. Belore fuguftus Cxefar, Lufitania feems to have been bounded on the north by the ocean, and on the fouth by the river 'T'ugus ; by which means it comprehended all Galicia, and excluded two of the fix provinces of lortug.ll. But in the more frict and rell rained fenfe of the word, it was bounded on the notth by the Durius, now the Douro, and on the fouth by the river Anas, now the Guadiana; in which fenfe it was not quite fo long as molern Portugal, but conliderably broader.
The commonly received opinion with regard to the Frymology etymology of the word Poriugal, is, that a great num of the ber of Gauls landed at Porto, or Oporto, whence it rame. received the name of Portus Galiorum, or the Port of the Gauls; and in procefs of time that name gradually extended over the whole country, being foltened, or rather thortened, into Portugal. But the time when this event happened, the reaion why thefe Gauls came thither, and what became of them afterwards, are all particulars which lie buried in oblivion. It is alleged, however, that, upon an eminence which overlooks the mouth of the river Douro, there food an anaient town called Cale, frong and well peopled, but ill feated for trade; and this occafioned the conftrution of a lower town or hamlet, which was called Portus Cale, that is, the baven of Cale; and, in procef's of time, Portucalia. At length, becoming fo confiderable as to morit an epifcopal claair, the bifhops fubferibed themfelves, as the records of ancient councils tentify, Portucalenfes, and the name of the city was transferred to the diocefe. It is true, that thefe bifhops afterwards clanged their title, and fubfribed themfelves Portuenfes, that is, biflops of Porto. But the facts jult mentioned are actually recorded in authentic hifories; and as the diocefe of Portucalia contained in a great meafure that little country in which the fovereignty originally began, the name extended itfelf, together with the acquifitions of the fovereigns, and has remained to the kingdom, though the diocefe itfelf has changed its name, and poffibly on that very account.

Portngal, though even yet but a fmall kingdom, Originalif was originally much fmaller. The Spanilh and Por-only a tuguefe hiftorians agree, that Don Alonfo, king of Imall kingLeon and Caftile, and fon to Don Ferdinand the dom, Gient, heflowed liis daughter Donna Therefia in marriage upon an illuftrious ftranger, Don Henry, and gave him with her the frontier province which he had conquered from the Moors, fmall indeed in extent, but excellently fituated, and fo pleafant and fertile, that it has fometimes been ftyled Medulla Hijpanica, or the marrow of Spain. To this territory was added the title of Count; but authors are much divided about the time that this franget came into Spain, and who he was. However, the authors of the Univerfal IXiftnry make it pretty evident, that he was a grandion of Robert the firlt duke of Durgundy. The mamer in

Whict?

## POR [ 408 ] O R

Pretugal. which he obtained the principality above-mentioned is

- related as follows:

The king, Don Alonfo, apprelierfive that his fuccefs in taking the city of Tolerlo would bring upon lim the whole force of the Moors, fent to demand alfifance from Philip I. of France, and the duke of liugundy, whole daughter he had maried. His requeft was granted by both princes; and a numerous body of troops was feedily collected for his fervice, at whofe head went Raymond count of Burguady, Henry younger brother of Hugh duke of Durgundy, Raymond count of Tholoufe, and many others. They arrived at the court of Don Alonfo in the year 1087, where they were received and treated with all poffible marks of efteem; ard having in the conrfe of two or three jears given great proofs of their courage and conduct, the king refolved to beftow his only daughter named Urract, then a mere clild, being at mof in her ninth year, upon Raymond count of Durgundy,

4
Henry of Surgundy the firft count of lortugal. and affigned them the province of Galicia for the fupport of their dignity. About four years after, Don Alonfo being very defirous to exprefs his gratitude to Henry of Burgundy, gave him in marri.ge a natural daughter of his, born while he remained in exile at To. Icdo, whofe name was Dorna Therefat and upon this marriage, he gave up in full property the country whieh has been already mentioned.

The new fovereign, with his confort, fixed their refidence in the town of Guimaraez, pleafantly fituated on the banks of the river Ave. The remains of an ancient falace belonging to their fucceffors are fill to be feen; and on account of its having been anciently the capital, the king, Don Denis, granted the inhabitants an immunity from taxes, which they ftill enjoy.

The Portuguefe, now finding themfelves independent, immediately began, like other nations, to attempt the fubjection of their neighbours. Henry is faid to have perlormed great exploits againft the Moors; but the accounts of them are fo indiftinct, that they cannot be taken notice of here. He died in 1112 ; and was fucceeded by his fon Don Alonfo, then an inDifferences fant in the third year of his age. In his minority, the with Caf. kingdom was governed by his mother Donma Therefa, tile.
bithop of Braga, who had not efpoufed her caufe fo 1 watmly as the had expected The bimop, however, was quickly delivered by a bull from the pope, who alfo threatencd the kingdon with an interdist; and this was the firf remarkable offence which Therefa gave her fubjefts.

Soon after this, Queen Urraca died, and all differences were amicably fettled at an interview between Therefa and Don Alonfo Raymond, who fucceeded to the kingdom of Caltilc. But, in 1126 , the kirg of Cantile being obliged to march with the whole frength of his dominions againft lis father-in-law the king if Navarre and Arragon, Therela took the opportunity of again feizing upon Tuy; but the king foon returning with a fuperior army, the was again obliged tn abar.don her eonqueft. But the greateft misfortune which befel this princefs, was a quarrel with her own fon Don Alonfo Enriquez. It does not appear indeed that Therefa had given him any juft caute of offence; but it is certain that a civil war enfued, in which the queen's forces were totally defeated, and the herfelf ninde prifoncr , in which fituation the continued during the remainder of herlife.

Enriquez having thus attained to the free and full DC polfelion of his dominions, made feveral attempts upon tor fome places in Galicia, but without fuccers ; fo that he was at laft conltrained to make peace with Aloufo king of Caftile and Leon, who had alfuned the title of Emperor of the Spains; the more efpecially as his dominions happened to be at that time invaded by the Moors.The number of infidels was fo great, that the count of Portugal had little hopes of fubuding them; but a plague breaking out in the Moorifh army, they were obliged to retreat; after which he reduced leveral places belonging to that nation. But, in the mean time, the emperor Don Alorfo, breaking into the Portuguefe territories, deftroyed every thing with fire and fword. The king of Portugal furprifed and cut off a confiderable part of his army; whieh, hovever, did not hinder the emperor from marching directly towards him.But, at the interceflion of the pope's legate, all differences were accommodated, and a pcace concluded; all places and prifoners taken on both fides being-delivered up.

In the mean time, the progrefs of the Chritian arms in Spain being reported to Abu-Ali Texeficn, the miramamolin or chief monarch of the Moors in B.arbary, he directed Ifmar, or Iflmael, his lieutenant in Spain, to aflemble all the forces in the fouthern pruvinces, and dtive the Chriftians beyond the Douro. Ithmael imme. diately began to prepare for putting thefe orders in execution; and having added a confider ble body of troops brought from Barlary to thofe whom he had raifed in Spain, the whole army was very numerous. He was met by Don Alonfo of Purtugal, in the plains of Oa. rique, on the banks of the tiver Tayo; and Iffmeel rid took ail polfible mans to prevent the Chriltians fiom Uu paffing that river, becaufe his own cavaly, in which the ferength of his army chiefly confined, had thus more 100 m to act. The Portuguefe forces were very incontiderable in number in comparifon of the Mours; but Ihmacl, leing too confident of vifory, divided his army into 12 bodies, and difpofed thens in fuch a manner as might beft frevent the flight, not fuftain the attack, of the Chrifians. The conferuence was,

## POR

that his army was overthrown with incredible flaughter, and a vall number of prifoners taken, among whom were 1000 Chiffians, of the fect fyled Mozarabians, whom, at the requeft of Theotonus, prior of the Foly Crofs, Don Aloufo fet at liberty with their wives and children, and procured them fettlements in his own dominions.
Ater this fignal vitory, gained in the year 1139 , Don Aloufo was proclaimed king by his foldiers, and ever after ctained that title, renouncing all kind of tubjection to the crown of Spain. Being very defirous, however, of bringing down the power of the emperor, he entered into a league with Raymond count of Barcelona and regent of the kingdom of Arragon againft that prince. In confequence of this treaty, he entered Galicia with a confiderable force on one fide, while Don Raymond did the fame on the other. Neither of thefe enterprifes, however, fucceeded. The Portugufe monarch met with a fevere check in his expedition into Galicia, where he received a dangerous wound, and had fome of the nobility who attended lim taken prifoners. At the fame time he received intelligence that the Moors had invaded his dominions, fo that he was obliged to retire ; which, however, was not done in fulticient time to prevent the fronet fortrefs of Leyria from falling into their hands. This fortrefs they demolithed, and put all the garrifon to the fword; but the king caufed it to be rebuilt ftronger than before, and put a more numerous garifon into it; however, he undertwok nothing farther this campaign. The was continued with various fuccefs till the year 1145, when the King projected an enterptife againtt Samaren, a ftrong city about 12 miles from Lilbon. In this he luckily fuccocded: and by that means gained a confiderable thet of country, and a Atrong barrier to his dominions.
After this fuccefs Don Alonfo canfed himfelf with much ceremony to be chofen and crowned king of Portugal before an affembly of the fates, where he alfo foleninly renounced all dependence on the crown of Spain, declaring, that if any of his fucceflors thould condefeend to pay tribute or to do homage to that crown, he was unworthy of enjoying the kingdom of Portugal. The a and next jear the king undertook the recovery of Lifbon out of the hands of the Moors; and concerning this c..pedition there are fuch numbers of fables, that it is alinoll impofible to come at the tuth. What can be gathered from thefe accounts is, that he undertook the fiege with a frnall army, and was able to make butlittle progrefs in it, partly from the Arength of the place, and partly from the numerous garrifon by which it was defunded. At length, fortunately for Don Alonfo, a thest of adventurers, French, Englifh, Germans, and Ilemings, that were going to the Holy Land, anchored at the mouth of the river lagus, whofe alfilance he denuanded, as not altogether furcign to their delign of maling war on the infidels. His requeft was readily granted ; and, with their alfillance, Lifben was fpeedily reduced; which conqueft fo much railed the reputation of this minnurch, and brought fuch numbers to recrnit his army, that befure the end of the year 1147 he had reduced 12 ( ther cinfiderable cities.

For many years after this, Don Alonfo was fuccefsful in all his undercakings. He fetticd the internal govcrument of his kingdom, procured a bull from pope

Vos. IV.

Alexander IIT. confirming his regal dignity, undertook lortughl. many fuccefsful expeditions agaimit the Moors, and became matter of four of the fix provinces which compote the prefent kingdom of Portugal. In all his underiakings he was allifed by the councils of his queen NIFtilda, who was al woman of great capacity, and fufficient for the government of the kingdon in her hufband's abfence. By her he had a numerous offspming, particulaly three daughters ; the ckledt of whom, Don11:a Mafalda or Mathilda, was married to the hing of Arragon; the fecond, Urraca, to Don Ferdirand king of Leon; and the third, Therefit, to Philip cant of Flanders. In II66, however, the king thought pro. His unfueper, from what provocation we know not, to invade ceffful war the dominions of his fun-in-law Don Ferdinand; and poffeffed limelf of Limmia and Turn, two citics of Galicia, in which he put ftrong garrifons. The next year, elated with lis fuccefs, he marcled with a numerous army towards Wadajos, which he inveficd; on the news of which, Don Ferdinand, who had atfembled a large army at Ciudad Rodrige, marched to its relief. Yet before he could come within fight of it, it had fur. rendered to the king of Portugal; upon which Don Ferdinand came to a refolution of befieging his antagonit in his newly conquered city ; which Don Alonto perceiving, endeavoured to draw out his forces into the field. Though he was at that time upwards of 70 ycars of age, he was himfelf on horfeback, and pulhing forvards at the head of his horfe to get out at the gate, he ftruck his leg againt one of the bolts with fuch violence that the bone was fhattered to picces. This accident occafioned fuch confufion, that the Portuguefe troops were eafily beaten, and Don Alonfo was taken prifoner. He was exceedingly mortified by this difgrace, efpecially as he had no great reafon to expect very kind treatment from his fon in law. However, the king of Leon behaved towards him with the greatelt refpect and affection. He defired him to lay afide all thoughts of bufinefs, and attend to his cure; but find. ing him reftlefs and impatient, he affured him that he expected nothing more than to have things put into the fame condition as before the war, and that they might live in peace and friendthip for the future: to which the king of Portugal moft readily allented; but returned to his dominions before lis cute was perfeeted, which was the caufe of his being lame all the rctt of his life. However, this did not abate his military ardour; for, notwithftanding this inconyenience, his courage tranfported him into the field whenever he was called by the interelt of his fubjects. 'Towards the end of his reign, an oppormnity feemed to prefent itfelf of obtaining once for all an entire releafe from the difagreeable pretenfions of the king of Leon, who, it feems, Jad infilted on the king of Portugal's doing homage for his kingdom. The opportunity which now prelented itfelf was a quarrel between the king of Leon and his nephew Don Alonfo king of Caftile. The latter atked aftiftance from the king of Portugal, which was readily granted. But Don Ferdinand, having received intelligence that the infant Don Sancho (he king's elde! Con) was advancing towards Ciudad Rodrigo, allembled his rroops on that frontior with fuch diligence, that he wats emabled to attack him unexpectedly, and entirely defeated him. Underlanding, however, thrat Don Sancho was recruiting his forces with great diligence, $3 F$

## POR

Fortugal. he let him know that they might be nuch better employed againft the infidels, who remained carelefs and unprepared, expecting the iffue of the war. Don Sancho made a proper ufe of this advice; and, after making fome motions to amufe the enemy, made a fudden irruption into Andalufia, penetrating as far as Triana, one of the fuburbs of Seville. The Moors affembled rheir forces in order to attack him on his retreat; but Don Sancho having firl fatigued them by the celerity of his march, at lengll chofe a flrong camp, and, having given his troops time to repofe, drew them out and offered the enemy battle. The Moors accepted the challenge, but were entirely defeated; and Don Sancho returned into Portugal with foils to an immenfe amount. For fome years after the war was continued without any remarkable event; but, in 1184 , Jofeph king of Morocco, having already tranfported multitudes of men from Barbary, at length followed in perfon with a prodigious army, and carried all before him as far as the Tayo. He appeared before the city of Santaren; but having wearied and reduced his army by unfuccefsful affaults on that place, he was attacked by the Portuguefe forces affited by Ferdinand of Leon, entirely defeated, and limfelf killed. By this victory, the Portuguefe were left at liberty to improve the interior part of their country, and fortify their fromtiers; and during this interval, the king died in the 76th year
after by order of the king. Don Emanuel that it might Portu be laid in a new tomb, it was found uncorrupted.

The hiftory of Portugal affords fcarce any event of Differe ${ }^{\mathrm{I}_{4}}$ importance till the year 1289 ; when, in the reign of Differe 0 Don Denis, a difference commenced with Caftile, which filib, fubfifted for a long time. Frequent reconciliation took place; but thefe were either of very fhort duration, or never fincere. At length, in the reign of John I. Don Juan of Caftile, who had alfo pretenfions to the crown of Portugal, invaded that kingdom at the head of the whole force of his dominions, and with the flower of the Caflilian nobility entered the province of Alentego. According to the Portuguefe hiltorians, he befieged the city of Elvas without effect; which difappointment enraged him to fuch a degree, that he determined next year to invade Portugal a fecond time, and ruin all the country before him. Accordingly, having collected an army of 30,000 men, he invaded Portugal, took and ruined feveral places, while king John lay inactive, with a fmall army, waiting for fome Englilh fuccours which he expected. At laft he ventured an The ${ }^{13}$ engagement with the forces which he had; and, not- lianser withltanding the great fuperiority of the enemy, ob- tirely, tained a complete vitory; after which he made an ir. feated. ruption into Caftile, and had the good fortune to gain a nother battle, which fixed him firmly on the throne of Portugal. The Caftilians were obliged to confent to a tiuce of three years, which was foon after improved into a lafting peace.

In 1414, King John undertook an expedition againft The ci the Moors in Barbary, where he commanded in perion; Ceuta but before he fet out, his queen (Philippa the daugh. ken fr ter of Jolin duke of Lancafter) died of grief at the the $M$ thoughts of his abfence. The expedition, however, proved furcefisful, and the city of Ceuta was taken from the Moors almoft at the firft affault: but fcarce had the king left that country, when the princes of Barbary formed a league for the recovery of it; and though they were defeated by the young princes of Portugal, whom John again fent into Barbary, yet the trouble of keeping it was fo great, that fome of the king's council were of opinion that the town fhould be demolithed. But John, having confidered the arguments on both fides, determined to keep the city; and therefore enlarged and ftrengthened the fortifications, augnenting his lorces there to 6000 foot and 2500 horfe, which he hoped would be fufficient for keeping off the attacks of the Moors.

King John died in 1428, and was fucceeded by his eldeft fon Edward. He undertnok an expedition againft 'langier in Barbary : but the event proved very unfortunate ; the Portuguefe being fo fhut up by the Moors, that they were obliged to offer Ceuta back again, in order to obtain leave to return to Portugal. The king's fon, Don Ferdinand, was left as an hoftage for the delivery of Ceuto ; but was, with the utmolt cruelty and injuftice, left in the hands of the infidels, by the king and council of Portugal, who conftantly refured to deliver up the place. Many preparations indeed were made for recovering the prince by force; but before any thing could be accomplithed the king died in 143 C , which put an end to all thefe defigns. Sce PEdro (Don).

The war with Barbary continued at intervals, but Paffag tha with little fuccers on the part of the Portuguefe; and

## POR

## YOR

ral. till the year 1497 , there is mo event of any confequence recorded in the hiftory of Portugal. This year was remarkable for the difenvery of the paffarge to the Eaft Indies by the Cape of Good Hopc. The enterpriling fpirit of the Portuguefe had prompted them to undertake voyages along the coaft of Africa for a confiderable time before; but when they undertook their firlt .voyage of difcovery, it is probable that they had nothing farther in view than to explore thofe parts of the coalt of Africa which lay neareft to their own country. But a fpirit of enterprifc, when roufed and put in motion, is always progrefive; and that of the Portugucfe, though flow and timid in its firlt operations, gradualls acquired vigour, and prompted them to advance along the weftern thore of the African continent, far beyond the utmoft boundary of ancient navigation in that direction. Encouraged by fuccefs, it became more adventurous, defpied dangers which formerly appalled it, and furmounted difficulties which it once deemed infuperable. When the Portuguele found in the torrid zone, which the ancients had pronounced to be uninhabitable, fertile countries, occupied by numerous nations; and perceived that the continent of Africa, inftead of extending in breadth towards the weft, according to the opinion of Ptolemy, appeared to contract itfelf, and to bend eaftwards, more extenfive profoets opened to their view, and infpired them with hopes of reaching India, by continuing to hold the fame courfe which they had fo long purfued.

After feveral unfuccefifful attempts to accomplifh what they had in view, a fmall fquadron failed from the Tagus under the command of Vafco de Gama, an officer of rank, whofe abilities and courage fitted him to conduet the mof difficult and arduous enterprifes. Fiom unacquaintance, however, with the proper feafon and route of navigation in that vaft ocean through which he had to teer his courfe, his voyage was long and dangerous. At length he doubled that promontory, which, for feveral years had been the object of terror and of hope to his countrymen. From that, after a profperous navigation along the fouth-eaft of Africa, he arrived at the city of Melinda, and had the fatisfaction of difcovering there, as well as at other places where he touched, pcople of a race very different from the rude inhabitants of the weflern flore of that continent, which alone the Portuguefe had hitherto vifited. Thefe he found to be fo far advanced in civilization and acquaintance with the various arts of life, that they carried on an active commerce, not only with the nations on their own coaft, but with remote countries of Afia. Conducted by their pilots, who held a courfe with which experience had rendered them well acquainted, he failed acrofs the Indian ocean, and landed at Calecut, on the coaft of Malabar, on the 22d of May 1498, ten months and two days after his departure from the port of Libbon.

The famorin, or monarch of the country, aftonifhed, at this unexpected vifit of an unknown people, whore afpect, and arms, and manners, bore no refemblance to any of the nations accuflomed to frequent his harbours, and who arrived in lis dominions by a route hitherto deemed impracticaile, received them at firt with that fond admiration which is often excited by novelty; but in a fhort time, from whatever motives, he formed varieus fchemes to cut off Gama and his followers. The

Portuguefe admiral, howerer, was not to be over-reached by fuch politics as his. From every danger to which he was expofed, either by the open attacks or fecret machinations of the Indians, he extricated himfif with fingular prudence and dexterity, and at latt faited from Catecut with his thips, loaded not only with the commodities peculiar to that coaft, but with many rich productions of the ealtern parts of India. He returncit to Portugal in two ycars after his failing from the Tagus, but with a great lofs of men; for ont of 148 perfons whom he took out with him, only 55 rcturned. The king received him with all poffible teflimnnies of re$f_{\text {pect }}$ and kindncfs; created him count of Videgueira ; and not only declared him admiral of the Indies, but made that office hereditary in his family.

On the firlt intelligence of Gama's fuccefoful voyage, The Verie the Venetians, with the quick-fighted difcernment of tians dread merchants, forefaw the immediate confequence of it to the ruin at be the ruin of that lucrative branch of commerce which had contributed fo greatly to enrich and aggrandize their country; and they obferved this with nore poignant concern, as they were apprehenfive that they did not poffefs any effectual means of preventing, or even retarding, its operation.

The hopes and fears of both were weil-founded. The Portuguefe entered upon the new career opened to them with activity and ardour, and made exertions, both com mercial and military, far beyond what could have been expected from a kingdom of fuch inconfiderable extent All thefe were directed by an intelligent monarch, capable of forming plans of the greatef magnitude with calm fyftematic wifdom, and of profecuting them with unremitting perfeverance. The pruderice and viguur of his meafures, however, would have availed little without proper inftruments to carrs them into execntion. Happily for Portugal, the difcerning eye of Emanuel felected a fucceflion of officers to take the fupreme command in India, who, by their enterprifing valour, military fkill, and political fagacity, accompanied with difinterefled integrity, public fpirit, and love of their country, have a title to be ranked with the perfons moft eminent for virtue and abilities in any age or nation. Greater things perhaps were atchieved by them than werc ever accomplifhed in fo thort a time. Within $2+$ years only after the voyage of Gama, the Portuguefe had rendered themfelves matters of the city of Malacca, in which the great faple of trade carried on among the imhabitants of all thofe regions in Afia, which Europeaus have difinguithed by the general name of the Eafl Indies, was then eftablifhed. This conquef fecured to them great influence over the interior commerce of India, while, at the fame time, by their fettlements at Goa and Diu, they were enabled to engrofs the trade of the Malabar coaft, and to obftruct greatly the long eftablifhed intercourfe of Egypt with India by the Red Sea. In every part of the ealt they were reccived with refpect; in many they had acquired the abfolute command. They carried on trade there without rival or controul; they prefcribed to the natives the terms of their mutual intercourfe; they often fet what price they pleafed on the goods which they purchafed; and were thus enabled to import from Indoltan and the regions beyond it, whatever is ufeful, rare, or agreeable, in greater abundance, and of more various kinds, than had been known formerly in Europe.

## POR

Poriuga'. Not fatiffied with this afcendant which they had acquired in India, the l'ortuguefe early formed a fcheme no lefs bold than interefted, of exeluding all other nations from participating of the advantages of commerce with the ealt; :nnd they accomplifhed one half of what
22
Oppofition made by the Verietians. their ambition had planned.
In confequence of this, the Venetians foon began to feel that decreafe of their owa Indian trade which they had forefeen and drcaded. In order to prevent the farther progrefs of this evil, they incited the Soldan of the Mameluks to fit out a fleet in the Red Sea, and to attack thofe unexpected invaders of a gainful monopoly, of which he and his predeceflors had long enjoyed undifturbed poffelion. The Portuguefe, however, encountered his formidable fquadron with undaunted courage, entirely defented it, and remained mafters of the Indian occan. They continued their progrefs in the ean almont without obfruction, mantil they eftablifhed there a commercial empire; to which, whether we confider its extent, its opulence, the flender power by which it was formed, or the fplendor with which the govenment of it was conducted, there had hitherto been nothing comparable in the hifory of nations. Enanuet, who laid the foundation of this ftupendous fabric, had the datisfaction to fee it almoft completed. Every part of Europe was fupplied by the Portuguefe with the productions of the eaft; and if we except fome inconfiderable quantity of them, which the Venetians thill continued to receive by the ancient channel of conveyance, Europe had no longer any commercial intercourle witha India, and the regions of Afia beyond it, but by the Cape of Good Hupe.

In September 1522, King Emanuel died of an epidemical fever, and was fucceeded by his fon John III. The moft remarkable tranfiction of this prince's reign
nions. This happened in the year :525, or, as fome fay, in 1535. A fumine happening to ceafe in a fhort time afier it was introduced, the priefts perfuaded the ignorant multitude that it was a bleffing from heaven on account of the erecting fuch an holy tribunal. Howceer, it was not long before the bulk of the nation perceived what kind of a bleffing the inquifition was: but their difcernment came too late; for by that time the inquifitors had acquired luch power, that it became equally dangerous and ineffectual to attempt dicclofing any of their my'teries.
In the mean time Solyman the Magnificent, the moll culightened monarch of the Ottoman race, obferving the power and the opulence of the Portugroefe rifing, and attributing it to its proper caule, and eager to fupplant them, fent orders to the bathaw of Eigypt to employ his whole ftrength againft the Chriftians in the Eaft Indies. The bafhav, in obedience to thefe orders, failed out from the Red Sea with a greater naval force than ever the Mohammedans had employed before; having 4000 Janizaries, and 16,000 other land troops on board. Yet, by the courage and conduct of the Portugucfe officers and foldiers, all this mighty armament was defeated, and their Eaft India policflions faved from the danger which threatened then. In Africa likewife the king of Fez was bafiled before the town of Safi, and frefh quarrels breaking out among the princes gave great relief to the Chriltians, sho had long been obliged to carry on a defenfive war,
and had more than once becn on the very brink of ruin. For a long time indeed their fafety had been clerived only from the quarrels of the Moors among themfelves; for fuch was the envy and jealoufy which reigncd among the Portuguefe, that they could never unite heartily in oppofing the common enemy; and therefire, had their enemies united againft them, they muft certainly have been cut off. But whenever the cheriffs quarrelled with each other, one party was fure to have recourfe to the Portuguefe; who, by fending them a fmall fupply, fecured quiet to themielves, and had the pleafure of feeing their enemies deftroy one another. Yet in the end cven this lad bad confequences; for, lad 1 on one hand, it kept up a martial firit among the affais Moors, and on the other it made them acquainted with the Portugucfe difcipline; fo that after every fhort interval of repofe they not only found them as much enemics as before, but much more formidable than ever. The confequence of all this was, that King John began to appreliend that the conqueft of Barbary was impoffible, and therefore is limit his defires to the keeping of thofe few fortreffes which he had already; which, though a neceffary and prudent meafiere, difpleafed the generality of his fubjects.

King John exerted himfelf mush in the fetlement of Brazil in South America, which he brought into a very good fate, caufed feveral Atrong towns to be erected there, and took all polimbe nethods to encourage the converfion of the natives to Chritianity. He alfo made many regulations tor the welfare and happinefs of his fubject. The difputes of the nobility about precedency were frequenly attend:d with very difagreeable confequences, which made the king refolve once for all to iettle them by eftablifhed rules; and the rules eftablifhed by him on this occafion have fubfifted ever lince, and in a great meafure prevent thefe altercations. He had other great defigns in his mind, particularly with regard to the reformation, which he had pufhed very far with refpect to religious perforis of both fexes ; but, on a clofe examination of his affairs, he found his fubjeits in general to have been fo much injured by his leaving their concerns to the infpection of his council, that he was thrown by the grief of it into a kind of apoplexy, from which he never recovered. His death lappened in June 1557; and he was fucceeded by his fon Don Sebaftian IiI. an infant of three years of age.

After the death of King John, the adminiftration remained in the hands of the queen, grandmother to Scbaftian, who belaved with great prudence and circumfpection. The Moors, however, fuppoting that under a minority they might be able to difpoffeis the Chriftians of fuch places as they held in Darbary, laid clofe fiege to Maiagnan. But the queen-regent fent fuch fpeedy fuccours, and promifed fuch rewards to thofe who diftinguifhed thenfelves, that the Moors, though they brought 80,000 men into the field, were obliged to abandon the enterprife. This was at firf magnified as a high inflance of the queen's capacity and wifdom; but in a thort time the natural averfion which the Portuguefe had to the goverument of women, together with the prejudice they had againt her country, as being a CaRilian, appeared fo plainly, and gave her fo much uncafinefs, that of her own accord the refigned. her authority into the_hands of Cardiaal Don Henry

## 1 O R

al. the ling's brother. Dy him Don Alexins de Menefes was appoiated the king's governor, and Confales de Gumera with two other priefts his preceptors. By means of thofe infructors the ling's education was totally marred. Flis governor afiduouly inculcated upon hin that the chief virtue of a king was courage; that danger was never to be avoided, hat always fiurmounted, let the occafion be what it would. His other tutors, inflead of infurusting hins in the true religion, only infpired him with an abhorrence of profeffed infidels: the confequence of all which was, that he became rafh, incontiderate, and obRinate; all which qualities confipired to draw upon him. the cataftrophe which ruined both him and the kingdom.

Alter the king was crown up to man's enate, his defire was to ditingu:fh himfelf againft the infidels. He himfelf chofe at expedition to the Eaft Indies; but the prime ininifter Alcoçova, who did not chonfe to attend his monarch to fuch a diftance, fubftituted Africa in its feald. This expedition the king entered into in the moft inconfiderate and abfurd manner. He firf fent over Don Antonio prior of Crato, with fome hundreds of fol diers; carried his principal courtiers over with him from a humting match, and without equipages; he then ient for the duke of Aveyro, with fuch troops as he could collect on the thort warning he had got; and when all thefe were affembled, the king fpent lis time i: hunting, and flight excurfions againt the enemy, without doing any thing of confequence, exrept expofing his perfon upon all occafions. At length he returned to Portugal in fuch tempefluous weather, that his fubjects had given him up for loft; when they were agreeably furprifed by his unexpected arrival in the river of Lifoon, which they celebrated with the greatelt rejoicings.

The little fuceefs which attended the king in this expedition ferved only to inflame him more with defire for another; fo that from the time he returned, he feemed to think on nothing elfe. He was highly delighted alfo with an accident which at this time furnifhed him with a pretence for war, though of that he food in no great need. Muley Hamet, king of Fez and Morocco, had been difpofielfed of his dominions by his uncle Muley Moloch. At the beginning of this var Don Sebaftian had ofiered him his troops in Alrica, which offer was rejected with contempt : but now being a fugitive, and having in vain applied for afliftance to Philip of Spuin, Muley Hamet applied to the King of Portugal ; and, that he might the more eafily fucceed, caured the fortrefs of Arzila, which his father had recovered, to be reftored to the Purtuguefe. The king was in rapture at this event, and fancied that his glory would exceed that of all his predeceffors. He was advifed againt this expedition, lowever, by all his fi iends. King Philip of Spaia having done every thing to difluade him from it in a perfonal conference, fent Francifco Aldana, an old and experienced officer, to Morocen ; and at his return ordered him to attend Don Sebaftian, in order to give him an account of the Rate of affairs in that country. This he performed with the greatef fidelity, but without any effect. The queen dowager and cardinal united in their endeavours to divert him from this unfortunate enterprife; but he treated them both with fo little refpect, that his grandmother broke her heart; and the cardinal, to fhow his dif-
tafte to the mafure, retired to Levora without coming l'ontugald either to court of council ; which example was followed by many of the ncbles. Many of there, however, fent very free remonftrances to the king on tha impropriety of his conduat ; and King Philip fent to him the duke de Medina Celi, once more to lay before him the reafons why he thought his feheme impracticable, and to put him in mind that he had wo hand in pufuing hins upon his deftruction, of of crascealing from lim the dangers in:o which he fecmed deternised to plurge himfulf and his fubljects. Laftly, he reccived a letier on the fubjeat from Muley. M.loch himfelf, wherein that prince explained to him his own right to the crown of Fex, and nowed that he had only difpoffeffed a tyrant and a murderer, who had therefore no right to his friendhip or alfillance. He next affured him that he had mo reafon to fear cither the power or neighbourhood of the Portuguefe; as a proof of which, and as a mark of his cftcem, he was content to make him a prefent of ten miles of arable ground round cach. of the fortreifes he poffeffed in Africa, and which indeed were no more than four, viz. Tangier, Ccuta, Mafagan, and Arzila. At the fame time he addreffed himfelf to King Philip of Spain, with whom he was on good terms, defiring him to interpofe with his nephew Sebaltian, that things might be yet adjurted without the effufion of human blood. But the king of Portugal was deaf to all falutary advice; and therefore paid no regard to this letter, nor to the remonftrances of his uncle. On the 24 th of June 1577, therefore, he fet Account ot fail from the bar of Lifbon with a fleet of 50 flips and his furcees five galleys, twelve pieces of cannon, and tranfports and tenders, making up near 1000 fail. His troops confifted of 9000 Portuguefe foot; 3000 Germans; 700 Italians conmanded by Sir Thomas Stukeley, an Englifh exile, but remarkably brave; 2000 Caftilians and 300 volunteers, commanded by Don Chriftopher de 'Tuvara mafter of the horfe, a man of courage, but without either conduct or experience. He touched firlt at Lagos bay in the kingdom of Algarve, where he remained for four days: thence he proceeded to Cadiz; where he was magnificently feafted for a weak by the duke de Medina Sidonia, who took the opportunity once more, by ordcr of Philip, of diffuading him, from proceeding further in perfon. But this exhortation proved as fruitlefs as the reft; and the king laving failed with a frong detachment for Tangier, ordered Don Dicgo de Souza, his commander in chief, to follow with the remaining part of the army.

The troops landed on the coalt of Africa withont any bad accident, and joined at Arzila. Here the king was met by the cheriff Muley Hamet, on whofe account he had undertaken the war, who delivered him. his fon Mnley, a boy of 12 years of age, as a honage. and brought a reinforeement of 300 Muors. The boy Was fent to Mafagon under aftrong guard; but the fa-. ther remained in the Portuguefe camp. Here it was refolved in a council of war to reduce the tnwn of La. rache, but it was difputed whether the tronps fhould. proceed thither by land or fea. Don Scbaftian, who efpoufed the former opinion, finding himfelf oppofed by Miley Hamet, gave him fach a rude anfwer, that he left his prefence in difcontent; arter which the king's opinion prevailed, and the army began its march on theagih of July. As they proceeded, the king reccived an
lettes

# POR 

Fortugal. Ietter from the duke of Alba, requefting him to attempt nothing beyond the taking of the town of Larache. Along with the letter was dent an helmet which had been worn by Charles V.

On the other hand Muley Moloch, having intelligence of this formidable invafion, took the field, thougb at that time fo ill of $a$ fever that he conld not fit on horfeback, with 40,000 foot and 60,000 horfe. He conducted every thing, notwithftanding his diltreffed fituation, with the greatelt prudence. Finding fome reafon to furpect that part of his army were defirons of going over to his rival, he proclaimed that fuch as inclined to join their old mafter were at liberty to do it. This at once put a top to the defection, and only a very few made ufe of the liberty which was granted them. Standing in doubt likewife of the fidelity of a body of 3000 horfe, he fent them to reconnoitre the enemy, by which act of confidence he fecured them. Still, however, he feared that his officers might be corrupted by the Portuguefe gold; for which reafon he changed the difpofition of his army entirely, fo that none of his officers commanded the corps to which they had been accuftomed; and therefore, having new men to deal with, had none whom they could truft.

Having taken thefe precautions, he advanced againft the Portuguefe army with fuch celerity, that he came in fight of them on the 3 d of Augult. On this Don Sebaltian called a council of war; in which many who out of complaifance had given their opinions for this march, were now for returning. They were feparated from the enemy by a river, and the Moors were matters of the ford, fo that it was impoflible to force them immediately in their pofts; neither was it practicable for them to wait for a more favourable opportunity, becaufe they had no provifions. The foreign officers, on the contrary were of opinion that fighting was now become neceffary, and a retreat dangerons. This, however, was violently oppofed by the cheriff, who faw plainly that they ran a great rifk of being defeated and of lofing all, while at the fame time they were not certain of gaining any thing of confequence though they fhould be vistorions: whereas, if they drew down towards the fea, they might entrencb themfelves till they were relieved by their fleet; during which interval if Muley Moloch fhould die, he looked upon it as certain that a great part of the army would defert to him, which would render him mafter not only of the kingdom, but of the fate of the Chriftians alfo. When he found that the king was bent on fighting, he only requefted that the engagement might be delayed till 4 o'clock in the afternoon, that, in cale of a defeat, they might lrave fome chance of efcaping : but even in this he could not prevail; for the king laving difpofed of every thing for a battle the next day, was impatient to begin the onfet as foon as it was light.

In the mcan time Muley Moloch was fo fenfible of the advantages of his fituation, that he was inclined to take the whole Portuguefe army prifoners; but finding his difeafe increafe, fo that he had no hopes of recovery, he came to the refolution to fight, that his antagonitt might not avail himfelf of his death. The difpofition of the Chrillian army was very regular and correet, through the care of fome old officers in Dom Sebaflian's fervice : the infantry were difpofed in three lines; the battalion of volunteers made the vanguard;
the Germans commanded by colonel Amberg, and the Italians by Sir Thomas Stuckeley, were on the right; the Caftilian battalions on the left; the Portuguefe in the centre and rear ; the cavalry, confifting of about 1500 men, partly on the right under the command of the duke d'Avegro, to whom the cheriff joined himfelf with his horle: on the left was the royal ftandard, with the relt of the cavalry, under the command of the duke ot Barcelos eldelt fon to the duke of Braganza, Don Antonio prior of Crato, and feveral other perfons of great rank. 'The king took polt at firft with the volunteers. Muley Moloch difpoled alfo his tronps in three lines: the firt confifted of the Andalulian Moors, commanded by three officers who had diftinguithed themfelves in the wars of Granada; the fecond of renegadoes; and the third of the natives of Africa. They moved in a half moon, with 10,000 horfe on each wing, and the relt in the rear, with orders to extend themfelves in fuch a manner as to encompafs the Chrittan arny. Muley Moloch, though extremely weak, was taken out of his litter and let on horfeback, that he might fee how his commands had been obeyed; and being perfectly fatisfied with the fituation of his troops, he directed the fignal of battle to be given. The Chrittians advanced with the greatelt The relolution ; broke the firlt line of the Moorifh infantry, guef and difordered the fecond. On this Muley Moloch entis drew his tword, and would have advanced to encou. feate rage his troops, but that his guards prevented him; on which his emotion of mind was fo great, that he fell from his horfe. One of his guards caught him in his arms, and conveyed him to his litter; where he immediately expired, having only time to lay his finger on his lips by way of enjoining them to conceal his death. But by this time the Moorifh cavalry had wheeled quite round, and attacked the Chriflian army in the rear: upon which the cavalry in the left wing made fuch a vigorous effort that they broke the Portuguefe or the right ; and at this time the cheriff, in paffing a rivulet, was drowned. In this emergency, the Germans, Italians, and Caftilians, did wonders; but che Portuguefe, according to their own hiftorians, behaved indifferently. Attacked on all fides, however, they were unable to relift; and the whole army, except about 50 men, were killed or taken prifoners. The fate of the king is varioully related. According to fome, he had two horfes killed under him, and then mounted a third. His braveft officers were killed in his defence; after which the Moors furrounded him, feized his perfon, Itripped him of his fword and arms, and fecured him. They immediately began to quarrel about whofe prifoner he was; upon which one of the generals rode in among them, crying, "What, you dogs, when God has given you fo glorious a victory, would you cut one anothers throats about a prifoner?" at the fame time difcharging a blow at Seballian, he brought him to the ground, when the reft of the Moors foon difpatched him. Others affirm, that one Lewis de Brito meeting the king with his flandard wrapped round him, Sebaftian cried out, "Hold it faft, let us die upon it!" upon which charging the Moors, he was feized, refeued by Bito, who was limfelf taken with the flandard, and carried to Fez. He affirmed, that after he was taken, he faw the king at a diftance, and nopuriued. Don Lewis de Lima met him afterwards

## POR

making towards the river; and this is the laft account we have of his being feen alive.

Muley Hanet, the brother of Muley Moloch, was proclaimed king by the Moors inmediately after the battle. Next day, having ordered all the prifoners to be brought before him, the new fovcreign gave orders to fearch for the body of Don Sebatian. The king's valet-de-chambre brought back a body, which he faid was that of his mafter, but fo disfgured with wounds, that it could not well be known; fo that notwithflanding the moft diligent fearch, this monarch's death could never be properly authenticated. This body, however, was preferved by Muley Hamet, who delivered it up as the body of Don Sebaltian to King Philip of Spail. By him it was fent to Ceuta, from whence it was tranfported to Portugal, and buried among his anceftors in the inonaftery at Belem, with all ponible folemnity.

By this terrible difalter, the kingdom of Portugal, from being the mon eminent, funk at once into the loweft rank of the European flates. All the young nobility were cut off, or caried into flavery : the kingdom was exhaufted of men, money, and reputation; fo that Don Henry, who affumed the government after the death of his brother Don Sebaftian, found himfelf in a very difagreeable fituation. The tranfactions of his reign were quite trifling and unimportant; but after his death a great revolution took place. The crown of Portugal was claimed by three different competitors; viz. the prince of Parma, the dutchefs of Braganza, and Philip of Spain. Whatever might have been the merits of their refpective claims, the power of Philip quickly decided the contelt in his favour. He found his fchemes facilitated by the treachery of the regents, who took the mof fcandalous methods of putting the kingdom into his hands. Under pretence of infpecting the magazines, they took out fome of the powder, and mixed the reft with fand: they appointed an agent to go to France for fuccours, from whence they knew that they could not arrive in time; they dillulved the fates as foon as they difcovered that they were bent on maintaining the freedom of the nation; and, under a thow of cunfidence, fent off to diftant places fuch of the nobility as they fulpected.

King Philip, finding every thing in his favour, commanded the duke of Alva to invade Portugal, at the head of 20,000 men. The people, perceiving that they were betrayed, exclaimed againtt the governors, and placed on the throne Don Antonio prior of Crato. But his forces being inexperienced, and he limbelf behaving in a very improper manner, he was quickly defeated by the duke of Alva, and forced to fly out of the kingdom, which he effected with great difficulty. On his flight the whole kingdom fubmitted, together with the garrifons in Barbary, the fettlements on the weltern coalt of Africa, of Brazil, and in the Edf Indies. All the Madeiras, however, except the ifle of St Michael, held out for Don An. tonio until they were reduced, and the French navy, who came to their affifance, entirely defeated and deAtroyed.

Philip made his entry into Lifbon as foon as the king dom was totally reduced, and endeavoured to conciliate the affections of the people by confirming the terms which he had before offered to the fates. Thefe terms were, that de would take a folemn oath to main-
tain the privileges and liberties of the people: that the Portugat fates fhould be affembled within the realm, and nothing propofed in any other fates that related to l'ortugal: that the vicerny or chief governor fhould be a native, unlefs the king fhould give that charge to one of the royal family: that the houfehold thould be kept on the fame footing: that the poft of firft prefident, and of all oflices, civil, military, and judicial, fhould be fillecl with Portuguefe; all dignities in the church and in the orders of knighthood confined to the fame; the commerce of Ethiopia, Africa, and the Indics, referved alfo to them, and to be carried on only by their merchants and veffels : that he would remit all impofts on ecclefiatical revenues: that he would make no grans of any city, town, or jurifdiction royal, to any but Portuguefe : that eftates refulting from forfcitures thould not be united to the domain, but go to the relations of the laft polfeffor, or be given to other Portuguefe for recompenfe of fervices : that when the king came to Portugal, where he fhould refide as much as pollible, he fhould not take the houfes of private perfons for his officers' lodging, but keep to the cuftom of Portugal : that wherever his majefty refided, he fhould have an ecclefialtic, a treafurer, a chancellor, two mafters of requelts, with under officers, all of them Portuguefe, who floould difpatch every thing relating to the kingdom : that Portugal thould ever continue a difinct kingdom, and its revenue be confumed within itfelf: that all matters of juftice fhould be decided within the realm : that the Portuguefe fhould be admitted to charges in the houfeholds of the king and queen of Spain : that all dutics on the frontiers fhould be taken away: and, laftly, that Philip thould give 300,000 ducats to redeem prifoners, repair cities, and relieve the miferies which the plague and other calamities had brought upon the people. All thefe conditions, formerly offered and rejected by, the Portuguefe, the king now confirmed: but whereas the duke of Offuna, by way of fecurity for thefe conditions, had promifed them a law, that if the king did not adhere to them, the fates fhould be freed from their obedience, and might defend their right by the fword, without incurring the reproach of perjury, or the guilt of treafon ; this he abfolutely refufed to ratify.

All thefe conceffions, however, did not anfiver the Cannot purpofe; nay, though Philip was to the lat degree conciliate lavifh of honours and employments, the Portuguefe their affex were ftill diffatisfied. This had alfo an effect which tious, was not forefeen : it weakened the power, and abforbed the revennes, of the crown; and, by putting it out of the power of any of his fucceffors to be liberal in the fame proportion, it raifed only a fhort-lived gratitude in a few, and left a number of malecontents, to wi.ich time was continually adding.

Thus Philip, with all his policy, and endeavours to pleafe, found his new fubjects fill more and more difgulted with his government, efpecially when they found their king treating with the utmon feverity all thofe who had fupported Don Antonio. The exiled prince, however, fill Ayled himfelf ling of Portugal. At firt he retired to France, and there demanded fuccours for the recovery of his dominions. Here he found fo much countenance, that with a fleet of near 60 fail, and a good body of troops on board, he made an attempt upon the Terceras, where his fieet was beat by the Spaniards; and a great number of prifowers being ta?

## POR [4IG J POR

Portugai. Ken, all the officers and gentlemen were beheaded, and a greit number of meaner people hanged. Don Antonio, notwithfanding, kept poffefion of fome places, coined money, and performed many other acts of regal power ; but was at length contrained to retire, and it was with fome difficulty that he did fo, and returned into France. He pafid from thence into England, where he was well reccived ; and many fitted out privateers to cruife againlt the Spaniards under his commifion. 13ut after king Philip had rained the naval power of Portugal as well as Spain, by equipping the armada, Queen Elizabeth made no difficulty of owning and aliting Don Antonio, and even of fending Sir John Norris and Sir Francis Drake with a ftrong fleet and a great army to reftore him. Upon this occation Don Antonio fent his fon Don Chiftopher a hotage to Muley Hamet king of Fez and Morocco, who was to lend him 200,000 ducats. But king Philip prevented this by furrendering Arzila: and this difappointment, the anfeafonable enterpife upon Corunna, and the difputes that arofe between Norris and Drake, rendered that expedition abortive ; fo that, except carrying the plague into England, it was attended with no conlequences worthy of notice. He remained fome tine after in England: but finding himelel little rerarded, he withdrew once more into France, where he fell into great poverty and diftrefs; and at length dying in the 64th year of his age, his body was buried in the church of the nens of Ave Maria, with an infeription on his tomb, in which he is fyled king. He left feveral chillaren behind him, who, on account of his being a knight of Malta, and having made a vow of virginity at his entrance into the order, were looked upon as illegitimate. He preferved, even to the day of his death, a great intereft in Portugal; and had drawn from thence, in the courfe of his life, immenfe fums of money; which had been fquandered in many fruitlefs negociations and attempts to d'furb the poffeffions of king Philip in almoft all parts of his dominions, and particularly in the Indies, where the Portuguefe were rather more averie to the Caftilian yoke, or at leaft teftified their averfion more openly, than in Eurcpe.

But Don Antonio was not the only pretender to the
body of about 800 men , and fome blood was filt before I he was apprehended : at length, being clearly proved to be an impoltor, himfelf and his intended father-in.law were publicly hanged and grartered at Libon ; which, inftead of extingnihing this humour, farther increafed it.

There was, however, a perfon who appeared about A 20 years after the fatal defeat of Sebaftian, at Venice, a, who created much more trouble. He alliumed the name bl of $D_{n n}$ Sebafian, and gave a very diftinct account of the manner in which he had paffed his time from that defeat. He affirmed, that he had preferved his life and liberty by hiding himfelf amongf the flain : that, atter wandering in ditguife for fome time in Africa, he returned with two of his friends into the kingdom of Algarve : that he gave notice of this to the king Don Houry: that finding his life fought, and being unwil. ling to difturb the peace of the kingdom, he recurned again among the Moors, and palfed freely from one place to another in Barbary, in the habit of a peni. tent: that after this be became a hermit in Sicily ; but at length refolved to go to Rome, and difcover himfelf to the pape. On the road he was robbed by his domeftics, and came almoft naked to Vcnice, where he was known, and acknowledged by forne Porturuefe. Complaint being made to the fenate, he was obliged to retire to Padua. But the governor of that city ordering him alfo to depart, he, not knowing what to do, returned again to Venice; where, at the requeft of the Spanifl ambaffador, who chaiged him not only with being an impoitor, but alfo with many black and atrocious crimes, he was feized, and thrown into prifon. He underwent 28 examinations before a committe of noble and impartial perfons; in which he not only acquitted himfelf clearly of all the crintes that had been laid to his clarge, but entered alfo into fo minute a detail of the trantactions that had paffed between himfelf and the republic, that the commifioners were perfecty afomithed, and thowed no difpofition to declare him an impoftor; noved more efpecially by the firmncfs of his behaviour, his fingular modelly, the fobriety of his life, his excmplary piety, and his admirable patience under his aflictions. The noife of this was diffufed throughout Europe, and the enemies of Spain endeavoured every where to give it credit.

The fate, however, refufed to difcufs the great point, whether he was or was not an impoftor, unleis they were requefted fo to do by fome prince or fate in alliance with them. Upon this the prince of Orange fent 1 on Chiftopher, the fon of the late Don Antonio, to make that demand; and at his requeft an examination was made wih great folemnity : but no decifion followed; orly the fenate fet him at liberty, and ordered him to depart their domintons in threc days. He went therefore, by the advice of his friends, to Padua, hut in the difguife of a monk, and from thence to Florence; where he was arrefted by the command of the grand duke, who delivered him to the viceroy of Naples. The count de Lemos, then in poffeltion of that dignity, died foon after ; before whom he was firt brought ; this man affirted, he mult know him to be Don Sebaltian, fince he lad heen twice fent to him from the king of Spain. He remained prifoner fevenal ycars in the cafle Del Oro, where he endured incredible hardihips. At leng ho he was brought out, led with infamy through the Alecet 8

## POR

of the city, and declared to be an impofor, who aflumcd the name of Schaftian: at which words, when proclaimed before him, he faid gravely, Awd fo $I$ an. In the fame proclamation it was affirmed, that he was in truth a Calabrian; which as foon as he heard, he faid, It is falf. He was ne:t fhipped on hoard a galley as a flave ; then carried to St Lucar, where he was fome time confired; from thence he was transferred to a cafle in the heart of Callile, and never heard of more. Some perfons were exechted at Lifon for their endeavours to raife an inturrection on his belalf: but it was thought Atrange policy, or rather a flrange want of policy, in the Spaniards, to make this affair fo public without proofs: and the attempt to filence this ohjection, by affirming him to be a matgician, was jufly looked upon as ridiculous.

The adminiftation of affirs in Portugal, during the reign of Muii:p, was certainly detrimental to the nation ; and yet it does not appear that this flowed fo much front any ill intention in that monarch, as from errors ia judgment. His prodigions preparations for the inv:ation of Enghed impeverithed all his European dominions; but it abfolutely exhaulled Portugal. The pretenfions of Dan Antonio, and the hopes of derpoiling their Indian fleets, expered the Portuguefe to the rcfentment of the Euglifh; from which the king having granted away all his clomains, wanted powar to defend them. Their clamours were net at all the lefs loud for their being in fome meafure without caufe. The king, to pacify them, borrowed money from the nobility upon the cufoms, which were the only fure remedy he had ftill left ; and this was attended wihh fatal confequences. The branclies, thus mortgaged, became, and continuc to this hour, fixed and hereditary; fo that the merchant was nppreffed, and the king reccived nothing. This expedient failing, a tax of three per cent. was impofed, in the nature of hip-money, for the defence of the coa:ts and the commerce, which for fome years was properly applied; but it then became a part of the ordinary revenue, and went into the king's exchequer without account. This made way for diverting other appropriated branches; as for inflance, that for the repair of for tifictions, the money being frictly levied, and the works fuffered to decay and tumble down; and for the mainienames of the conquef in Africa, by which the garrifons mouldered away, and the places were lof. Upon the whole, in the face of is years, the nation was vifibly impoverifhed: and yet the government of Philip tras incomparably better than that of his fuccefFors; fo that his death was jullly regretted; and the Portuguefe were tanght by experience to confecs, that of bad mafters he was the beft.

IFis fon Philip, the fecond of Portugal and the third of Spain, fat 20 years upon the throne before he made a vifit to Portugal, vhere the people put themfelves to a moft enormous expence to receive him; for which th::y reccived little more than the compliment, that beforc his cntry into Lifbon, he knew not how great a king he was. He held an affembly of the fates, in which his fon was fworn fiecceffor. Having done all that he wanted for limfeif, he acquired a falle idea of the ciches of the nation from an immenderate and focling dufplay of them during his fhort fay at Lilbon; and having fown himfelf little, and cone lefs, he returned us:o Spain; where he acted the part of a good king Yos. XU.
upon his death-bed, in deploring bitterly that he rever Portugale thought of acting it before. The reign of Philip 111. and IV. was a feries of wole meafures, and worle for- Gre elufes tunc: all his dominions fuffered greatly ; Pootugal mant in alia and of all. The lut, of Ormus in the Eaft, of Brasil in the cancria. Wcil Indies, together with the thipwrect: of a neet fent to efort that from Goa, brought the nation ircredibly low, and encouraged the conde dulie to hope they might be entirely crufficd. 'Thefe are the heads oniy of the tranfasions for 40 years: to "nerr in any degree into the particulars, is, in other words, to phint out the breaches made by the Spanith mini hors on the condtions granted by king Philip; which, with refpest to them, was the original contrict, and unaterable coantitution of Portugal while fuljucit to the monarchs of Caltile ; and which, notwithtatiding, they fo often and fo flagrantly violated, that one would have imagined they had fludied to provoke the wrath of heaven, and infult the patience of men, intlead of availing then:felves, as they might have cone, of the riches, power, and martial fpirit of the Portuguefe poople.

It was the very batis and fomdation of their privi- The I'urleges, that the kingdom thould remain feparate and in- tuanere on dependent, and confequently that LiBon flould conti- prefed hy nue as much its capital as crer, the feveral fupreme the ops. councils and courts reliding ; fo that the natives of this riards. realm might not be obliged to travel in fearch of juftice. So little, or at lcaft fo thort a time, was this obferved, that neither promotion nor juftice was to be obtained without journeys, and Madrid was not more the capital of Catile than of Portugal. The general affembly of eflates was to be held frequently, and they were hold thrice in the face of 60 ycars; and of theie twice within the firft three. The king was to relide in this realm, as often and as long as peffule ; in compliance with which, Philip I. wiss there bat once, Philip I!. but four months. and Plilip III. was never there at all. The houfehold eftablifnment was fuppreffed through all their reigns. The viceroy was to be a native of Portugal, or a prince or princets of the blood; yet when any of the royal family bore the title, the power was in reality in the hands of a Spaniard. Thus, when the princefs of Mantua was vice queen, the marquis de la Pcebla was to afift in council, and in all difoutches; and fae was to do nothing without his advice. The council of Portugal, which was to be compofed eni irely of natives, was filled with Cantilians, as the garrifons alfo were, though the contrary had been promifed. The prefidents of provinces, or corregidors, were to be uatives; but by kecping thofe ofices in his own hands, the king eluded this article. No city, town, or difriet, was to be given but to Purtugufe: yecthe duke of Lerma had Beja, Serpa, and other parts of the demefines of the crows, which were formerly appendages of the princes of the blond. None but natives were capable of offices of juftice, in the revenue, in the tlect, or of any polt cisil or military; yet thefe were given promifcuoully to foreigners, or fold to the higheft bidder; not excepting the governments of caftcs, cities, and prowinces. The natives were fo far from laiving an equal chance in fuch cafes, that no pofis in the prefictials were ever given to them, and fearce any in garrifons; and whencver is happened, in the cale of a perfon of extraordiuary merit, whofe pretenfions could net be rejected, he was sither removed, or not allowell to cxercife lis chalyc:

Portugai.
as fell out to the marquis of Marialva and others. The froms of proceeding, the juridicior, the minillers, the fecretaries, were all clanged, in the council of Portugal ; being reduced from five to thrce, then two, and at lat to a fingle perion.
Ley reafon of thefe and many other grievances too tedious to be mentioned here, the deteftation of the Spanilh government became univerial; and in $26+10$ a revolation took place, in which John duke of Braganza was declared king, by the title of John IV. This revolution, as being determined by the almoft unanimons voice of the nation, was attended whih very litule ciftution of blood; neither were all the efforts of the king of Spain able to regain his authority. Several attempts indeed were made for this purpoic. The firit battle was fought in the year 1644, between a Portuguefe army of 6000 foot and 1100 horfe, and a Spanith armoy of nearly the fame number. The latter were.entirely defeated; which contributed greatly to eitablith the affuirs of Portugal on 2 firm balis. The king carried on a defenfive war during the remainder of his life; butafter his death, which happened in 1655 , the war was renewed with sreat vigour.
This was what the Spaniards did not expect ; for they exprefied a very indecent kind of joy at his death, hoping that it would be followed by a diffolution of the governnent. It is not indeed eafy to conceive a king. dom left in more perilous circumftances than Portugal was at this time:-The king Don Aionzo Enriquez, a child not more than 13 years of age, reputed of no very fround contitution either in body or mind ; the regency in a woman, and that woman a Caftilian; the bation involved in a war, and this refpecting the title to the crown ; the nobility, fome of them fecretly difaffecied to the reigning family, and almolt all of them embarked in feads and contentions with each other ; fo that the quecen farce knew who to trult or how the thould be obeyed. She acted, however, with great vigour and prudence. Dy marrying her only daughter the pincets Catharine to Charles II. Ki.g.g of Great Britain, fhe procured to Portugal the protection of the Englifh fleets, with rcinforcements of icme thoufands of horfe and frot; and at laft, in 1665, tesminated the war by the glorinus vi\&tory of Munterclaros. This decifive action broke the power of the Spaniards, and fixed the fate of the kingdom, though not of the king, of Purtugal. Alonzo was a prince whofe education had been neglected in his youth, who was devoted to vulgar amafements and mean company, ond whom the queen for thefe reafons wifhed to deprive of the crown, that the might place it on the head of his younger brother Don Pedro. To accomplih this purpore, the attempted every method of ftern authority and iecret artifice ; but the attempted them all in vain. The portegnefe would not confent to fet afide the sights of prinogeniture, and involve the kingd m in all the miteries atterding a difputed fuccelion. After the death, however, of the queen-mother, the infant entered into cab ls arainll the king of a much more dangerons nature than any that fhe had carricd on. Alonzo had married the princefs of Nemours; but being, as was faid, mpotent, and hikewice lefs handfinme than his brother, that lady transferred her affection to Don Pedro, to whom fhe lent her allitance to hurl the king from the thronc. Aloazo was compelled to fign a rcfigna-
tion of the kingdom ; and his brother, after governing a few months without any legal authority, was in a meeting of the ftates unanimoully proclaimed regent, and velled with all the powers of royalty. Soon after this revolution, for fuch it may be called, the marriage of the king and queen was declared null by the chapter of Lilbon ; and the regent, by a papal difpenfation, and with the confent of the flates, immediately efpouted the lady who had been wife to his brother. He governed. under the appeliation of regent, 15 years, when, upon the death of the king, he mounted the throne by the title of Don Pedro II. and after a long reign, during which he conducted the affairs of the kingdom with great prudence and vigour, he dicd on the rgth of December 1706.

Don John V. fucceeded his father; and though he non ${ }^{4}$. was then little more than 17 years of age, he acted V . a with fuch wifdom and refolution, adhered fo fteadily to and r the grand alliance formed againt France and Spain, and fhowed fuch refonrces in his own mind, that though he fuffered great loffes during the war, he obtained fuch terms of peace at Utrecht, that Portugal was in all refpects a gainer by the treaty. The two crowns of Spain and Portugal were not, however, reconciled thoroughly till the year 1737; and from this period they became every day more united, which gave much fatisfaction to fume courts, and no umbrage to any. In this fituation of things, a treaty was made in 1750 with the court of Madrid, by which Nova Colonia, on the river of Plata, was yielded to his Catholic majefty, to the great regret of the Portugncfe, as well on account of the value of that fettlement, as becaufe they apprehended their poffelfion of the Brafils would by this ataion be rendered precarious. On the laft of July the fame year, this monarch, worn out by infirmities, deceafecl, in the 6ill year of his age, and in the $44^{\text {th }}$ of his reign.

Don Jofeph, prince of Brafil, fucceeded him, to the Eon univerfal fatisfaction of his fubjec?s, and with as great feph expectations as ever any monarch that mounted the cellet throne. It was generally believed that he would make mion tion. confiderable alterations, in which he did not difappoint the hopes of the public; and yet they were done fo fluwly, with fuch moderation, and with fo many circumAances of prodence, as hindered all grounds of comphint. A monglt other new regulati ns, the power of the inquifition fuffered fome reliriction; the king direating, that none of their fentences foruld be put in execution till reviewed and approved by his privy-counct. But as in the reign of his father he had confented to the treaty with Spain, he ratified it after his a.cceffion, and fince carried it into execurion upon this noble principle, that no confiderations of intcreft ought ever to induce a mondrch to break his word.

However, within the fpace of the few years of this Drea king's reign, the calamities of Portugal in general, and calan thofe of the city of Lifbon in particular, cannot, in a duri great degrec, be paralleled in all hifory. An earth- reign quake, a fire, a famine, an affalination-plot aghinft their prince, executions upon exccutions, the fcaffolds and wheels for torture recking with the nobleft blood; insprifonment after imprifonment of the greateft and moof dillinguifhed perfonages; the expultion of a chief order of ecclefiaflics; the invafion of their kingdom by a powerful, Rionger, and exafperated nation; the nume-

## 1'OR

gal. rous troops of the enemy laying wanc their territory bringing fire and fwe with them, and rolling like diftent thunder towards the gates of their eapital ; their prince ready alnolt to tave himfell by flight! The Spanifa min fey lad already decreed the doom of Portugal, sud rothing was to be heard att the Efcurial but Ihieenda of. Garthago. Carthaginian, perhaps, or Jewith fory, may ponfibiy afford a leene fomething like this, but for the flortncfs of the period not to big with events, though in their inal dellrution fuperior. From that indeced, meder the hand of Providence, the national lumanity and cencrolity of Creat Britain has preferved the Portuguefe; and it remains now to be Feen, in future treatics, how that people will exprefs their gratitude (fice lerrain, $n^{2} 450$ ). Thofe who are able to fea-cla deper into human affars, nay afign the caufes of fuch a wonderful chain of events; hut no wife man will :fcribe all this to fo fingular a caufe as that which a Spaniard has donc, in a famous pamphlet, printed in the year ${ }^{1762}$ at Madid. It is incitled, $A$ Spanifo Propbocy; and endeavours to thow, that all thefe calamitics have befallon the Portugueie, folely on account of their connection with the heretic Englifh. The great Ruler and Gove:nor of the world undonbtedly alts ty univerfal laws, regarding the whole fyltem, and caunot, without blapheny, be confidered in the light of a partizan. The relt of the pamphlet tends to how, that his Catholic majent carried his arms into Portugal, folcly to give them liberty, and fet them free from Englifn tyranny.

Jofeph dying without male iffuc, the fucceffion de. volved to Mary, his daughter, now queen of Portugal. She was married fome time before he died, with the pope's difpenfation, to his brother Don Pedro.

The air of Portugal, in the fouthern provinces, would be excefiivels lot, it it were not refrethed by the feabreezes; but in the northern, it is much cooler, and the weather more fubject to rains. The foring is ex. tremely delightulf here; and the air, in general, more temperate than in Spain. Litbon has been much reforted to of late by valetudinatians and confumptive perfons from Great Britain, on account of its air. The foil is very fruitful in wine, oil, lemons, oranges, pomegranates, figs, railins, almonds, chefnuts, and other fine fruits; but there is a want of corn, owing, it is §aid, in a great meafure to the neglect of agriculture. There is plenty of excellent honey here; and alfo of fea and river filh, and fea-falt. The horfes in Portugal are brifk lively animals, as they are in Spain, but of a flight make: but mules being furer-footed, are more ufed for carriage and drauglat. By reifon of the fcarcity of p.ifure, there are not many herds of cattle or flocks of heep; and what they have are fimall and lean, though the flefh is tolerably good: their beft meat is faid to lic that of logs and kids. The country in many parts is mountainous: but the mountains contain all kinds of ores; particulanly of filver, copper, tin, and iron, with a variety of gems, beantifully variegated marble, millfones, and many curious folils. Not far from Lifbon is a mine of faltpetre; but nonc of the metal mincs are Ficre worked, we inkabit.ants being fupplied with metals of all kinds from thcir foreign fettlements. The principal rivers are the Minho, in Latin Minius; the Limia, anciently the famed Lethe; the Cavado; the Deuro ; the Cuaciiana, anciently Anas; and the Cujo,
or Tagus, which is the largelt aiver in the kingdom, carrying fome $\underline{a}$ de in its fands, and falling into the fe:t a lit:le bel , w liitbon. There arc feveral minetal fpings in the kingdom, beth hot and coid, which are mach frequented.

The only relizion tolerated in Portugal is that of the church of Ront; yet there are mainy coneealed Jews, and thol: too even amony the nobility, binhops, prebends, monks, and muns, and the very iiaquilitors themielves. If a Jew pretends to be at Chritian and a Roman Catholic, while he is really a Jew, by groing to mafs, confellion, sc. or it after being converted, or fretending to be converted and pardoned, he relapfes into Juduifm and is clifoovered, the inquifition lays hold of him. In the firt cafe, if he renounce Judaifin, he is only condemned to fome corporal punithment of public fhame, and then ordered to be inftructed i.. the Chrifian religion. In the fecond, he is condemad to the flames without mercy. Defides Jews and.heretics, who broach or maintain any doatrines contrary to the religion of the country, the inquifition punifhes all fodomites, pretenders to forecry and the black art, :ipoftates, blafjhemers, perjured perions, impofers, and hypocrites. The burning of thofe condemned by the inquilition, is called an cutto do fe, or "act of faith." There arc feveral tribunals of the inquiftion, one of which is at Goa in the Ear Indies; but there are none in Brafil. The number of convents in Portugal is faid to be 900 . The order of Jefuits hath been fupprelled in this country, as they have been in others. Here is a patriarch, feveral archbifops and bifhops: the patriarch is always a cardinal, and of the royal family. The archbifhops rank with marquilles, and the bilhops with counts. The Portugucie have archbifhops and bilhnps in the other quarters of the world as well as in Europe. T'ke fums raifed by the pupes here, by virtue of their prerogatives, are thought to exceed the revennes of the crown, and the nuncios never fail of acquiring vaff fortunes in a flort time. Thnugh there are two univerfities and feveral academics, yet whle the papal power, and that of the ecclefanics, continues at fuch a height, true learning is like to make but a imall progrefs. The language of the Portuguefe does not differ much from that of Spain: Latin is the groundwork of both; but the former is more remote from it, and harfher to the ear than the latter. The Portuguele tongue is fpoken on all the coalt of Africa and A lia as far as China, but mixed with the languages of the feve. ral nations in thofe diftant regions.

With regard to manufactures, there are very few in ManufasPortugal, and thefe chiefly coarfe filks, woollen cloths, turto. and fome linen; but their foreign trade is very conliderable, efpecially with England, which takes a great deal of thcir wine, falt, foreign commoditics, and fruits, in return for its woollea manufafures, with which the Portuguefe furnill their colonies and fubjefts in Afi:, Africa and America. 'Thei: plantations in Brafil are very valuable, vielding gold, diamonds, indigo, copper, tobacco, fugar, ginger, cotion, hides, gums, drugs, dying woods, sce. From their plamations in Aftica, they bring gold and ivory, and flaves to cellivate the r fugar and tobacco plantations in brail?. They have fiill fo. veral fettencents in the Eaft Indies, but far lefs conl:derable than formerly. The Azores or Weltern Ihes, Madeira, and the Cape de Verde illands, al:o be.ong to

## POR

Fortusai. them; but a great part of the riches and merchandize brought from theie diliant countries becomes the property of foreignees, for the goods they Jurnith the Portuguefe with to earry 1hither. The king's firth of the gold brotght from Brafl amount commonly to about $300,0 c o$ 1. Sterling ; fo that the whole annual produce of gold in Drafl may be eftimated at near 2,000,000 Sterling. Lifon is the greateft port in Europe next to Londun and Amfterdam.

As to the conflitution of Portugal, it is an abfolute hercditary monarchy. Both here and in Spain there were anciently cortes, ftates, or parliaments; but they have long fince entirely loft their fhare in the legiflaure. For the adminifration of the civil government, there is a council of ftate, and feveral fecretariss; for military affairs, a council of war; for the finances, a trenfury court ; and for the diftribution of juftice feveral high tiibunals, with others fubordinate to them, in the feveral difricts into which the kingdom is divided. The cities lave their particular magiltracy. The proceedings of the courts are regulated by the Rnman law, the royal edies, the canon law, and the pope's mandates. Like the Spaniards, they tranfad moft of their bufinefs in the morninge and evenings, and fleep at noon. The nobility are very numerous, and many of them are defcended from natural fons of the royal family. They are divided into high and low. The high confifts of the dukes. marquilies, counts, vifcounts, and barons, Tho are alfo grandees, but of different claffes, being fuffered to be covered in the king's prefence, and haring the title of Dons, with a penfion from the royal treafury, to enable them the better to fupport their dignity: the king ftyles them Il'uffrious in his letters, and treats them as princes. A dukc's fons are alfo grandees, and his daughters rank as marchionefles. The inferior nobility or gentry are termed Hiddalgos, i. e. gentlemen: they cannot aflume the title of Dor without the king's licence.

The revenues of the erown, fince the difiovery of the Brafil mines, are very confiderable; but the real amount can only be gueffed at. Some have faid that it amounts, clear of all falarics and penfions, to npwards of $3,000,000$ Sterling ; others make it a great deal lefs. Thus much is certain, that the cuftoms and othes taxes pun cxcefively high. Befides the royal demefnes, the herecitary eftates of the houfe of Braganza, the monupoly of Brafil fnuff, the coinage, the money ariling from the fale of indulgences granted by the pope, the fifth of the gold brought from Brafil, the farm of the Lrafil diamonds, the mafterfips of the orders of knighthood, and other fources, field very large fums. The forces, notwith!tanding, of this nation, both by fea and land, are very iaconfiderable ; their land-furees beiner the wort minitia in Entope, and their navy of litule importance. They would be an enfy conquelt to the Spaniards if they were not under the protection of 13 i itain.

There are fever ll orders of kn:ghthond here, wiz. the order of Chrill, the badge of which is a red crofs within a white one, and the number of the commanderies 454. 2. The order of St James, the badge of which is a red fword in the thape of a coofs. A great number of towns and commanderies belong to this order. 3. The order of Aviz, whofe badge is a green crofs in form of a lily, and the number of its commanderies 49 .

Though thefe three ordere are religious, set the kni:ghts Por are at liberty to marry. 4. The order of St John, which has allo feveral commanderies.

Port
The king's titles are, Kiny of Portugal and the Al. garves, on this fide ant 1 the otber fite the fia of Africa; Lord of Guinea, and of the mavigation, conquefis, and conmerce, in Elbiopia, Aralia, Perfia India, \&sc. The king's eldeft fon is ityled Prince of Brafil. In the year 1749 , pope Benedict XIV. dignified the king with the title of His mol fiuthful majc ly.

The Portuguefe are reprefented as inferior to the Char Spaniards both in perfon :nd geaius: as estremely of t? haughty, treacherous, and crafty in their dealings; peop much given to avarice and ufury ; and vindictive, malicious, and cruel. The meaner fort are faid to be extremely addicted to thieving : notwithflanding, it mu!t be owned, that they have flown themfelves on many occafions a brave and warlike people. They are juftly famed for their flill in navigation; and for the many difcoveries they have made, both in the Eaft and Welt Indies. The women here, and in other countries of the fame degree of heat, are not fo prolific as in the colder climates; but they are faid to be very beautiful whilit young, though their complexion is fomewhat upon the olive. Their eyes are very black and fparkling, and retain their brilliancy after all their other charms are gone. It is the fallion here, at prefent, as in moft other countries, for the ladies to fpoil and disfigure their fkins and complexions with paints and wathes: but, though lively and witty, they are faid to have a nice fenfe of female honour. Both men and women make great ufe of fpectacles; often not fo much to aid their fight, as to denote their wifdom and gravity. Their drefs, like that of the Spaniards, never ufed to vary, efpecially among the men; but of late jears, both men and women have given much into the French modes. The women, when they go abread on foot, are wont to ufe long veils, which cover their heads, but leave their faces bare.
PORTUGALLICA rerra, earth of Portugal; the name of a fine aftringent bole, dug in great plenty in the northern part of Portugal.
portulaca, purslane: A genus of the monogynia order, belonging to the dodecandria clafs of plints; and in the natural method ranking under the 13 th order, Succulentic. The corolla is pentapetilous; the calyx bifid; the capfule milocular, and cut round. Tliere are feveral fpecies, but the two following are the moft remarkable. 1. The oleracea, annual, or common culinary purnane, rifes with herbaceous, low, fucculent, branchy falks, lix or eight inches high, garnilhed with wedge-flaped, thick, iucculent leaves, and falll cloce-fetting flowers. There are two varictics; one with deep green leaves, the other with yellow leaves; hoth of which rife from the fame feed. 2. The anacampferns, peremial, or flabuby cape purlane, rifes with a flutuby branchy talk, about fix inches high, with oval, cribbous, fucculent leaves, and the flalks terminated by dimall clufters of red flowers. Bothethefe plants are of a fucculent rature : the firft is an herbaceous annual, for culinary ufes; and the fecond a flrubby perennial, raifed by the curious for variciy. They are both exotics of a tender quality, of the temperature of greenhoufe or flove plants. The common culinary purflone is raifed annually from feed for fummer ufe, and is an excellent in-
gredicnt

## POR [421] 1OR

gredient in fummer falads, but improper for winter on account of its cold moilt nature. The plant being tender, mult be raifed either on a hot-bed or in a warn border; in which latt it will not fucceed before April or May. The flrubby fort mult be kept in the hothoufe, in pots of a dry fuil.

PORTUMNA, a town of Iteland, in the county of Galway and province of Comaught, is 74 miles from Dublin. The caftle of Portumna, the feat of the Earl of Clamricarde, is at this place, and nedr it are the ruins of an ancient cafte. 'there is alfo a garrifou for a troop of horfe and two companies of foot. The town is feated on the river Shannon, where it falls into Lourh Dreg. The monks of the Ciftertian abbey of Dunbrody, in the county of Wexford, had for a ling time a clappel here, dedicated to St Peter and St Paul ; but having at length forfaken it, O'Madden, dynaif of the country, gave it to the Dominicen fiars, who, with the npprobation of the monks of Dunbrody, erefled a friary here and a church, which they dedicated to the blefied Virgin and the original patron faints; at the fame time they built a fteeple, and all other neceffary offices. Pope Martin V. granted a bull to confirm their pofieflions, dated the 8th Oetober 1426 ; and on the 23 d of Novem. ber following he granted indulgencies to all who had contributed to the building. The walls are fill nearly entire, and fhow that the monatery of Portumna was by no means an ignoble fruture. The ancient choir is now the parifh-church.

POSE, in heraldry, denotes a lion, horfe, or other beaft, flanding fill, with all his four feet on the ground. See Holling fhead's Defrription of Britain, chap. xvi.

POSITIVE, a term of relation oppofed to regative. It is alfo ufed in oppofition to relative c. 5 abitrary: thus we fay, Beauty is no pofitive thing, but depends on the different taftes of people.

Pose five Degree, in grammar, is tle adjective in its fimple figntication, without any compa:ifor.

Positive Eluaricity. In the Frankinian fyttem all bodies fuppofed to contain more than their natural quantity of electric matter are faid to be poffively electriticd; and thofe from whom fome part of the clectricity is fuppofed to be taken away are faid to be elec. trified segatioclls. Thefe two electricities being firft prochiced, one from glafs, the other from amber or rofin, the former was called silitecus, the other refinsus, clectricity.

POSPOLITE, in the military eftablifhment of Po. land, is the name given to a kind of militia. It is the molt numerous and the moft ufelefs of the Polifh armies. It confifts of the gentry at large, who, in cafe of invafion, are aflembled by a regular fummons from the king, with confent of the dies. Every palatinate is divided into diftriAs, over each of which preper officers are appointed; and every perfon polfelifing free and noble tenures is boumd to military fervice, either fingly or at the head of a certain number of his retainers, according to the extent and nature of his polfeffions. The tronps thus affembled are obliged only to ferve for a limited time, and are not under the neceffity of marching beynnd the limits of their country. They fubmit to no difcipline but fuch as they like themfelves; and are very apt to mutiny if detained more than a fortnight in the place appointed them to meet in, without march-
ing. The mode of levsing and matis.in.ing this army is canctly fimilar to that practife!! unde: the feudal fyllem. At present, thourl it is rimhlt totally unfit for the purpois of repelliag a foreign eneny, it is yet a poweriul infirument in the ha ds in domaRic faction: for the expedition with which it is rafed under the foudal regulations shacilitates the formation of thofe dangernus confederacies which fuddenly nare up on the c ntened election of a fovereign, or whenever; the nobies are at vacianee with each other.
POSSE conitarus, in Englifhlaw, fign:fies the power of the county, of the aid and affilance of all the knights, gentlemen, yeomen, labourers, fervante, apfremtices, \&ir. and all others within the county that are above the age of 15, except women, ccclefiafical fcrfons, and fuch is are decript and infirm.

This pofle comitatus is to be raifed where a riot is committed, a poffellion kept upon a farcible entry, or any force of refcue ufed contrary to the king's writ, or in oppolition to the execution of jaftice; and it is the duty of all theriffs to alfint juftices of the peace in the fuppreflion of riuts, S.c. and to raife the pofe comitatus, or to charge any number of men for that purpote.

POSSESSION, in law, is cither actual, where a perfon aqually enters into lands or tenements defeended or conveyed to him; or where lands are defcended to a perfon, and he has not yet entered into them. A long poffedion is much favoured by the law as an argument of right, even though no deed can be fhown, and it is more regarded than an ancient deed without poffeftion.

If he that is out of poffelion $n f$ land brings an action, he muft prove an undeniable title to it ; and when a perfon would recover any thing of another, it is not fufficient to deftroy the title of the perfon, in poffeflion without he ran prove that his own right is better than his.

In order to rnake poffelion lawful upon an entry, the former pofiefor and his fervants are to be removed from off the premiffes enteed on: but a perfon by liafe and releafe is in poffefion without making any entry upon the lands.
Possesion, in Scots law. Sec Law, Part III. No clsii. It, ǐc.

Diembitical Possestray. (See D) man and Dranomacs.) In the thirid volume of the Manchefler Tranfactions, there is a paper on popular illyjuris or medical demomology by Dr Forriar. He infurns us in at rote, that, 01 the 13 th of Jone 1758 , Ceorge Lnkins of Yatton in Somerfethire was exorcifed in the tenople charcl: at Briftol, and delivered from the poffeflion of feven devils hy the efforts of feven clergymen. An account of his deliverance was publifhed in feveral of the public papers, authenticated by the Reverend Mr Eafterbrook, vicar of the temple church in Britol.-Dr Ferriar gives us the following particulars, extrasted from this account, which we flall here infert.
"Lukins was firft attacked by a kind of epileptic fit, when he was going about asting Chriamas plays, or mummeries: this he afcribed to a blow given by an invifible hand. He was afterwards feized by fits ; during which he declared, with a roaring veice, that be was the devil, and fung different fonçs in a variety of keys. The fits always began and ended with a frong 2 eritaticu
beffin a aritaion of the right hand. He frequently uttered
${ }^{1}$ et. dreadful execrations during the fits. The whole dubet. ration of lis diforder was cighteen years.
"At lengih, viz. in Juse 1786, he declared that he was polfefled by feven devils, and could only be freed by the prayers (in fuili) of feven clergymen. Accordingly the requilite force was fummoned, and the patient fung, fwore, laughed, and barked, and treated the company with a ludicrous parody on the Te Deun. Thefe afton:fting lymptoms acfifted both hymns and frayess, till a fardl, faim, quice admonithed the miniilets to adjure. The fipiits, after fome murmuring, ielded to the adjuration, and the happy patient retumed thanks for lis wonderful eure. It is remarkable that duing this fulems mockery, the fiend fwore - by his infennal den,' that he would not quit his patient; an oath, I believe, no where to be found but in the P:lをrim's progrefs, from which Lukins probably got it.
"Very foon after the firlt relation of this flory was fubi:ilhed, a perfon, well acquainted with Lukins, tnok the troub.e of undecciving the public with regard to lis pretended diforder, in a plan, fenfible narrative of I is conduct. He alferts, that Luhins's firt feizure was nothing elfe than a fit of drunkemel's; that he alway's firetold his fits, and remained fenfible during their continuance; that he frequently faw Iukins in his fits, ' in every one of which, except in finging, he performed not more than mont active young people can ce:fity do ; that he was detected in an impofture with refped to the clenching of his hands; that after money hat been collested for him, he got very fuddenly well; that he never had any fits while he was at St George's Hofpital in London; nor when vifitors were excluded irom his lodgings, by defire of the author of the Narrative ; and that he was particularly careful never to hurt himfelf by his exertions during the paroxyfm.
"Is it for the credit of this philofophical age, that fo bungling aa impoture fhould deceive feven clergymen in o a public act of exorcifm? This would not have palled even on the authors of the Mallius Maifuartum; for they required figns of fuperiatural aBency, fuch as the fulpenfion of the policifed in the air, without my vifible fupport, or the ufe of different languages, unknown to the demoniac in his natural tate."

EOSSESSIVE, in grammar, a term applied to pronouns which denote the enjnyment or poffefion of any thing either in particular or in common: as meus, - mine ;" and tures, " thine."

POSSESSORY Action, in Scots Law. See Law, no clxasiii. 28.

POSSIBILITY, in law, is defined to be any thing that is altogether uncertain, or what may or may not be.

Possibility, alfo denotes a non-repugnance to exifting, in any thing that does not any way exif.

POSSIBLE, is fometimes oppofed to real exiftence, and is underftood of a thing, which, though it actually docs not exif, yet may exift ; as a new ftar.

POSSIDONIA, (anc. geog.) Sec l’oestum.
POST, a word derived from the Latin pofitus, "fet "r placed." It is ufed in feveral different mannings, but all of them referring either immediately or remotely to this primitive fenfe of pofition. Thus the word Ton tig. rifies, 2. A thake or piece of timber fet upright ; a. A
fation, particularly a military fation; 3. An office or cmployment ; 4. An operation in book-keeping; ; 5. A conveyance for letters or difpatches; 6. A particular mode of travelling.

Dos $r$, a flake or piece of timber fet upright. Ports are ufed both in building and in fencing ground. In brick-buildings much of the ftrength of the fabric depends on the nature of ile pofs; as it is through thens that the feveral parts are fuftained and hell together. The corner pofs are called the principal pofts; thofe form. ed into breflummers between principal pofts for Atrengthening the carcale of the houte are called the prick-pofs. Pots which are to be fet in the ground ought to be well feafoned and coated to preferve them froni rotting; burning the downward end has been recommended as an excellent prefervative, but a coating of pitch or tar, particularly the late invented coal-tar, can be moft fafely relied upon. For the various ules to which pofts may be applied, and the form and fpecies of them fitteft to be employed in each cafe, fee the articles $A_{r-}$ chitecture, Joining, Gardening, House, Fencle, \&sc. In architecture and fculpture rosts is a term ufed to denote certain ornaments fornied after the man* ner of rolls or wreathings.

Post, a fation, particularly a military fation.Any place where perions are fet or placed upon particular occafions may be termed a poft; but the word in this view is now chicfly refricted to military operations, and means any place or fituation where foldiers are fationed. Thus the detachmemts eftablifhed in front of the army are termed the out-pofs, the fations on the wings of the army are faid to be the trfes of honour, as being the moft confpicuous and molt expofed. But in the operations of a campaign, a poit properly fignifies any foot of ground capable of lodging fildiers, or any fituation, whether fortified or not, where a body of men may make a ftand and engage the enemy to advantage. The great advantages of good pofts, in carrying on war, as well as the mode of fecuring them, are only learned by experience. Barbarous nations dildain the choice of pofts, or at leatt are contented with fuch as immediately fall in their way ; they truft folely or chiefly to ftrength and courage : and hence the fate of a kingdom may be decided by the cvent of a battle. Dutenlightened and experienced officers make the choice of ponts a principal object of attention. The ufe of them is chiefly felt in a delenfive war againft an invading enemy; as by carrying on a war of putts in a country where this can be done to advantage, the moft formidable army may be fo harafled and reduced, that all its enterprifes may be rendered abortive. Indeed in modern times this is fo well underfood, that pitched battles have become much more rare than formerly, mancuvring and fecuring of pofts being confidered as the moft cifcntial objecis in the conduat of a campaign; a change in the art of war much to the advantage of humanity; fkil, conduet, and prudence, having thus obtained the afcendency over brutal courage and mere bodily Arength. In the choice of a poft, the general rules to be attended to arc, that it be convenient for fending out parties to reconnoitte, furprife, or intercept the encmy ; that if polfible it have fome natural defence, as a wood, a rivcr, or a morafs, in front or fank, or at leall that it
be difficult of aecefs and fufceptible of fpeedy fort:fication; that it be fo fituate as to preferve a communication with the main army, and have covered places in the rear to favour a retreat ; that it command a view of all the approaches to it, fo that the enemy cannot advance mperceived and reft concealed, while the detaclinent flationed in the poft are forced to remain under arms ; that it be not commanded by any neighbouring heights; and that it be proportioned in extent to the number of men who are to occupy and deiend it. It is not to be expected that all thefe advantages will often be found united; but thofe polts ought to be felested which offer the greateft number of them. Sce War, Indes.

Post, an office or cmployment. This wfe of the word is probably derived immediatcly from the idea of a military ftation; a poft being ufed to exprefs fuch offices or employments as are fuppofed either to expofe the holder to attack and oppofition, or to require abilities and exertion to fill them. Hence the term is ufed only for public offices, and employments under the government; and were frict propricty of ipeech always attended to, pofts would denote thofe fations only in which duty mult be performed. In common language, however, every pablic office or appointment, even though nominal and fimecure, goes under the name of a pof.

Post, an operation in book-keeping. Polting in bookkeeping means limply the translerring an article to the place in which it fhould be put, and arranging each under its proper head. It is upon this that the whole thenry of book-keeping is founded. The Wafte-book, which is the groundwork of all fubfequent operations, records every tranfaction exacly in the order in which it occurs. From this the feveral articles are pofted, or transferred into the Journal, which in fact is but a kind of fupplementary beok to the Walte-took. From the Journal they are pofted anew into the Ledger; in which a feparate place is appropriated for each perfon with whom tranfactions are carried on, and frequentiy for every feparate article ahout which the bufinefs is conserned. The particular mode according to which fuch transferenccs are made, may vary according to the nature of the trade carried on; the object is the fame in all, to plase cuery article fo as that its operations on the general Aa:e of the bulinefs may be certainly known and dininatly traced. For a full accomat of the way in which this is done, fee Book-Keeping.

Post, a conveyance for letters or dilpatches.
In the early periods of focicty, communication between the different parts of a country is rarc and difficult, individuals at a diflance having little inclination or opportunity for mutual intercourfe: when fuch com. munication is at any time found necelfary, a feccial meffenger muft be employed. As order and civilization advance, occalions of correfpondence multiply. In particular, the government finds it requilite frequently to tranfmit orders and laws to every part of the country; and Cor doing fo he makes ufe of couricrs or meffingers, to whom he commits the charge of forwarding his difpatches. But without fations in the way, where the'c couriers can be certain of finding refrefment for themfelves and fupplies of what may be neceffary for carrying them forward, the journey, however urgent and important, muft always be retardecl, and in many cafcs
altogether Roppad. Frperience, thirefore, foon printed out the neceflity of cofuring fuch accommodition, by ercating upon all the great roads houfes of fitions at convcnient intervals, where the meffengers night Aop, as occation requircd, and where too, for the greater comvenience, relays of froth hores fin midalwiy:be in readinefs, to cuable them to purfiuc their joun ney with uninterrupted difpatcl. Thefe houfes or Atations were with great propriety termed pofls, and the ma!fener who made ufe of them at pofl. Thongh ar firit, it is probable, the inflitution was intended folely fir the government and the neceftities of the ente; jot by degrees individuals, fecing the benefit refulting from it. mode ufe of the opportunity to carry on their own corrcfpondence; for which they were willing to pay an allowance to the government. Thus a polt offes, it fome kind or other, gradually came to be eflatiithed in every civilized country. Without taking notice of the different means of carrying on corrcfoondence faid to have been attenpted by pigeons, dogs, and other aninali, we can at lealt trace with certainy the invention of fome hing like regular pofts as far back as the ancient Perlians. Xenophon affures us, that they were invented by Cyrus on his Scythian expedition, about 500 years before Chrift; that the houles at the feveral itations were fumptuoully built, and large enough to contain a number of men and horfes; and that everycourier on his arrival was obliged to communicate his difp,tches to the poltmalter, by whom they were immediately forwarded. From the fhore of the Ege.m. fea to Sula the capi:al, there were, according to Herodotus, 11 I fages for pofts, eadı a day's journey diftant from the preceding.

In what manner pofs were eftablifhed and conducted among the Greeks does not clearly appear; but from the extended commerce carrica on, and the frequent communications enjoyed among the different fates, there. can be no doubt that a regular conveyance, in fome form or other, was eflablified.

Thongh poits were well known among the Romans, yet it is ditficult to trace with certainty the perind $r \boldsymbol{r}$ their introdustion. Some writers carry it back to the times of the republic ; pofts and poit-offices, tinder thes names of flatores and fationes, having been then, it is faid, eltabilifhed by the fenate. Whether this was thee cafe or not, Suetonius affures us that Augrifus inftRuted poits along all the great roads of the empire. At firit the difpatches were conveycd from polt io poit by young men who ru: on foot, and delivcred the difp.atcin to others at the next fargc. By and by Augufus fab. flituted, in room of thefe, hories and chariots, both for the conveyance of difpatches and the convenience of travelling. His fucceflors continued the fame efablithment; to the maintenance of which every firbjet. of the cm . pire was obliged to contribute. Ponthores arc mentioned in the theodorian code decurfiphoblico; but there werc only the public horfes appointed to he kept there for the ufe of the public meffengers, who before this inft:tution feized any that came in their way. At each poitfation, according to lrocopins, 10 herfes and as many pottilimens were kept, and the ufual rase of their travel!ing was from five to cight fations a-day.

It is to be obferved, however, that all thefe eftablith ments of polts in ancient times were formed as inuch, if not more, for travclling fations, than for the mero.

## POS

Poar. conveyance of letters and difpatches. This latter ob. mafter's offiee is therefore exprefsly prohioited. King ject, it is true, was thereby fecured; but the epiftoliry correfpondence of antiquity was probably at no time fo extenfive as to require or maintain polt-offices on the footing of modern poifts, for the mere conveyance of letters. It is in later times only when the extenfion of commerce and diffulion of literature gave oceafiom to frequent communication, that thefe eftablifhments are to be looked for.

The carlief inftitution of pofs that occurs in modern bifory is abont the year 807 by the emperor Cbarls\%e tgne; who, having reduced under his dominion Italy, Germany, and a part of Spain, eftablifhed three public polts at the public expence, to carry on the communiration with thefe three provinces. The inflitution of polis, however, like many other inflitutions of that emperor, dropped at his death, and for a confiderable time afterwards no traces of any fuch effablifhment are to be found. We cannot indeed difoover them with certainty fonser than 1.464 , when that reflefs and fufpicions wince Louis XI. eftablithed poits in France, that he might be the fooner advertifed of all that pafied in his own or the neighbourng ling dorns. He employed in this fiervice 230 couriers, who delivered the letters at the different itations, and in the various towns through which they paffed in their courfe. Succeeding mo1:archs created at different times certain offices for the exprels purpole of fuperintending the polls; but the Frequent clanges to which thefe offices were expofed, prevented for a long time the eftablifhment of any re©fular filtem of potts in that kingdom; infomuch that in 1619 the author of the life of the duke d'Epernon fiays the pachet or letter-office was not yet fet up in France. Former eftabliflunents, it is probable, were iulely for the ufe of the court, not for the general good of the nation. From Frauce, the inftitution gradually pread through feveral other parts of Europe. In Germany, Lewis Hornig afures us they were firt introduced by Count Taxis, who ictled them at his own expence; in acknowledgrent for which the Emperor Matthas in 16.6 gave as at fief the office of pofmafter to him and his defcendants.
-In England, the eftablilhment of pofts in frome form or other appears as early as the reign of Edward III. but the notices concerning them are fo, vague, that no account can be given of them. In the reign of Edliand VI. however, fome fipecies of pofts mult hive been fet up, as an act of puliment palled in 1549 , fixing the rate of polthorfes at one periny per mile: The pofthorfes here referred to were, it is probable, chiefly for travelling, and the catriage of letters or packets only an occationalfervice. In i581, we find in Cambderi's Aurals mention made of a chief pofmafter for Engl.md being appointed.-How this office was manared, does not clearly appear; the limited fate of the correfpondence of the country, probably rendered it of trifing confequence. King James I. originally erected a poll-ofice, under the controul of one Ma hath de Queler or de l'Equefter, for the convevance of letters to and ircon inceign parts; whielz office was alterwards claimed liy 1 arid Stanhope ; but was confirmed and consiuned to Whitam Frizel and Tho. Witherings, by king Charles I. ii 1632 . Previous to this time, it would appear that wiwate perfons were in ufe to convey letters to and frota forcion patis; all fuch interference with the por-

Charles, in 1635, erefted a letter office for England and Scotland, under the direction of the above Themas Witherings. The rates of poltage then eftablifhed were, two-pence for every fingle letter for a diftance under 80 miles; four-pence from 80 to 140 miles; fix. pence above 140 miles. The allowance to the poftmatters on the road for horles employed in thefe pofs was fixed at two-pence halfpemny per mile for every fingle horfe. All private inland polts were difcharged at this time; and in 1637 all private foreign pols were in like manner prohibited. The polls thus citablifhed, however, extended cnly to a few of the priacipal roads; and the tinses of tranfmilien were not in every cafe fo certain as they ought to nave been.

Witherings was fuperleded for abufes in the execution of his offces in $10 \neq 0$, and they ware fequeftrated into the Latuds of Philip Burlanachy, to be exercifed under the care and overtight of the king's principal fecretary of itate. On the breaking out of the civil war, great confutions and interruptions were neceffarily occafioned in the conduct of the letter-olfice: but it was about that time that the outhe of the prefent more exiended and regular plan feems to have been conceived by Mr E.dmond Prideaux, who was afterwards ap. pointed atturney-general to the cormmonvealth. He was chairman of a committec in $\mathbf{1 6 ! 2}$ for confidering the rate of portage to be fet upon inland letters; and fume time after was appointed pollmalter by an ordinance of both houfes of parliament; in the cxecution of which offize he firft eftabliflied a cocelly conveyance of letters into all parts of the nation. In 1653 , this revenue was farmed for L. ro,coo for England, Scotland, and Ireland; and aiter the charge of maintaining poftmafters, to the amount of L. $70<0$ pcr annum, was faved to the public. Prideanx's emoluments being confiderable, the common council of London endeatvoured to ereat another poff-office in oppofition to his; but they were checked by a refolution of the houfe of commons declaing that the office of poltmatler is, and ought to be, in the fole power and difpolal of the parliament. This office was farmed by one Maubey in 1554. In 1656 a new and regular general polt-office was erefted by the :uthority of the proted re and his parliament, upon nearly the fame model that has been ever fince adopted, with the folluwing rates of poftage: For 80 miles diftance, a fingle letter two pence; for a greater difance, not out of England, three-pence; to Scotland, four pence. By an att of parliament paffed foon after the reftoration in 1600 , the regulations fetled in 16.56 were re-eflablilhed, and a general pof-office fimiliar to the former, but with fome improvernents, was erected. In 1663 the revenue of the poll-office was found to produce L. 21,500 annually. In 1635 it was made over to the king as a brancli of his private income, and was then ellimated at $1.65,000$ per annum. The year after the revolution the amount of the pofl-nfice revenue was $\mathrm{L}, 90,50 \mathrm{f}: 10: 6$. At the union the produce of the Englith pot-office was itated to be L. 101,101 . In 17 tr the former eflablifhments of teparate polt-offices for Lngland and Scotland were aboHithed; and by the ftat. 9 Anne, e. 10 . one general portofice, and one follmatter-gener.ll, were eltablithed for the whole unitad kingdom; and this poftmatter was emlowered to erect chiof letter-olfices at Edinhurgh, at

Dia'lin',

Dabin at Nezu Jork, and other proper places in America and the Weft Indies. The tates of poftage were alfo increafed at this time as follows.-In England, for all diftinces under 80 miles 3 d ; ; above 80 miles 4 d. From London to Edinburgh 6 d . In Sontiand, under 50 miles 2 d .; from 50 to 80 miles 3 d .; above 80 miles 4 d . In lreland, under 40 miles 2 d .; above 40 miles \&d.-By the abnve ast all perfons, except there employed by the poftmalter, were flicily prohibited front conveying letters. 'Wlat year the grofs amount of the poft-office was L 111,561 175 s 10d. The nett anount, on a medium, of the three preceding years, was, in the printed report of the commiffioners, fir the equivalent flated to be for Fingland, $L$. 62,000 , and for Sicotland L. 2000. In 1754 the grofs revenue of the poof-office for Great Britain amounted to $\mathrm{L} .210,66_{3}$, in 1764 to L. 281,535 , and in 1774 to L. $345, \mathrm{j}^{21}$. -The privilege of franking letters hid been enjoyed by members of parliament from the firft erection of the poll-office; the original defign of this exemption was, that they might correfpond freely with their confituents, on the bufinefs of the nation. By degrees the privilege came to be flamefully abufed, and was carried fo far, that it was not uncommon for the fer vants of menbers of parliament to procure a number of franks for the purpotic of felling them; an abnfe which was eafily pracifed, as nothing more was required for a letter's pafling free than the fubfription of a nember on the cover. To reftrain thefe fruads, it was enaeted, in 1754 , that no letter fhould pafs free unlefs the whole direation was of the member's writing, and his fubfoription annexed. Even this was found too great a latitude; and by a new regulation in 178 , no letter was permitted to go free unlefs the date was marked on the cover in the member's own hand-writing, and the letter put into the poftoffice the fame day. That year the rates of poftage were raifed in the following proportions: an addition of Id. for a fingle flage; id. fromi London to Edinburgh; 1 d . for any diftance under, and 2 d . for any diftance above, 150 miles. An addition to the revenue of L. 120,000 was eflimated to arife from thefe regulations and additional rates. In all the fatements of duties upon poftage of letters given in this account, the rates meniuned are thofe upon fingle letters, double letters pay double, treble letters treble, an ounce weight quadruple poltage; all above are charged by the weight in the rame proportion.
A bnut the year $1_{7} 8_{4}$, a great improvement was made in the mode of conveying the mails, upon a plan firft ruggefted in 1782 by Mr John Palmer. Diligences and itage coaches, he cblerved, were eftablifhed to every town of unte in the kingdom; and he propefed that goicenment, inftead of fending the mails in the cld mode, by a boy on horleback, thould contrast with the mafters of thefe diligences to carry the mail, along with a guard thr its protestion. This plan, he fhowed, could not lail to enfure much more expeditions conveyance, the tate of travelling in diligences being far quicker than the rate of the polt ; and it was eafy to carry it into execution with little additional expence, as the coach usners would have a firong inducement to contract at a cheap rate for corveying the mail, on account of the additi nal recommendation to paffengers thair carriages would ther by acquire in point of fecurity, regularity, and difnacch.

Yos. XY.

Thu' govemment leartily approved of this fhan, and the publec at large were fatisfied of its urilisy; yet, hite all new felhemes, however beneficia', it mat with aftorg eppofition: it was reprciented by a number of the oldert and allelt officers in the poft-oflice, nut on! y as impraceticable, but dangerous to commerce and the revenie. Notwihhanding of this orpofition, lowever, it was at lift cflablified, and gradually extended to many diferent parts of the kirgdom ; atd, unon a lair compatifon, it appeared that the revenue was improved, ardite e plan itfelf excented for L. 20,000 per ammun lefo than the fum nirft cltimated by Mr Palmer.

The prefont cftublifment of the gencrai pof office for Grear Britain, confitts of two poftmaters-general, a fecretary, furveyor, comptrolier-general, and upwards of 150 afiftants and cletks for the head lctier (flice in London; the number of deputy poftmafters ard ohher officers through the kingdons is very eonfiderdble, but not ealy to afcertain with accuracy, as it mult frequent. Iy vary with the changes made in the cftablithment of coun'ry pofs. The total expence of this branch of the revenue in 1788 was L. $149: 029,17 \mathrm{s}$.2 d , the grufs produce may now be reckoned at L. 6,0,000.

The firlt accounts we have of the eflablifliment of a pot-office in sco:land reach no farther back than $163 \%$, when Charles I. erested one both for Scctland and England. The pof to Scotland by that apprintment was to run night and day, to go from London to Edinburgh and to return in fix days, taking with it all letters intended for any polt-town in or rear the road; the rate of poftage from London to Edinburgh was 8 d . for a fingle letter. The expedition with whith the poft went from London to Edisburgh at this time, is indeed furprifing, confidering the nature of the roads; perhaps, however, though the king made the regulatic: that it thould go and return in lix days, the journes was not always performed in the fpecified time. During the government of Cromwell, the public poft comveyed letters to Scotland as well as England; the poitage from London to Scotland was only 4 d . After the Reftoration, when the poft-office was ereted for Encुland, mention is made in the aft of parliament of the conveyance of letters to Scotland; and the poftare t.. Berwick is fixed at 3 d. For fome time after, however, we find no eftablifhment by act of pariidment of an internal pof in Scotland. In 1662, a polt bettreen Ireland and Scotland was firth eftablithed ; and the privy council gave Rnbert Main, who was then pofmattergeneral for Scotland, an allowance of L aco Steling to build a packet-boat for conveying the mail between Portpatrick and Donaghade: the poftare to Ireand was 6 d . In 1669 , a poit was eftablithed to go betweea Edinburgh and Aberdeen twice a-week, and betreen Edinburgh and Invernefs once d-weet: :he rate of pollage was fived, for 40 S-ots miles 2 d . and for cyery 20 miles farther an additional penny. Thefe appear $t$ have been the on!y pulitic poffs in Scotiand at that tme: but as they could not fufice for thic enirefpont. ence of the country, there nuit lave been more, either under the direstion of the polma?er, or in th: hands of private perions; probably there might he rt both kinds. In 1690 , an act for the fecurity of the: common pof was palled, fulbesting robier; of the mail to capital punifament. It was not till 1605 that the eftablinment of the poft ofice in Scrian!! rec.ival the

3 II
fanatia

## POS [ 426 ] POS

fanstion of parliament: polls were then appointed for all parts of Scotland; the rates of poftage were fixed, for any place within 50 miles of Edinburgh 2 d . between 50 and 100 miles 3 d . all places above 100 miles 4 d . By the fame act, a weekly packet to Ireland was eftablifted, and L. 60 Sterling annually allowed for that fervice. Though pofts were eftablifhed in confequence of this act, yet fuch was their mode of travelling, that they hardly deferved the name. Thus, for inftance, the perfon who fet out to carry the mail from Edinburgh to Aberdeen, in plate of fopping at the firf intermediate 解e from Edinburgh, and delivering over the mail to another, to be carried forward, went on with it himfelf the whole journey, relting two nights by the way, firftat Dundee, and nest at Montrofe.

In this manner the mail was conveyed thrice a.week from Edinburgh to Aberdeen; but between moft parts of Scotland the poit went only twice, and between fome only once a-week. The poft-boy generally travelied on foot. Horfes were but little ufed in the fervice of the poit-office.

At the Union, the Scots pof -office was farmed for L. 1194: in 1710, the nett amount for Scotland was reckoned to be L. 2000. The epithlary correfpondence of Scotland muft have been fmall indeed, when even the rates of potage then eftablifhed proved fo very unproductive. This may perhaps, however, be in part accounted for, by conjecturing, that as private pofts had probably prevailed pretty much before 1695 , it was long before thefe were entirely fuppreffed, the people ftill adhering to their old conveyances, and difficulties occurring in flrictly enforcing the lav; the amount of the poit-office revenue, therefore, at the twn periods rbovementioned probably exhibits a view of only a part of the correfponderce of Scotland.

In 1731, it has been already mentioned, one general poil-office was eltablithed for the whole mited kingdom; but the poftmafter-general was authorifed to erect at Edinburgh a chief letter office for Scotland.This was accordingly done, and a poftmafter-general for North Britain, with other neceflary officers, appointed. All the deputy potmafters in Scotland are under his immediate direction, but he himifelf is under the controul of the poftmafer-general for Great Britain. From this head letter office pofis were eftablithed to the different parts of Scotlind.

For many years the pof-bows generally travelled on foct, or if on torfeback, without a change of horfes. It wass reot till about 1750 that the mail began to be conveyed from ftage toftage by different poft-boys and freft borfes to the principal places in Scotland, and by font runners to the reft. The communication between Lond n and Edinburgh was at firt but thrice a-week, and to flow, that the mail from London to Edinburgh was upon thic road 85 hours, and from Edinburgh to London 131 hours. In 1757, upon a reprefentation from the woyal borongks, regnlations were fallen upon, by which the time was fhortened to 82 hours in the one cafe, and 85 in the other. Dy the extenfion of Mr Padmer's plan to Scotland, the time has been ftill farther flim tened to abont 60 hours in each cafe.

The eft.blithment of the Scots poft-office, which has been gradually enlarged as the fate of the country requised, coinfifts at prefent of a pofmafter-general, feexetary, folicitor, and accountant, with a number of
other clerks and affitants for the head office at Edinburgh ; under its management are about 180 deputypoftmafters for the different pof-towns through Scot. land.

The nett produce of the pof-office for Scotland in ${ }^{1} 733$ was L. 5399 , in $1754 \mathrm{L.8927}$, in $1757 \mathrm{L.10,623}$. in 1760 L. $1 \mathrm{r}, 942$, in $1776 \mathrm{~L} \mathrm{3:,103}$.In 1788 tho grofs produce was L. 55,836 , the expence L. 22,636 , 13 s. 6 d .: in 1793 the grofs amount was about L.64,000, the nett produce about L. 40,0 oco.

Ponny-Post, a polt eftablifhed for the benefit of London and other parts adjacent, whereby any letter or parcel under 16 ounces weight, or L.io value, is fpee. dily and fafely conveyed to and from all places within the bills of mortality, or within 10 miles of the city. It is managed byparticular officers, and receiving houfes are eftablithed in moft of the principal ftreets, for the more convenient tranfmiltion of the letters. Some other large towns have inflituted fimilar eftablifiments.

A bont 20 years ago a penny-poft was fet up in Edin. burgh by an individual, unconnected with the general poft-office. It met with but indifferent encouragement for fome years, doubts being entertained as to its punctuality in delivering the letters; by degrees, however, it feemed to be advancing in eflimation, and was more frequently employed. About a year ago, the general poft-office, in virtue of the act of parliament prohibiting the conveyance of letters by any but thofe employed under the poftmafter-general, took the pennypoit entirely into its own hands; and at prefent letters are tranfmitted from the general poit-office to the diffe. rent quarters of Edinburgh and the fuburbs, three or four times a-day.

Post, a particular mode of travelling. A perfon is faid to travel pof, in contradiftingtion to common journey travelling, when, in place of going on during his whole journey in the fame vehicle, and with the dame horfes, he Itops at different ftages, to provide frelk horfes or carriages for the lake of greater convenience and expedition. As he thus ufes the fame mode of travelling that is empluyed for the common poit, he is faid to travcl poft, or in poft, i.e. in the manner of a poit.

In tracing the origin of pofts, it has been already remarked, that the more ancient eflablifuments of this kind were fully as much fur travelling fations as the conveyance of letters. The relays of hories provided at thefe public ftations for the meffencrers of the prince, were occafionally, by fpecial licence, allowed to be u ed by other travellers who had fufficient intereft at court. Frequent demands of this nature woull fuggelt the expedient of baving in readiwefs fipplies of freth horfes ur carriages over and above what the public fervice required, to be hired out to ather travellers on payment of an adequate price. We find, therefore, that in furmer times the pollmafters alone were in ufe to let out horfes for tiding poit, the rates of which were fixed in 1548 by a Atatute of Edward V1. at one penny per mile. In what fituation the flate of the kingdom was with regard to travelling polt for more than a century after thas period, we cannot now centainly difcover; but in the faltute re-eltablilhing the poll-office in 1660 , it is enacted, that none but the poftmafter, his deputies, or altigns, thall furnilh pof herfes for travellers; with a provifo. however, that if he has them not ready in half an hour
after being demanded, the traveller thall be at liberty to provide himfelf elfewhere.

The fame prohibition is contained in the act enablifhing the Scots poft-office in 1695 , as well as in the fubfiquent act of Queen Anne, ereating the genersl office fur the unted kingdom. It is doubiful, however, whe ther it ever was itrictly evforced. By an explanatory, act of 26 Geo . II. the prohibition is confined to poft borfes only, and every perfon declared to be at liberty to furnilh carringes of every kind for riding polt. 'This regulation has, in fact, du ne away the prohibition, as hardly any perton now thinks of travelling poft except in a carriage.

The rate fixed by the ad 1695 , in Scotland, for a horle riding polt, wis three-pence per Scotch mile. Dy the at 9 Anne, c. 10 . three-pence a-mile without, and four-pence a-mile with, a guide, was the fum fixed for each horfe riding polt. The increafe of commerce, and nec:fity fir a lpeedy communication between different parts of the kingdom, have brought the mode of travelling poft io much into ufe, that upon every great road in the kingdom polt-chailes are now in readinefs at proper dittamces; and the convenience of polling is enjoyed in Britain to a degree far fuperior to what is to be met with in any othel country whatever.
loulting at latt appeared to the legiflature a proper object of taxation. In 1779 the firft act was palfed, impoling duties on bortes hired either by themfelves or to run in carriages travelling polt : the duties were, one penny per mile con each horfe if hired by the mile or lage, and one thilling per day if hised by the day. Every perfon letting out fuch loorfes was alfo obliged to take out a licence at five fhillings per annum. Thele duties were next year repealed, and new duties impo. fed, of one penny per mile on each horfe hired by the mile or ftage, and 15. 6d. on each if hired by the day. A number of additional regulations were at the fame time enacted for fecuring thefe duties. An addition of one hallfpenny per mile, or three pence for day, for each horfe riding poll, was impofed in 1785 , by Stat. 25 Geo. IlI. c. 5 r . The duty is fecured, by obliging every letter of horfes to deliver to the perfon hiring them a ticket, exprefling the number of horfes hired, and either the diftance in miles to be travelled, or that the horfes are hired by the day, as the cafe happens to be. 'lhefe tickets mult be delivered to the bar-keeper at the firf turnpike through which the traveller paffes; and the turnpike-keeper gives, if demanded, what is termed an exchange ticket, to be produced at the next turnpike. The famp-office iflues to the perfon licenfed to let poft horfes iuch a number of thefe tickets as is required, and thefe mun be regularly accounted for by the perfon to whom they are iffued. As an effectual check upon his account, the turnpike-keeper is obliged to return back to the famp-office all the tickets be takes up from travellers. Evalions are by thefe means rendered difficult to be practifed without running a great rifk of detection. In 1787 , fur the more effectualiy levging the polt-horfe duties, a law was palfed, suthorifing the commifioners of the ftamp-office to let them to farm by public auction, for a fum not lefs than the produce in the year ending ift Augult 1786.

In the advertifement publifhed by the commiflioners in confequence of this law, previous to the receiving propofals for farming them, the total amount of the
duty for Great Britain is fated to have licen at the periss abose referred to, L. 119,873 . The fum for which that duty was farmed in 1794 amounted in all to I. 140,030, of which the ditriet of North Britain was L. 6000 .

Soon after the tax was impofed, entfiderab?e dificulties were railed about the meaning of the term $p, f_{-}$ ing, and what mode o! jonrneying thould fubjea travellers to duty. 'The old law, Stat. 9 Anuz, c. 10. Cxzplained pofting to be "travelling feverdl tajes, and changing horfes;" but the aets impofing the pofting duties exprefsly declare, that "every loorfe hised by the mile or Itage fhall be deemed to be liined to trivel polt, although the perion hining the fame doth not ${ }^{\text {gon }}$ feveral Atages upon a polt road, or change horfes;" and that "every horfe hired for a day or lefs period of time, is chargeable with the duty of three halfpence per mile, if the diftance be then afcertained; and if the diftance be not then afcertained, with 15 . 6d. each horfe." Horfes hired for any lefs time than two days are by thete acts to be deemed to be hired for a day. An attion was brought in 1788 , in the court of exchequer at Edinburgh, to determine whether feveral difputed cafes fell under the meaning of the act, and were liable to duty; when the following decifions were given:
saddle-horfes both hired and paid by the mile, and faddle horfes hired originally for an excurfion, but afterwards paid by the mile, were found liable to duty according to the number of miles paid for; carriagehorfes, where the carriage is hired and paid for only at the ufual rate of outgoing carriages, and no more, whether the perfon hiring it does or does not return in it, were found liable to duty only for the number of miles out; but if the carriage be hired and paid for, or actually paid for though not originally hired, at the ufual rate of carriages employed both to carry out and bring back the farne comprany, the duty was found to be exigible according to the number of miles both out and home taken th. gether. Hackney coaches in Edinburgh, hired and paid for lefs than two mi'es, were found liable to duty for one mile.

No duty was found to be exigible on faddle-horfe hired for a mere excurfion, and paid for accordingly. where the diftance neither is nor car be afcertained, on hackney-coaches employed in the ftreets for lefs than a mile, or for an excurfion or round of vifits merely ; and on horfes or carriages hired for a journey of three days or more, and paid for accordingly, or paid for at the rate of three days, though the journey fhould actually be performed in two full travelling days. The general rule of thefe decifions was, that in every cafe, except unafcertainable diftance, or journeys exceeding two days, the mode of travelling fell under the legal dcfini. tion of poling. The only point that may feem doub:ful in the judgments here ftated, is that where the duty is found chargeable by the number of miles both going and returning. Yet as the law exprefsly declares, that horfes hired by the mile or ftage are to be deemed $p \rho /$. ing, and as the number of miles for which they are hired can only be afcertained by the number paid for, it is clear, that where an addition to the outgoing charge is made on account of bringing back the perfon hiring the carriage, the carriage in that cafe is aftually hired and paid for according to the number of miles both out and home, and the duty mult fall to be rated accord-

## 1OS

Fofericr ingly. The dontiful peints being now fettied by the above deciliens, the mode of levying the Juty in Scctland has been recoulated acree.ibly to themeror fince the mater was thas determines!.

PUSTERIOR, a cim of relation, imply ng finerling ion hand, cr that conics after, another. In whichenfe it is 1.fed in oprefition to prior and ancorior.

The back and hijis are the poferior parts of man. A-i.atle has given pricr and pofterior analytics. A date is polterine to another, when it is later or fiefher.

I'OSTERN, in fortification, a fmall ga'e, ufually made in the angle of the flank of a baftion, or in that of the custain, or near the orilon, defcending into the ditch; wherrby the garsifn can march in and out, unperceived by the cnemy, either to relieve the works, or to make private fillies, ite.
The word is alfo ufed in the general for any private or back-dror.

POSTHUMOUS a child born after the death of his father, or tiken out of the body of a deat mother; from whence it is frequently applied to the works of an author not rublifhed till after his deceafe.

POSTIL, a rame anciently given to a note in the margin of the Bible, and afterwards to one in any other book polterior to the text.

POST'ING, among mercbants, the putting an account forward from orie hook to another, particularly fre $m$ the journal or wafe-book to the ledger. See Post and Buok-Keeping.

POSTLIMINIUM, among the Romans, the return of one who had gone to fojourn elf where, or had been ban thed, or taken by an cnemy, to his own country or it.ite.
POSTPONING, putting any thing after or behind another with regard to timie.

POSTSCRIPT, an article added to a letter or memoir, containing fomething leant or recollected after the piece was written:
POSTULATE, in mathematics, \&c. is defcribed to be fuch an eafy and felf-evident finppofition, as needs no explication or illultration to render it intelligible; as that a right line may be drawn trom one point to anwher.

POSTURE, in painting and fenlpture, the fitnation of a figure with regatd to the eye, and of the fereral principal members thereof wilh regard to one another, whereby its action is expreffed. A confiderable part of the art of a painter confifts in adjufting the polturcs, in giving the molf agrecable ones to his figures, in accommodating them to the charaters of the refpedtive figures, and the part each has in the action, and in conduating and in purfuing them throughcut.
Poflurcs are either natural or artificial.
Notural poflures are fuch as nature feems to have had a view to in the mechanifm of the body, or rather fuch as the ordinary actions and oncafions of life lead us to exhibit while young, and while the joints, mufcles, ligamunts, \&c. are flexib'e.

- Arificial poftures, are thofe which fome extrandinary vicws or tludies occafion us to learn; as thofe of dancing, fencing, \&c. Such alfo are thofe of our balance, and gollure mathers.

A painter would be frangely puzzled with the figure
of Clark (a late Eamous follure-mater in London) in $P$ a hitory-piece. This man, we are told in the Phil. Tranf. had fuch an abfolute command of his nofiles, \&c. that he could disjoint almon his whole bedy; fis that lie impofed on the great furgeon Mullens, who looked upon him as in fuch a miferatle condition, ha would not undertake his cure. Though a well mad: man, he would appear with all the deformities imaginabie; hunch-backed, pot-bellied, tharp-breatted, \&e. He disjointed his arms, thoulders, legs, and thighs; and rendered himfelf fuch an object of pity, that he has frequently extorted money, in quality of a cripple, from th: fane company in which he had the minute before been in quality of a comrade. He vould make his hips fland a confiuerable way out from lis loins, and fo high as to invade the plice of his back. Yet his lice was the molt changeable part about him, and thowed more poltures than all the relt.

FOTAMOGETON, POND-WEED: A genus of the tetragynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 15 th order, Inumdate. There is no calyx; but four petals; no ftyle, and four feeds. There are 12 fpecies, all of them floating vegetables on the furfaces of ftagnant waters, affording an agreeable fhade to firh, and rood to cattle.

POTAMON or Potamo, was a philofopher of Alexandria. Hc kept a middle courfe between the fcepticifn of the Pyrronians and the prefumption of the dogmatifts; but attached himfelt to none of the fchools of philofophy of his time. He was the firlt projector of the Eclectic feet ; for though that mode of philofophifing had been pretty common before, he was the fif that attempted to inftitute a new feet on this principle. "Dingenes Laertius relates, that not long before he wrote his Lives of the Philofophers, an Eclec. 1 tic feet, ixater $i$ кй tis aspesie, had been introdured by Po. tamo of Alexandria, who felceted tenets from cvery! former fect. He then proceeds to quote a few particu. lars of his fyftem from his Eclectic inftitutes, refpecting the principles of reafoning, and certain general topics of philofoplical inquiry; from which nothing further can be learned, than that Potamo endeavoured to reconcile the precepts of Plato with thofe of other mafters. As nothing remains concerning this philofopher befides the brief account juit referred to in Laetios, an obicure palfige in Suidas, and another ftill more obfcure in Porphyry ; it is probable that his attempt to inflitute a fchool upon the Eeclectic plan proved unfuccersful. The time when Potamo fourilhed is uncertain. Suidas places him under Anguftus; but it is more probable, from the account of Latertins, that he began his undertaking abont the clofe of the fecond century."

POTASH, the lixivious alhes of certain vegetables, ufed in making of gla's, foap, \&ce. See Glass, Soap, \&ire

The method of making potath is directed by Dr Shaw as follows. Burn a quantity of billet-wand to 1 grey alhes; and taking feveral prounds of thefe athes, boil them in water, fo as to make a very flrong lixivium, of or ley. Let this ley be ftrained through a coarfe linen ! cloth, to keep out any black parts of the half bunt wood that might happen to remain in the afhes ; then evaporate this framed lye in an iron-pan over a quick firc almoft to dryrels: then taking out the matter remaining

## POT

maining at the bottom, and parting it in:o an iron cruciblc, fet it in a Rrong fire till the mator is melted, and then imm:diatcly pour it out upous an irch plate, where it foon conls, and appears in the form of a folid lump of potath *. Much after this mamer is pot-anh made in the larye way of hufine's, fur the fervice of the foap-boiler, ghais-maker, fuller, Se. Lut according to the dififrence of the wo d, or combultible matter cm ployed, with the manner of curning it, and ennducting the procets, different kinds of potath are prepared. There are certain fatine plants that yield this potall to grea: advantage, as patuicularly the plant kali; there are others that afford it in lefs plenty, and of an inferior quallity, as bean-falks, \&cc. but in general, all vegetable fubjects afford it of one kind or other, and may muft of them be made to yield it tolerably perlect alter the manner of the process already laid down, even the loppings, roots, and refufe paits of ordinary trees, vine clippings, \&o. The fixce lalts of all vergetables excepting the kalli and marine plants, when reduced to abfolute purity, or entirely feparated from the other prin. ci, le,, appear to be one and the fame thing: whence it flould feem, fays Dr Shaw, that by a fuitable management, gnod faleable potaflı might be made in all places where vegetable matters abound. For if by examining Rulfis (a) potafh, fir example, we find that its fupetior exiellence depends upor its being clear cf earth, or upon its containing a large proportion of vil, or refined tah, thefe advantages may, by properly regulating the operation, be given to Englifh potafhes, fo as perhaps to render the latter as good as the former: but where the potath of any remarkable fatine vegetable is to be imitated, that of the kali, for example, the Docon recomiands a prudent frrinkling of the fubject with falt, or fea-water, in the burning; and by thefe wayc, properly diverfified, any principle that is naturally wanting might be artificially introduced fo as to perfect the art of potalh.

About 40 years añ, or upwards, Mr Stephens, encouraged by the Scciety of Arts, \&c. and by a parliamentary grant of 3000 1. eftablifhed a manufacture of potalh in North Americs, which produced fuch as was to perfectly good as to anfiver in bleaching and other ufes the purpofes of pearl-afh; and which at the fame time afforded a very large produce. But the very great beat which his procefs required, occafioned the deftruction of a very extenfive apparatus; and other circumfances concurred to difappoint the hopes and clieck the fpirit of the proprietors. The manufacture was, however, afterwards undertaken and profecuted by others. Mr Stephens's apparatus was as follows : Fig. 1. A is the bed of the kiln, which fies off about four feet by
two fiom the grate, nate or lefs acconding to the ine ;
 fents quadrangular hats of iron, with their r.ppofite of hisapangles placed upwards and downwards, not above an pratu*. inch afunder. Fig. 3. A, B, and C, are three Iteepers five feet deep, and of any wid h from four to cight fect quare, of the bin white pine or cyprus plank, with quare joints and frong oak framer, placed each over at receiver, with a cock to let off the lye, and a vent ju.t bencath the furface of the giating. E repreicuts three receivers, flanding each under, and projecting out, from its flecper. They munt be made of the beff fuff, carefully put together, and laid in tough rlay well rammed within the ground, their tops being level with the furface: they need nct be folarge as the Reepers by lix, eight, or twelve inches. Fig. 4. E repretints a falle bnitom or lattice of boards, eight in lies deep and five fquare, wi.h a hole in the under edge (f every partition for the lye to pafs into the fteeper. Fig. 5. A is the veffiel over the furnace in which the lye and afhes are mixed; $B$ is a ho!e or funnel a few inches from the back of the furnace, with an iron fecket to let the pipe through the hinder part of the arch, to reach down within two inches of the flone of the furnace. C is a caft iron cauldron for boiling the lye to drynefs when pearl-afh is made. D is a veifel whence the liquor is let into the cauldron as it evapolates. The mortar for building the furnace fhould be made of loam; the anch fhould be 18 inches thick, and the floor fhould be haid with tiles on a layer, of fand an inch thich, with neat joints.

Mr Stephers's procefs, both with and with=ut the Procecis kiln, was as follows. Cut timber, feled at any fealon, into w thout leng ths of about eight feet ; lay from three to ten of them wing a lerggthwife in a heap upon dy $y$ ground, and fill the vacan. bult. cies between with fmaller wood: the fooner it is burnt after fe!ling, the better. Set fire to it by laying embers on the bottom logs at each end ; and for burning the brufh and lappings, wilh other finaller wonds, lay them lengthwife on the ground, top to top, lapping over a litthe, with the butt ends outwards, and as clofe as a faggot ; laying the large woods on tnp till the heap is fuil four feet light, the length of the hruh fet againgleach other making che breadth of the heap. As to the choice of the timber, chl hollow trees, if not dead, are belt : pine, cyprus, and cedar, are to be totally reiected.

As foon as the pile is burnt down, rake fuch a ahes as lie round the outhide a little in towards the middle; add no frefh fuel, nor throw on any brands. Let the athes lie without firring till you can jult bear your hand in them; then carry them to a houfe, or under a thed, on a plank floor raifed a little from the earch and well
jointed;
(1) According to Sir Peter Warren, the beft woods for making Ruffia potafin are, nak, afh, poplar, hiccory, elm, hazle, and becch. They mult be cut in November, December, J.muary, and February, fplit and facked to dry. After 12 momhs in warm open weather, it muf be burmt on a brick hearth by a flow fire in a kiln, or clofe place; the afhes muft be fifted through two fieves, one finer than the other, and then put up in brick troughs or wooden backs, covered with rain or river water, and muft remain, well marthed and inonrporated five months. Brick furnaces thaped like bakers ovens muft be heated with a frong fire of oak or ath, burning night and day; the prepared athes munt be gradually thrown on the fire, when they will run into metal like lead: the fire mult not go out till the furnace is nigh filled with potathes. The athes mull then be broken to be taken out, but the larger the pieces the better; they roult be preferved from the air in t:ght cafore, the large pieces by themfelves, and the duat by iffelf.

## Р О T $\quad\left[\begin{array}{cc}430\end{array}\right] \quad$ POT

jninted; there wet them till brought nearly to the confiltence of mortar in the firt mixture of lime and fand, and ram them in a heap, in which they mult lie full 20 days, or fome months if you pleafe; obferving to be more fparing of water in winter, and ramming them clofer, and fometimes wetting the top that it may never grow quite dry.
Wood may alfo be burnt in a kiln, as fig. 1 and 2 ; and then it mult be cut into fuch lengths as may be molt convenient for carriage, and beft fuit the fize of the kiln. The mouth of the afh-hole mult be clofe ttopped by daubing the joints of the lid with loam, or throwing a bank of fand or earth againt it : keep the bed of the kiln filled with wood up to the furface, but not above it, and let it buin inceflantly till the afhes rife within fix or eight inches of the grate. Draw them out whild red-hot, and in that flate fyrinkle them with lye, from four to fix carads weight; weigh a fmall vial which holds about four ounces very exactly ; then fill it with water and weigh that alfo: divide the weight of water into equal parts till you come to $\frac{1}{8} \frac{1}{8}$ of the whole, which is called a caraft, $\frac{\text { 万ै }}{6}$ two caratts, \&c. until you have a weight equal to $\frac{1}{5}$ of the whole watcr, which is called 32 caracts: all which fma!l weights, together with one equal to the phial filled with water, are to he kept for weighing the lye in the faid phial till they are made damp; then ram them as before in a heap, but feparate from the afthes made as above. N. B. By kihnbarning a ftronger lye may be more certainly procured than by the other way, where rain may clance to fall on the allies before they can be removed.

The athes thus prepared are to be put in vats or fteepers fig. 3 , with a falfe latticed bottom as fig. 4; firlt putting coarfe wheat or rye fraw about a foot thick on the lattice or grating; on which put afhes to within four or five inches of the top, ramming them all the way tip, efpecially at the fides, with a fmall light rammer, as tight as you can, without burlling the vat. Form on the top of the fteeper a hollow bafon in the athes four or five inches deep, leaving the athes four or five inches thick on the fides, by railing a fmall bank sound the fides, fo that the liquor may not overflow the ediges of the athes at top: keep this bafon conftantly filled wih foft water in the feeper A, until the athes will imbibe no more, which will be in 24 hours or more, according as it is rammed; ther turn the cock, and let off what thall be foaked through into the receiver or lower cliamber of the feeper, and no more; for if the feveral runnings are not kept feparat:, the lye will not be bronght to its due Rrength. Follow that fteeper with frefn water on the fame afles for feveral other runnings, which will each come off in a few daye, till the liquor has neither fmell nor talte; then heave out the alhes, and charge the Aceper afrelh.

Upon drawirg off the firt rumning from the feep. cr A, fig. 3. fill the fleeper B with alhes as before, and put into its hollow at the top the lye io firt run off, and the finaller or half lyes alfo, till fill, and draw off as directed for the feeper A: if this weighs 18 caracts or more, pump it into the cytern $F$ as fit for ufe; if it be fhort of that, pars it off as half lye to the flecper C, and through frefl afhes till ftrong enough. Wich kilualhes only, from water palling through the firlt Aceper, it will be frong enough for the ciftern, if the afhes are well piedred. If your water be hard, let it Rand two
or three days expofed to the air and fun in a flallow back, and it will be foft. When you ufe kiln-afhes with others, lay them at bottom.

The lye muft be conveyed from the ciftern $F$, as it is wanted to the veffel A fig. 5 ; where with every galIn of proof lye mix three ounces of fine, light, wood athes; and to the lye that is over-proof put lix ources of afles; and if $\frac{2}{5}$ over-proof 12 ounces, increafing or leffening according to the ftrength of the lye.

For evaporating the lye and melting the falt, heat a furnace till you bring it very near a white heat, of which the fide-doors being redhot is a mark. This will take 48 hours or more, if the funace be quite cold; when thoroughly hot, a little fuel keeps it io. Then, through the cock of the vefiel $A$, pafs the mixture by the funnel D into the furnace, not fo as to reach much beyond the middle of the floor, before it changes from dark to bright red, letting the heat prevail towards front or back as you fee neceffary. When the mafs begins to gather about the flues or in heaps, run in no more till the furnace in cleared by driving the fire backward. You mult have two funne!s, one foon choaking: in an hour or lefs will iffue out a red hot fream of melted falt, which is potath, to be broken to pieces as foon as cold, and packed in tight clofe cafk; being in no relpect interior to the belt foreign ath whatever.

The beft potafh is made from barilla, and comes from spauth Spain. The plants from which it is procured are found in gre it plenty about Carthagen:, where they are indigenous, and may be collected in a fwamp called Almojar eaft of that place; the Sayones barilla is the beft. They are found, befides all along that coalt, on the borders of the Mediterranean for 60 leagues in length and 8 in breadth. About 150,000 quintals of it are annually exported from Spain. It produces a revenue of 25,5001 . a year; each quintal paying a duty of 17 reals: yet Don Bernardo de Ulloa, A. D. 1740 , fays it was farmed at L. 1822, 4 s. 3 d. M. Macdonnell has brought the manufacture of potath to its prefent perfegion in Spain; but its exportation is materially injured hy the heavy tax on it. See Townthend's Travels, vol. iii. p. 131. See alfo Barilla, Kelp, and Fucus.

In the 70 th volume of the Philofophical Tranfactions we have an account of a method of procuring this falt from the putrid water which runs from dunghills. The procefs is very eafy, confifting only in fimple evaporation of the fluid, and calcining the impure falt till moft of the foulnefs is burnt out. From 24 wine-pipes full of this muck-vater were obtained 9 cwt . 1 q .12 lb . of faleable potalh, valued at 42 s . per cwt; the expence of manufacturing thens being only valued at 41.9 s .

The potath thus made is of a greyifh white alpearance; deliquefces a little in moift air ; but if kept in a dry room, near the firc, acquires a powdery furface. It is hard and of a fpongy texture when broken, with many fmall crytals in its fubftance. The colour of its internal parts is dulky and variegated. To the talle it is acrid, faline, and fulphureous. It emits no fmell of volatile alkali, either in a folid form, diffolved, or when added to lime-water; neither does it communicate the fappiire-colour to a folution of blue vitriol. Silver is quickly tinged black by it ; a proof that it contains much phlogitton. Ten grains of this potafh required II drops of the weal fpirit of vitriol to feparate it.

The like quatity of falt of tartar required $2+$ drops: a Atrong effervefecnce occurred in both mixtures; and a fulphureous vapour cxhaled from the former. A tea proonful of the lyrup of viclets diluted with an ounce of water was clanged into a bright green colour by five grains of the falt of tartar; but ten grains of this potalh were neceflary to produce the fame hue in a timilar mixture. Half an ounce of the falt diffolved entirely in ha'f a pint of hot water ; but when the liquor was cold, a large purple fediment fubfided to the bottom; and it was found that this fediment amounted to about two-thirds of the whole quantity of athes ufed.

Dr l'ercival, the author of this paper, concludes with olferving, that this potafh is a true fixed vegetable al. kali, produced by putrefaction; that the quantity of alkali contained in it may be entimated at one-third of its weight, whereas the white Mufcovy athes are faid to yield orly one-eighth part; that no quicklime appears to be contained in this potafh, for a folution of it ponred from its fediment remained clear though long expofed to the air: that it would be worth trying, whether the large purple fediment, which fubfides when this potalh is lixiviated, might not be applied to the manulacture of Pruffian blue, or ufed in. the manner recommended by Macquer for dyeing wool and filks; and that this manufacture will furnith the farmer for top-dreffing for his garden and land, of great fertilizing powcrs. See Phil. Tranf. Vol. LXX. p. 345 .

Thefe are the procelles molt ellentially different from cne another which have appeared concerning the manufdeture of this ufeful falt. Some indeed hąve attempted to compofe it on the fappofition that alkali confinted of an earth combined in a pcculiar manner with a certain acid. But the little fuccefs of all thefe attempts Show that they have been built on a falfe principle. The only method of producing alkaline falts origina'ly is from the athes of vegetables; and the vegetable fubfances which yield the largelt quantity of them are tar. tar and marine plants. From the former the pureft and ftrongelt vegetable alkali is obtained, and from the latter the mineral alkali. From other vegetables, as fern, broom, bean-ftaks, \&c. an alkaline falt is produced, but fo impure, and in fuch fmall quantity, that no manufacture of it can be eftablifhed with any reafonable expecta. tions of profit.

Dr Wation (the prefent bilhop of Landaff) fuggelts, that the inveltigation of a method of extrasting its aikaline patt from rock-falt would be a molt ferviceable difonvery. We have inexhauftible mines of rock falt in this country, which (he obferves) the froprietors can afford at ten fhillings a ton. A ton of rock falt contains about half a ton of mineral alkali, which is for molt purpoles far preferable to potath. To thofe who have leiliure to attempt fuch a difcovery be gives the following hint: whether the alkaline part of reck-fiait may not be obtained by calcining it in conjanction with charcoal in open fires? His reafon for this conje? is fonnded upon the following experiment: upon burning fea-wreck to a black coal and forping the procels at that point, he has obtained great plenty of common falt, but no mincral alkali fron the black athes: though we are certain, that when the black afhes are thorcue h. ly calcined, or reduced to white athes, mineral alkali may be obtained from them. This makes it prolable, that the common falt contained in the black afhes of
fea-wreck is decompofed, and changed into a mineral] alkali, during the burning of the black aftes. There are reafons to fupprefe, that the cinder of pit-coal would antwer the purpofe better than charcoal. Chem. Eif. vol. i. p. 136, \&c.

The potathes of different countries vary much in Dr 10 quality: and the experiments of Dr Home, in his trea- experitife on Bleaching, feem to fet forth their different pro-merts on perties in the cleatelt point of view. The different the potkinds tried by him were,

Bíue pearl-afles. Thefe appear to be a pure al- different kaline falt, mixed with a fmall quantity of vilriolated tartar and earth. Half a pound of thic, fileered and evaporated, yielded $5_{\frac{1}{2}}^{5}$ ounces of puse falt.-Herc, however, we mult obferve, that thongh the quantity was fo far diminifhed by this cperation, yet we are not to imagine that the whole of this diminutioa was owing to impuritics; for all faits are deftroyed in fome meature by folution in water and exficcation.
2. White pearl-aßles are nearly of the fame quality with the former; half a pound of them giving five ounces and feven drams of pure falt, with fome vitriolated tartar and earth.
3. Rufia or Mufcory a/hes have very much the appearance of flacked lime, and are, like it, friable betwixt the fingers. They adhere to the congue ; and their alkaline tafte foon goes away, leaving in the mouth a ftrong talte of lime. Some fmall bits of charcoal are obfervable in their compofition, and they never turn moif in the air. Hilf a pound of the filt lisiviated with water and evaporated, gave only te drams 15 grains of very cauftic falt. Thete conifit therefore of a mall quantity of alkalinc falt united with a large quantity of lime.
4. Ca/bub-a/bes are of the colour of iron fone, and extremely hard, with many flining particles of charcoal. in them. They have a faline talte, with a confiderable degree of pungency; feel gristy in the mouth when broke in pieces by the teeth; and will diffolve in water. Toextract the pure falt, half a pound of the alles were boiled in a pint of water; then that wa:cr poured nff, and haif a pint put on the athes again; and fo on, till the afhes tatied no more falt. This boiling took 24 hours, and the laft water that came off had a flrong tafle of fulphur, and was blackith. A piece of filver put in the decoction was in a few minutes turned almoft biack; but though the decoction was evaporated confiderably, it did not turn filver black more fipeedily than before. The whole, when totally evaporated, yielded only 10 drams of a brown falt having a ftong caultic alkaline tafte. Some Cafhul-ahkes powdered, and often wathed in water fo that the falts were all carried off, were infuled in water. After fanding fome time, there was a weak lime-water, with fomething of a faline tafte, but no pellicle. Some of this refituum was put into a reverberatory furnace for two hours; after which it afforded good lime-water. Callub-afhes then appear to contain an earth half vitriticd, fome lime, alkaline falts, and a quantity of fulphur.

5 Marcoft-afies, are of a paler colour than the former, with iom=imall pieces of charcoal in their compofition. They have a frong faline taite; and fo great pungency, that they cannot be heid long in the month. Halt a pound diffolied in water, filtered and evaporated, yielded is drams one ferupie and two grains of al-

## POT [432] [OT

I'utach.
kaline refiduum. The decoaion blackened filver, but not fo letongly as the former; and by evaporation it quickly lol that quality.

Our author next proceeds to confider the probability of manufacturing thefe ahles in Britain. On which fubjea he has the following obfervations."The blue and white pearl athes we have difcovered to be pure alkaline falts, withont any confiderable mixture of heterogeneous bodies. Their purity fhows the lixive to have been frained through fome clofe fubflance, fuch as linen or flannel. The blue afhes fhow by their colour that they have fuftained the moft fire. But both of them are fo much alike, that the one may be futfituted for the other; and therefore we flall confider them in one view.
"Every one knows that alkaline falts, fuch as thefe, are got from all plants except the alkalefcent, and from all trees except the molt relinous, which afford thern in very fmall quantity. Thefe plants or trees, when found, are pulled or felled in the fpring, dried, and burnt to afhes. By the affufion of warm water the Gelts are diffolved, and, by ftraining, feparated from the earth along with the water. This faline liquor, which is called a lixize, is evaporated over a fire; and what remains is an alkaline falt of the fame kind with the pearl-alles.
"I was informed by a fkilful bleacher in Ireland, that he pracifed a more expeditious way of extracting the falts. He bought the athes of different vegetables from the commonalty for 9 s. a bufhel. From thefe a very flrong lye was made, into which dry flraw was dipped until it fucked up all the lye. This fraw was afterwards dried and burnt, and gave him falts which he thowed me, almoft as good and pure as the pearlathes. This method I have feveral times tried; but could never burn the ftraw to white athes, the falts diminithong the inflammability of the fraw. It is a very expeditious method if it can be prastifed. But I can fee no occalion for bringing the lye into a folid form, as the falts mult again be diflolved in water befnre they can be ufed. The ftrength of the lye can eafily be determined by the hydroftatical balance.
"Though I make no queftion, that the quantity of falt, in phints of the fame fpecies, will vary in different foils and climates; yet it would be of advantage to lave the proportion afcertained in general. Some tria!s of this kind I have made.
"Two pounds of fern which had been pulled An. gult 16. were dried, and burnt to white afhes. There weighed 7 dr . and tafted very falt. When lixiviated, firained, and evaporated, they gave me 49 gr . of fath, about the eighth part of the athes. If the fern had heen pulled in A pril, it would have afforded more falt. Why then hould we not preprefalts from this vegetable? 'There is more of it growing on our hills than wwild ferve all our bleachfields. The Lrith make great we of $i$.
"From in oz. of tohacco-athes I had a oz, of falt. Two ounces of peat-afhes afforded half a drachm of
falt. Nettles, I am informed, afford meech falt. Furz and broom, natives of this country, are very fit for this purpofe.
"But the kelp, as it grows in fuch plenty along our fhore, and contains more falt than any other vegetable I know, would be the moll proper, were it not for a mixture of fome fubfance that 1 enders it unfit for bleaching, at leat of fine cloths, after they have obtained a tolerable degree of whitenefs. It is obferved by bleachers, that, in thefe citcumllances, it leaves a great yellownefs in the linen. As thefe athes are much ufed in Ireland, and as it is not uncommon to bleach cnarfe cloths with them in Scotland, a difquifition into their nature, and fome attempts to purify them, may not be improper. There are no aftes fold fo cheap as thefe; for the bell gives but 21 . the 2000 weight ( B ). They may, therefore, allow of more labour to be ex. pended on them, and come cheaper at long-run han the foreign falts.
"I dried fome fea-ware, and burnt it, though I found that laft operation very difficult. When I had kept it fured in the fire for two hours, it weighed $3 \frac{1}{\frac{1}{2}}$ 07. I poured on the afhes an Englifh pint and a half of cold water, that I might have as little of the fulphur as pofible. This lye, after it had Rood for fome hours, was poured off clear, and had but a nlight tendercy to a green colour. I made a fecond infulion with milk-warm water, and poured it off from the rediment. This had a darker colour than the former; was kept feparated from it, and evaporated by itfelf. There was a third infufion made; but having no file tate, it was thrown away. The fecond infufion feemed to contain more fulphur than the firft; and a piece of white Jinen kept in it half an hour, while it was boiling, was tinged yellow, and could not be wathed white again. The earthy part remaining, weighed, when well dried, 107.2 dr . The faline decoction evaporated by degrees, and fet at different times in a cellar to cryftallize, afforded me $5 \mathrm{dr} .4^{6} \mathrm{gr}$. Thee liquor, when entirely evaporated, left $4 \frac{1}{2}$ dr. of a yellow falt, which ap. peared to be a ftrong alkaline. Tle falts which cryfallized feemed to be moftly fea-falt, with a confider. able quantity of fulphur, and fome alkaline falt. There appeared no figns of the birtern in thefe falts, as their folution did not tutn turbid with the sil of tartar. Nor is any of the bittern to be expected in kelp ahhes, although it probably is to be found in the recent vegctable; becanfe the alkaline falts formed by the fire mult have changed it into a neutral. The lye made warm with water, being evaporated, left 4 dr . of a black bitter filt, which, from its quantity of fulphur, appenred unfit for bleaching. There athes, then, feem to be a compofition of fomewhat lefs than the fouth of fulphur, the fame quantity of fea falt, about a fouth of alkaline falt, and fomewhat more than a fouth of earth. The alkaline falt contained in kelp-athes amounts to one penny a pound. This cheapne's makes it worth our pains to beftow fome labour on them.
"If the bad cffeets in bleaching with kelp-athes arife from
( E ) "Since this treat fe was writien, however, the price of kelp las been advanced to 7 l . or upwards the acoo weight; for that thofe who would now attempt any thing of this kind, mult alfo manafacture the kelp t'cmiclves."

Sh. from tie fea. fult, as fome of the moit knowing, bleach-
ers think, they can be freed from it in an caly manner. ers think, they can be freed from it in an enty manner.
Let a lixive of kelp-aflies be made with cold water, for that does not extrat fo much of the fulphur ; it mult Itand bat for a thort time, for thefe falts diflolve cafily ; decant it, and evaporate the lye. As the boiling continues, the fea falt will crytallize. When that is all feparated, the remaining lye will contain alkaline falt with fome fulphur. This operation every mafter of a bleachfield may learn and overfee, without taking up much of his time. A fimilar procefs is carried on by common fervants in the alum-works who have by practice learned it from others.
"I had fome hopes that the fulphur might be carsied of by long roafting, fuch as theie falts undergo before they are fured in order to be turned into glafs; becaufe I had obferved, that the longer time they were kept in the fre, the freer were they from this fulphureous part.
"I ordered a quantity of kelp afhes to be kept in the furnace of a glashoufe, where the heat was juf below the vitrifying point, for 24 hours. During this time they had loft alnoolt four-fifths of their wcight. They were now much freer from their fulphur, and were of a light colour; but much of the alkaline falt had been driven off with the oils. - If a lye is much imFregnated with this fulphureous matter, it appears to be carried off in a great meafure by long boiling.
"We come now to explain the method of maunfacturing the white Mufcovy athes. We have Chown, by undoubted experiments, that the greateft part of thefe athes conlits of lime; and yet we have feveral acts of parliament which forbid the ufe of that material under feverc penalties. The parliament were in the right to dicharge its ufe, upon the difadvantageons reports which were made to them. We thall immediately fee how dangerous a material it is when ured improperly, or without the mixture of alkaline falts, which render it fafe, and more foluble in water. But I will venture to fay, that experiment will not fupport the prejudice enterrained with regard to it, if carried any further.
"Since bleaching, then, cannot be carried on without it (for thofe athes which contain it are quite neceffary in that operation), and fince we import them from foreign countries, let thefe prejudices againit it ceafe, and let us only confider how we may render our own lime as fafe as the foreign. If we can do that, the wifdom of the legiflature will be as ready to abrogate thefe acts as they were to make them.
"Bymy cxperiments on the white Mufcovy ahes, I got ibout the eighth part of alkaline falts from them. This niade me expect, that, by mixing in the fame proprtion quicklime and alkaline falts, I fhould be able to produce Muffovy afhes.
"To an onnce of quicklime and a drachm of white pearl athes, I added about a gill of water, and boiled them together till the water was all evaporated. The tatte of this fubtlance was little different from lime. To recover the falts again from the lime, I diffolved it in water Atrained off the liquor, and evaporated it. Infead of the drachm of falts, I had but 2 gr . of a fubftance which was more earthy than faline.
"To 3 dr. of quicklime and as much potafhes, $I$ added a pint of water, and kept it boiling for two Vol, XV.
hours till it was evaporated. I diffllyed it again in water, which being filtered and evaporated, gave me $1 ;$ dro of a caulic fall, that liquefied in the air whe: it had heen but four minutes from the fire. It appears, then, that the allaline falts are deftroyed by lime, and that a great part of them can never be again recovered. From the remaining lime, after the falts were exiratted, 1 got flrong lime-water, but without a pellicle. This Mows, that a quantity of alkaline falts, equal to the lime, boiled with it for two hours, are not able to fix all the foluble part of the lime.
"From thefe experiments we may draw fome corollaries with regard to the prefent fulject. $1 / f$, That evaporating the water from the lime and falts by boiling, is a molt unfrugal way of preparing thefe white afhes. $2 d l y$, That thefe afhes ought to be kept clofe flut up in cafks; for if expofed to the open air, though in a room, the alternate moifture and drought mult fix their moft ufeful parts. This I lave found to be fact : for the falts that I made became lefs pungent by keeping ; and I have obferved, that the furface of the Murcovy athes loft all pungency by being expofed to the air, while their internal parts fill retained it. 3 dly, That all boiling is prejudicial to thefe Mufoovy alhes, as it fixes, and that quickly, their moft fubtile and probabiy their moft ferviceable parts.
"Let us now proceed to another method of making thefe white afhes. I imagined, that if the falts were diffolved in water, and the quicklime flacked with that, the mafs would foon dry without the afliftance of fire. In this way I added equal parts of both; but the com. pofition was follrong, that it bliftered my tongue if it but touched it. When the fourth part was alkaline falt, it bliftered my tongue when kept to it a few feconds. I could tafte the filts plainly in the compofition, when they mude but the thirty-fecond part of the whole.
" I thought, when compofed with the eighteenth? part of falt, it had, when frefh made, juft the tafte and look of the Mufcovy afhes; nor could any perfon have ditinguifhed them. This I once imagined was the proportion; but when I found that the faline pungency foon turned weaker by keeping, and that this compofition would not afford the fame quantity of falcs that the Mufenvy afhes did, I faw that a much greater quan. tity of falts was neceffary. The proportion appears to be one of falt to four of lime, prepared in this laft way. Three drachms of afhes prepared in this way, and kept for a fortnight, gave me but 15 grains of falt; which is but the half of what the Mulcovy would have afforded. I find, if the quicklime is firlt quenched, it does not fix the filts fo much; and therefore is better and cheaper. One drachm of potalhés dillolved in a little water, and added to 3 drachms of quenched lime, gave me 44 grains of a very caultic falt. I prefer this methat as the belt.
"The manufacturers of this falt probably pour the lixive upon the lime, as they can know by its fpecific gravity what quanticy of falts is in the water, and fo fave themfelves the expence of procuring the falts in a dry form.
"The manufacture of the Marcoft and Caflub aflies remains yet to be explained. We have diffovered that both of them contain fulphur, earth alkaline falts, and
3 lime ;

## PO 1

Potafin. $\underbrace{2}$
lime; and differ in nothing but in the Cahub's having more fulphur than the Marcoft afhes. We thall therefore confider them together.

Whether thefe two fpecies of athes are of any ufe in bleaching, may be, and has already been, difputed. I find they contain no other principles, the fulphureous part excepted, then the former afhes combined together. Why then fhould we expect any other effects from the fume ingredients in the Marcoft and Caflub afhes, than what we have from either of the pearl and Mufcovy afhes mixed together? The fulphureous principle in the former muft have very bad effects; as I find by experiment, that it leaves a yellownefs on cloth that is very hard to be wathed out. It is owing to this fulphurenus principle that linen, after it has been waflied with foap, and is pretty well advanced in whiteners, is apt to be difcoloured by lye which is brought to boil : ter, by boiling, the fulphureous part is extracted from thefe afthes, and the lye becomes of a deep brown colour. 1)aily practice, then, hows the difadvantage of this fulphureous principle. Befides, as fulphur unites itfelf quickly and firmly with alkaline falts, it muft weaken or altogether deftroy a great quantity of thefe in the Marcoft and Cafhub afhes, and fo render them of no effect in bleaching. Thefe two reafons feem to me fufficient to exclude them from the bleachfield; efpecially as, by increafing the other materials, we can attain perhaps more fpeedily the fame end.
"However, as cuftom has introduced them into general practice, we thall confider how they are to be manufictured. Dr Mitchel, has, in a very ingenious and ufeful paper, containe 1 in the Philofophical Tranfactions for the year 1748, delivered an account tranfmitted to him by Dr Linnæus of the method of making rotafhes in Sweden. This account was contained in an academical diflertation of one Lundmark upon this fubject at Aboe in Sweden. The fubitance of this account is, ' That birch or alder is burnt by a flow fire to athes, and made into a pate with water. This patte is plaftered over a row of green pine or fir logs. Above that is laid tranfverfely ancther row of the fame; and that likewife is plaftered over. In this way they continue byilding and plaftering till the pile be of a confiderble lheight. This pile is fet on fire; and whenever the alhes begin to run, it is overturned, and the melted afnes ate beat with flexible Aticks, fo that the athes incrult the logs of wood, and become as hard as ftone.' This, in the Doctor's opinion, is the method of making the potafhes that come from Sweden, Ruffia, and Dantzic : and that there is no other difference betwixt the afhes made in thode different countries, but that the Ruffan, containing more falt, mult be made into a palte with a frong lye.
"There would appear, by my experiments, a greater difference than this betwist the Swedifh ames, if that is the true procef, and thofe I have examined. I had dfocvered the greatelf part of the Mufcovy ahhes to be lime. I fuppected it might enter into the compofition of the Mincrift and Cafhub : and have accordingly difcovered it therc. Without the fame grounde, none would ever have fearched for it. Whence then comes this lime? It muft either enter into its compofition, or arie fiom the matcinds managed according as the proectis diveds.
" I have tried the birch afhes made into palte with water. I have tried common charcoal made into a pafte with a third part of potathes, and kept them in a ftrong reverberatory heat for fome hours, and yet no fuch canflic fubitance appeared. I have kept earth and falts of kelp-athes fufed together for 24 hours in the furnace of a glafshoufe, where the heat was juft below the degree of vitrification; and yet no remarkable cauflicity appeared afterwards in the concreted mafs. But fuppoling that there did, will ever this account for the gencration of lime? Thefe chemifts do not affert that it is a calcareous caufticity. The earth of vegetables kept in fufion with their falts, is fo far from turning into a quicklime, that the mafs takes the oppofite courfe, and becomes glafs. Bodies that, by the laws of nature, are vitrefcible, can never, fo far as we know, become calcareous. In one or other of thefe two fubtances all bodies terminate that are changeable by fire ; and vegetables are of the former kind. Here it may be akent, Why then, fince they endure fuch a fire, are they not vitrified? the objection would be juf, did they contain nothing elfe but what was found in vegetables. But if we once allow that lime is one of the materials, the difficulty is eafily folved: for lime, we know, in proportion as it is mixed, hinders the vitrification of all bodies. In effect, the earthy part in thefe afhes is al: molt vitrified: and I think that I have carried the vitrification yet farther in that part; but I never was able, with the utmof heat of a reverberatory furnace, continued for fix hours, to produce any thing like a thorough vitrification in thefe afhes. The heat of the fire ufed in the procefs would feem to be very great; and mult, if it were not very difficult, reduce them to glafs. The invitrefcible nature of thefe falts, fo far from being an objection, becomes a ftrong proof of my opinion.
"Thefe falts have a remarkable pungency. This we have already feen is the natural effect of quicklime on falts.
"Thefe falts are found to be the fittef for making foap, and to incorporate fooneft and beft with oils. Salts, we know, of themelves do not readily unite with oil; but when once mixed with quicklime, they have a 'greater tendency to union.
"Again, I find that thefe afhes are more eafily flux. ed than charcoal made into a palte with the third part falt ; which is much more than the alhes contain. Now, it is obferved that quicklime increafes the fluxing power of alkaline falts; for the common canftic made of quicklime and alkaline falts is fooner fufed than the latter alone.
"From thefe reafons, and the experiments that difcover lime in thefe afhes, I am led to think, that it is not generated by the procefs, but mixed with the afhes when they are made into a pafte. The following experiment is a convincing proof of what I have been endeavouring to make out.
"I boiled fome peafe-ftraw in a frong lye of pearlathes burnt into a black coal, and made it into a patte with water. Another quantity of fraw was boiled in a. lye made of one part of quicklime and fur pars of pearl falts, the lye bcing foured off turbid from the lime. This ftraw was likewife burnt when dry, and made into a palte. Thefe two fubftances were put ins-

## FOT

to reparate crucibles, and fluxed in a reverberatory furand Callub allies more than the former, which leemed to want their pungency."

Though the only method of preparing the alkaline - falt originally is by the combullion of vegetables, yet there are tome nentral falts from which if it were poffible to expel the acid, we fhould have it in our power to procure the tineft pearl-alhes in w.it quantity. Thefe are vitriolated tartar, nitre, but efpecially fea-falt, on account of the inexhauftible quantities of it to be met with in the waters of the ocean. Unhappily, however, there are fome objeations to every one of thofe. The vitriolated tartar, or any other falt in which the vitriolic acid enters, cannot be decompofed without converting the acid into fulphur by charcoal-duft ; in which cafe it is as difficult to get free of the fulphur as of the acid; and if we attempt it by frequent folutions in water, we deftroy the phlogiton of the fulphur, and have only vitriolated tartar again inftead of alkali.

Sec Chemistry, $\mathrm{n}^{\circ} 716$, \&ec.
With relpect to nitre, though its acid may be ex. pelled by tire, yet it is too high-priced, and too much ufed in other manufactures, to be thought of for this purpofe. A potafh manufacture from fea-filt has in. deed been lately erected in England. The principle on which this was eltabliihed is, that the acid of fea-falt may be extracted by means of lime; and accordingly we find that the faline efflorefcence, which frequently appears on walls, conlifts chiefly of the marine al. kali deptived of its acid. But this, though delivered on the credit of a very eminent chemift, we can alfirm from our own obfervation to be a miftakc. Of the many cafes in which we have examined this effloref cence only one was found to be alkaline; the others uniformly appeared to be true Glanber's falt compofed of the vitriolic acid and fofill alkali. Neither did this appear to be formed by any decompofition of falt originally in the plafter, but to be a real generation of both acid and alkali where none of them exited before. See Efflorescence.
potato, in botany. See Solanum.
Potatoes, it is generally thought, came originally from North America, where they were not reckoned good for food. They were firlt (we are told) introduced into Ireland in the year 156 , and from thence into England by a veffel wrecked on the weftern coaft, called North MIeols, in Lancaihire, a place and foil even now famous for producing this vegetable in great perfection. It was 40 years after their introdnetion, however, before they were much cultivated about London; and then they were conlidered as rarities, without any con. ception of the utility that might arife from bringing them into common ufe. At this time they were dittinguilhed from the Spanifh by the name of Virginia potatoes, or buttatas, which is the Indianname of the Spanilh * fort. At a meeting of the Royal Society, March $18 \mathrm{~h}, 1662.3$, a letter was read from Mr Buckland, a Somerfet genticman, recommending the planting of po tatoes in all parts of the kingdom to prevent tamine. L'his was referred to a committee; and, in confequence of their report, Mr Buckland bad the thanks of the fociety, fuch members as had lands were intreated to plant them, and Mr Evelyn was defired to mention the propofals at the clofe of his Sylva.

In Sweden, notwithfanding the indefatigable indur. try of Linnaus, the culture of potatoes vias only introduced in $17 \sigma_{4}$, when a royal edict was publifled to
potis. encourace their geral culter Their late there, however, at an earlier period; for in the MEmpirs intriducof the Royal Academy of Sciences in Szue.len, 1747, M. Swedra. Charles Skyte propofed to difil brandy from them, in order to dave corn, which in that country is very dear. He found by experience, that an acre of $12 n d$ fet with potatoes will yield a much greater quantity of beand y than when fown with barley.

The utility of potatoes to the common people is well Theirgreat known, and this utility has brought them into general utility. ufe, and has extended them over every part of this country. To promote this utility, and to make thicir cuitivation more eafy, a variety of experiments and inquiries have been made. Some of thefe we thall now lay before our readers, without repeating, however, what has been faid on the fame fubject in the article AgriculTURE, no 158-167. By many people the Irifh purple Remarks potato is thought to be the fweeteft and beft; and of and experitheie the bright and middle-fized are directed to be fet thents on whole, in February, March, and April, in a fine deep theire. tilth, in any foil. During the froft, the firt fetting thould be covered with litter or fern. They thould be tct fix inches deep, and a yard diftant from each other every way, in a kind of hillocks like a mole-caft; and they mult be moulded every month or fortnight, as high as pofifile. By July or Auguit, under each billock there will be nearly a bufhel of potatocs. The white kidney potato runs all into ftringy roots in leofe ground, while the pink-coloured will do extremely well in the way we have now directed; and the fmalleft of them, though often given to hogs, unle's they be otherwife improper or unhealthy, will be very good reed.

The following experiments concerning the cuiture of pntatoes are related in the Georgical Ellays.
"By all the experiments that have been made, the of the Howard or large Bedfordhire potato is found to pro. Howard duce the largett crop. On that account they are potato. chiefly ufed in feeding of cattle. In two beds, €nur feet wide, and 200 feet long, I planted in a common field a fufficient number of fets of this kind of potato. and managed them by a horie-hoe. The produces was 64 buikels, each bufhel up-heaped, weighing about 70 lb . My cattle eat them boiled with as much eagernefs as the beit forts, and came on as well with them. I have built a boiling-houfe, sic. on Mr Young's plan, and during this whole winter have boiled potatues for my cattle. For the fattening ones, I mix ground oats with them; and for the milk-cows, ma'tdult; and dare venture to affirm, that they are much more profitable than either turnips or calbbages. Once, when my potatoes grew low. I detifted giving them to the milking-cows. Immediately, though fed with the beft hay, they fell of amaziagly in their milk. Itherefore began again; and in a week's time they gave better than one-third more butter. I own this accidental difovery save me much fatisfaction, as it conhirme. I my opinion, that potatoes briled are an excellent winter foond for cattle. Their culture is not fo difficule, at leaft not fo precarious, as either turnips or cahbages. Their value is fuperior, and there is sio rik of their giving a difugrceable talte either to butcer or
milk.

Sotato.

Of the increafe of potatues.
milk. Add to this the valt increafe of the Howard po-
tato, and its equality with the beft forts when ufed for cattle.
"My gardner cut a large potato into nine pieces, which be planted with dung, in a drill, in the garden. By earthing up and laying the fhoots, he produced 575 (A) fizeable potatoes, which weighed eight Rone eight pound. Another of my fervants produced, in the field, feven flone of good potatoes from the fame number of fets. Though this experiment cannot always be executed in its full force in an extenfive feale, it ought, notwithtanding, to be imitated as nearly as circumflances will allow. It fhows, in the moft dittinguilhing manner, the ufe of clean and careful hufbandry.
"On the 14th of April, I cut a large white potato into 17 fets, which were planted in as many hillocks, at the diftance of four feet. In the courfe of growing, the plants were earthed up, and on the 14 th of OEtober the crop was taken up: The produce, 10 pecks of fizeable potatoes. At the time that this experiment was made, 1 had feveral hillocks, in which I put three and four fets of the fame kind of potato. But, upon the moft careful examination, I could not obferve that thefe hillocks produced a greater crop than the others planted with a fingle fet. Hence it is obvious, that the potato freads its root moft kindly when leaft crowded."

While fpeaking of the increafe of potatoes, we can. not help taking notice of a memoir by John Howard, Efq; of Cardington, in Bedfordfhire, on a new kind of potato remarkable for its prolificacy. "In the year ${ }_{17} 65$ (fays he) being at Clifton, ncar Briftol, I was intormed a perfon had brought from America a new fort of putato, and with fome trouble I procured half a do. zen roots of it, as the greateft part of thofe brought over were already planted. That autumn I planted three of them, and in the following fyring the other theee, in my garden at Cardington in Bedfordfhire; feting them in hillocks about fix feet afunder. The ftrength of the ftems, and largenefs of the bloffom and apples, gave the pleafing profpect of great increafe: and accordingly, when I took them up in the autuma $17^{66}$, I'found they had increafed far heyond any of the common fort, which for fome years I had encouraged our cottagers to cultivate. The produce from each cutting was in weight from 26 to 27 pounds and a laalf. I fent for two of the Bedford gardeners, who ferve the mat ket, to fee them taken up, and they were furprifed at the great increafe. I gave fome of them to thefe gardeners, and others to almoft all our own cottagers. The increale continucd to appear the fame in the lucceeding year, viz. 1767 , as in the laft : only, as many of the fingle potatoes had been then found to weigh four or five pounds each, I had now planted moft of them in drills three feet afunder, in order to procure a greater number, and a lefs fize. Their produce was now from 22 to 30 pounds from each cutting; and the potatoes were more
fueable for common ufe. The vegetation was not fo luxuriant as in thofe I before planted in hillocks; but the increafe of thefe was, allowing the cuttings to weigh one ounce, full 400 -fold. Having laft year upwards of a waggon-load of thefe potatoes, I with pleafure ordered it to be made publicly known, that every perfon who chofe to cultivate them were welcome to have a quantity for planting. In confequence of this, numbers applied in our own and the adjacent counties. In my plantations, as well as thofe of other perfons, the in. creafe has been fill greater this year: for the feafon ha. ving proved very favourable, I have had from fome hillocks 41 pounds and a half, allowing for dirt."

We now continue our extracts from the Georgical Effays.
"Take a bunch of the apples of any fort of potato. of rai ? Hang it up in a warm room during the winter, and in fedilir February feparate the feeds from the pulp, by wafhing potato the apples in water, and preffing them with the fingers. Then dry the feeds upon paper. In the month of A pril, fow thefe feeds, in drills, in a bed of carth well dug, and manured with rotten dugg. When the plants are about an inch high, draw a little earth up to them with a hoe, in order to lengthen their main roots. When they are about three inches high, dig them up with a fpade, and feparate them carefully from each other, in order for planting out in the following manwer. Prepare a piece of frefh ground by trenching it well. Dig up the feedling plants as before directed; and plant them out in the ground, thus prepared, in fuch a manner that there fhall be 16 inches between each plant. As they advance in growth, let them receive one or two earthings up, in order to lengthen the main roet, and encourage the fhoots under ground. By this management, the potatoes will, in the courfe of one feafon, arrive at the fize of hen's eggs, and the haulm will be as vigorous as if fets had been planted. But what proves the luxuriancy in the moft convincing manner, is, that flowers and apples are produced.
" In Lancafhire, where the gardeners raife potatocs from feed, they are always two, and fometimes three, years in bringing them to full fize. By the above method of tranfplanting, with wide diftances, many of the potatoes nearly attain their full fize in one feafon. It is obfervable, that thefe feedlings produce potatocs of all the different kinds; and fometimes new forts are procured. We do not find any difference whether the apple comes from one kind or another. It is not fo whien we ufe the fet, which invariably produces the fame kind. Potatocs, when propagated from fets, after a number of years, are found to decreafe in bearing; for which reafon they fhould be brought back every 14. years to their original. From a want of attention to this circumftance, I have known potatoes for run out, that they hardly returned treble feed. The farmer complains that his land is tired of them; but the true caufe
(A) Intances of the amazing increafe of potatecs are very numerons, and are almof every year detailed in the public papers. In the Gentleman's Magazine for 1757, p. 480 , we are told, that from one flice of a potain, fet in the fipring of the fame year by Mr Simon M‘Hoy, a farmer at Park near Tuam in Ireland, there protesded vo lefs than 84 falks, which produced 265 potatoes.

## POT

 raifed from feed is altonifling. They continue in vigour for about 14 jears; after which the produce gradually declines."As the culture of potatoes, and particularly of the early forts for the table, has of late become an object of very general attention, I hope the following account of a new method of obtaining thefe (withont the help of loot-beds) will be acceptable to the public.
"On the 2 d of January 1772 , I made a hot-bed for the forward fort of potatees, and on the 7 th put in the fets, placing. a glafs and frame over them, and taking every precaution to defend them from the frots. Of thefe fmall potatoes, or fets, there remained about 40 in a balket, which was accidentally lung up in a warm kitchen, and there remained unnoticed till about the 25 th of April. I then accidentally obferved the balket, and perceiving fomething green on the edge of it, took it down, and, to my great furprife, found that the putatoes had fprouted half a yard in length, and that there were a great number of very fmall potatoes forned on the filurous roots which had grown out. I took them into my garden, and planted them in a rich fandy foil, without any manure. The roots I put into the ground three inches deep, and laid down the fems that had fprouted, horizontally, and covered them with two inches of foil, but left the tops uncovered. Wihout further attention they greiw furprifingly.
"On the 26th of May, I took up the roots planted in the hot-bed on the 7 th of January. They by no means anfivered my expectations, or paid for the trouble of their culture: but, at the fame time, I was afonifhed to find the others, which were put into the ground fo late, to have produced larger potatroes than the roots in the hot bed. I took up all the roots, and picked of the large potatoes from them, which amounted to fronn 4 to 12 on each root, and then fet the roots again in the fame ground. This, indeed, I have fucceffffully pratitied for many years, fometimes even twice, and have had a third good crop at Miclaalmas. When this meethod is tried, the 10ois mult be watered on the evenings of hot days.
"In January 1773, in order to make a fecond trial of this experiment with a large quantity, I placed a great many potatoes of the early forts on a thick layer of gravelly foil, clofe to each otlier, over an oven, flated over, but open to the fouth-weft, and covered them two inches deep with the fame earth. At the end of April I took them up, and found the flems about a foot long or more. For fear of injuring the fine and delicate fibres of the roots, I took great eare in taking them ug, and planting them in the foil. This I now manured, but in all other refpeits treated theni in the manner above defribed, many of the fibrous roots lhaving then poratooes formed upon then nearly as large as walluts. For a weck, the plants came on furpriingly, when, hy one fharp nighl's's uncommon froft, they were nearly dcAtroyed. IIowever, notwithlanding this, frefh flems grev up in a few dilys, and I actually gathered from theni, on the 3 d of June following, finer potatoes than were fold at that time, at Mancliefler, from 1 s . to is. 6 d. per pound, being the produce of hot-beds. After taking off the layger potatees, I again plantcd
the roots for a fccond crop, and in September ob. tained a very large produce. I weighed the increafe of many feparate roots, which amounted from four pound eight ounces to 14 pound 12 ounces, the putitocs being the largef of the forward kinds 1 ever faw.
"Make a compon of earth, fand, and coal-anles. With On raifing this mixture fill a tub about 16 inches deep. Plant them in this artificial foil with fome feis of the early round potato, and place the tub in a fable oppolite to a window, taking care to water the carth now and then. In all fealons the fets will fprout, and give a tolerable increafe of potatoes. Laft November 1 planted fome fets in the above manner; and in February following I took up a confiderable number of young potatoos, clean fkinned and well flavoured.
"On the 18 th of May 1772, finding fome beds I 10 had fown very early wich onions to be a miling crop, planting I was induced to make the following experiment. The pirtiotope year before, I had fet fome potatoes in another part of my garden in the common way; and as it is impofible but fume will remain in the ground all winter, fo I found a number of fprouts about three inches high, which I nipped off clofe to the ground, and tranfplanted them into the onion-beds, without any further preparation, about a foot and a half afunder, in the fame manner that cabbages and cauliflowers are planted. As the feafon became immediately very dry, $I$ was obliged to give my plants a little water for four or five fucceflive nights; after which they began to flourifh, and had. the appearance of a promifing crop during all the fummer. At the ufual time, in October, I ordered them to be taken up; and for fize, quantity, and quality, they exceeded all I ever had in the common way. Had the ground been frefh, properly manured and prepared, and the plants put down at a proper diftance írom each other, I am of opinion that the fuccefs would have been Alll greater.
"From an accurate experiment made laft year, I Onfeedite dare venture to recommend baked potatoes as an excel. hoge, \&c. lent food for hogs. The pork produced by this food with potso was equal to that from barley and beans: but at prefent toes. I cannot exactly afcertain the comparative experiment with regard to expence ; however, 1 am of opinion, that roafted potatoes, confidering the improvement of the hogs, is as cheap a food, if not chciper, than can be given them. I roafted niy potatoes upon a kiln, fimilar to what is ufed by oatmeal fhellers for drying their oats. The difference in expence between boiling abd roafling the potates is prodigious, both with regard to the labour and fuel. A hiln that will cuft 3 l. wi'l roaf potatoes fufficient for the maitainance of more than 20 hogs; and one man will beftow all the necefiary attendance upon them, and do other work beffes. The action of the fire, by difipating the clude juices. that are contained in taw potatses, reduces them intoa fate lighly wholefome and nutritius. Boiling does this in part, but not fo effeaually. A petato roafted in the manner above defribed, partakes much of the nature of a chefnut, and perliaps is not creatly inferion to it."

Potatoes are found to be ufeful food for moft other animals. Sce Agriculture, $n^{\circ} 45$.
To thefe exper:nems we flall add fome important obfervations of Dr Anderfon of Cotefeld near Leilh,

Fotato.
12
Remarks
on the
feeds moft
proper to be planted.
who has paid a very particular attention to this as well as other branches of agriculture. Our readers will find the Doctor's remarks and experiments at large in- the Bath Papers, volume fourth. He firt confiders the nature of the feeds moit proper to be planted; and from his experiments he thinks it appears that the produce is not materially affected, by planting for feed, either whole potatoes or cuttings, or large or fmall potatoes as fuch; for it is only incidentally that thefe things -can affet the crop. In the fith volume of the Bath Papers, Mr Wimpey reiates an experiment, by which -it would appear that there is an advantage in planting cut potatoes. His conclufion is as follows. "The meafure of all the ground planted, fays he, was 325 poles; the whole produce 378 bufhels. The meafure of the ground planted with cut potatoes was 265 poles; the produce 312 buthels The ground planted with whole or uncut fets was 60 poles, and the produce of the fame 66 bufhels. Now, if 48 bufhels, the whole quantity of fets ufed, produced 378 bufleels, then 34 bufhels, the quantity cut, fhould produce 267 buthels; - but they produced 312 , which is 45 bulhels more than the proportion. Again, if $4^{8}$ buhhels produced 378 buthels, then 14 bufhels thould have produced 110 bufhels; but 14 buthels of uncut produced only 66 buthels, which is 44 bufhels lefs than the proportion. $A$ preference of 40 per cent. in favour of cut potatoes, in comparifon with whole fets." Mr Wimpey corroborates the fact in the fixth volune of the fame work, and informs us, moreover, that he ufed to fupply many of his neighbours with potatoes for planting ; fome of whom defired to have them all fmall as they had found them equally productive with the larger, and faved much trouble in cut--ting. "Others (continues he) preferred the largeft, who carried their economy much further : they, it feems, ufed to pare them, eat the flehy part, and plant the rinds only. Upon inquiry, I found it was not an unufual :practice among the cottagers; and I have been credibly informed they get as large crops and as good potatoes in that method of planting as in any other whatever. If this be a fact, it feems to appear that the flefly part of the bulb is of no ufe in fupplying nourifhment to the young fruit after the fibrous roots have put forth and laid hold of the ground. Pcrhaps an experiment of this fort may be thought worth making. "The weight of the crop, however, Dr Anderfon afferts (and Mr Wimpey agrees with him, fee Bath Papers, vol. v. p. 34.), is always in fome mealure influenced by the weight of the feeds planted; but the weight of produce is not augmented in the fume proportion with the weight of the feed planted; the fmalleat feed yielding the greateft returns in proportion to the feed, but the fmallelt in proportion to the extent of ground. It is in no cafe protrable, however, the Doctor thinks to plant lmall potatocs (e), or imall euttings, unlef's where it is meant to increafe
as falt as ponible a favourite kind ; in which cafe it may be fometimes eligible to plant pieces very fmall, as in that way the kind will be molt quickly multiplied. We may alfo remark here, that fuch as wifh for a large increafe thould never plant the worf of the crop; it is, we know, extremely common, and may indeed be an immediate faving ; but it is unqueftionably a lofs upon the whole; and perhaps it is one caufe of the curl difenfe, which is the fure indication of a poor dwindling crop, and of which we thall fpeak moreat large immed ately.

Our author further remarks, that there feems to be no reafon to fufpect that eyes taken from any particular part of the bulb are polfeffed of a degree of prolifecacy greater than thofe taken from any other part of it , independent of the fize of the flethy part that adheres to the eye. It is however highly probable that a difference in the crop, either with refped to the number and fize, or general weight of the whole, would refult fromplanting large cuttings of equal weight, taken from the big end of large potatoes, or from the poin:, as many eyes would be in the laft in comparifon of the firf. This is therefore one of the many preparatory experiments that requite to be made. It is poffible too that even the apples may be an object of value, and may indicate a thriving crop or otherwife; but of this there is no certainty, as no fpecific experiments have yet been made on this fubject.

With refpect to the effects of cutting the ftems of Dnc potatoes while growing, the Doctor feems to be doubt the a ful. The Items of potatoes, if cut while growing, and of po ufed green, are found to be a wholefome food for cattle, and horfes. But though fome farmers maintain that the produce in potatoes it not leffened by having the flems cut off while they are in flate of vigorous vegetation ; others as pofitively infif that the crop is effentially injured by that operation. It is proper that this point thould be afcertained. Probably the crop is hurt if the ftems are cut over before they have attained a certain point of maturity, though it is poffible they may be afterwards cut without doing any effentinl injury to it.

We have already mentioned that an experiment was Onex made a good while ago in Sweden, to extract ardent fpiw irg a rits from potatoes. Other experiments have been made fpirit in this country of a later date, but with litule effect, potat This, however, appears to have proceeded either from ignorance or a want of proper attention to the fermentation and after-diftillation; as appears from Dr Anderfon's experiment, which fucceeded extremely well by attending to thefe proceffes. What he made be afferts to have been the finelt and molt agreeable vinous fpirit he ever faw, refembling in tafte very fine brandy, but more mild, and having a certain coolnefs on the fom mach peculiar to itfelf.

Much may be done in bringing potatoes to pefec-
(B) In oppofition to this, it is the opinion of even practical men, that the fmall potatocs are to be preferred. " I have been informed (fays Mr Hollins) by a native of America, that what we call the long red American potato, grows in thit rich and newly cleared foil to a very large fize; but that the potatoes proceeding from the roots were never ufed as feed; for there fprung fromı the ftalk, very near the furface of the ground, fmall potatoes as they called them ; but, he faid, they were about the fize of thofe raifed in England, and thofe were always planted. I hope the Society will forgive iny mentioning this, as it confirms what Ihave already inid, "that frall potatocs are belt for feed." Loncon Society of Arts, vol. ai. p. S2.

## POT

tion by attending to their feveral varieties. For this purpofe fome partieular potato mult be fixed upon as a Atandard; and when this is done, the inquiry mult be carried on by attending, fir $R$, to their appearances below ground, as, 1 . the general form and lize of the bulbs; 2. their colour ; 3. the fmoothnets or roughneis of the fkin; 4. the contiftence, that is, the mealinefs or vifcolity and tafte of the bulb; 5. the colour, length, thickness, \&c. of the umbilical cord; 6. their tendency to grow deep, or to rife near the furface ; to ramble wide, or to adhere clofe to the ften: 7. the time when the bulbs knot and fet; marking, not by the kalendar only, but a'fo compared with the advance of the plant above ground: 8. the time when they attain perfect maturity with refpect to lize, and allo that period of their growth at which they lofe the hew baceous, and attain the farinaceons, tafte; g. their general prolificacy; 10 . how long they may be kept, at what feafon they are in greatent perfection for eating, acc. We muit next attend to the particulars obfervable aboveground; as, 1. the greneral height, colour, and form of the ftem; 2. their tendency to pulh out many or few ftems from a root; 3. whether they carry bloffom or not; 4. the form, dimenfions, and colour of the leaves; 5. the form, colour, and general habitude of the bloffom where there is any; 6 . the time at which the blof. fom appears; 7. the tendency they have to produce few or many apples; 8. the tendency they have to produce thofe excrefeences on the ftalks that refemble potatoes below ground, which may be called air potatnes; 9. the comparative hardnefs or tendernefs ot the leares, in refpect of frof or other variations of weather that affect them. And, lafly, we mult attend to the particulars that concern the whole plant; as, 1. the foil which feems beft to fuit each kind; 2. the nonde of culture that beft agrees with them; 3 . the accidents which are moft liable to affect chem ; and in general every particular that could indicate any. difference between one kind and another.

Our author next confiders the circumftance of raifing feedling potatoes. His mode of railing them was fimilar to that recommended in the Georgical Efrys quoted above; but he differs with refpect to the utility or fuccet's of that mode. It has been alleged, he lays, that potatoes, whicli have been long propagated by means of bultus, lofe in time their generative quality, fo as to become much lefs prolific than at firft ; and it is afferted that thofe bulbs which have been lately obtained from feeds are much more prolific, and confequmtly muck more profitable for being employed as plants than others: but this npinion appeats to have been adopted without fufficient examination: for there appears not the fmallef indication of fuperior proliticacy in thofe railed from feeds, but rather the reverie. That potatoes do not degenerate in point of prolificacy. in confequence of being long propagated in the ufual way, feems to be confirmed by the general experience of all Europe. It is now about a hundred years fince the potato wais pretty generally eultivated in Ireland, and it has been very univerfally culcivated in Britain for

## 439 ] <br> ${ }^{2 \cdot} \mathrm{O}$ T

50 ycars paft; and all that have been reared in it fince their fir! introduction two hundred years ago, a very few of late only excepted, have been propagated from bulbs only; fo that il they have declined in point of prolificacy, the degeneracy flould in this time have been very apparent. Nothing of that hind however. was ever remirked, nor any infinuation of that fort thrown out, till the difcovery of rearing potatoes from feed was made, when it was for the firlt time heard. of. There are many perfons now living who lave been in the conftant practice of rearing potates for 30. or 40 years ; and notwithtanding the gencral tendency that mankind lave to difpraife the prefent, when eonipared to palt times, yet none of them bave given the fmallett hint of degeneracy in this repeet. And perhaps it will be found that this is merely a groumblets nution, that has originated from the partial fondnefo of thofe who firt propagated this plant from feed, in tiavour of their new difcuvery. It has been further faid, that by raifing potatoes from feed, may new and raluable kinds may be obiained ; and it is allo alferted in the G:orgical Effays. Indeed an opinion of obtaining new varicties of plants by propagating them from feed univerfally prevails among naturalifts. Bat Dr Anderfon, in his firlt paper, doubts whether this be fact, and whether, when any of thefe occur, they have not been the efo. feet of accidental pofition or other eaules. We may certainly (fays he) affert on the whole, that if the practice: of rearing potatoes from feeds thall ever be productive. of any advantages to fociety, they have not yet been difcovered. Since he wrote that treatife which appears in the Bath Papers, vol. iv. (and of which we are now giving a fhort account), however, he has had occafion to alter his opinion, which he does with great candour in vol.v. The experiment which induced him to alter his opinion, and which appears to be decifive, was made with the feed of a potato procured from Ireland of a very peculiar kind. Its colour was a dirty dark purple, its thape a round irregular bulb, and its ftem tall and upright. The feeds procured from this potato were fown by themfelves, and the feedlings when of a proper fize were tranfplanted. Fxom the appearance of the ftems he foon difcovered that they were not all of one fort, and on taking them up the variety was almof infinite; and fuch as could not be accounted for on the principles of a mongrel adulteration. The diverfities reipected colour, fhape, \&c. fome of which he enumerates. See Batb Papers, vol. v. p. 127.; fee alfo p. 35. where Mr Wimpey controverts the Doctor's former cpinion.

Refpecting the eaufes and prevention of the curled on the difeife in potatoes there has been a great varicty of opi- curled dis:nions, which we have detailed at fome length under cafe. the article Agriculture, p. 267 to 270. Dr Anderfon confeffes that he canday but little pofitioe as to the caufe of this diforder, but he thinks a good deal may be faid on the negative fide of the queftion. It was. little known till lately (c), and in the northern parts of Britain it was abfolutely unknovin but a very few years acn; and even now in the more remote corners it is Atill lefs frequant than in the more fouthera ar.d
(c) In the eighth volume of the Tranfections of the Londen Society for Encouragement of Arts, $\& \mathrm{c}$. p. 43. we are told that the curl fort appeared in 1764 , in the rey d dibrict in Lancanhite where they, wore fist: cullivated.

## 1 OT

long produced this plant in a climate not deemed congenial to it, had become fo far exhauted as to occafion this difeafe. But in this cafe, the more northern parts, where the climate is moft unfavourable, fhould have been fooneft afferted. It has been alfo thought that potatoes, whofe bul's are froft bitten before they are houfed, occafion this difeafe in the plants they produce. But the fagt is, that they are leaft liable to the diifafe in thofe dilfrifts where they are moft expofed to frolt. A potato can never indeed be benefited by froft ; but it is not at all probable that the being touched by it oceafions the curl. The taking up potatoes before they arrive at maturity has been thought to occation the difeafe; but in places where they muft be taken up fo, the difeafe is fcarcely known. It has alfo been thought that potatocs obtained from feed are entirely free from it. But Dr Anderfon gives a proof of the contrary; for one half of the plants of a large field planted from potates the third year from the feed were curled; while another field adjoining raifed from potatoes that never were, that he knows, produced from feed in Britain, had fearcely one curled plant in the whole. The difeafe has been fuppofed by others to arife from the foil or feafon. But that this is not the cafe, appears from the circumftance of a fingle field which Dr Anderfon planted with potatoes of the very fame fort, but obtained from diferent perions. The ridges were intermixed, and the one was very much curled, and the other perfectly free. The difeafe, therefore, appears to arife from infected feed: it is however pofible that it may be communicated by juxtapofition; and if fo, the difeafe might be in a great meafure if not entirely avoided, by pulling out thofe that fhowed the leaft fymptom of it , on their firft appearing above ground.

In the Tranfactions of the London Society for encouragement of arts, \&cc. we find a good deal about the curl difeafe. Many of the writers agree in opinion with Dr Anderfon in many particulars; and particularly, that though the difeafe may be prevented, we do not yet know enough of its nature to be able to cure it. See their vol. viii. p. 18, \&c. ix. p. 52, \&e. and x. p. 75. In this laft volume we are told that the principal caures of the curl are three: 1. From their being forced by cultivation to overgrow their power for vegetation; 2. From their vegetative power being dried up in ebb foil by the forching heat of the fun ; and, 3. From their being expofed too long after they are cut in fets before they are planted.
It is generally and very naturally belicved that a dry On the froil foil or a dry feafon necelfarily produces the driett pomoff pro- tatnes. But there is good reaton to doubt the truth per for po- of the opinion. The year 1775 was the drieft and zatoes.
warmeft leafon that has been known in Scolland within the memory of man, yet the potatoes of that year's crop were watery almolt to a provelb: on the other hand, the potatoes of e1op 1777, although it was a remarkably rainy feafon, were as dry and mealy at leaft
as is common, and much more fo than in the year 1775. It deferves alfo to be remarked, that the crop of 1775 was almoft double in quantity to that of 1777. Hence a dry feafon would feem to augment the produce, though it does not for eertain in all cafes improve the quality, of this crop: nor does a dry foil neceflarily infure meally potatoes; for our author fays he has often feen potatocs of the fame kind, and of the fame year's produce, reared in two different places; the one of them in a naturally damp foil, which turned out to be much freer and more mealy than the cthers which werc reared on a drier and fharper foil. He confeffes, that he has alfo often feen it turn out in fact, that po: tatoes raifed in thofe diftricts where the foil is hot and fandy, are ufually more free and tender than thofe raifed in countries where the foil is cold and damp. Ons author tries to account for thefe contradictory phenomena by conjecturing the probable caule of the waterynefs or drynefs of a crop. He alks, Whether in this refpect the crop is anywife affected by the degree of ripenefs that the plants employed for feed may have attained in the preceding feafon? That this is the cafe he thinks highly probable. Potatoes which, on account of the richnefs or other peculiarity of the foil, continue in a flate of vegetation highly luxuriant till they are nipped by frolt, or checked in their growth by other inclemencies of the feafon, have much lefs chance of being dry and mealy than others of the fame fort which have attained their full growth before the coldnefs or inclemency of the weather checked them. But our author's queftion does not relate to this, but to the effect thefe unripe potatoes, ufed as feed, would have on the fucceeding crop; a circumfance which experience alone can determine. "But even if it fhould be found (continues our author) that the maturity of the feeds affected the quality of the potatoes, it would not follow invariably that the feeds produced on early dry foils would be better than thofe from later feils; becaufe it might fometimes happen from local pofition, and other aceidental circumftances, that the growth of the potatoes in the dry early foil might be checked by frofts many weeks before thofe on the other foil were affected, in confequence of which the plants in the cold foil might attain to more perfect maturity than thofe on the drier one. I mention this peculiarity merely to fhow how cautious the farmer ought to be in adopting geueral conclufions without carefully attending to all the collateral circumftances that may affect his experiment. I fhall only farther add on this head, that I had occafion to know well a dry warm fpot of ground on which the ftems of the potatoes of crop 1776 were frof-bitten at lealt fix weeks bcfore thofe on another fpot at fome miles diftance fromi it, where the foil was naturally more cold and damp, were in the fmalleft degree affected by it. It likewile fo lappened, that the potatces raifed on the firl-mentioned fpot in the year 1777 (their own frof-bitten (D) feed was employed) had fuch a peculiar acrid and bitterifh tafte as to be hardly at all eatable, while thof in the colder place of that crop had nothing of that unufual
(D) Obferve, the term frof bith is here applied to the fems only, and not to the bulbs. The nems were fo much hurt ty the froft as to turn black and decay, but the bulbs were taken up before the froft had been fufficiently inienfe to hurt them.

## POT

to. ufual tafte Whether this diverfity was occafioned by the circumftance hor: alluded to, 1 do net take it on nee to fay. In matters of duch nice díquition as tue prefent, many fucts ebtained by :cry accu:ate obcorvation are neculaty bstore any conclufion can be retied en."
Potatoes, when plansed in watcr, thoot , ut a grat number of fine whate toust lie lancads into the water; but on mone of thom is tiace in loc found the leati ap. Jeatance of a bulb; whiac on the cher hand the potaloes in that cafe always grow on the tip. Potatocs are found to be catrencly utciul in br ngeng caluanted land Ento heart again. See Aghowlure, ro. 35 and isb, 1. $\hat{3}$ oy, cul. 1. The bith.p of Killalne in Freland directs the uie of then for this purpole in a latter in the Dath l'apers, vol. 4. 1. 232, and contirms its utility in this reapet by experiments of his own. In the roth vol. ot the Iranfacions of the Loadon Soci:ty for Enco:tragenent of Aris, \&c. P. 34, there is al.o a mult decilive Irvot ct this utility.

We have been indaced, from the extenfive utility of this rovt, to cätend our obfervations on the iubjed to a greater length than we thould otherwife have done. buch of our reader: as with for furiher information, will of courfe contult the boots from which we have made up the picfent article, as well as other books on Agriculture; in wheh they will find the obtervations and experiments which we have mentioned at much greater length than we could poffibly give them. In the tixth volune of the Lath Socicty Papers there is an excellent paper ost the culture of putitoes and feeding hogs with them during feven years by Jolin Billingfley Eiq; of which our linsits do not permit us to take particular notice. There are alio a vaniety of other papers in the feveral volumes of that work, as well as in the Traniactions of the Londun Society, which we have already leveral times mentioned; which will deferse the particular attention of fuch as wilh well to the poor, or have a defire fill farther to exiend the utility of this molt valuable root. We have already mentioned a cheap prepa. ration by means of potatoes for the poor, fee Agriculture, $n^{6} 161$; and we fhall dinith the prefent article witla reccipt to make a potato herrico, which may be equally uleful to thofe whofe circumfances are not fuch as to make them regrardieds of cconomy. We take it from the Gentleman's Magazine, and give it in the words of a perfon who had tiied the experiment.

Scrape the $\mathfrak{R}$ in clean off four pounds of good raw potatoes, then walh them clean in fair water: take two pounds of beef, one of mutton, and one of pork; or as you like belt, four pounds of any of thefe meats; cut them into pieces of three or four ounces cach, feafon them very well with pepper and falt and a good onion clopped very fmall: have ready a trong wide mouthed fone jar, fuch as hares are ufually jugsed in ; flice thin a lajer of the potatues into the jar, then a bayer of the feafoned meat over them, and fo altemately layers of potatoes and meat ; let your uppermoft hayer be potatoes, fo that your jar be about three quarters full, but put nowater inio your jar ; then clofe or fop the mouth of it with a large well-fitted piece ot cork, covering the fime with a frong piece of canva, and tyeing it down will pack-thread, fo as only a litite of the fteam may efcape in the ftewing; for a little fhould conftantly evaporate from the fide of the cork to fave the jar from burting. Then place you: jar upright in a liettle of
cold water on the fire, fo as th= month nf the jar may be always two inches above the water in the ketile when boiling. The herreo its the jor will begin io buld face minutes fonner that the watter in the ket:le, and ihat for obvious reafons. In about an houn alter the water ia the kottle begin, to beil, yeur ianticn will be fully llew d. Then taic ont and open the jar, poirs ont the haricu into a deejp dith, und ferve it up.

Th s excellent, wholefonc, a ed cennomical difi fupplies an ascreable dimat twace a wect: to a fanaity contifting of thee grown poop!e, ind three clildren under fourten years of age, whele neithe health nor good lio. machs are waning, thats to God: and, in print of economy we mutt obferve, ilat hore is the whole article of butter faved, as alfo the whole atticle of bread, ot nearly fo; nor does there require fo large or fo contiace a fire, nor fo much ime or irouble as is neceflary for th: drefing of many other difhes that by no means deferve the preference of this excellent henico.

We have alfo (by waty of clange) made it with powdered beef, fometimes with powilered pork, fometimes with hald fiefl beef or mutton and hali pickled port, and found it good in all thefe wags, particularly wit! three pounds of frefh beef and one of pick!ed pors. W: have left off fending pies and ftews to the bakers. We fometimes (ia a larger kettle) boil a fmall piece of pow. dered beef along-lide of the jar, by continuing the boiling an hour and an half longer, and this ferves tis to eat cold the next day, with hot garden-ftulf or a pudding.

POTENT, or Porexce, in heraldre, a term for it kind of crof;, whofe ends all terminate lite the hea 1 of a crutch. It is otherwife called the forufalerizerofs, and is reprefented Plate CCXXIX, fig. 12, 12.

POTENTIA (ROwER), that whereby a thing is capable either of atting or being acted upon.

POTENTLAL, in the ichools, is uled to denote and diftinguith a kind of qualities, which are fuppoled to exift in the body in fotntim only; by which they are capable in fome meafure of affecting and imprefing on us the ideas of fuch qualities, though not a Gually inlierent in themfelves; in which fenfe we fay, potentid! heal, potential cold, \&c.

Pofential Cu:tery, in medicine, denetes the confuming, or reducing to an efchar, any part of the human body by a cauftic alkaline or metallic falt, \&ec. inftead of a red-hot iron, which laft is called the $a<$ uual coutery.

Potental, in grammar, an epithet applied to onc of the monds of verbs. The potential is the fame ia form with the fubjunctive, and is, according to Ruddiman, implied in that mood, for which reafon that grammarien rejects it; but others will have it to differ from the fubjunctive in this, that it always implies in it either pofinn, volo, or debico. It is fometimes called the fermiflive okood, becaure it of en implies a permiffion or concention to do a thing. See Gramerar.

PGTENTILLA, s!lfer-weed, euild tanfey, or cincusfoil: A genus of the pentagynia order, belonging to the icofandria clafs of plants ; and in the natural method ranking under the 3 jth order, Sentiogfe. The calyx is decemfid; there ate five petals; the feeds rounciith, naked, and afixed to a fmal! dry receptacle. The fpecies ire, 2. The fruciicofa, or hrubby potentilla, com-

## POT

Puenotilla, monly called Brub-cinquefoil. This rifes with a fhort
Potcrium. flrubby ftem, dividing into a branchy full head, three or
four feet high; clnfely garnifhed with piunated leaves of five nblong, narrow, acute-pointed, folioles, pale green above, and whitifh underneath; and the branches terminated by clufters of large fpreading, yellow flowers. This is a beautiful deciduous flowering thrub, worthy a place in every curious colle Etion. It grow's wild in Yorkhire and other northern parts of England, Sc. but has leeen long cultivated in gardens as an ornamental hirub. 2. The reptans, or creeping common five-leaved potentilla, or five-leaved grafs, hath a thick filbry root, flender, trailing, repent falks, digitated, five-lobed, peti lated leaves, and yellow flowers fingly. 3. The rupeftris, or mountain uptight cinquefoil, hath upright ftalls, eight or nine inches high ; pinnated five and three Inbed alternate leaves, having oval crenated lobes, and the falks terminated by fmall white flowers. 4. The reta, or eredt feven-lobed jellow cinquefoil, lath ereat tlalks, feven-lobed leaves; having three lobes fpearflaped and ferrated, green and hairy on both fides, and the ftalks terminated by corymbore clufters of yellow Howers. 5. The fragaroides, or flrawberry-like trailing potentilla, hath a fomewhat tuberous root, furnilhed with many long fibres, long trailing thoots, rooting at the joints ; pinmated, monty three-lobed leaves, having oval lobes, with the extreme lobe the largeft, and clufters of frall white flowers. This fpecies bears a great refemblance to the fmall ferile ftrawberry plants. 6. The argentea, filvery upright potentilla, hath upright falks, branching a foot ligh; and five tobed leaves, having the lobes wedge-fhaped, cut on the edges, hoary and white underneath, and the branches terminated by fimall yellow flowers.

All thefe plants flower in June and July ; the flowers are compofed each of five ronndith petals, and about 20 ftamina. They are all very hat dy, and may be employed in the different compartments of the pleafure ground. Their propagation is very eafy. The flarubby potentilla may be propagated abundantly by fuckers, layers, and cuttings ; all of which will readily grow, and make plants in one year, which after having two or theree years gowth in the nurfery will be fit for any of the fhrubbery compartments. All the herbaceous kinds may be propagated by parting the roots in antumn or fring, or by ieed in any of thofe feafons.

POTERIUM, garden eurnet: A genus of the polyandiria order, belonging to the moncecia clafs of plants and in the natural method ranking under the 54 th order, Mijcellaner. The male calyx is tetraphylious ; the corolla quadripartite; and there are from 30 to fo tlamina. The female calys is tetraphyllous; the corolla quadripartite ; there are two piftels; the berry is formed of the indurated tube of the corollia. The fipecies are, I. The fanguiforbt, or common garden burnet, hath tibry perennial roots, crowned by a large tuft of pimated leaves, or fix or feven pair of fawed lobes, terminated by an odd one; upright angular ftalks, dividing, and branching a foot and a half high, terminated by oblong fpikes of purplifh red flowers. This fpecies grows wild in England, in chalky fuils; but has been long culiivated as a choice falad-herb for winter and fpring ufe, it being of a warm nature ; the young leaves are the ufeful parts. It is perennial in ront, and xctains its radical leaves all the year, but the falks are
annual. Montpelier burnet, rifes with upright, taper, clofely gathered ftalks two feet high; pinnated odoriferous leaves of three or four pair of fawed lobes, terminated by an odd one ; and the Ptalks terminated $\mathrm{b}_{\mathrm{g}}$ long footftalks dividing into fmaller, each fupporting a fmall roundill fyike of flowers. This fpectes often proves biennial ; but by cutting down fome of the falks before they flower, it will caure it to multiply at bottom, and become abiding. 3. Poterium finolum, fhrubby fpinous burnet of Crete, hath a Arubby ftem and branches, lifing a yard ligh, armed with fpines; fmall pin. nated evergreen leaves, of fix or feven pair of lobes, ter. minated by an odd one, and the branches terminated by fnall heads of greenith flowers.

All thefe fpecies flower in June and July, fucceed. ed by ripe feeds in Autumn. They are all naturalIy perennial ; but the two herbaceous ones are abiding in root only; the other in root, ftem, and branclies: the two former are hardy, and the third requires fhelter in winter. The firft fort merits culture in every kitchengarden for winter and fpring falads. Some plants, both of the fint and fecond forts, may be introduced in the herbaceous collection in the pleafure-garden for variety. The third fort muft be kept always in pots to have fhelter in winter. They are all eafily propagated, the firft fort by feed and by parting the roots. The fecond fort may alfo be increafed by feeds and flips of the root, as for the former fort. And the propagation of the third is by flips or cuttings of the branches in fpring and fummer, planted in pots, and placed under glatles, giving fhade and water; or might be forwarded more by plunging them in a hot-bed.

Burnet is of a heating, drying nature, cordial and alexipharmac; in fumnier, the leaves are ufed for cool tankards, to give the wine an agreeable flavour. The powder of the root of the fint pecies is commended againg fpitting of blood, bleeding at the nofe, dyfenteries, and difeafes attinded with violent fecretions. In winter and ipring, the young tender leaves are ufed in falads. For its ufes as food ior cattle, fee Agriculture, $n^{\circ} 184$

POTHOS, in botany ; a genus of the polyandria order, belonging to the gyuandria clals of plants. The fpatha or fheath is a fimple fpation covered; there is no calyx but four petals, and as many ftamina; the berries dijpermous.

POTION, a liquid medicine, confiting of as much as can be drumk at one dranght.
POTIPHAR, or l'utiphar, an officer of the court of Pharaoh king of Eggypt, and general of his troops, according to our tranilation, Le Clerc, and the verlion of the vulgate; but according to the Hebrew and Septuagint, the chief of his butchers or cools. The Hebrew text, the Septuagint, and vulgate, call him Eunuch. But it is probable it in this place means only an oficer of the king's courr, for he was certainly married and had children. We have no other accomms of him but what appear in feripture; and that account is too generally haown to require to be enlarged on in this place. See Genefis xxxviii. xxxix. \&8c.

POTOSI, a city of Peru in South America, fituated at the bottom of a mount, min of that name, in which is the richeft filver mine ever difcovered. To give an idea of its richnefs, we hall mention its produce at dif-
dam. ferent times. Exclufive of what was not regiftered, fiys Abbé Raynal, and was finuggled away, the fifth part belonging to the government, from 1545 to 1564 , 1,8751. amounted to $3^{6,450,0=0}$ livres* Per annum. But this abudance of metals foon decreafed. From 15 th to 1585 , the ammal fith part anomuted to no more than 8121. $15,187,489$ lisres four fols if. From 1585 to 1624 , it amounted to $12,149,99+$ livres 12 fols $\dagger$. From 2.291. $162+$ to 1633 , to $6,074.999$ livres fix fols $\ddagger$. From 6.1. this latt period, the produce of thefe mines hath fo evi${ }_{9}^{124} 1$ l dently decreafecl, that in 1763 the fifth fart, belonging to the king, did not exceed $1,364,682$ lives 12 fols $\|$. Situated in W. Long. 67. S. Lat. 22. See the article Ieru, p. 220, col. 2.

POTSDAM, or Postdam, a town of Germany, in the circle of Upper Saxony, with a palace, belonging to the king of Pruflia. It is feated in an ifand ten miles in circumference, formed by the rivers Sprae and Havel. The palace is very curions, and finely built upon a delightul fpot 12 miles weft of Berlin. E, l.ong. 13.42. N. Lat. 52. 34. Reibleck in his travels informs us, that the houfes in Potfdam are flill finer than thofe of Berlin; but like them they are inhabited only by perfons of the lower and middling ranks.

POTII (Percisal), washorn in London in 1713 . He reccived the firt rudiments of his education at a private finool at Darne in Kent; and became an apprentice to Mr Nourfe, one of the furgeons of St Bartholomew's hofpital ; of which hofpital, in $17+4-5$, he was elceted an affif ent furgeon, and in 1749 appointed one of the principal furgeons. In 17+6, he married the daughter of Robert Cruttenden, Efq. His firft publication is faid to have been planned in 1756, during his confinemert in confequence of a compound fracture of the leg: from that time, his pen was feldom long utiemployed. His pratice and his reputation were now lapidly increafing: in $1_{7} 6_{4}$, he was elected a fellow of the Royal Society; and afterward was complimented with honorary diplomas from the Royal Colleges of Surgeons at Edinburgh and in Ireland. In 1787 , he refigned the office of furgeon to St Bartholomew's hofjital, "after having lerved it (as he ufed to fay), man and boy, half a century ; and on the 22 d of December $1_{7} 88$, after an illnefs of eight days, he expired.
" The labours of the greatel part of his life (fays Mr Earle, who publifhed his Chirurgical works), were without relaxation : an increafing family required his ntmoft exertion: of late years he hald a villa at Neafden; and in the autumn ulually paffed a month at Bath, or at the fea-fill. Thus, though he gatherecl, as he expreffed it, fome of the fruit of the garden which he had planted as he went along, and always lived in a generous and hofpitable manner, at the fame time beftowing on four fons and four daughters a libe. ral and neceifarily expenfive education, and applying large fums to their eltablithment during his lifetime, he ieft an ample provifion for them at his deceave. A. mong his papers was found, what he had often mentioned, a imall box, containing a few picces of money, being the whole which te ever received from the wreck of his father's fortune. With this was depofited an exact account of every individual fee which a long life of walinets had produced-abundant evidence of vicll fent time, and the indultrious application of abi-
lities, to which the res angufla domi, at the commencement probably afted more powerfully as an incentive than as an obftacle."

POTLER (Chrifopher), a learned Englifh divine, was born in 1591 , and bred at Oxford. In 1633, he publifhed his "Anfwer to a late P'opith Piot," intitled Charity mifuker, which he wrote by feccial order of King Charles I. whofe chaplaba he was. In 16́3t, he was promoted to the dcanery of Worcclier; and, in 16.40, was conflituted vice-chancellor of the tiniverfity of Oxford, in the cxecution of which office be met with fome trouble from the nembers of the long parlament. Upon breaking out of the civil wars, he tent all his: plate to the king, declaning, "that he would rather, like Diogenes, drink in the hollow of his hand, than that his majefty fhould want;" and he afterwards fuifered much for the royal caufe. In conlideration of this he was nominated to the deanery of Durham in 1646 , but was picvented from being inlialled by his death, which happencd alout two months after. He was a perfon learract and religious, exemplary in his converiation, courseo: s in his carriage, of a fweet and obliging nature, and of : comely prefence. He was remarkable in his charity to the poor.

Potter (Dr John), archbifhop of Canterbury, was the fon of a linen-draper at Wakefield in Yorkihire, where he was born about the year $167 \%$. He Audied at Univerfity college, Oxford; and at ig publifhed Variantes lectiones $\underset{B}{ }$ note ad Plutarchi lilvum de audiendis poctis; © ad Buflii magni orationem ad juvenes, quamods cum fruthu legere $p y$ yint Gracorum libros, Svo, 1693 . In 1697 , came out his edition of Lycophron, in folio; which is reckoned the beft of that obfeure vriter: fonu after, he publifhed his Antiquities of Grecee, 2 vols. 8vc. Thefe works eftablifhed his literary reputation, and crigaged him in a correfpondence with Grevius and other learned foreigners. In 1706, he was made chaplain to the queen; in 1715 , bifhop of Oxford; and in 173i, he fucceeded archbihop Wake in the fee of Canterbury: which high ftation he fupported with much dignity until his death in $=1747$. He was a learned and exemplary churchman; but not of an amiable difpofition, being but too ftrongly tinctured with the pride of office ; nor is it to his credit that he difinherited his eldeff fon for marrying below his rank in life. His "Theological work: containing fermons, charges, difoourfes on church-government, and divinity lentures," were printed at Oaforu, in 3 vols, 8 vo, 1753.

POTTERY, the manufacture of earthen-ware, or the art of making earthen veffels. See Delfa-/Vare, StoreWare, and Purcelain, \&ce.

The wheel and lathe are the chief and almolt the only infruments in pottery: the firf for large works, and the laft for fmall. The potter's wheel conlifts principally in the nut, which is a beam or axis, whofe foot or pivot plays perpendicularly on a free-flone fole or botcom. From the four corners of this beam, which does not execed two feet in height, arife four irnn bars, called the fpokes of the avieel; which forming diagonal lines with the beam, defend, and are fiftened at bution to the edges of a frong wooden circle, four feet in diameter, perfenly like the felloes of a coachwheel, except that it has neither axis nor radii, and is only joined to the beam, which ferves it as an axis by the iron-bars. The top of the nut is flat, of a rir-

Foter,
I'otrery.

## $1 \mathrm{OV} \quad[444]$ <br> PO U

Potery culdar figure, and a foot in diameter; and on this is laid 11
the clay which is to be turned and fathioned. The whee thus diffofed is encompalfed with four fides of
four different pieces of wood fattened on a wooden frame; the hind-piece, which is that on which the workman fits, is made a little inclining towards the wheel; on the fore-piece are placed the prepared earth; on the fide-pieces he refts his feet, and thefe are made inclining to give him more or lefs room. Having preparcd the earth, the potter lays a round piece of it on the circular head of the nut, and fitting down turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with watcr, he preffes his हit or his finger-ends into the middle of the lump, and thus forms the cavity of the velfel, continuing to widen it from the midde; and thus turning the inlide into form with one hand, while he proportions the outfide with the other, the wheel conftantly turning all the while, and he wetting his hands from time to time. When the veffel is too thick, he ufes a flat piece of iron, fomewhat flarp on the edge, to pare off what is redundant ; and when it is finithed, it is taken off from the circular head by a wire paffed under the veifel.

The potter's lathe is alfo a kind of wheel, but more fimple and flight than the former: its three chief members ate an iron beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the bcam, and ferving to form the veffel upon: and another large wooden wheel, all of a piece, thres inches thick, and two or three fect broad, fattened to the fame beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the botom in an iron ftand. The workman gives the motion to the lathe with his feet, by pulhing the great wheel alternately with each foot, fill giving it a greater or leffer degree of motion as his work requires. They work with the lathe with the fame inftruments, and after the fame manner, as with the wheel. The mouldings are formed by holding a piece of wood or iron atit in the form of the monding to the veffel, while the wheel is turning round; but the feet and handles are made by themelves and fet on with the hand; and if there be any fculpture in the work, it is ufually done in wooden moulds, and nuck on piece by piece on the outlide of the veffel. For the glazing of the work, fee Glazeng.

POICILE, an Englifh meafure containing two g1unts.

PUVERTY fignifies indigence or want of riches, and has been the lot of a large portion of men in every agc. Whether, on the whole, it has been produaive of grod or bad confequences, has been difputed. In a moral view, perlaps it has been, on the whole, ufetul, as adverlity is in general more conducive to vitue than profperity, which too often leads to luxury and vice. Sometimes, however, poverty has had a banetul effect upon the mind, and has prompted men to commit very tuhuman actions; but this in civilized communities very feldomoccurs. In a political vicw, poverty is thought by fome to be hurful: Raynal thinks it is a check ti) population, (fee his Hittory, vol vi. p. 47t.); and Dr Smith fo far agrees with him ; for thougli he allerts, and indeed proves, that poverty is no check to the produation of children, he allows it to be very unfavour-
able to raifing them. See Smith's vol. i. p. ing, iec. See allo Ponz.

POULADUFF, two remarkable great holes in the ground, about a mile welt of Rofs, in the county of Cork, and province of Manfter, in Ireland, 80 yards deep, in which the fea flows by fubterraneous paffages. They are called Eat and Welt Pouladuff; one is on the lands of Downcen, and the other on Tralong.

POULTICE, a fort of medicine, called alfo a catapíafm. See Cataflasma.

POULTRY, all kind of clomentic birds brought up in yards, as cocks, hens, capon', ducks, turkeys, \&c.
Alnolt all the domeflic birds of the poultry kind that we maintain in our yards are of foreign extraction : but there are others to be ranked in this clafs that are as yet in a tlate of nature, and perhaps only wait till they become fufficiently farce to be taken under the care of man to multiply their propagation. It will appear remarkable enough, if we conlider how much the tame poultry which we have imported from diftant climates has increafed, and how much thofe wild birds of the poultry kind that have never yet been taken in o kceping have been diminifhed and deftroyed. They are all thimed; and many of the fecies, cipecially in the more cultivated and populous parts of the country are utterly unfeen.

Under birds of the poultry kind may he ranked all thofe that hatc white flefh, and, comparatively to their heads and linmbs, have bulky bodies. They are furnithed with thort ftrong bills for picking up grair, which is their chief and often their only fufter ance. Their wings are fhort and concave; for which reafn they are not able to fly far. They lay a great many eggs; and as they lead their young abroad, the very day they are hatched, in queft of fuod, which they are thowa by the mother, and which they pick up for themelves, they generally make their nefts on the ground. The toes of all thefe are united by a membrane as far as the firft articulation, and are then divided.

Under this clafs we may therefore render the common cock, the peacock, the tarkey, the pintada or Guinea hen, the pheatint, the buftard, the grous, the partridge, and the quail. They all bear a trong fimilitude to each other, being equally granivorous, Helhy, and de"'icate tu the palate. They are among birds what beats of paiture are among quadrupeds, peaceable tenants of the field, and fhunning the thicker parts of the forelt, that abound with numerous animals who carry on uncealing hollilities againft them.

As nature has tormed the rapacions clafs for war, fo fhe feems equally to have fited thete for peace, reft, and fociety. Their wings are but floort, fo that they are ill formed for wandering from one region to another: their bills are alfo hort, and incapable of annoying their oppofers: their legs are flong indect; but their toes are made for feratching up their food, and not for holding or tearing it. Thefe are fufficient indications of their harmlefs mature; while their bodies, which are fat and flefhy, render them unwield travellers, and inc:apable of ftraying far from each other.

Accordingly, we find them chiefy in fociety: thay live together: and though they may have their diipuies, like all other animals, upon fome occafions; yet, when kept in the fame diftrict, or fed in the

## POU

fame yard, they learn the arts of fubordination; and, born in 159t, at Andel, a little city in Norman!', in proportion as each knows his ftrength, he feldom tries a fecond time the combat where he has once been worted.

In this manner, all of this kind fecen to lead an indolent voluptuous life. As they are furnifhed internally with a very ftrung Atomach, commonly called a gizzard, fo their veracioufnefs fearce knows any bonuds. It kept in clufe captivity, and feparated from all their former companions, they have flill the pleafure of eating left; and they foon grow fat and unwieldy in their prifon. To fay this more fimply, many of the wilder ipecies of bird, when croped or cayed, pine away, grow glonmy, and fome refufc all fultenance whatever ; none cxecpt thofe of the peultry kind grow fat, who feem to lofe all remembrance of their former liberty, fatisfied with incolence and plenty.

POUNCE, gum fandarach pounded and fifted very fine, $t$, tub on paper in order to preferve it from drinking, and to make it more fit to write upon.

Pounce, is alfo a little heap of charcoal duf, in. clofed in a picce of muflin or fome other open ftuff, to be palled over holes pricked in a work, in order to mark the lines or deligns thereof on paper, filk, \&c. placed underneath; which are to be afterwards finithed with a pen and ink, a needle, or the like. This kind of pounce is much ufed by embroiderers, to transfer their pattens upon fuffs; by lace-makers, and fometimes alfo by engravers.
Pounces, in falconry, the talons or claws of a bird of prey.

POUND, a ftandard-weight ; for the proportion and fubdivifions of which, fee the article Weight.

Pound alfo denotes a money of account; fo called, becanie that ancient pound of filver weighed a pound cne penny troy.
Pound, imong lawyers, denotes a plase of ftrength, in which to keep cattle that are ditrained, or put in for treispafs, until they are replevied or reteemed.

POUNDAGE, in England a fubfidy of 12 d . in the pound, granted to the crown on all goods and merchandizes exported or imported; and if by aliens, more.
POURPRESTURE, in law, is a wrongful inclofure, or incroachment upon another perfou's property.

Puursuivant, or Pursuivant, in heraldry, the lowelt order of officers at arms.- They are properly attendarts on the heralds when they marihal public ceremrnies. Of thefe in England there were formerly many; but at prefent there are only four, viz. blue man:le, rouge-crofs, rouge-dragon, and port cullice. In Scotland there is only one king at arms, who is fyled $L$ yon; and has under him no lefs than fix heralds, as many purfuivants, and a great many meliengers at arms Sce Lurne.
pourveyance, or Purveyance, in Englifh law, the providing corn, fuel, viatuals, \&: for the king's houte. hold; and hence the officer who did fo was termed pourv:yor. As feveral offences were committed by thefe officens, it was enacted by flat. 12. Car. II. that no perfon, under colour of pourveyance, fhall take any timber, catcle, corn, \&c. from any fubjest withour his fice confent, or without a juft appraifement and paying for the fanie.

POUSSIN (Nicholas), an eminent French painter,
where his, father was of molle extraction, hut horn to it furall eflate. IIc was infructed for a few months by one Ferdinund Flle, a portrait-painter, and afterward; fpent a month with L'Allemant; but fuding thefe ar tills not likely to improve him fuitably to his defires, he firft fudied the paintings of the be:t mallers, an:t then latlened to finith a few pieces he was engaged in, and travelled to Italy. Here he devoted almont his whole attention to the Ilndy of antique Itatutes and bas reliefs; which was probably the caufe of his womt of knowledge in, and tatte for, the art of colouring. Being invited back to Paris by Lon:s XIII. whio afigned him a penfioa with lodgings in the Thuilleres, he painted for prince Juftiniani an hiforical pinure reprefenting Herod's cruelty; an admirable compofition. in which he gave fuch expreflion to every charater, a; could not fail to frike the beholder with terror and pity: he then laboured for feveral years on the celebrated pifures of the feven facraments of the Romith church. But none of Poufin's deligns have been more gencrally admired than that of the death of C.rmannicus; which would have gained him imrantal honont if he had never painted another piture. He began tha labours of Hercules in the gallery of the Luvie; but the faction of Vouet's fchonl railing at him and his performances, put him fo out of humour with his own conntry, that he returned to Rome, where he died in 1665. He never went beyond eafel-pieces, for which he had a perpetual demand; and his method was to fix the price he expected on the back of the canvas, which was readily paid.
Poussin (Gafpar). This painter, whofe real name was Dugher, was born at Paris in 1600 ; and was in. duced to travel to Rome, not only formalove to the art cf painting, but alfo to vilit his tifter, who was married to Nicholas Pouffin. Saudrart fiys that Gafpar wav employed at fi) ft only to peefare the palles, pencile, and crlours, fir N cholas ; but by the precepts and example of that exccllent maiter, giadually rofe to the highelt reputation, and is ucdoublediy one of the beit handfape painters that ever appeared. It is generally thought that no painter ever lludied nature io better purpofe, or repretented the effeets of land-ftorms mare happi'y, than Gafpar; all his tees how a natural degree of agitation, evcry leat being in mation; his ficenes are all beautifully cholen, as are the fites of his buildings. He defigned hunan figures but very indifferently; for which reafon he frequently prevailed on Nicholas to paint them for him; and they were always introduced with the utmott propriety. While he contirued at Rome he dropped his own name, and allimedt th it of his brother in-law and tencfager, by which onily he is at prefent known. He died in 1562.

POWDER, in plarmacy. a dry medicine well broken, either in a mortar by grinding or by fome chemical operation.

Gum-Pumber. Sce Cunpowner. See alfo Obfervation: on Gumpowder in the Irilh Tranfalions $17^{83,}$ P. 97. clats Stiance, by Mr Napier.

Pomder Cheils, certain fmall boxes charged wih powder and. quantity of nid nails or fplinters of iror, and f.iftened necalionally en the deck and fides of a flip, in order to be ditcharged on an enemy who at. tempts to feize her by boarding. Thefe cafes are ufin.

Puln
Pusder.

Powder aily from 12 to 18 inches in length, and about eight or ten in breadth, laving their outer or upper part terminating in an edge. They are nailed to feveral places
of the quarter-deck and bulk-head of the waift, having a train of powder, which communicates with the inner apartments of the flip, fo as to be fired at pleafure to annoy the enemy. They are particularly ufed in merchant-hips which are furnihed with clofe-quarters to oppofe the bouders.

Pormek Magazine, a bomb-pronf arched building, to contain powder in fortified places.

Pormber for the Hair. 'ilhe bett fort is march well fromed and fifted, and generally prepared with fome perfume.

Fima's's Pomrnfr. See J:mas's Powder. In the Ihtofuphical Tranfactions tor 1791, p. 317. there is a paper by In learfon, containinge experiments and obtervations on James's powder. Dr Fearfon fay's, it was originally a patent medicine ; butit is wall known that it cannot he prepared by following the diredtions of the fecification in the cont of chancery. His obfervations :and experiments, therefore, he thinks, may explain the rature and manner of preparing this medicine, and perlaps may extend the hifury of antimony. The refult of the whole, in Dr Pearfon's own words, is as follows:
r. James's powder conlitts of phofphoric acid, lime, and ancimonial calx; with a minute grantity of calx of iron, which is confidered to be an accidental fubftance. 2. Either thefe three eflential ingredients are united with ach other, forming a triple compound, or phofphorated line is combined with the antimonial calk, compoling a double compound in the proportion of about 57 parts of calx and 43 parts of phofphorated lime. 3. This antimonial calx is different from any other known calx of antimony in feveral of its chemical qualities. About threc-fourths of it are foluble in marine acid, and afford Algaroth powder ; and the remainder is not foluble in this menftrum, and is apparently vitrified. It alfo ap. pears, that by calcining together bone-afhes, that is, phofphotated lime and antimony in a certain proportion, and atterwards expofing the mixture to a white heat, a compound was formed, confiting of antimonial cals and phophorated lime in the fame proportion, and polle lling the lame kind of chemical properties as James's puvider.

POWDIKE, in the fens of Norfolk and Ely. By fat. 22 Hen. VIll. c. It. perverfely to cut down and deltroy the powdike in the fens of Norfolls and Ely is felony. See Blachfone's Commentaries vol. iv. p. 243 .

POWER, has been defined the faculty of doing or futiering any thing. Power, therefore, is two-fold, viz. confidered as able to make, or able to seceive, any change; the former whereof may be called adive, and the latter $p: \sqrt[F]{ }$ wer, ponver : but this diltinction is improper. Sce Metaphysigs, no 116.

Power, in mechanics, denotes any force, whether of a man a horfe, a furing, the wind, water \&c. which being :applied to a machine, tends to produce motion.

Power, in law, fignifies in general a particular authority granted by any perfon to another to reprefent him, or to act in his ftead.

POWERS in arithmetic and algebra, are nothing but the products arifing from the continual multiplicafinms of a number or quantity into itfelf. See Aler. Bra and Aritemetice

POX, French-Pox, or Lues Venerea. See Mebl. CINE, $1^{\circ} 350$

Small-Pux See Inoculation, and Medicine, $n^{\circ}$ 222-225.

POYNING's law, an act of parliament made in Ireland under Henry VII. whereby all the fatues of force in England were made of force in Ireland; whlich before that time they were not.-Nor are any now in force there made in England fince that time.

The law took its name from Sir Edward Poyning, lord-lieutenant of that kingdom at the time of its making. See Ireland, ${ }^{\circ} 46$.

## j'ozzolana, See Puzzolana.

PRACTICE, in arithmetic. Sec there, $n^{\circ}$. 6. \& c.

Gun-P $P_{\text {acfice, }}$ in Englifh military education. In the fpring, as foon as the weather permits, the exercife of the great guns begins, with an intention to fhow the gentlemen cadets at the royal military academy at Woolwich, and private men, the manner of laying, loading, peinting, and firing the guns. Sometimes inftruments are ufed to find the centre linc, or two points, one at the breech, the other at the muzzle, which are marked with chalk, and whereby the piece is dirceted to the target : then a quadiant is put into the mouth to give the gun the required elevation, which at firft is guefled at, according to the diftance the target is from the piece. When the piece has been fired, it is fponged to clear it from any duft or fparks of fire that might remain in the bore, and loaded : then the centre line is found as before; and if the thot went too high or too low, to the right or to the left, the elevation and trail are altered accordingly, This practice continues morning and evening for about fix weeks, more or lefs according as there are a greater or lefs number of recruits. In the mean time others are fhown the motions of quick-firing with field-pieces.

ATortar-PRACIICE, generally thus. A line of 1500 , or 2000 yards is meafured in an open fpot of ground from the place where the mortars Itand, and a fiag fixed at about 300 or 500 yards: this being done, the ground where the mortars are to be placed is prepared and levelled with fand, fo that they may lie at an elevation of 45 degrees; then they are loaded with a fmall quantity if powder at firf, which is increafed afrerwards by ans ounce every time, till they are loaded with a full charge; the times of the flights of the thells are obferved, to determine the length of the fuzes. The intention of this prafice is, when a mortar battery is raifed in a fiege, to know what quantity of powde: is required to thow the fhells into the works at a given diftance, and to cut the fuzes of a juft length, that the hell may burft as foon as it touches the ground.

PRAMUNIRE, in Englifh law, is taken either for a whit fo called, or for the offence whereon the writ is granted ; the one may be underftoed by the other.-The church of Rome, under pretence of her fupremacy and the dignity of St Peter's chair, took on her to beftow molt of the ecclefiaftical livings of any worth in England, by mandates, before they were void; pre. tending therein great care to fee the church provided of a fuccellor beiore it needed. Wherce thefe mandates or bulls were called gratix expeßlative, or frovifionts; whercol dee a learned difcouite in Duarchus ode
lengeficis, lib. 3. cap. 1. Thace provifions were fo common, that at laft Edward 1. not digefting fo intolerable an encroachment, in the 35 th year of his reign made a ftatute againft papal provitions, which, according to Sir ldward Coke, is the foundation of all the fubrequent Itatutes of promunire: which is ranked as an offence immediately againft the king, becaufe every encouragement of the papal power is a diminution of the authority of the crown.

In the weak rcign of Edward II. the pope again endeavoured to eneroach, but the parliament mantully withitood him; and it was one of the articles charged againt that unhappy prince, that he lad given allowance to the bulls of the fee of Rome. But Edw. III. was of a temper extreniely dificrent; and, to remedy thefe inconveniences, fifft by gente means, he and his nobility wroce an expoftulation to the pope: but receiving a menacing and contemptuons aniver, withal acquainting him, that the emperor (who a few years before at the diet of Nuremberg, A. D. 1323, had eftablifhed a law againt provifions), and alto the king of France, had lately fubmitted to the holy fec; the king replied, that if both the emperor and the French king fhould take the pope's part, he was ready to give battle to them both, in defence of the liberties of the crown. Hereupon more fharp and penal laws were devifed againft provifors, which enact feverally, that the court of Rome fhall prefent or collate to no bihop. ric or living in England; and that whoever difturbs any patron in the prefentation to a living by virtue of a papal provifion, fuch provifor thall pay fine and ranfom to the king at his will, and be imprifoned till he renounces fuch provifion; and the fame punifhment is inficted on fuch as cite the king, or any of his tubjefts, to anfwer in the court of Rome. And when the holy fee refented thefe proceedings, and pope Urban V. attempted to revive the vaffalage and ammalrent to which ki,g John had turjeated his kingdom, it was unamimoully agreed by all the eftates of the realm in parliament aflembled, 40 Ediv. III. that king John's donation was tull and void, being withont the concurrence of parliament, and contrary to his coronationo.th, and all the temp.rary nobility and commons engaged, that if the pope flonld endeavour by procefs or otherwife to maintain thefe ufurpations, they would refift and withltand him with all their power.
In the :eiga of Richard 11. it was found neceflary to fharpen and frengthen thefe laws, and therefore it was enacted by flatutes 3 Ric. II. c. 3. and 7. Ric. II. c. 12. firf, that no alien flall be capable of letting his benefiec to farm ; in order to compel fuch as had crept in, at leaft to refide on their preferments: and aiterwards, that tio alien fhould be capable to be prefented to any ecclefianical preferment, under the penalty of the fiatutes (f) provifors. By the fattute 12 Rich. II. c. 15: all liegemen of the king accepting of a living by any foreign provilion, ane put out of the king's pro. tegion, and the beuffice made void. To which the flatute 13 Rich. II, At. 2. c. 2. adds banifhenent and fafeiture of l.and and goods: and by c. 3. of the fame natute, any perion bringing over auy citation or excommunication from beyond fea, on account of the execution of the foregoing flatutes of provifors, fhall be imprifoned; forfeit his goods and lands; and moreover fuffer pain of life and member.

## PR A

In the writ for the exccution of all thefe thaturen, the words premanire faizias being ufed to comnand at citation of the parsy, have denominated in common fipech, not only the writ, but the offence itfelf of maintaining the papal power, by the name of framanire. And, according!y, the next thatuse we flall mention, which is generally referred to by all fubfequent flatute,, is ulually called the flature of promunire. It is the Itatute 16 Riclard LI. e. 5. which ena:ts, that wheever procures at Rome, or clicwhere, any tranfations, procefles, excommunications, bulls, infruments, or otlicr things which 1 mach the king, açainalt him, his crown, and realm, and all perfons aiding and affilling there:n, Thall be put out of the king's protcction, their lands and goods forfeited to the ling's ufe, and they thall ha attached by their bodics to antwer to the king and his council ; or procefs of pramanire fucias flalll te made out againft them as in other cafes of provifors.

By the flatute 2 Henry IV. c. 3 . all perfons who accept any provition from the fope, to be exempt from canonical obedience to their proper ordinary, arc alfo fubjected to the penalties of premunire. And this is the latt of the ancient flatutes tonching this offence: the uturped civil power of the bithop of Rome bein. pretty well broken down by thefe flatutes, as his ufur;ed religious power was in about a century afterwards: the fipirit of the nation being fo much raifed againt forcigners, that about this time, in the reign of Hen. V. the alien priories, or abbeys for forcign monks, were finprefled, and their lands given to the crown. And no farther attempts werc alterwards made in fuppors of thefe fereign juiduictions.

This, then, is the original meaning of the offence which we call pranumire; vis, introducing a foreign power into the land, and creating inperiunn in imperio, by paying that obedience to papal precefs which conftitutionally belonged to the king alone, long before the Reformation in the reign of Henry VIII. at which time the penaltics of promunire were indeed extended to more papal abufes than befure ; as the kingdom then entirely renounced the authority of the fce of Rome, though not at all the corrupted doctrines of the Romata church. And therefore, by the feveral fatuies of $2+$ Hen. VIII. c. 12 and 25 Hen. VItI. c. Ig. \& 21 . 10 appeal to Rome from any of the king's courts, whicis (though illegal before) had at times heen comived at ; to fiue to Rome for any licence or difipenfaion, or to obey any procefs from thence, are made hiable to the pains of premunire. And, in order to rellore to the king in effect tlie nomination of vacant bilh prics, and yet keep up the eflablifhed forms, it is enacted by thatute 25 Hen. VIII. c. 20 . that if the dean and chapter refufe to elet the perfon maned by the king, or any arclabifhop or lifhop to confirm or confecrate him, they thall fall within the penalities of the tatutes of promunire. Alfo by flatute 5 Eliz. c. i. to refufe the oath of fupremacy will incur the pains of promunire; and to. defend the pope's jurididion in Britain, is a promunire for the firlt offence, and high treafon for the tecond. So, too, by ftatute 13 Eliz. c. 2. to import any agnus Dci, crolfes, beads, or other fuperflitious things pretended to be hallowed by the bith po of Rome, and tender the fume to be ufed; or to receive the fame with fuch intent, and not difeover the offender ; or if it juftice of the peace, knowing thereof, thatl not wi:hin

14 days declare it to a privy-counfellor, they all incur a permunirc. But impor:ing or felling mafs-bocks, or other Popifh books, is by flat. 3. Jac. I. c. 5. \$ 25 . only li.ble to a penalty of 4.0 s . Laitly, to contribute 10 the maintenance of a Jefiuit's college, or any Popith feminary whatever beyond fea, or any perfon in the fame, or to contribute to the maistenance of any Jefuit or Popih prieft in England, is by fatute 27 El:z, c. 2 . made liable to the penalties of promunire.

Thus far the penalties of pramunire feem to have l.ept within the proper bounds of their original inlticurion, the dejreffing the powcr of the pape : but they being pains of ro confdarable confequence, it has been thought fit to apply the fime to othcr heinous offences; fome of which bear mone, and fome lef, relation to this original offence, and fome no relation at all.

Thns, i. Dy the ftatute i \& 2 lh . and Mar. c. 8. to molet the poliefiors of abbey-limds granted by parliament to Heary VIlf. and Edward VI is a premunire. 2. So likcwite is the offence of asing as a broker or agent in any ufurious contradt where above 10 per cent. increft is tahen, by ftatute 13 Eliz. c. 10. 3.'To obthin an.j ftay of proceedings, other than by arrelt of judgment or writ of error, in amy fuit for a moncopoly, is hitewnfe a promunire, hy fat. 21. Jac. I. c. 3. 4. I'o obtain an exciufive patent for the fole making or importation of gunpowder or ams, or to hinder others from innporting them, is alfo a pixmunire by two flatutes; the cne 16 Car. I. c. 21 . the other 1 Jac. II. c. 8. 5. On the abolition, by flat. 12. Car. II. c. 24. of purveyance, and the prerogative of pre-emption, or taking any vicual, bcaf, or goods for the kirg's ufe, at a Itated price, without confent of the proprietor, the exortion of any fuch power for the future was declared to incur the penalties of promunire. 6. To affert, malisioully and adviledly, by fyeaking or writing, that both or either houfe of pan liament have a legiflative authority without the king, is declared a premunire by fatute 13 Car. II. c. 1. 7. Dy the labeas corpus act allo, 31 Cir. II. e. z. it is a premurirc, and incapable of the king's pation, befides other heavy penalties, to fend any iubject of the realm a frifoner into parts beyond the feas. 8. By the fatute I W. \& M. At. 1. c. 8. perfons of 13 years of age refuting to take the new oaths of allegiance as well as fupremacy, upontender by the profer magiftrate, are fubject to the penalties of a promunire; and by flatutes 7 \& 8 W. I1I. c. 24. Serjeants, comfellors, proctors, attorneys, and ail officers of courts, prakifing wihout having taken the oaths of allegiance and fupremacy, and fubfribed the declaration againlt pepery, are guily of a premunire whether the caths be tendered or not. 9 . By the flatute 6 Amm. c. 7. to affert malicioufly and directly, by preaching, teaching, or advied fecaking, that the then pretended prince of Wales, or any perfon other than according to the acts If fotilament and union, hath any right to the throne of thefe kingdoms, or that the king and pasliament canroo make laws to limit the defeent of the crown; fuch preaching, teaching, or advifed fpeaking, is a promunire: as writing, printing, or publifhing the fame doctrines amounted, we may remember, to high treafon. 10. By Ratute 6 Ann. c 23. if the affembly of peers of scotland, convered to eleet their 16 reprefentatives in the Buitith pariament, fhall prefume to treat of any other matter five orly the elcaion, they incur the penalios
cf a p:æmunire. 11. Tle fat. 6 Gco. İ. c. 1s. (enactcd in the ycar after the infamous South Sea prnject had begg.ared half the nation) makes all nuwarrantable undertahings by unlav:ful libificiptions, then commonly known by the mame of lublids, dubject to the penalics of a premunire. 12. The llat. 12. Geo. III. c. II. fubjects to the penalties of the fatute of promin. nire all fuch as knowingly and wilfully folemnize, affitt, or are prefent at, any forbided nantiage of fuch of the defcendants of the body of ling Geo. 11. as are by that act prohibited to contsact matimony wihout the confent of the crown.

Having thus enquired into the nature and fereral fpecies of premunire, its punifhment may be gathered from the foregoing tatutes, which are thus nortly fummed up by Sir Eduard Coke : "Lhat, from the conviction, the defendant thall be out of the king's pretection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body flall semain in prifon at the king's pleafure, of (as other authorities have it) during life; both which anount to the fame thing, as the king by his prerogrative may at any sime remit the whole, or any part of the punifhment, except in the cafe of tranfgrefing the ftatute of babeas corpus. Thefe forfeitures here infisted do not (by the way) bing this offence within cur former definition of Flisons ; being infliced by particular flatutes, and not by the common law." lut foodious, Sir Edward Coke adds, was this offence of promunire, that a man that was attanuted of the fame, might have been flain by any other man with. out danger of law ; becaufe it was provided by law, that any man might do to him as to the king's enemy; and any man may lawfully kill an enemy. However, the pulition itfelf, that it is at any time lawful to kill an enemy, is by no means tenable: it is cnly lawful, by the law of nature and nations, to kill him in the heat of battie, or for necelfary felf-defence. And to obriate fuch favare and miftaken notions, the fatute 5 Eliz. c. I. provides, that it thall not be lawful to kill any perfon attainted in a promunire, any law, fatute, opinion, or expontion of law to the contrary notwithtand. ing. But jlill fuch delinquent, though protected as a part of the public from public wrongs, can bring no action for any private injury, how atrocions foever; being fo far out of the protection of the law, that it will not guard his civil righte, nor remedy any grievance which he as an individnal may fuffer. And no man, knowing him to be guilty, can with fafcty give him comfort, aid, or relief.

PRFNESTE (anc. geng.), a town of Latium, to the fonth-ealt of Rome, tuwards the territory of the Equi ; a flace of great frength. Iramous for the tem. ple and oracle of Fortune, called Sories Pranefind (Strabo) ; which Tiberins warted to deftroy, but was deterred by the awful majelty of the place. From a colony it vas raifed to a municipium by Tiberius (Inferiptions, Florus, A. Gellius), on the confideration of his reco:ery from a dangerous illnets near this place. 'Thither the Roman emperors ufually retired, on account of the agreeablenefs of the fituation (Suetonius). It was a very ancient city, with a territoyy of large extent (Livy). The temple of lortune was built in the molt fumptunus manner by $\mathrm{S}_{\mathrm{y}} \mathrm{l}_{\mathrm{a}}$, and the pavement was Mo . faic worl (Pliny). Concerning the Sortes, there is a rumatlable pafige in Cicero; who fays, that it was all
ium a mere contrivance, in order to deceive, cither for the purpofes of gain or fuperfition. The cown that has fisceeded it fands low in a valley, and is called Pal.ftrina, in the Campania of Rome. E. Longr. 13. 30. N. I.at. 42.0 .

PRASSIDIUM (Notitia), a town of the Cornavii in Iritain. Now thouglat to be Warwick (Camden).Another of Corfica (Antonine), 30 miles th the fouth of Aleria.- A third Prafiditum furnamed Julium, it Bxtica (Pliny).

PR AECORIA avgusta (Ptolemy), a town of Daciar. Now called Braflow by the natives, and Cronfladt by the Germans (Bandrand) : a town in Tranfylvania. L. Long. $25^{\circ}$. N. Lat. $47^{\circ}$.-Another of the Salafli, near the two rates or defiles of the Alps, the Grajx and Pinninæ (Pliny) ; a Roman colony, icttled by Auguftus after the defeat of the Salafii by Terentius Virro, on the fpot where he encamped (Strabo, Dio Gafius, Ptolemy), fituated on the river Duria Major. The town is now called Aofla or Aouff, in Piedmont. E. Long. 7. 14. N, Lat. 45. 19.

PRAETORIUM (Antonine, Notitia Impcrii), a town of the Brigantes. Now Paterington (Camden), near the mouth of the Humber in Yorkihire. Cozeniry (Talbot).

PRAGMATIC sanction, in the civil law, is defreed by Hottoman to be a refcript or anfwer of the fovereign, delivered by advice of his council, to fome college, order, or body of people, upon confulting him on fome cafe of their community. The like anfwer given to any particular perfon is called fimply refcript.

The terns pragmatic function is chiefly applied to a fettlement of Charles VI. emperor of Germany, who, in the year 1722, having no fons, fettled his hereditary dominions on his eldeft daughter the archduchefs Maria Thercfa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States-General, and moft of the powers in Europe. The word pragnatic is derived from the Greek $\pi$ fajua, negotium, "bufinefs."-It is fometimes alfo called abfolutely pragmatic, to $\pi \neq \alpha \gamma \mu a t$ ко $0^{\circ}$

PRAGUE, a city of Bohemia, and capital of the whole kirgdom, is fituated $14^{\circ} 40^{\prime}$ of longitude, and $50^{\circ} 5^{\prime}$ of latitude. It fands on both fides the Moldau, over which there is a bridge 700 feet long, bnilt of large frecthone. The river, though of great breadth hore, is neverthelefs thallow, and not navigable. On loth fides the bridge are feveral flatues, and among nthers that of St John of Nepomuch, whom king Wenfol caufed to be thrown from the bridge into the river, for renturing to reprove him upon fome occafion; but in 1720 he was canonized as a faint, and is at prefent Feld in fuch veneration in Eohemia, that all other faints faem on his account to be forgoiten. Near the bridge, which flands at the upper part of the city, the number of people is very great, but the further you go from thence the more defolate you find every place. The city is about three miles long and two brnad; the number of its Chriftian inhabitants is faid to be 70,000 , and of Jews about $12,0<0$. The principal branch of i's trade confilts in brewing of beer. It is divided into the Old and the New Towns, and that called the Small fide; the former lying on the eaft fide of the Moldan, and the latter on the weft. The whole is about 12 mities in circunference. The fortincations are not of
great importance, as it may be fanked and raked on Pragive. ali fides. However, the king of Pruffia was not able to make himfelf maner of it in the late war, though he almoft deftroyed it with his bon:bs, sec. Sce Prussin, $n^{\circ} 24$. \&c.- It hath fuffered greatly $\mathrm{D}_{\mathrm{y}}$ fieges, and bath been often taken and plundered. The univerfity was fonnded by Charles IV. in the jear $134 \%$. In 1409, when John Hufs wats re?or of the univertity, there were no lefts than 44,000 Rudents; and when thic emperor Chatles V. wonld have retrenched their privilegres, 24,000 are faid to have left it in one week, and 16,000 in a flort time after. The Jews have the trade of this city almof entirely in their own hands. They deal in all forts of commodities, e.pecially the precious fones found in the Bohemian mines, and, by receiring all old-fafioned things in payment, quite ruin the Chriftian landicraffermen. In $17+4$ they narrowly efcaped being expelled the kingdom, having been fufpetted of correfponding with the Pruflians, when they made themfclves mallers of the city. The grand prior of the order of Malta, for Bohemia, Moravia, and silefia, refides here; and the church and hofpital of the Holy Ghoft is the feat of the general and grandmaters of the holy order of knights of the crofs with the red ftar, refiding in the abovementioned countries, and in Poland and Hungary. The houfes of this city are all built of ftone, and generally confit of threc ftnries: but there arc very few gond buildings in it, and almoft every thing looks dirty. The cathedral, which is dedicated to St Veit, is an old building, in which there are fome picces of excellent architefture and many magnificent tombs of great men. There are 100 churches and chapels, and about 40 cloifters in the place. On Ratchin-hill, in Upper Prague, moft of the nobility have houres, and the emperor a very magnificent pilace, and a fummer houfe commanding one of the finef profpects in the world. Here the tribunals of the regency meet; and the halls, galleries, and other apartments, are adorned with a multitude of noble pictures. The great hall, where the coronation feaft is kept, is faid to be the largeft of the kind in Europe next to that of Weftminfer. The cafte fands on the abovementioned mountain, called Ra'fchin or the White Mountain, and is very frong. From a window of this caftle the emperor's counfellors were thrown in $16+8$; bat thengh they fell from a great height, yet they were not kilied nor indeed much hurt. On the fame momtain fands alfo the archiepifoopal palace. In the Now Town is an arfenal, and a religions foundation for ladies, called the Free Tempral Entlifa Foundation, over whichan ablet:prefides. In the Leffer Side or Town, the counts Colloredo and Wallenftein have very magnificent pahaces and gardens. The ftables of the latter are very crand; the racks being of icel and the mangers of marble, and a marble pillar betwist each horfe; over c:tch horfe al:o is placed lis pisture ats big as life. Though the inlubitants of Prague in geneal are poon, and their thep; but meanly furniflied, yet, it is fuid, there are fetr cities where the nobility and gentry are more wenl:hy, and live in greater ftate. Here is much gaming, mafquerading, feating, and very fplendid public balls, with an Italian opera, and affemblies in the houfes of the quality every night. On the White Monntain, rear the cown, was fought the batte in which the l'rotefants, with Vot. XV.

## 1) in

The luffrs and drinking-glaffes made here of Boherepe. Thefe cryftais are alfo polifhed by the Jews, and fer in rings, ear-pendants, and inirt-buttons. The chiet tribunal conitts of twelve ftadtholders, at the head of whom is the great burgrave, governor of the kingdom and city, immediately under the emperor, and the chancery of Dohemia. Though the city of Prague is very i!l-built, it is pleafantly fituated, and fome of the profpects are beautiful, and the gardens and pleafure-houfes are excellent. The people, Riefbeck informis us, enjoy fenfual pleafures mere than thofe of Vienna, hecaufe tbey krow better how to conned mental erjoyments with thom. The numerous garifon kept in the place ( 9000 men ) contributes much to its gainety and livelinef.

PRAM, or Prame, a kind of lizhter ufed in Holland and the ports of the Baltic Sea, to carry the cargo of a merchant- Ship along-fule, in order to lade or to bring it to fhore to be lodged in the Itorehoufes after being difcharged cut of the velfel.

Prame, in military affairs, a kind of fleating battery, being a flat-bottomed velfel, which draws little water, mounts feveral guns, and is very ureful in covering the difembarkation of troops. They are generally made ufe of in tranfporting troops over the lakes in Anmesica.

PRAMNION, in natural hitory, the name of a femipellucid gem. This is a very fingular fone, and of a very great concealed beauty. The lapidaries, when they meet with it, call it by the name of the black agate. It is of an extremely clofe, compact, and firm texture, of a mooth and equal furface, and in thape very irreyular, being fometimes round, fometimes oblong, and nften Hits in lize it feldom exceeds two inches. It appears, on a common infpection, to be of a fine deep black; but held up againf the fun or the light of a candle, it is an elegant red, clouded by a quantity oi fubtile black earth. It is brought from the Eaft Indies.

PRASIUM, in botany: A genus of the gymnoPpermiat order, belnnging to the didjnamia clafs of fhunts ; and in the natural method ranking under the $\$ 2 \mathrm{~d}$ order, ${ }^{\text {Perticilhata. There are four monofpermous }}$ berries.

PRATINAS, a Greek poet contemporary with Fsfchylus, born at Phlius. He was the firft among the Grecks who compofed fitires, which were reprefented as farces. Of thefe 32 were acted, as alfo 18 of his aragedies, one of which only obtained the poetical prize. Some of his verfes are extant, quoted by Athenexus.

PRATIQUE, or Pratric, in commerce, a nego. ciation or communication of commerce which a mer-chant-veffel obtains in the port it arrives in and the countries it difcovers : hence to obraia a pratique, is to ob. tain liberty to frequent a port, to go athore, to buy and icll, \&ic.

PRATI (Charles), earl of Camden, was the third fon of Sir John Pratt, knight, chicf-juftice of the court an king's-bench under George I. by his fecond wife Elizabeth, daughter of the Reverend Hugh Wilfon canon of Bangor and was born in 1713 , the year before his father was called to the honour of the bench. He rowived the firf rudiments of his eduration at Eton,
and afterards remored to king's college Cambridge. Of his early life at both places there is little known, other than that at college he was found to be remarkably diligent and fludious, anel particularly fo in the hiftory and contlitution of his country. By fome he was thought to be a little too tenacious of the rights and privileges of the college he belonged to: but perhaps it was to this early tendency that we are indebted for thofe noble liruggles in defence of liberty, which, whether in or ont of cffice, he dilplayed through the whole courfe of his political life. After flaying out the ufnal time at college, and taking his mafter's degree, in 1739 be entered himfelf a fudent of the Inner Temple, and was in due time admitted by that honourable fociety as a bariller at law. And here a circumfance developes itlelf in the hitory of this great man, which thows how much chance governs in the affairs of this world, and that the mult contiderable talents and indifputable integrity will fometimes require the introduction of this miftrels of the ceremonies, in order to obtain that which they ought to polfefs from their own intrinfic qualifications.

Mr Pratt, after his being called to the bar, notwith. ftanding his family introduction, and his own perfonal character, was very near nine years in the profeffion, without ever getting in any degree forward. Whether this arofe from a natural timidity of confitution, illluck, or perhaps a mixture of defpondence growing out of the two circumftances, it is now dificult to tell; but the fact was $\mathrm{f}_{\mathrm{\prime}}$ : and he was fo difpirited by it, that he had fome thoughts of relinquibing the profeffion of the law, and retiring to his college, where, in rotatation, he might be fure of a church living, that would give him a fmall but honourable independence. With thefe melamcholy ideas he went as ufual the wellern circuit, to make one more experiment, and then to take his final determination. Mr Henly, afterwards Lord Northington and chancellor of England, was in the fanie circuit : he was Mr Pratt's molt intimate friend; and he now availed himfelf of that friend!hip, and told him his fituation, and his intentions of retiring to the univerfity and going into the church. He oppofed his intention with ftrong raillery, and got him eng:iged in a caufe alung with himeelf; and Mr Henley being ill, Mr Pratt took the lead, and difplayed a proteftonal knowledge and elocution that excited the admiration of his brother barritters as much as that of the wholecourt. He gained his caule ; and belides, h: acquired the reputation of an eloquent, profound, and conftitutional lawyer. It was this circumatance, tngether with the continued good offices of his friend Henley, which led to his future greatnefs ; for with all his ablities and all his knowledge, he might otherwife in all probability have paffed his life in obfeurity unnoticed and nnknown.

He became nuw one of the moft fuccefsful pleaders at the bar, and honours and emoluments flowed thick upon him. He was chofen to reprefent the borough of Downton, Wilts, after the general election in 1759; eecorder of Bath 1759; and the fame year was appointed attorneygeneral ; in January 1762 he was called to the degree of ferjeant at law, appointed chief-juftee of the common pleas, and knighted. His lordihip prefided in that court with a dignity, weight and impartiality, never exceeded by any of his predecelfors; and when John Wilkes, Efy ; was feized and committed to the Tower on an illegal
general

## PRA

general warrant, his Lordflip with the intrepidity of a Britith magiltrate, and the becoming fortitude of all Englifhman, granted him an baleas corpuss; and on his being brouglit before the court of common pleas, difrharged him from his confinement in the Towcr, May 6. $176_{3}$, in a fpeech which did him honour. His wife and lipirited behaviour on this remarkable occafion, to interefting to every true-born Briton, and in the comeequent judicial proceedings between the printers of The Nouth Briton and the metfengers and others, was fo acceptable to the nation, that the city of London prefented him with the freedon of their corporation in a gold box, and delired his picture, which was pu: up in Cuildhall, with this infcription:

## HANCICONEM

CAROLI PRATT, EQ.
SUMMI JUDICIS C. E .
IN HONOREM TANTIVIRI, ANGLIC有 LIBERTATIS LLGE

ASSERTORIS,
S. P. C. $\mathbf{L}$.

IN CURIA MUNICIPALI
PONI JVSSERVNT
NONO KAL. MART. A. D. NDCCLXIV. GULIELMO BRIDGEN, AR, PRR, VRB.
This portrait, painted by Reynolds, was engraved by Batire. The corporations of Dublin, Ba'h, Exeter, and Norwich, paid him tpe like compliment; and in a peticion entered in the joumals of the city of Dublin, it Was declared, that no man appeared to have acquitted himelelf in lis high ftation with fuch becoming zeal for the honour and dignity of the crown, and the fulfilling his majetty's moft gracious intentions for preferving the treedom and happinets of his fubjects, and tuch invincible fortitude in adminiftering jultice and law, as the Right Honourable Sir Chayles Pratt, kn'ghr, the prelent lord-clieff-jultice of his majelty's court of common pleas in Eugland, has thown in funie late judicial determinations which mult be remembered to his lordthip's honour while and wherever Britifh liberties are held facred.

Higher honours, however, than the breath of popular applaufe awaited Sir Charles Pratt. On the 1 oth ot July 1765 he was created a peer of Great Britain, by the $1 t y l e$ and title of Lord Camden, Baron Camden, in the county of Kent; and July 30. 1766. on the re. ligrastion of Robert earl of Northington, he was apyointed lord high-chancellor of Great Britain ; in which capacity he, in a fpeech of two hours, declared, upon the firlt decilion of the fuit agninat the melfengers who :Irrefted Mr Wilkes, that "is was the unanimous opinion of the whole court, that general warrants, excejpt in cafes of high treaton, were illegal, oppreflive, and unw.irrantable. He conducted himlelf in this high office fo as to obtain the love and efteem of all parties; but velben the taxation of Anerica was in agitation, he declared himielf againt it, and ftrongly oppoling it, was removed from his ftation in 1770.

Upon the fall of Lord North he was again taken into the adminittration, and on the 27 h ol March 1782 appointed preiident of the council; an office which he refigned in March 1783. On the $1^{1} 3$ th of May 1786, he was created Vilcount Bayham of 3ayham arbbey Kent, and Earl Camden.

Whather we confider Earl Camden as a fettofriant, calied to that ligh lituation by his talents; as a laz:ytr,
defending, fupporting, and enlarging the comittotion: or as a nun fuftaining both by his firmefs atid tintia. kcn integrity-in all he excites our general pratfe; and when we contemplate t is high and cxalted vitue, we mult allow him to have bece an honour to his countre. 11e died on the 18 th of April $179+$ at his houfe i: Hill ftreet, Berkeley-fquare, being at that time [relident of his majefty's molt honourable privy-ecimail, . governor of the charter-houfe, recorder of the city of Bath, and F. R. S.

He married Elizabeth, daughter and echeir of Nicholas Jafficrys, Efq; fonand hicir ffSir Jeffery Jafterys of Brecknock priory, knight, who died in Deecerober 1779 , and by whom he had iffue John Jafferys Pratt (now Lord Camden), born ${ }^{7}$ 759, M. P. for Bath, commil: fioner of the admiralty, 1782 , refigned and re- 1 ppointich 1785; and four daughters, Frances, marriei, 1775 , R:bert Stewart, Eiq; of Mount Stewart, comnty of Down, ${ }^{175 \%}$, and M. P. for that county; Flizabech, fingle; Saralh, married Nicholas Saintfield, Efo; county of Down, 1779 ; Jane, married 1780 William Head Jumes, E!q; fon and heir of Sir I. Head of Langley, cuenty oi Hucks. His feat at Camolen place, Chifelhurft, was the refidence of the great William Camden; on whofe death it came by feveral intermediate owners to Weftrn, Spencer, and Pratt, and was much improved by his Lordibip. His remains were interred in the family bu-rying-place at Seal, in Kent.

PRAXAGORAS, a native of Athens, at 19 years of age compoted the Hittory of the Kings of Athens, in two books; and at 22 the Life of Conftantine the Great, in which, though a pagan, he tpeaks very advantageoufly of that prince. IFe alio wrote the Hiftory of Alexander the Great. He lived unde: Conftantius about the year 345 .

PRAXITELES, a very famous Greek feulptor, who lived 330 years before Chrit, at the time of the reign of Alexander the Great. Ali the ancient writer s mention his itatues with a high commendation, efpecially a Venus executed by him for the city of Cnicos, which was fo admirable a piece, that l:ing Nicomedes offered to releafe the inhabitants from their tribute as the purchafe of it; but they refuled to part with it. The inhabitants of the ine of Cos requelled of Praxiteles al fatue of Venus; and in confequence of this application the artilt gave them their choice of two; ona of which reprefented the goddets entirely naked, and the other covered with drapery. Both of thele were of exquifite workmanfhip; althnugh the former was efleemed the mof beautiful, nevcrhelefs the intahitans of Cos had the wifdom to give the preference to the latter, from a convition that no motive whiterer couid jallify their introducing into their city any indecent Itatues or paintings, which are fo likely to tmame the paffions of young people, and lead them to immorat. ty and vice. What a reproach will this be io mony Chritians - -He was one of the çallames of Phryne the celebrated courtefan.

PRAYER, a folemn addrefs to God, which, when it is of any conliderable length, confiks of atioraticn, wi\%feffion, fupplication, interceflion, and thank fivin.

By adoration we exprets our fenfe of God's infinite perfeations, his power, wiflom, goodnels, and mercy: and acknowledge that our contant dependence is up ou Him by whom the univerfe was created and has been

## PR．A

 ハールーー・ー・
bithe：to preferved．By confifion is meant our ack now－ ledgment of our manifold tranfgreffions of the divine laws，and our confequent unworthinefs of all the goad things which we enjoy at prefent or expect to be con－ fored upon us hereater．In fupplication we intreat our omairotent Creator and merciful Judge，not to deal with us after our iniquities，but to pardon our trand－ grefin $n$ ，ard by his grace to enabie us to live hence－ forth righteoully，foberly，and godly，in this prefent world；and by Chriftians this intreaty is always made in the name and through the mediation of Jefus Clrift， becaufe to them it is known that there is none cther nume under heaven given unto men whereby they may be faved．To thefe fupplications for mercy we may likervife add our prayers fur the necefliaries of life； becaure if we feek fivf the kingdenn of God and his rightenufnef，we are affured that fuch things thall be a ided unt us．Int．weflon fignifies thofe petitions which we offer upfir others，tor friends，for enemie，for all men，efpecially for our lawful governors，whether fu－ preme or fubordinate．And thanl／giving is the expref－ fion of our grati ude to God，the giver of every good and peifect gift，for all the benefits enjoyed by us and cthers，for the means of grace，and for the hope of glo－ ry．Such are the compment parts of a regular and fo－ lema prayer，adapted either for the chmeh or for the cloiet．But an cjaculation to God，conceived on any emergency，is likewife a prayer，whether it be uttered by the voice or fuffered to remain a mere affection of the mind；becaufe the Being to whom it is addreffed difeernctl）the thouglits of the heart．

That prayer is a duty which all men nught to per－ form with humility and reverence，has been generally acknowledged as well by the untaught ba barian as by the enlightened Chriftian；and yet to this duty objec－ tions have been made by which the undertanding has been bewiklered in fophility and afironted with jargon． ＂If God be independent，omnipotent，and pirfeffed of every other rerfection，what pleafure，it has b．en aiked， can he take in our acknowledgment of thefe perfec－ tions？If he knows all things patt，prefent，and future， where is the propriety of our confefling our fins unto him？If he is a benevolent and merciful Being，he will pardon our funs，and grant us what is needful for us without our fupplications and intreaties；and if he be likewife poffeffed of infinite wifdom，it is certain that no importunities of ours will prevail upon him to grant us what is improper，or for our fakes to clange the equal and fteady laws by which the world is governed．

> "Shall burning Eina, if a fage requires,
> "Forget to thunder, and recal her fires?
> "On air or fea new noctions be impref,
> "Oh blamelefs Bethel! to relieve thy brealt?
> "When the loofe mountain trembles from on ligh,
> "Shall gravitation ceafe, if you go by?
> "Or fome old temple, nodding to its fall,
> "For Chartres' head referve the hanging wall*""
－Effay on Man．
ilts，and there is not a mathematical theosens capabie of more rigid demonfration，it is obvious that no man can think of fuch a being without having his mind frongly inprefled with the conviction of his own conftant de－ pendence upon him ；not can he＂contemplate the hea． vens，the work of Cou＇s hands，the moon，and the tars which be las ord：uneत，＂without forming the moft fub－ lime conceptions that he can of the Divine power，wif－ dom，and goodners，\＆c Bu：fuch comitinn，and fuch conceptions，whether clothe 1 in words or not，are to all iutents and purpoles what is meant hy adoration ；and are as well known to the Deity while they re rain the filent affections of the heart，as after they are fooken in the beginning of a prayer．Our adora ion，therefore， is not expreffed for the purpofe of giving infirmation to God，who underftandeth r，ur thoughts afar off；but merely，when the prayer is private，becaufe we cannut think any more than fpeak without words，and becaure the very found，f words that are well chofen affeets the heart，and helps to fix our at ention：and as the Being who fees at once the paft，prefent，and to come，and to whom a thoufand ye．rs are but as one day，ftands not in need of our infurmation；fo neither was it ever fup－ pofed by a man of rati nal piety，that he tales pleafure on his own：account in hearing his perfections enumerated by creatures of yellerday；for being independent，he has no paffions to be gratified，and being felf－fufficient， he wats as happy when exifting alone as at that moment ＂when the morning fars fan together，and all the fons of God fhouted for joy．＂Adoration is therefore pro． peronly as it tends to preferve in our minds juit notions of the Creator and Goverror of the world，and of our own conftant dependence upon him；and if fuch no． tions be ufeful to ourfelves，wh，have a part to ad in the fcale of exiftence，upon which our happincfs dc－ pends（a propofition which no theit will controvert）， adoration muft be acceptable to that benevolent God， who，when creating the world，con＇d have no other end in view than to propogate happinefs．Se Meraphy－ sics，$n^{\circ} 312$.

By the fame mode of reaforing，it will be eafy to fhow the duty of confefion and fupplication．We are not re－ quired to contejs our fins unto God，becaufe he is igno． rant of them；for he is ignorant of no hing．If he were，no rafon could be afligned for our divulging to our judge actions deferving of punifhment．Neither are we required to chy for mercy，in order to move him in whom there is no valablenefs，neither thadow of turn． ing．The Being that made the world，governs it by laws that ane inflexible，becanle they are the left；and to fuppofe that he can be induced by prayers，oblations， or facrifices，to vary bis plan of government，is an im－ pious thought，which degrades the Denty to a level with man．One of thete ingexible laws is the cunneftion eftablithed between certain difpolitions of mind and hu－ man happinets．We are enj inned to purfue a particular courfe of conduct under the dan mination of virtue，not becaufe onr viriu us actions can in any degree be of ad． vantage to him by whom we were created，but becaute they neceflarily generate in our own minds thofe difpoli－ tions which are ellential toour ultimatehappiners．A man of a malignamt，arrogant，or fenfual difpolition，wauld have no enjoyment in that heaven，where all are actua－ ted by a firit of love and puity；and it is doubtleis for this Ieafon among others，that the Chrifian reli，ion

## PRA

pear infur monatubie. If, indeed, we fippofe that in the origimal connitusion of things, when the hws of nature were cffablilhed, a determinate duration was given to the top of the m-untain and the nodding temple, with. out any rejard to forefeen confequences, it would undoubtedly be abfurd and perhaps impions to expect the law of gravitation to be fufpended by the prayers of: good man, who thould happen to be paling at the inItant decreed for the fall of th.fe oljects. But of luch a conflitution there is fo far rom being evidence, that it appears not to be confincnt with the wifl mand gondnefs of the Author of nature. This world w:is undoubtedly formed for the bahitation if man and of other animals. If fo, we malt necellarily fippofe, that in the eft wlithing of the laws of Nature, God adjufted them in fuch a manner as he faw would beft ferve the accommdation of thofe fentient beings for whofe accomm dation alone they were to be eftablifhed. Let it then be admitted, that all the human beings who were cver to exift upon this globe, with all their thought", words, and astions, were at that important moment prefent to the divine intellect, and it furely will not be impofible to cenceive, that in confequence of the forefeen danger and prayers f a good man, the deter minatc duration of the mountain and the tower might be either lengthened or fhortencd tolet him eicape. This idea of providence, and of the efficacy ot prayer, is thus illuthrated by Mr W. llaton *. "Suppofe M (fime man) certainly to fordknow, by fome means or other, that, when he fhould come to be upon lis death-bed, L would pitition fir fome particular legacy, in a manner fo earneft and humble, and with fuch a good di pofition, as would render it proper to grant his requelt : and upon this, M mikes. hi, laff auill, by which he devifes to $L$ that which was to be afked, and then locks up the wi\%; and all this many years before the death of M , and whillt L h.d yet no expectation or thnught of any fach thing. When the time comes, the pelition is made and granted; not by making any $n$, w will, but by the old one atready made, and without alterati $n$ : which legacy had, notwithlanding that, never been left, had the petition-never been prefer rel. The grant may he called the effea of a future ate and depends a- much upคn it as if it had been made after the act. Sn, if it had been forefeen, that $L$ would not fo much as afk, and he had been therefore left ut of the will, this prsierition would have been caufed by his carriage, though much later than the dare of the will. In all this mothing is hard to be admitted, if $M$ be allowed io foreka w the calfe, And thus the prayers which grod men ffer to the all-knowing God, and the noglett of prigers by others, may find filting ef. feats alrea.y lorecalted in the courfe of nature."

This folution of the difficulty prefens indeed to the mind a prodigious fcheme, in which all things to come are, as it were, comprehended under one view, and eflimated and compared together. But when it is confidered what a mafs of wonders the univerle is in other reipets; what an incomprehenfibly geat and perfect Beng God is; that he ca not be ignorant if any thing, no not of the future wa ts and dep rements of particular men; and that all thinss which derive their exiltence from him mult be confiltent with one another-it muit furely be confeffed that fuch ais adjnltment of phyfical caules to moral volitions is within the compafs of infinite power and perfeat wiflom.
votaries, and requires the cultisation of the oppofite virtues. But a perfem who has deviated far from his duty cannot think of retu:ning, unlefs he be previoufly convinced that he has gone all ray. Such convietion, whenever he obrains it, will neceffarily impre's upon his mind a feufe of his own denger, and fill his heart with forrow and remorte f $r$ ! aving tranfgreffed the laws eftablithed by the molt belevole:t of all Beings for the propacation of uriverfal feliciey: This convita of error, this fenfe of danger, and this $\mathbf{c}$ mpunation for having tr.a grefled, are all per:eived by the deity as foon as thes take place in the mind of the finmer; and he is required tur confifs his firs, only becaule the agt of conieflith tends to imprint more deepiy on his mind his own unnorthiness, and the necellity of returning immediate1y into the paths of that virtue of which all the ways are plealancrets and all the paths are peace.

In the ohjeet on, it is taken for granted, that if G -d he a benevolent and merciful Being, he will pa don our finc, and grant us what is reedful for us, whether we fupplicate him or not: but this is a grofs and palpable niltake, atiling from the objecor's ignorance of the end of virtue and the nature of man. Until a man be ferrfible of his fins and his danger, he is for the reafon already affigned incapable of pardon, becaufe his difpofition is incompatible with the happinefs of the blelled. But whenever he acquires this conviction it is impollible f.r him not to form a m.ntal wijlh that he may be pardoned; and this wilh being perceptible to the all-feeing eye of his Judge, forms the fum and fubftance of a fup. plication ior mercy. If he clothe it in words, it is only for a reafin fimilar to that which mike, him ad re his Creater and cenfefs his fins in words, that jult notions may be more deeply imprinted on his own mind. The fame reafoning holds good with refpeft, thoie prayers which we pat up for temporal bleilinge, for protection and fupport in our journey through life. We are told by high authority, that "the Lord is nigh unto all them that call upon him, to all that call up. n him in truth." This, however, is not becauie he is attrafted or delighted by their prayers and intrea:ies, but becaufe thofe prayers and intreaties fit fuch as offer them for receiving thofe benefits which he is at all times readv to pour upon all mankind. In his effence God is equal! y prefent with the righteous and with the wicked, with the fe who pray, and with thofe who pray not ; f. I " the cyes of the Lord are in every place beholding the e il and the good." But as the atmofphere equaily fur. rounds every perfin upon this globe, and yet in i's thate of greatelt purity does not affer the althmatic as it affets thofe who are wh le; fo the Divine preferce, thi ugh effientially the fame everrwhere, yet does not protect the impious an it proteds the devout, becaufe the impious are not in a ltate lapable of the Divine protection. The end for whilh G d requires the exercife of prayer as a duty, is ot his benefit but ours; becaufe it is a mean to generat - in the petiti ner fuch a dilip fition of mind as mult resder him a tpe cial oijer of that love and that pruvidential care which extend over the whole creation.

That part of the objection which refults fr m the confideration of the fixed laws of nature, and which the pet has fin finely illuftrated, prefents, it muft be conferficl, confiderable dificulties; but none which to us ap-

1rdyer. terceffion, it has bcen objected, that "to intercede for others is to prefume that we poffers an intereft with the Deity upon which leir happinets and even the profpesity of whole communities depends." In anfwer to this objection, it has been obferved by an ingenious and uleful writer $\dagger$, that "how unequal foever our knowledge of the divine economy may be 10 a complete folation of this difficulty, which may require a comprehemfion of the entire plan, and of all the ends of God's moral government, to explain it fatisfactorily, we can yet underfand one thing concerning it, that it is, after all, nothing more than the making of one man the infrument of happinets and mifery to another; which is perfectly of a piece with the conle and order that obachn, and which we mutt believe were intended to obtain 21: human affairs. Why may we not be atlited by the jrasers of other men, as well as we are beholden for our hupont to their libour? Why may not our happinefs be made in fome cafes to depend upon the intercefion as it certainly does in many upon the good offices of our neighours? The happinefs and mifery of erreat numbers we fee oftentimes at the difpofal of one man's choice, or liable to be muel affected by his condust: what geteater dificulty is there in fuppofing, that the prayers of an individual may avert a calamity from multitudes, or be accepted to the benefit of whole communities."

Thefe obfervations may perhaps be fufficient to remove the force of the objection, but much more may be faid for the practice of mutual intercefion. If it be one man's duty to intercede for another, it is the duty of that other to intercede for him; and if we fet afide the partieular relations which arife from blood, and from frerticulur ftations in fieiety, mutual intercellion mult be equally the duty of all mankind. But there is nothing (we fpeak from our own experience, and appeal to the expericuse of our readers) wheh has fo powerful a tendency to generate in the heart of any perfon good-will towards another as the confant prastice of praying to God for his happineis. Let a man regulaly proy for his enemy with all that ferioufnefs which devosion requites, and he will not long harbour refentment :againft him. Let him pray for his friend with that ard ur which friendhip naturally infpires, and he will perceive his attachment to grow daily and daily fronger. If, then, univerfal benevolence, or charity, be a difpofilion which we ought to cnltivate in ourfelves, mutual intercefion is undeniably a duty, becaule nothing centributes fo effectually to the acquitition of that fpirit which an apofle terms the end of the commandment.

When it is faid, that by interceding for kings, and all in authority, we feem to emfider the profperity of communities as depending upon on interell with God, the objector miflakes the nature and end of thele interceflions. In the profperity of any community confits great part of the happinefs of its individual members ; but that frolperity depends much upon the conduct of its governors. When, therefore, individuals intercede for their governors, the ultimate object of their prayers muft be ennceived to he their own good. As it is equally the duty of all the members of the commonity to pray for their governers, fueh interceffions are the payers of the whole community for itfelf, and of every udividual for himfelf. So that in this view of the cafe, the molt jult, we apprehend, that can be taken of it,
it is not true that fupplications and intercoffions for lings and all in autiority are the prayers of one individual for another, but the prayers of many individuals for that body of which each of then knows limfelf to be a member.

Having evinced the duty of adoration, confeflion, fupplication, and intercefion, we need not furely watte our reader's time with a formal and laboured vindicat:on of thankfgiving. Gratitude for benefits received is fo univerta'ly acknowledged to be a virtue, and ingratitude is fo deteltable a vice, that no man who lays claim to a moral charaster will dare to affirm that we ought not to lave a jut fenfe of the good. nels of God in preferving us from the numberlefs dangers to which we are expofed, and "in giving us rain from heaven, and fruitful featons, filling our hearts with food and gladnefs." But if we have this fenfe, whether we exprefs it in words or not, we offer to God thankfyiving; beeaufe every movement of the heat is open and expofed to his all-feeing eye.

In this article we have treated of prayer in general, and as the private duty of every individual; but there ought to be public as well as private prayer, which flall be confidered afterwards. (See Worship.) We have likewife obferved, that the prayers of every Chriftian ought to be offered in the name and through the mediation of Jefus Chrift, for whieh the reafon will be feet in the article Theology. We thall conclude onr refections on the general duty, with obferving, that nothing fo forcibly reftrains from ill as the remembrance of a recent addrefs to heaven for pretection and affitance. Aiter having petitioned for power to refift temptation, there is fo great an incongruity in not continuing the ftruggle, that we blufh at the thought, and perfevere left we lofe all reverence for ourfelves. After fervently devoting our fouls to God, we ftart with horror at immediate apoltacy : every act of deliberate wickednefs is then complicated with hypocrify and ingratitude: it is a mockery of the Father of Merciss, the forfeiture of that peace in which we clofed our addrefs, and a renunciation of the hope which that addrefs in. fpired. But if prayer and immorality be thos incompatible, furely the former thould not be negleeted by thefe who contend that moral virtne is the fummit of human perfection.

PREACHING. Sce Declamation, Art. I.-The word is derived from the Hebrew parafch, expsfiif, " he expounded."

PREAI AMITE, a denomination given to the in ; habiants of the earth, conceived, by fome people, to have lived before Adam.

Iface de la Pereyra, in 1655 , publifhed a book to evince the reality of Pocadamites, by which he grained a confiderable number of prolelytes to the opinion: but the anfwer of Demarets, profeffor of theology at Groningen, publiflacd the year following, put a ftop to its progrefs; though Pereyra made a reply.

His fyftem was this: The Jews he calls Adumier, and fuppofes them to have iflucd fiom Adam; and gives the title Preadmites to the Gentiles, whom he fuppofes to have been a long fime befure Adann. But this being exprefily contrary to the firll words of Genefis, Pereyra had recourfe 10 the fabulous aniquit es of the Egyptians and Chaldeans, and to Come idle rabbins, who inagined there had been another world belore that dectibued
ble defcribed by Mofes. He was apprcliended by the inquilition in Flanders, and very roughly ued, though in the lervice of the dauphin. But he appealed Irom thacir fentence to Rnme; whither he went in the time of Alexander ViI. and where he printed a retration of his book of Preadamites. See Pre-existence.

PREAMBLE, in law, the beginning of an act of a legiflature, \&c. which ferves $t o$ open the inteat of the act, and the mifchiefs intended to be remedied by it.
I'REBLDND, the maintenance a prebendary receives out of the eltate of a cathedral or collegiate church. Prebends are dillinguifhed into timple and dignit.ry: 2 fimple prebend his no more than the revenuc for its fupporr; but a prebend wit.: dignity has aiways a jurifdiction annesed to it.
PREBENDARY, an ecclefiafic who enjoys a prebend.

The difference between a prebendary and a canon is, that the fornter receives his prebend in confideration of his officiating in the church, but the latter mercly by his being recelved into the cathedral or college.

PRECARIUN, in Scots law. See Law, $N^{\circ}$ claxiii. 9 .
PRECEDENCE, in Europe, a place of honour to which a perfon is entitled. This is cither of courtefy or of right. The former is that which is due to age, eftate, \&cc. which is regulated by cultom and civility: the latter is fettled by anthority; and when broken in upon gives an astion at law.

In Great Britain, the order of precedency is as fol. lows: The king; the princes of the blood; the archbithop of Canterbury; the lord high chancellor; the archbithop of York; the lord trealirer of England; the lord prelident of the council; the lind privy feal; dukes ; the eldelt fons of dukes of the blood royal ; marquilles; dukes eldell fons ; earls ; marquiffes eldent fons; dukes younger fons; vifcounts; earls eldeft fons; marquiffes younger fons; bilhops; barons; fpeaker of the houfe of commors; lord commilliener of the great feal; rifcounts eldeft funs; earls younger fons; baroms eldef fons, privy counfellors not peers; chancellor of the excliequer; chancellor of the duchy: lnights of the garter not pecrs; lord chief juftice of the king's bencl; malter of the rolls; lord chief jultice of the common pleas; lurd chicf baron of the exchequer ; puiline judges and barons; knights banneret, if made in the Eeld; malters in chancery; vifcounts younger funs; barons yourger fons; baronets; knights bamieret; knights of the Bath; knights bachelors; baroncts eldelt fons; knights eldeft fons; baronets younger fons; knights younger fons; field and flag officers; dotors graduate; ferjeants at law; efquires; gentlemen bearing coat armour ; jeomen; tradefmen; artificers; labuturers. Note, The ladics, except thrfe of archbifhops, bilhops, and judyes, take place according to the degree of quality of their hulbands; and unmarried lalies take place according to that of their fathers.
PRECEDENT, in law, a cale which has been determined, and which ferves as a rule fur all of the fame nature.
PRECENTOR, a dignity in cathedrals, popularly called the chantor, or maller of the choir.

PRECEPT, in law, a command in writing fent by a chief juftice or jullice of the peace, for bringing a perfon, record, or other matter before him.

Paecepa oj Clare Conglat in Scots law. Sce Law, Presept Part IlI. no claxx. 28.

Pracert of S:ifn, in Scots liw. See Law, Pant III. lrecelfin. $n^{0}$ clxix. 16.
PRECEPTIVE, any thing which gives or contains precepts.

Preckpater Pofty. Sce Poetry no iqu, ace.
PRECESSION Of the EQuinozes. The mof Diarna! obvious of all the celeftial motions is the diurnal revo. revolution lution of the ftarry havens. The whole appears to of the farturn round an imaginary $A x 15$, which palfes through ${ }^{\text {ry heavcrio. }}$ two oppolite points of the heavens, called the poles. One of thefe is in our light, being very near the llar and in the tail of the little bear. The great circle which is equidifant from both poles divides the heavens into the northern and louthera hemifpheres, which are equal. It is called the equator, and it cuts the horizon in the ealt and weit points, and every ftar in it is 12 fiderial hours above and as many below the horizon, in each revolution.

The fun's motions determine the lengrth of day obervaand night, and the vicifitudes of the feafons. By a tions of the long feries of obfervations, the fhepherds of Afia were Affistic able to mark out the fun's path in the heavens; he bcing flepherdo always in the oppofite point to that winich comes to the meridian at midnight, with equal but oppofite declination. Thus they could tell the ftars among which the fun then was, although they could not fee them. They difovered that his path was a great circle of the heavens, afterward called the Ecliptic; which cuts the Equator in two oppofite points, dividing it, and being divided by it, into two equal parts. They farther obferved, that when the fun was in either of the? points of interfection, his circie of diurnal revolution coincided with the equator, and therefore the days and nights were equal. Hence the equator came to be called the Equinoctial line, and the points in which it cuits the ecliptic were called the Equinoctial points, and the fun was then faid to be in the equinoxes. One of thefe wis called the Vernal and the other the Autumais Equinox.

It was evidently an important problem in practical To deteraftronomy to determine the exat moment of the fun's mine the occupying thefe flations; for it was natural to compute time of the the courle of the year from that moment. Accordingly fyyng orctuthis has been the leading problem in the aftronomy of equinctia! all nations. It is fercep:ible of confidcrabie precifion, points.
without any apparatus of infuments. It is only neceffary to obferve the fun's declination on the noon of two or thiee days before and affer the equinoctial day. On two confecutive days of this number, his declinaticn mult have changed trom north to fouth, or from fouth to north. If his declination on one day was obferved to be $2 \mathrm{~s}^{\prime}$ north, and on the next $5^{\prime}$ louth, it follows that his declination was nething, or that he was in the equinotial point about 23 mirutes after 7 in the morning of the feccnd day. Knowing the preciie moment:, and knowing the rate of che fun's motion in the ecliptic, it is eafy to afcertain the precife point of the ecliptic in which the equater interfeeted it.

By a feries of fuch of lervations made at Alexandria Hipparhetween the years 16: and 127 belore Chrif, Hippare chus's difchus the father of our aftronomy found that the point cuverics of the autumnal equinox was abcut fix degrees to the caltward of the flar called Spica vibginis. Eager to dotermise

## PRE

Brecffion. determine every thing by multiplied oblervations, he ranfacked all the Chaldean, Egyptian, and other records, to which his trave's could procure him accefs, for obfervations of the fame kind; but he does not mention his having found any. He found, however, fome obfervations of Ariftillus and 'Timochares made about 150 years before. From thefe it appeared evident that the point of the autumnal equinox was then about eight degrees eaft of the fame Atar. He difcuffes thefe obfervations with great fugacity and rigour; and, on their authority, he afferts that the equinoctial points are not fixed in the heavens, but move to the weltward about a degree in 75 years or fomewhat lefs.

Why called the preceffion of the gquinoses

6
1mportance of the difcovery.

This motion is called the Precession of the Enutnoxes, becaufe by it the time and place of the fun's equinoctial ftation precedes the ufual calculations: it is fully confirmed by all fubfequent obfervations. In 1750 the autumnal equinox was obferved to be $20^{\circ} 21^{\prime}$ weftward rf fica virginis. Suppoling the motion to have been uniform during the period of ages, it follows that the annual preceflion is about $50^{\prime \prime} \frac{1}{3}$; that is, if the celeftial equator cuts the ecliptic in a particular point on any day of this year, it will on the fame day of the following year cut it in a point $50^{\prime \prime \prime}$ to the weft of it, and the fun will come to the equinox $20^{\prime} 23^{\prime \prime}$ before he has completed his round of the heavens. Thus the equinotial or tr pical year, or true year of feafons, is fo much fhorter than the revolution of the fun or the fidereal year.

It is this difcovery that has chiefly immortalized the name of Hipparchus, though it muft be acknow. ledged that all his aftronomical referrches have been condu fed with the fame fagacity and intelligence. It was natural therefore for him to value himfelf highly for the difcovery. It mutt be acknowledged to be one of the moft fingular that has been made, that the revolution of the whole heavens fhould not be ftable, but its axis continually changing. For it muft be obferved, that fince the equator clanges its pofition, and the equator is only an imaginary circle, equiditant from the two peles or extremilies of the axis; thefe poles and this axis mult equally change their pofitions. The equinotial points make a complete revolution in about 25745 , the equator being all the while inclined to the ecliptic in nearly the fame angle. Therefore the poles of lhis diurnal revolution muft deffribe a circle round the poles of the ecliptic at the diftance of about $33^{\frac{1}{2}}$ degrees in 25745 years; and in the time of Timochares the north pole of the heavess muft have been 30 degrecs eathward of where it now is.

Hipparchus has been accufed of plagiarifm and infincerity in this matter. It is now very certain that the precoflion of the equincxes was known to the aftro. nomers of India many ages before the time of Hipparchus. It appears alfo that the Chaldeans had a 1retty accurate bnowledge of the year of feafons. Prom their faros we deduce their meafure of this year to be 355 days 5 hours 49 minutes and it feconds, exceeding the truth only by $26^{\prime \prime}$, and much more exact than the year of Ilippaichus. They had alfo a fidereal year of 365 days 6 hours 11 minutes. Now what could recafion an attention to two gears, if they didnotfuppore the equinoxes moveable? The Eryptians alfohad a knowledge of fomething equivalent to this: for they had difcovered that the dog far was ro longer the faith ful forewarner of the ovchlowing of the Nile; and they com-
bined him with the far Fomalhafet* in their myftical Preceffic kalendar. This knowledge is alfo involved in the precepts of the Chinefe aftronomy, of much older date than the time of Hipparchus.

But all theie acknowledged facts are not fufficient for depriving Hipparchus of the honour of the difeo. very, or fixing on him the charge of plagiarifm. This motion was a thing unknown to the aftronomers of the Alexandrian fehool, and it was pointej out to them by Hipparchus in the way in which he afcertained every other pofition in attronomy, namely, as the mathematical refult of actual obfervations, and not as a thing deducible from any opinions on other fubjects related to it. We fee him, on all other oceafions, eager to confirm his own obfervations and his deductions from them, by every thing he could pick up from other aftronomers; and he even adduced the abovementioned practice of the Egyptians in corroboration of his doctrine. It is more than probable then that he did not know any thing more. Had he known the Indian preceffion of $54^{\prime \prime}$ annually, he had no temptation whatever to withhold him from uling it in preference to one which he acknowledges to be inaccurate, becaule deduced from the very fliort period of 150 years, and from the obfervations of Timochares, in which he had no great confidence.

This motion of the farry heavens was long a matter fieaven of difulion, as a thing for which no phytical reafon motions could be afirgned. But the eftabilifment of the Co- counten perniean fytem reduced it to a very fimple affair; the motion which was thought to affect all the heaventy pernica bodies, is now acknowledged to be a deception, or a falfe judgment from the appe rances. The earth turns round its own axis while it revolves round the fan, in the fame manner as we may caufe a child's top to fpin on the brim of a mill-fone, while the fone is curning flowly round its axis. If the top fin fteadily, with. out any wavering, its axis will always point to the zenith of the heavens; but we frequently fee, that while it jpins brifkly round its axis, the axis itfelf has a flow conieal motion round the vertical line, fo that, if produced, it would flowly defcribe a circle in the hearens round the zenith point. The flat furface of the top may reprefent the terreftrial equator, gradually turning itfelf round on all dides. If this top were formed like a ball, with an equatorial cirele on it, it would reprefat the whole motion very prettily, the only diference being, that the fpinning motion and thi, wavering motion are in the fame direction; whereas the diurnal rotation and the motion of the equinoctial points are in contrary directions. Even this diflimiluity may be removed, by making the top turn on a cap, like the card of a mariner's compafs.

It is now a matter fully efablinied the wile the 10 earth revclues round the fun from weft to ealt, in the earch's. plane of the ecliptic, in the courle of a year it turns round its own axis from weft to ealt in $23 h 5^{\prime} .4^{\prime \prime}$, whech axis is inclined to this plane in an angle of nently $23^{\circ} 28^{\prime}$; and that this axis turns round a lome perpen. d cular to the ecl pric in 25,745 years from eall to welt, keeping nearly the fame inclination to the ecl:ptic.By this means, its pole in the fphere of the farry heavens defribes a circle round the pole of the ecliptic at the diftance of $23^{\circ} 28^{\prime}$ nearly. The confequence of this mult be, that the terreftrial equator, when frodu-

## PRE

a circle clitant from it $23^{\circ} 28^{\circ}$, reprefentang the circle defcribed hy the pule of the equator during one revolution of the equinotinl points. Let IP be the place of this lat mentioned pole at fome given time. Round $P$ dercribe a citcle $A B C D$, whofe diameter $A C$ is $18^{\prime \prime}$. The real fituation of the pole will be in the circumference of this circle ; and its place, in this circumference, depends on the flace of the moon's afcending node. Draw EPF and Gl'L perpendicular io it; let GI, be the cclurc of the cquinoxes, and EF the colure of the folftices. Dr Bradley's olfervations thowed that the pole was in A when the node was in L, the wernal cquinox. If the node recede in $H$, thic winter iohflace, the pole is in B. When the node is in the antumal equinox at $G$, the pole is at $C$; and when the node is in $F$, the fummer folltice, the pole is in D. In all intermediate fitrations of the moon's afcending node, the pole is in a point of the cir:untference ABCD , three figns or $90^{\circ}$ more advanced.

Dr Bradley, by comparing together a great number Moreerace of obfervations, found that the mathematical theory, if an ellipp and the calculation depending on it, would correfpond much better with the obfervations, if an ellipee were fubftituted for the circle ABCD, making the longer axis $\mathrm{AC} 18^{\prime \prime}$, and the fhorter, $\mathrm{BD}, 16^{\prime \prime}$. Mir d'Alernbett determined, by the plyyfical heory of gravitation, the axes to be $18^{\beta}$, and $\mathrm{I}^{\prime \prime}, 4$.

Thefe obfervations, and this mathermatical theory, Thefe onmult be confidered as fo many fats in aftronony, and fervations we mult deduce from them the methods of conpputing the places of all celeftial phenomena, agreeable to the univerfal praticc of determining every point of the heavens by its longitude, latitude, right afcenfion, and declination.

It is evident, in the firft place, that this equation obliquity of the pole's motion makes a change in the obiiquity of the of the ecliptic. The inclination of the equator to the ecliptic. ecliptic is meafined by the arch of a great circle intercepted between their poles. Now, if the pole be in O inftead of $P$, it is plain that the obliquity is meatured by EO infteal of EP. If EP be conlidered as the mean obliquity of the ecliptic, it is augmented by $9^{\prime \prime}$ when the moon's afcending node is in the vernal equinox, and confequently the pole in A. It is, on the contrary, diminifhed $9^{\prime \prime}$ when the node is in the autumal equinox, and the pole in C ; and it is equal to the mean when the node is in the colure of the folltices. This change of the inclination of the earth's axisto the plane of the ecliptic was called the nutation of the axis by Eir Iflac Newton; who fhowed, that a change of nearly a fecond nuft oltain in a year by the acion of the fun on the promirent parts of the terreftrial fpheroid. But he did not attend to the change which would be made in this motion by the variation which obtains in the difturbing force of the moos, in confsquence of the dificerat obliquity of her action on the equator, urifing from the motion of her own olligue orbit. It is this clange which now goes by the neme nutation, and we owe its difonery entirely to Dr Baadiey. The gencral change of the pofition of the earih's anis has been termed deviation by modern aftronomers.

The quantity of this change of oblicquity is eatily afo ounatity certaincd. It is evident, from what has been already of it cafity faid, that when the poie is in O , the arch ADCO is afcertani-

3 M
eq"al ${ }^{* d}$

## IR [ [ 458$] \quad$ PR E

Frecefion.
equal to the node's longitude from the vernal equinox, and that PM is its cofinc ; and (on account of the fmallnefs of AP in comparifon of EP) PM may be taken for the change of the obliquity of the ecliptic. This is theretore $=99^{\prime \prime} \times$ cof. long. node, and is additive to the mean obliquity, while O is in the femicircle BAD , that is, while the lengitude of the node is from 9 figns to 3 figus; but fubtractive while the longitude of the node changes from 3 to 9 figns.
But the nutation clanges alfo the longitudes and right afcenfions of the fiars and planets by changing the enuinodial points, and thms occafinning an equa. tion in the precefion of the equinoctial points. It was this circumftance which made it neceflary for us to confider it in this place, while exprefsly treating of this preceflion. Let us attend to this derangement of the equinoctial points.

The great circle or moridian which paffes through the poles of the ecliptic and equator is always the filAitial crlure, and the equinoctial colure is at right angles to it: therefore when the pole is in P or in O , EP or EO is the follitial colure. Let S be :any fixed ftar or planct, and let SE be a meridian or circle of longitude ; draw the circles of declination PS, OS, and the circles $\mathrm{M}^{\prime} \mathrm{EM}^{\prime}$, $m$ Enn', perpendicular to PE, OE.

If the pole were in its me:un place $P$, the equinotial points would be in the ecliptic meridian M ${ }^{\prime} \mathrm{EM}^{\prime}$, or that meridian would pafs through the interfections of the equator and ecliptic, and the angle MES would meafure the longitude of the far $S$. But when the pole is in O , the ecliptic meridian $\mathrm{mE} \mathrm{E} \mathrm{m}^{\prime}$ ' will pafs thro' the equinocial points. The equinodial points muit therefore be to the weftward of their mean place, and the equation of the precellion mut be additive to that preceffion; and the longitude of the har $S$ will now be incafured ty the angle $n_{2} \mathrm{ES}$, which, in the rafe here efprefented, is greater than its mean longitude. The dillierence, or the equation of longitude, arifing from the nutation of the earth's axis, is the angle OEP, or $\frac{\mathrm{OM}}{\mathrm{OE}}$ OM is the fine of the angle CPO, which, by what has heen already obferved, is equal to the longitude of the nidde : Therefore OM is equal to $91 \times$ lung. node, and $\frac{O M}{U E}$ is equal to $\frac{g^{\prime \prime} \times \text { fin. long. node. }}{\text { fin. obliny. eclip. This equation is }}$ additive to the mean longitude of the flar when $O$ is In the femicircle CBA, or while the afcending node is jafling backwards from the vernal to the antumal equimons but it is fubtrative from it while O is in the femicircle ADC , or while the node is paffing backwards from the atummal to the vernal cquinox; or, to exprefs it more briefly, the equation is fubtractive from the mean angritude of the fart, while the afeending node is in the fint fix figns, and additive to it while the node is in the lat fix figns.

This equation of Inngitucle is the fame for all the ft.ute, for their longitude is reckoned on the ecliptic (which is here fispofed invariable) ; and therefore is :Hhected only by the wariation of the peine from which the le ngitude is computal.

The right afention, being computed on the equator, fuffers a double change. it is computed from, ir begrins at, a different point of the equator, and it tormimates at a difornt foint: becaule the equator having
changed its pofition, the circles of declinationalio clange Preces theirs. When the pole is at $P$, the right afcenfion of $S$ from the folfitial colure is meafured by the angle SPE, contained between that colure and the ftar's circle of declination. But when the pole is at O , the right affenfion is meafured by the angle SOE, and the difference of SPE and SOE is the equation of right afcenfion. The angle SOE confits of two parts, GOE and GOS ; GOE remains the fame wherever the flar $S$ is placed, bat GOS varies with the place of the flar.We mult firl find the variation by which GPE becomes GOE, which variation is common to all the flars. The triangles GPE, GOE, have a comftant fide GE, and a conflant angle G ; the variation PO of the fide GP is extremely fmall, and therefore the variation of the angles may be computed by Mr Cotes's Fluxionary Theorens. See Simpfon's Fiuxtions, \& 253, \&xc. As the tangent of the fide EP, oppofite to the conftant angle $G$, is to the fine of the angle EPG, oppofite to the conitant fide EG, fo is PO the variation of the fide GP, adjacent to the conflant angle, to the variation $x$ of the angle GPO, oppofite to the conitant fide EG. This gives $=\frac{9^{\prime} \times \text { lin. long. node. }}{\text { tang. obl. eclip. }}$

This is fubtractive from the mean right afcenfion for the firft fix figns of the node's longitude, and additive for the laft fix figns. This equation is common to all the fars.

The variation of the other part SOG of the angle, nther ${ }^{2}$ which depends on the different pofition of the hous riatior circles P'S and OS, which caufes them to cut the equa. \& e. tion in different points, where the arches of right afcenfion terminate, may be difcovered as follows. The triangles $S P G, S O G$, have a conitant fide $S G$, and a conttant angle G. Therefore, by the fame Cotefian theorem, tan. $\mathrm{SP}:$ fin. $\mathrm{SPG}=\mathrm{PO}: y$, and $y$, or the fecond part of the nutation in right afcenfion, $=$ $9^{\prime \prime} \times$ fin. diff. R. A. of far and nede

## cotan. declin. Itar

The nutationalifo affects the declination of the fars : Nutot ${ }^{2}$ For SP, the mean codeclination, is changed into SO. - affects Suppofe a circle defcribed round S , with the diffance decline SO cutting SP in $f$ : then it is evident that the equa- timns, tion of declin. is Pf $=P O \times$ cofine OPf $=9^{\prime \prime} \times$ fign ${ }^{\text {fars. }}$ r. alcen. ittur-long. of node.

Such are the calculations in conftant ufe in our a- A mor ${ }^{2}$ flonomical icfearches, founded on Machin's Thenry. aci mo When Atill greater accuracy is required, the ellipticill of calc theory muft be fubftituted, by taking (as is expreffed tion. by the dotted lines) $O$ in that point of the eilip ce defaibed on the tranfiorte asis $A C$, where it is cut by OM, drawn according to Machin's theory. All the change made here is the diminution of $O M$ in the ratio of 18 to 13,4 , and a correfponding diminution of the angle CPO. The detail of it may be feen in De ha Lande's Afronomy, art. 2874 ; but is rather forcign to our prefent purpore of explaining the preceflion of the equinoses. The calculations being in every cafe tedious, and liable to miftakes, on account of the changes of the figns of the different equations, the realous promoters of allonomy have calculated and publithed tables of all thefe equations, both on the circular and elliptical hypothefis. And fill more to abridge calcula:ions, which occur in reducing every atf ronomical obfervation, when the place of a plicnomenon is deduced from a compari-

## PRE

 tables of nutation and preceflion, for fome hundreds of the pincipal itarz, fur every polition of the moon's node and of the fin.It now remains to confider the preceflien of the equinosial points, with its equations, arifing from the nutation of the carth's axis as a phyfical phenomenon, and to endeavour in account for it upon thofe mechanical principles which have fo happily explained all the other phenemena of the celeftial motions.

This dill net efcape the penetrating eye of Sir Ifac Newton; and be quickly found it to be a confequence, and the molt beautiful proof, of the univerfal gravitation of all matter to all matter; and there is no part of his immortal work where his fagacity and fertility of refource thine more confipuoully than in this inveftigation. It mult be acknowledged, however, that Newton's it relligation is only a direewd gues, fuunded on allumptions, of which it would be extremely difficult to demonifrute either the truth or fallity, and which required the genius of a Newton to pick out in fuch a complicatimi of abfrufe circumbltances. The fobject has occupied the attention of the firf mathematicians of Europe fince his time; and is f:ll confidered as the moft curious and dificult of all mechanical problems. The molt elaborate and accurate differtations on the preceffinn of the equinoxes are thofe of Sylvabella and Walmelly, in the Philofoplical Traufagions, publithed about the year 1754; that of Thomas Simpfon, publithed in his Nifeelianecus Tracts; that of Faiher Frifus, in the Memnirs of the Perlin Academy, and afterwards, with great improvenents, in his Colmogiaphia ; that of Euler in the Miemoirs of Berlin; that of D'Alembert in a feparate differtation ; and that of De la Grange on the Libration of the Mocn, which obtained the prize in the Academy of Paris in 1760 . We think the differtation of Father Frifins the moft perficicunus of them all, being ennduged in the method of geometrical analylis; whereas moft of the others procced in the fluxionary and fymbolic method,- which is frequently deficient in dillinat noti ns of the quantities under confideration, and therefore docs not give ns the fame perficuous convistion of the trath of the refults. In a work like ours, it is impolible to do juntice to the problem, withcut entcring into a detail which would be thought extremely difproportioned to the fubject by the generality of our readers. Yet thofe who have the necelfary preparation of matlematical knowledge, and wifl to underland the fubject fally, will find enough here to give then a very diflinet untion of it; and in the article Ro. ration, they will find the fund.mental theorems, which will enable them to carry on the invelligation. We fhall firft give a thort fketch of Newten's invelligation, which is of the mott palpable and popular kind, and is highly valuable, not only for its ingenaiy, but alfo becaule it will give our unleaned readers dillinct and fatisfactory coniceptions of the clief circumitauces of the whole $f$ henomena.
Let $S$ (fir. 2.) be the Sun, E the Earth, and M the Moon, nleving in the orbit NMCD $n$, which cats the plane of the Lecli, tic in the line of the nodes $N u$, and has one half raifed atove it, as reprefented in the figure, the other half being hid below the Ecliptic. Suppole this orbit lolded down; it will cnincide with the Ecliptic in the circle Nmadu. Let EX reprefint the
axis of this orbit, perpendicular to its plane, and there. Prec: finn, fore inclined to the Ecliptic. Since the Moon gravitates to the Sun in the direation MS, which is all above th: Ecliptic, it is plain that this gravitation has a tendene: to draw the Moon towards the Ecliptic. Suppofe this force to be fuch that it would draw the Nioon down from M to $i$ in the time that the would have moved from M to $t$, in the tangent th her orbit. Liy the combination of thefe motious, the Moon will defict her orbit, and detcribe the line Mr , which makes the diaronal of the parallelogram: and if no farther action of the fun be fuppofed, hle will deferibe anothcr orbit Mon', lying between the orbit MCD $n$ and the Ecliptic, and fhe will come to the Ecliptic, and pafs through it in a point $n$ ', nearce to M than $n$ is, which was the former place of her defcending node. Dy this change of orbit, the line EX will no longer be perpendicular to it; but there will be annther line E.x, which will now be perpendiculis to the new orbit. Alfo the Moon, moving from $M$ to $r$, does not move as if the had come from the afoendings mode N, but from a point N' lying beyond it ; and the line of the nodes of the nrbit in this new polition is $\mathrm{N}^{\prime} n^{\prime}$. Alfo the angle $\mathrm{MN}^{\prime} n$ is lefs than the angle MNm .

Thus the nodes flift their places in a direstion cppofite to that of her motion, or move to the weltward; the axis of the orbit changes its polition, and the crbit itfelf changes its inclination to the eclip ic. Thefe momentary changes are different in different pazts of the orbit, according to the pofition of the lire of the nodes. Sometimes the inclination of the orbit is increafcd, and fometimes the nodes move to the ealtward. But, in general, the inclination increafes from the time that the nodes are in the linc of Syzigee, till they get into quadrature, after which it diminifhes till the nodes are again in fyzigee. The nodes advance only while they are in the ortants after the quadratures, and while the moon palfes from quadrature to the node, and they recede in all other fituations. Therefore the recefs ex. cceds the advance in every revolution of the moon romat the earth, and, on the whole, they recede.

What has been faid of one Moon, would be true of each of a continued ring of Moons furrounding the Earth, and they would thus compofe a flexible ring, which would never be flat, but waved, according to the difference (both in kind and degree) of the difturbing forces acting on its different parts. But fuppole theie Moons to cohere, and to form a rigid and fatting, nothing would remain in this ring but the excefs of the contrary tendencies of its different parts. Its axis wouldbe perpendicular to its plane, and its pofition in any moment will be the mean polition of all the axes of the crbits of each part of the flexible ring ; therefore the rodes ut this rigid ring will contimally recede, except when the plane of the ring palfes through the Su:n, that is, when the nodes are in lyzigee; and (fays Newton) the motion of thefe nodes will be the flane with the mean motinu of the nodes of the orbit of one MInon. The incliastion of this ing to the eclipric will be equal th the mean iuclination of the Moon's orbit during any one revolution which has the fame fituation of the nodes. It will therefore be lealt of all when the nodes are ia ghadrature, and will increare till they are in fycigce, and then diminillatll they are agtin in quadratare.

Suppofe this ring to contrat in dimenfions, the dif-

PRE

Preceflion. $\underbrace{1 \text { receliont. }}$ turing forces will dimininh in the fame proportion, and in this proportion will all their effects diminifh. Suppofe its motion of revolution to accelerate, or the time of a tevolution to diminifh; the linear effeds of the difturbing forces being as the fquares of the times of their aftion, and their angnlar eflects as the times, thofe erfors mult diminilh allo on this account ; and we e:n conipute what thofe crrors will be for any diameter of the rint, find for any period of its revolution. We can tell, therefore; what would be the motion of the nodes, the change of inclination, and deviation of the axis, of a ring which would touch the lurface of the earth, and revolve in 24 hours; nay, we can tell what thefe mofions would be, fhould this ring adhere to the earth. They mun be mush lefs than if the ring were detached; For the difturbing forces of the ring muft drag along with it the whole globe of the earth. The quantity of motion which the difurbing forces would have produced in the sing alone, will now (fays Newton) be produced in the whole mafs; and therefore the velocity mult be as much lefs as the quantity of mater is greater: But fill all this can be computed.

Now there is fucla a sing on the earth : for the earth is not a fphere, bat an elliptical fpheroid. Sir Ifaae Newton therefore engaged in a compolition of the effects of the difurbing force, and has exhibited a moft beautiful example of mathematical inveltigation. He firlt afferts, that the earth $m y / t$ be an elliptical fpheroid, whofe polar axis is to its equatorial diameter as 229 to 230 . Then he demonftates, that if the fine of the inelination of the equator be called $\pi$, and if $t$ be the numDer of days (fidereal) in a year, the annual motion of a detached ring will be $36 n^{\circ} \times \frac{3 \sqrt{1-7^{3}}}{4 t}$. He then fhows that the effert of the difturbing force on this ring is to its effect on the matter of the fame ring, dif. thiluted in the form of an elliptical Atratum (but Aill (letached) as $;$ to 2 ; therefore the motion of the nodes will be $360^{\circ} \times \frac{3 \sqrt{1-a^{2}}}{10 t}$, or $\pm 6^{\prime} I 6^{\prime \prime}=4^{\prime \prime \prime}$ annually. He flen proceeds to flow, that the quantity of metion in the fphere is to that in an equatorial ring revolving in the fame time, as the matter in the fphere to the matter in the ring, and as three times the fquare of a qua. drantal arch to troo fquares of a diameter, jointly: Thea he fhows, that the quantity of matter in the terreltrial fiphere is to that in the protuberant matter of the iplicroid, as 52900 to $4 G r$ (fuppofing all homogeneous). From thele premiles it follows, that the motion of $16^{\prime} 16^{\prime \prime} 24^{\prime \prime \prime}$, mult be diminithed in the ratio of 10717 to 100 , which recuces it to $9^{\prime \prime} 07^{\prime \prime \prime}$ annually. And this (he fays) is the precefion of the equinoxcs, occafioned by the attion of the fun; and the reft of the $50 \frac{\frac{1}{3}}{3}$, which is the obferved preeeflion, is owing to the action of the moon, nearly five times greater than that of the fun. This appeared a great diffieulty; for the phenomena of the tides thow that it cannot much exsecd twice the fin's force.
Nothing can exceed the ingenuity of this procefs. Jufly does his celebrated and candid commentator, Daniel Bernoulli, fay (in his Difertation on the Tides, which thared the prize of the French Aeademy with M•Lauia and Ewer), that Nexton faw through a ve!

What others could hardly difeover with a microfcope Precefife in the light of the meridian fun. His determination of the form and dimenfions of the earth, which is the foundation of the whole procefs, is not cffered as any thing better than a probable guefs, in redifficillima ; and it has been fince demonfrated with geometrical rigour by M'Laurin.

His next princip?e, that the motion of the nodes of the rigid ring is cqual to the mean motion of the nodes of the moon, has been moft critieally difeuffed by the firll mathematieians, as a thing which could neither be proved nor refuted. Frifius has at leaft fhown it to be a mitrake, and that the motion of the nodes of the ting is double the mean motion of the nodes of a fingle moon; and that Newton's own principles fhould have produced a preceffion of 18 feeonds annually, which removes the difficulty formeriy mentionsd.

His third affumption, that the quantity of motion of the ring mult be fhared with the included fphere, was aequiefeed in by all his commentators, till D'Alembert and Euler, in 1749, thowed that it was not the quantity of motion round an axis of rotation which remained the fame, but the quantity of momentum or rotatory effort. The quantity if motion is the produce of every particle by its velocity ; that is, by its dittance from the axis; while its momentum, or power of producing totation, is as the fquare of that diftance, and is to be had by taking the fum of each particle multiplied by the fquare of its diftance from the axis. Since the earth differs fo little from a perfect fiphere, this makes no fenfible difference in the refult. It will increafe Newton's precefiion about three-fourths of a fecond.

We proceed now to the examination of this phenomenon upon the fundamental principles of mechanics.

Bee:ufe the mutual gravitation of the particles of matter in the folar fyltem is in the inverfe ratio of the fquares of the diltance, it follows, that the gravitations of the different parts of the eartl' to the fun or to the moon are unequal. 'Fhe nearer particles gravitate more than thofe that are more remote.

Let PQ $p$ E (fig. 3.), be a meridional fection of the terreflial fphere, and $P O P$ the fection of the inferibed fphere. Let CS be a line in the plane of the ecliptic paling through the fun, fo that the angle ECS is the fun's deelination. Let ACM be a plane paffing thro' the centre of the earth at right angles to the plane of the meridian $\mathrm{PQ} p \mathrm{E}$; NCM will thercfore be the plane of illumination.
In confequence of the unequal gravitation of the matter of the earth to the fun, every particle, fuch as D , is atted on by a difturbing force parallel to CS, and proportional to BD , the diftance of the partiele from the plane of illumination; and this force is to the gravitation of the eentral particle to the fun, as three tinies $B D$ is to $C S$, the diftance of the earth from the fum.

Let Ala be a plane p.ffing through the particle E , parallel to the plane EC of the equator. This fection of the carth will be a circle, of which $A a$ is a diameter, and $Q_{q}$ will be the diamcter of its fection with the infcribed fphere.. Thefe will be two concentiic circles, and the ring by which the fection of the fipheroid exceeds the festion of the fphere will lave AQ for its breadth; Ip is the axis of figure.

It is cvilent, that with tefpea to the infuibed fph the difurbing forces are completely comipenfated, for evers particle has a correfponding particle in the adjeining quadrant, which is acted on by an equal and uppolite force. But this is not the cale with the protuberent mater which makes up the fpleeroid. The feginents $\mathrm{NS} s n$ and MT $t m$ are more acted on than the regments NT $: 4$ and $14 S$ sm; and thus there is produced a tendency to a converfion or the whole earth, round an axis pafling through the centre C , perpendicular to the plane $\mathrm{PC} p \mathrm{E}$. We thall diftinguith this motion from all others to which the foheroid may be fubject, by the name Libration. The axis of this libration is always jerpendicular to that dismeter of the equator over which the fun is, or to that meridian in which he is.

Preg. I. 'To determine the momentum of libration correfpunding to any pofition of the earth refpecting the fun, that is, to determine the accumulated criergy of the ditturbing forces on all the protuberant matter of the fyheroid.

Let B and 5 be two particles in the ring formed by the revolution of AQ , aind fo fituated, that they are at equal diftances from the plane NM ; but on oppofite fides of it. Draw BD, bi, perpendicular to NM, and FLG perpendicular to ITT.

Then, becane the momentum, or power of prodncing rotation, is as the force and as the dilance of its line of direation from the axis of rotation, jointly, the combined moninutum of the particles $B$ and $b$ will be f. BD. $\mathrm{DC}-f . \dot{t} . \mathrm{Ac}$, (for the particles 13 and $l$, are ureed in contrary direatiors). But the monentum of 13 is $f$. SF.DC $+f . F \mathrm{D} . \mathrm{DC}$, and that of $b$ is $f$. $b \mathrm{G} . d \mathrm{C}$ f. $\mathrm{G} . \mathrm{GC}$; and the combined momentum is $f$. BF.D. $d$ f.FD.DC $+\pi \mathrm{C},=2 f . \mathrm{BF} \cdot \mathrm{LF}-2 f . \mathrm{LT} . \mathrm{TC}$.

Becaufe $m$ and $n$ are the line and cofine of the angle ECS or LCCT, we have LT $=m \cdot \mathrm{CL}$, and $\mathrm{CT}=n . \mathrm{CL}$, and $\mathrm{LF}=m \cdot \mathrm{BL}$, and $\mathrm{BF}=n \cdot \mathrm{BL}$. This gives the mo: mentum $=2 f m n \overline{\mathrm{BL}^{2}-\mathrm{CL}^{2}}$.

The breadth AQ of the protuberant ring being very fmall we may fuppole, without any fenfible errer, that all the matter of the line $A Q$ is coilected in the point Q: and, in like manrer, that the matter of the whole ring is coljeged in the civcumference of its inner circle, and that B and $b$ now reprefent, not fingle particles, but the collected matter of lines ficis as AQ , which terminate at B and $t$. The combined momentum of two fuch lines will tharef:re be $2 \mathrm{~m} n \mathrm{f} \cdot \mathrm{AQ} \cdot \overline{\mathrm{BL}}-\mathrm{CL}^{2}$.

Let the circumference of eachi paraltel of latitude be divided into a great number of indefritely fmall and equal parts. The number of fuch pats in the circum. ference, of which $Q q$ is the diame:er, will be $\pi \cdot Q I$. . To earli pair of thele there belongs a momentum 2 maj $\wedge Q \cdot \overline{B L^{2}-C L^{2}}$. The fum of all the fquares of $B L_{0}$,

## 461 ]

## PにE

which can be taken round the circle, is one hair of its Preesfion.
6 many fquares of the radius CL: for LL is the fine of an areh, and the fum of its fquare and the fquare of its correfponding coline is equal to the fquare of the radius. Thercfore the fum of all the fquares of the fines, togcther with the fum of all the fquares of the cotincs is equal to the fum of the fame number of fquares of the radins; : and the fum of the fquares of the fines is equal to the fum of the fquares of the correfponding cofines: therefore the fum of the fquares of the radius is donble of tither fum. Therefore fin.(Q1.
 number п.(QL of $\mathrm{CL}^{2}$ s will be $=$ п.QL.CL ${ }^{3}$. There fums, taken ior the femicircle, are $\frac{3}{4}$ ni. QL...CL $=$, and $\frac{1}{2} 11 \mathrm{CL} . \mathrm{CL}=$, $\mathrm{o} \Pi \cdot \mathrm{CL} \div \mathrm{OL}^{2}$, and $\mathrm{r} \cdot \mathrm{CL} \cdot \mathrm{CL}^{2}$ : therefore the momeritum of the whole ring will be 2 mnf - AQ QL.II ( $: \mathrm{CL}^{2}-\mathrm{CL}^{2}$ ) : for the momentum of the ring is the comivined momenta of a mmber of pairs, and this number is $\frac{3}{2} \mathrm{H}^{-} \mathrm{CL}$.
By the ellipfe we have $O C: ~ Q L=E O: A Q$, and $\mathrm{AC}=\mathrm{CL} \frac{\mathrm{FO}}{\mathrm{OC}},=\mathrm{I} \frac{d}{b}$; therefore the momentum of the ring is 2 in $n f_{\bar{b}}^{d} \mathrm{CL}^{2} \Pi\left(\frac{\div}{4} \mathrm{CL}^{2}-1 \mathrm{CL}^{2}\right),=\dot{m} n f_{\frac{l}{b}}^{d}$ $\mathrm{CL}{ }^{2} \Pi\left(\frac{1}{2} \mathrm{CL} L^{2}-\mathrm{CL}^{2}\right):$ but $\mathrm{CL}^{2}=b^{2}-\mathrm{r}^{2}$; therefore $\therefore Q L L^{2}-C L=\frac{1}{2} b^{2}-x^{2}-x^{2},=\frac{1}{3} b^{2}-\frac{3}{2} x^{2}, \frac{b^{3}-3 x^{2}}{2}$ therefore the momentum of the ring is $n a n \frac{d}{b} n\left(l^{2}-x^{2}\right)$ $\left(\frac{b^{2}-3 x^{-1}}{2}\right)=n n f \frac{d}{b} \pi\left(\frac{b^{4}-4 b^{2} x^{2}+3 x^{4}}{2}\right),=n n f_{\frac{d}{2} b}^{d} \pi$ ( $b^{4}-4 b^{2} x^{2}+3 x^{4}$ ). If we now fuppofe another parallel extremely near to $A a$, as reprefented by the dotted line, the diftance $\mathrm{L} /$ between them being $\therefore$, we fhall have the fluction of the momentum, of the fpherois $\sin f \frac{d}{2 b} \pi\left(b^{4} x-4 b^{2} x^{2} x+3 x^{-1} x\right)$, of which the flueit is. $27 \pi \frac{1}{2 b} \pi\left(b^{4} x-4 b^{x^{4} \cdot \frac{3}{3}}+\frac{3 x^{5}}{5}\right)$. This expreffes the momentum of the zone EA aQ, contained between the equator and the parallel of latiiude $A a$. Now let $x$ be. come $=b$, and we fhall obtain the momentum of the hemifpheroid $=m n f \frac{d}{2 b} \pi\left(b^{5}-\frac{2}{3} b^{5}+\frac{2}{5} b^{5}\right)$, and that of the fyheroid $=n=n f \frac{d}{b} \pi\left(b^{5}-\frac{1}{3} b^{5}+\frac{3}{3} b^{5}\right)=i^{4} 5 m \cdot n d$.

This formula does not exprefs any motion, but only a preffure tending to produce motion, and particularly tending to produce a libration by its action on the cohering matter of the earth, which is affected as a number of levers. It is fimilar to the common mechanical formulia so $d$, where $w$ : means a weight, and $d$ its di-. fance from the filcrum of the lever.

It is worthy of remark, that the momentum of this protuberant matter is jult $\frac{5}{5}$ of what it would be if is were all collceted at the point $O$ of the equator : for the matier in the fphereid is to that in the inferibed fohere as $a^{2}$ to $b$, and the contents of the iafribed fphere is $\frac{2}{3} \Pi l^{3}$. Therefore $a^{2}: n^{2}-b^{2}=\frac{2}{5} \Pi b^{3}: \vdots \Pi b^{3}$ $\frac{a^{2}-b^{2}}{a^{2}}$; which is the quansity of prouberant matter. We may, without fenfible error, fuppofe $\frac{a^{2}-l^{3}}{a}$ $=2.1, \quad$,

## PRE <br> PRE

Fecechon, $=2$; then the protuberant matter will be $\frac{4}{3} \pi L^{*} \%$. If $\cdots-$ all this were placed at $O$, the momentum would be $\frac{4}{3} n$ $a^{2} f \cdot \mathrm{OH} \cdot \mathrm{HC}=\frac{4}{3} m n \int d l^{+}$, becalule OIJ $\cdot \mathrm{HC}=m \mu l^{2}$; now $\frac{4}{3}$ is 5 times -4.5

Alio, becaut the fum of all the refangles $\mathrm{OH} \cdot \mathrm{HC}$ round the equator is half of as many fquares of $O C$, it follows that the momentum of the protuberant matter placed in a ring round the equatur of the fohere or poperoid is one. half of what it would be if collected in the point $O$ or $E$; whence itfollows that the onomentum of the protuberant matter in its nitural place is two fiths of what it would be if it were difpofed in an equa. tovial ring. It was in this manner that Sir Iface Newton was enabled to compare the effect of the fun's action on the protuberant matter of the earth, with his effeft on a rigid ring of moons. The preceding inveftigation of the momentum is nearly the fame with his, and appears to us greatly preferable in point of perfpicuity to the fluxionary folutions given by later authors. Thete indecd have the appearance of greater accuracy, becaufe they do not fuppole all the protuberant matter to be condenfed on the furface of the inforibed fothere: nor were we under the neceffity of doing this, only it would have led to very complicated expretfions had we fuppofed the matter in each line AQ collected in its centre of ofcillation or gyration. We made a compendation for the error introduced by this, which may amount to $-\frac{1}{15}$ of the whole, and thould rot be neglect. cs, by taking $d$ as equal to $\frac{a^{2}-b}{2 a}$. inftend of $\frac{a^{3}-b^{2}}{a \times b}$. The confequence is, that our formula is the fame with that of the later authors.

Thus far Sir Ifaac Newton proceeded with mathematical rigour; but in the application he made two atfumptions, or, as he calls them, hypothefes, which have been found to be unwarranted. The firt was, that when the ring of protuberant matter is connected with the inferibed fphere, and fubjected to the action of the dif turbing force, the fame quantity of motion is produced in the whole mats as in the ring alone. The fecond was, that the motion of the nodes of a rigid ring of mons is the fanc with the mean motion of the nodes of a folitary moon. But we are now able to demonilrate, that it is not the quantity of motion, but of momentum, which remains the fame, and that the nodes of a rigid ring move twice as falt as thole of a fingle particle. We proceed thercfore to

Prob. 2. To determine the deviation of the axis, and the retrograde motion of the nodes which refult from this libratory inomentum of the earth's protuberant matter.

But here we mult reler our readers to fome fundamental propofitions of rotatory motions which are demonfrited in the article Rotation.

If a rigid budy is turning round an axis $A$, paffing through its centre of gravity with the angular velocity $a$, and receives an impulie which alone wonld caufe it to turn round an avis 3 , alfo p.ffiry through its centre of gravity, with the argular velocity $b$, the body will now turn round a third axis $C$, pathing thro' its centre of gravity, and lying in the plane of the axcs $A$ and $B$, and the line of the inclinution of this thid axis to the axis $A$ will be to the fine of inclination to the axis B as the velocity $b$ to the velocity $a$.

When a rigid body is made to turn round any axis by the ation of an extrmal force, the quantity of
momentam produced that is, the fum of the products of Proc cvery particle by its velocity and by its difance from the axis) is equal to the momentum or limilar postut of the moving force or forces.

If an oblate fpheroid, whofe equatorial diameter is $a$ and polar diameter $b$, be made to libiate round an equatorial diameter, and the velocity of that point of the equator which is farthelt from the axis of libration be $v$, the momentum of the fpheroid is $\frac{4}{15} \Pi a^{2} b^{2} v$.

The two laft are to be found in every elementary book of mechanics.

Let AN a $n$ (fig. 4.) be the plane of the earth's equa- coc tor, cutting the ecliptic CNK $n$ in the line of the nodes or equinoctial points $\mathrm{N} n$. Let OA . be the fection of the cartl by a meridian paling though the fun, fo that the line OCS is in the eclipt $c$, and CA is an arch of an hour-circle or meridian, nieafuring the fun's declination. The fun not being in the plame of the equator, there is, by prop. i. a force tending to produce a libration round an axis ZO z at right angles to the diameter Aa of that meridian in which the fun is fituated, and the momentum of all the dilturbing forces is $\frac{4}{5} m n f \cap l^{+}$. The product of any force by the n:oment $i$ of its adton exprefes the momentary increment of volocity; therefore the momentary velocity, or the velocity of libration generated in the time $b$ is $\frac{4}{\mathrm{~T}} m n f d$ $n b+i$. This is the abfolate velocity of a point at the diftance 1 from the axis, or it is the face which would be unifurmly deferibed in the mornent $i$, with the velo. city which the point has acquired at the end of that moment. It is double the face actually defcribed by the libration during that moment; becaufe this has bcen an uniformly accelerated motion, in confequence of the contibucd and uniform afion of the momentum during this time. This muR be carefully attended to, and the neglect of it has occafoned very faulty fulutions of this problem.

Let $v$ be the velocity produced in the point $A$, the moft remote from the axis of libration. The nomentum excited or produced in the fpheroid is $\frac{4}{5} \Omega a^{2} b^{2} v$ (as above), and this muf be equal to the momentum of the moving force, or to $\frac{4}{\sqrt{5}} m n f d \pi b^{+} i$; therefore we obtain $v=\frac{\frac{\pi}{5} m n f d \pi b^{4} t}{\frac{4}{5} \pi a^{2} b^{2}}$, that is, $v=m \pi f d t \frac{b^{2}}{a^{2}}$ or ve. ry nearly $m n f d \dot{t}$, becaufe $\frac{l^{2}}{a^{2}}=1$ very neanly. Alfo, becaufe the product of the velocity and time gives the face uniformly defcribed in that time, the face defribed by $A$ in its libration round $Z \approx$ is $m n f d \dot{t}^{2}$, and the angular velocity is $\frac{m n f}{a} \frac{d^{i} t}{}$.

Let $r$ be the momentary angle of diurnal rotation. The arch A $r$, defcribed by the point $A$ of the cquatur in this moment $i$ will therefore be a $\dot{r}$, that is, $a \times \dot{r}$, and the velocity of the point $A$ is $\frac{a r}{\dot{t}}$. and the angular valocity of rotation is $\frac{r}{i}$,

Here then is a body (tig. 5.) turning rombl an axis OP, perpendicular to the plane of the equator zos, and therefore fituated in the plane $Z$ P $a$; and it turns round

## PRE

this axis with the angular velocity $\frac{r}{i}$. It has receivel an impulfe, by which alone it would librate round the axis $\mathrm{Z} \approx$, with the angular velocits $\frac{m n f d \dot{t}}{a}$.

It will
thercfore turn round meither axis ( $n^{\circ} 31$ ), but round a third axis $\mathrm{OP}^{\prime}$, palling through O , and lying in the phane ZP $\approx$, in which the other two are fituated, and the fine P'r of its inclination to the axis of libration $Z \approx$ will be to the fine P' $P$ of its inclination to the axis
OP of rotation as $\frac{\dot{r}}{i}$ to $\frac{m n f}{a} d i$
Now $A$, in fig. 4 , is the fummit of the equator both of libration and rotation; m.n $\int \dot{t}^{2}$ is the fyace de. frribed by its libration in the time $i$; and $a r$ is the fpace or arch Ar (fig. 4.) defcribad in the fame time by its rotation: therefore, tahing $\mathrm{Ar}_{r}$ to $\mathrm{A}_{c}$ (perpendicular to the plane of the equator of rotation, and 15 ing in the equator of libration), as a $\dot{r}$ to $m n f \dot{l}^{d}$, and completing the parallelogram A $r$ m $c, A$ on will be the compound motion of $A\left(1^{\circ} 3 \mathrm{I}.\right)$, and $\dot{a r}: m n d \dot{f} \dot{t}^{3}$ $=1: \frac{m n f d \dot{t^{3}}}{a \dot{r}}$, which will be the tangent of the angle ${ }_{\mu} \mathrm{A} r$, or of the change of pofition of ti.e equator. But the axes of rotation are perpendicular to their equator; and therefire the angle of deviation $\dot{v} \dot{v}$ is equal to this angle $r \mathrm{Am}$. This appears from fig. 5. ; for $\cap \mathrm{P}: \mathrm{P}^{\prime} p=\mathrm{O}_{p}: \mathrm{P}^{\prime} p=\mathrm{OP}: \tan , \mathrm{POP}$; and it is evident that $a \dot{r}: m n f d \dot{t}=\frac{r}{i}: m n f d \frac{t}{a}$, as is requised by the compofition of rotations.

In ennfequence of this change of pofition, the plane of the eçuator zo longer cuts the plane of the ecliptic in the line $\mathbb{N} n$. Tre plane of the new equator cuts the former equator in the line $A O$, and the part $A N$ of the former equator lies between the ecliptic and tie new equater $A N^{\prime}$, while the part $A n$ of the furmer equator is alove the new one $\mathrm{A} a^{\prime}$; therefore the new node N ', from which the print $A$ was moving, is removed to the welward, or farther from A ; and the new node $n^{\prime}$, to which $A$ is approaching, is alio moved wellward, or nearet to $A$ : and this hay pens in every pofition of $A$. The nodes, thecefore, or equinocial points, continually flift to the wehward, or in a contrary direction to the retation of the eath, and the axis of rotation always deviates to the calt lide or the menidian which paffes threugh the tun.

This account of the motions is extremely different from what a perion thonld naturally expect. It the eat!le were placed in the fummer folltice, with refpect to us who imhabit its northern hemifphere, and had no. rotation round its axis, the equator would begin to appreath the ecliftic, and the axis would become more upright; and this would go on with a motion continuily $y$ accelerating, till the equator concinded wint the eclip:ic. It would not fop here, but go as bar on the nother fíde, till its motion were extinguitued by the oppofing forces; and it would reiurs to its former pulition, and azain begin to aprowh the echutic, playing up and down like the arm of a balume. On this accomet this motion is very properly tomest libration; but tlis very flow libration, comppuid a with the incompara!, ly fwifter motiun of diturnal rotation, prosuces a thind mo-
tion cxtremcly different from both. At firf the north Preceffior. pole of the eathlinclines forwaritoward the fun; after a long courfe of years it will incline to the fafinand after viewed from the fun, and be much more inclinced to the celiptic, and the plane of the equator will pafs through the finn. Then the fosuth pole will enme into view, and the north pole will begin to decline from the fun; and this will go on (the inclination of the cquator diminifhing all the while) till, after a conrfe of ycars, the nor:h pule will be turned quite away from the fun, and the inclination of the equater will be reftared to its origimal quantity. After this the phenomena will have another period fimilar to the former, but the axis will now deviate to the right hand. And thus, although both the earth and fun thould not move from their places, the inhabitants of the earth wuld have a complete fuccection of the feafons accomplifhed in a period of many centuries. This would be pretily illuftrated by an iron ting poifed very nicely on at cap like the card of a marincr's compars, having its centre of glavity eninciding with the point of the cap, fo that it may whir round in any pofition. As this is extremely difficult to execute, the cap may be pierced a litule deeper, which will caufe the ring to maintain a licrizontal polition with a very fmall force. When the ring is whirling very fteadily, and pretty brifkly, in the diredion of the hours of a watch-dial, hold a ftrong magnet above the middle of the nearer femicircle (above the 6 hour point) at the diftance of three or four inches. We thall immediately obicive the ring rife fiom the 9 hour point, and fink at the 3 hour point, and gradually acquire a motion of preceffiun and nutation, fuch as has been defcribed.

If the earth be now put in motion round the fun, or the fun round the earth, motions of libration and deviation will ftill obtain, and the fuccefion of their dif. ferent phafes, if we may fo call them, will be perfeatly analogous to the above fatement. But the quantity of deviation, and change of inclination, will now be prodiginuly diminifhed, becaure the rapid charge of the fun's pofition quickly diminifles the diflurbing forces, annilihates them by bringing the fun into the plane of the equator, and brings oppolite forecs into action.

We fee in general that the deviation of the axis is always at right angles to the plane paffing through the fun, ind that the axis, infead of oeing raifed from the: ecliplic, or brought nearer to it, as the libration would nccafion, deviates ficewife; and the equator, inftead of being raifed or deproffed round its eaft and welt points. is twitted-fidewvife round the north and fouth points; or at leaft things have this appearance: but we mult now attend to this circumfance more minatcir.

The compolition of rotation fhows uis tlat this chance of the axis of diurnal rotation is by no means a tranfation of the former avis (which we may luppote to be the nxis of figure) into a new poftion, in which it again becomes the axis of diurnal motion ; nor does the equator of figure, that is, the molt prominent fection of the terreftrial flezod, change its pofition, and in this new polition continue to be the efmatot of rotation. This was indeed fuppofed by isir lifuc Newtin; and this fuppofition naturilly retulted from the trai: of reafoung waich he adopted. It was hrictly true of a fingic monn, or of the imaginary on bit atacheal to it ; and therefore Newtun feppoleal that the whe 3: earth did in this mamare deviate from its fomer putition, nill, however, turming romand its axis of figure.

Ireceffion, moft of his commentators. D'Alembert was the firit who entertaned any fupicion that this might rot be certain ; and both he and Enler at land fhowed that the new axis of rotation was really a new line in the body of the earth, and that its axis and equator of figure did not remain the axis and equator of rotation. 'They afcertained the pofition of the real axis by means of a moft intricate analyfis, which obfeured the connection of the different politions of the axis with each other, and gave us only a kind of momentary information. Father Futins turned his thoughts to this problem, and fortunately difcovered the compofition of rotations as a general principle of mechanical philofophy. Few things of this kind have efaped the penetrating eye of Sir Ifata Newton. Even this principle had been glanced at by him. He affirms it in exprefis terms with refped to a body that is perfeetly feherical (cor. 22. prop. 66. B. I.) But it wats referved for Fifius to demonftrate it to be true of bodies of any figure, and thus to emrich meclanical fcience with a principle which gives fimple and elegant folutions of the mof difficult problems.

But here a very formidable objection naturally offers itfelf. If the axis of the diurnal motion of the hewens is not the axis of the earth's fpheroidal figure, but an imaginary line in it, round which even the axis of ficure mut revolve; and if this axis of diurnal retation has fo greatly changed its polition, that it now points at a flar at leaft 12 degrees difant from the poie obferved by Timochares, how comes it that the equator has the very fame fiuation on the furface of the earth that it lad in ancient times? No fenfible change has been obferved in the latitudes of places.

The anfwer is very fimple and fatisfactory: Suppofe that in 12 hours the axis of rotation has changed from the pofition PR (fig. 6.) to $p r$, fo that the north pole, intead of being at ${ }^{1}$, which we may fuppoie to be a particular mountain, is now at $p$. In this 12 hours the of rotation has got the pofition aff, and the axis of figure has got the pofition $p r$, and the mountain $P$ is now at $p$. Thus, on the mon of the following day, the axis of iggure PR is in the fituation which the real axis of rotation occupied at the intervening midnight. This goes on contintally, and the axis of figure follows the polition of the axis of rotation, and is never further removed from it than the deviation of 12 hours, which does not exceed $\frac{1}{\circ}$ th part of one recond, a quantity altogether imperceptible. Therefore the axis of figure will always fentibly coincide with the axis of yotation, and no clange can be procured in the latitudes of places on the furface of the carth.
We have hitherto conidered this problem in the moft gencral manner; let us now apply the knowledge we lave gotten of the deviation of the axis or of the mo. mentary action of the dilturbing force to the explanation of the phenomen : that is, let us fee what freceffion and vhat nutation will be accumulated after any given time of action.
For this purpecte we nuft afcertain the precife devintion which the ditlurbing forces are enmpetent to prodnce. This we cat do by companing the momentum of libration with the gravitation of the earth to the fon, and this with the force which would retain a body on the equator while the eartla tarns found its axis.

The graviation of the earth to the fun is in the pro- Pecee portion of the fin's quantity of matter Mi diresily, anicl to the fquareof the diftance $A$ inverfel $y$, and may therefore be exprefled by the fymbel $\frac{1 /}{\mathrm{A}^{2}}$. The difturbing force at the difance 1 from the plane of illumination is to the gravitation of the earth's centre to the fun as 3 tor A, (A being meafured on the fame feale which meafures the ditance from the planc of illumination). Therefore $\frac{3^{M}}{A^{3}}$ will be the dituibing force $f$ of our formuln.

Let $p$ be the centrifugal force of a particle at the ditance I from the axis of rotation; and let $t$ and ' I ' be the times of rotation and of anmal revolution, viz. fidereal day and year. Then $p: \frac{M}{A^{2}}=\frac{1}{t^{2}}: \frac{A}{T^{2}}$. Hence we derive $-\frac{3 \mathrm{M}}{\mathrm{A}^{3}}=3 F \frac{t^{2}}{\mathrm{~T}^{3}}$. But fince $r$ was the angu. lar velocity of rotation, and confequently $1 \times \dot{r}$ the fpace defcribed, and $\frac{I \times r}{t}$ the velocity; and fince the centrifugal force is as the fquare of the velocity divided by the radius, (this being the meafure of the generated velocity, which is the proper meafure of any accelerating force), we have $p=\frac{1^{2} \times r^{2}}{1^{2} \times \dot{t}^{2}},=\frac{r^{2}}{i^{2}}$, and $f=\frac{3 r^{2}}{i^{2}}$ $\times \frac{t^{3}}{\mathrm{~T}^{2}}$. Now the formula $f$ mnd $\frac{i^{2}}{a}$ exprefied the finc of the angle. This being extremely fmall, the fine may be confidered as equal to tbe are which meafures the angle. Now, fublitute for it the value now found, viz. $\frac{3 \dot{\dot{t}^{3}}}{\dot{t^{2}}} \times \frac{\dot{t}^{2}}{\mathrm{~T}^{2}}$, and we obtain the argle of deviation $\dot{w}=$ $\dot{r} \frac{3 t^{2}}{T^{2}}$ mn $\frac{d}{a}$, and this is the fimpient form in which it can appear. But it is convenient, for other reafons, to exprefs it a little diffcrently : $d$ is nearly equal to $\frac{a^{2}-b^{2}}{2 a^{2}}$, therefore $\dot{\varepsilon}=\dot{r} \times \frac{3}{2} \frac{t^{2}}{\mathrm{~T}^{2}} n \prime n \frac{a^{2}-b^{2}}{a^{2}}$, and this is the form in which we fhall now employ it.
The finall angle $\dot{r} \frac{3 t^{2}}{2 T^{2}} m n \frac{a^{2}-b^{2}}{a^{2}}$ is the angle in which the new equator cuts the former one. It is different at different times, as appears from the variable pait mn, the product of the fine and cofine of the fun's declination. It will be a maximum when the declination is in the folftice, for $m n$ increafes all the way to $45^{\circ}$, and the declination never exceeds $23 \frac{1}{2}$. It increafes, therefore, from the equinox to the folltice, and then diminithes.

Let ESL (fig. 7.) be the ecliptic, EAC the equatat, BAD the new polition which it acquires by the momentary ation of the fun, cutting tha former in the angle $\mathrm{BAE}=\dot{r}-\frac{3}{3} \frac{t^{2}}{T^{2}} m 2 \frac{a^{2}-b^{3}}{a^{2}}$. Let S be the fun's place in the ecliptic, and AS the fun's declination, the meridian AS being perpendicular to the equator. Let $\frac{a^{2}-b^{3}}{a^{4}} b=1$. The angle BAE is then $=\dot{r} \frac{3 t^{2}}{2 T^{2}} k$ nym. In
 lin．$A$ ：fur． lBE ，or $=A: B E$ ，becaufe very fmall angles and arches are as their fines．Thencforc BE， which is the momentary precelion of the equinosial point $E$ ，is equal to $A \frac{\text { fin．} A F}{1, n \cdot 13}=; \times \frac{31^{2}}{21^{23}}<n n$ ， fin．R．afcenf． iin．obl．cal．

The equator EAC，by taking the poition TiAD， recedes from the celiptic in the colure of the folfices CL，and CD is the change of rblitpuity or the rutation．loor let CL be the foiltitial colure of DAD，and $c /$ the folfitial colure of EAC．Then we have fin．$\Gamma$ ：fin．$E=$ fin．$L D:$ fin．$l e$ ；and therefore the difference of the arches LID and $l c$ wiil b：the maflue of the difference of the angles 1 ）and E．But when BE is indefinitely fmall，CD may be taken for the difference of I．D and $l c$ ，they lising n：］． imately in the ratio of equality．Therefore CD ine：r－ fures the clange of the obliquity of the ecliptic，or the nutation of the axis with refpeet to the celiptic．

The ral deviation of the axis is the fime with the change in the pofition of the equator，$P p$ being the meafure of the angle EAB．But this not being always made in a plane perpenticular to the ecliptic，the change of obliquity generally differs from the change in the poti－ tion of the axis．Thus when the fun is in the folltice，the momentary change of the pofition of the cquator is the greateft pofible；but being made at right angles to the plane in which the obliquity of the celiptic is com－ puted，it makes no change whatever in the obliquity， Lut the greatef pofible change in the preceffion．

In order to find $C D$ the change of obliquity，obferve that in the triangle $C A D, R: f i n . A C$ ，or $R$ ：cof． $A E=$ fin．$A:$ fin．$C D,=A: C D$（becaufe $A$ and CD are exceedingly fmall）．Therefore the change of ob－ liquity（which is the thing commonly meant by nu：a－ tion） $\mathrm{CD}=\mathrm{A} \times \operatorname{cof} . \mathrm{AE},=\frac{3 t^{2}}{2 \Gamma^{2}} \mathrm{kmn}, \operatorname{cof} . \mathrm{AE}^{\prime}=\frac{3 t^{2}}{2 \Gamma^{3}}$ $L \times$ fin．declin．$\times$ cof．declin．$\times$ cof．R．afcen！．

But it is more convenient for the purpofes of aftro－ nomical computation to make ufe of the fun＇s longitude SE．Therefore make

In the foherical triangle EAS，right angled at $A$ （hocaufe AS is the fun＇s declination perpendicular to the equator），we have $R:$ fin．$E S=$ lin．$E:$ fin．AS， and fin．AS $=p x$ ．Alfo $\mathrm{R}: \operatorname{cof} . \mathrm{AS}=\operatorname{col} \mathrm{AE}$ ：cof． ES，and cof．ES or $y=$ cof．AS $x$ cot．AE．There－ fore $p x=$ fin．$A S \times \operatorname{cof} . \Lambda S \times \operatorname{coi} . \Lambda E,=m m \times \operatorname{cof} . A E$ ． Therefure the momentary nutation $\mathrm{CD}=\dot{r} \times \frac{3^{t^{2}}}{2^{\prime} 1^{2}} / p x y^{2}$ ．

We mut recollet that this angle is a certain frac－ tion of the momentary diumbl rotation．It is more convenient to confider it as a fraction of the fun＇s an－ ratal motion，that fo we may direaty compare his mo－ tion on the ccliptic with the precefion and nutation correfponding to his fituation in the heavens．This change is eatily made，by augmenting the fraction in tle ratio of the fun＇s angular motion to the motion of

Vol．XV．

 tation is proportional to $x y$ or to the prode？of is． fine and coline of the fin＇s longitule，or to the fine ot twice the fun＇s langitudz； $1: 1:: y$ is cqual to haif itse finc of iwice $\approx$

If theref re we multipls tif fraction by the furs momen：aty ancular mo：ion，whic＇s we may fuppore，with abindarit accuracy，propostional to $\approx$ ，we obt un the fluxion of the suthtion，the flic：it of wheh will c．．． prefs the whole ratation while the fus deferibes the arch $\approx$ of the ecliptic，beginaing at the vernal cqu＂． nox．Therefore，inplace of y put $\sqrt{1-x^{2}}$ ，and in place of $\dot{\approx}$ put $\frac{\dot{z}}{\sqrt{1-\cdots}}$ ，and we have the fuxion of the mi： tation for the memert rihen the fun＇s longitule is $z$ and the fluent will be the rio！e ruwation．＇ille fluxion refulting from this procefs is $\frac{3^{t h}, p}{2 L^{2}} x$ ，of which the fluent is $\frac{3 \% / j}{4 T} x^{*}$ ．This is the whole change produ－ ced on the obliquity of the celiptic while the fun moves along the arcli $z$ ecliptic，reckoned from the vernal equinox．When this arch is $20^{\circ}, x$ is 1 ，and there． fore $\frac{s^{\text {llp }}}{+T}$ is the nutation produced while the fun mores from the equinox to the folfice．

Therefore $E \Gamma: C D=\frac{q x}{\sqrt{1-x^{2}}} p$ ，and $C D=E \Gamma$ ：
 lue found in no to．vi\％$\frac{3 t h p}{2!}: \therefore$ ，we obinin $\Gamma B=$ $\frac{3 t}{2 T} \times \frac{\lg x^{2}}{\sqrt{1}-}$ ，the fiuxion of the frecefion of $11=$

## PRE

Precefion, equinoxes occafioned by the attion of the fun. fluent of the variable part $\frac{\dot{x}^{2} x}{\sqrt{1-x^{2}}}=x \dot{y}$, of which the fluent is evidently a fegment of a circle whofe arch is $\approx$ and fine $x$, that is, $=\frac{z-x \sqrt{1-x^{2}}}{2}$ and the whole preceffion, while the fun defcribes the arch $\approx$, is $\frac{3 t}{2 T} \times \frac{k q}{2}\left(2-\times \sqrt{1-x^{2}}\right)$ This is the preceffion of the equinozes while the fun moves from the vernal equinox along the arch $\approx$ of the ecliptic.

In this exprefion, which confifts of two parts, $\frac{3^{t k q}}{4 \mathrm{I}^{\prime}}$ $\approx$, and $\frac{3^{t k} q}{4 \mathrm{~T}}\left(-x \sqrt{1-x^{2}}\right)$, the firft is incomparably greater than the fecond, which never exceeds $I^{11}$, and is always compenfated in the fucceeding quadrant. The preceflion occafioned by the fun will be $\frac{3 t k q}{4 \mathrm{~T}} z$, and from this expreffion we fee that the preceffion increafes uniformly, or at leaft increafes at the fame rate with the fun's longitude $z$, becaufe the quantity $\frac{3 t k q}{4 \mathrm{~T}}$ is con-

43
Mode of ning the furme! $x$.

44
Pxemple of the utility of the inwenigation. ftant.

In order to make ufe of there formulx, which are now reduced to very great fimplicity, it is neceffary to determine the values of the two conftant quantities $\frac{3 t p p}{4 \mathrm{~T}}, \frac{3 t k q}{4 \mathrm{~T}}$, which we fhall call N and P , as fators of the nutation and preceffion. Now $t$ is one fidereal day, and $T$ is $366 \frac{1}{4} \cdot k$ is $\frac{a^{2}-b^{2}}{a^{2}}$, which according to Sir Laac Newton is $\frac{231^{2}-230^{2}}{23 \mathrm{I}^{2}}=\frac{1}{115} ; p$ and $q$ are the fine and cofine of $23^{\circ} 28^{\prime}$, viz. $0,39^{8} 22$ and 0,91729 .

Thefe data give $N=\frac{1}{1+1030}$ and $P=\frac{1}{61224}$ of which the logarithms are +85069 and 5.21308 , viz. the arithmetical complements of 5.14931 and 4.78592 .
Let us, for an example of the ufe of this inveltigation, compute the preceffion of the equinoxes when the fun has moved from the vernal equinox to the fummer follice, fo that $z$ is $90^{\circ}$, or $3^{2}+000^{\prime \prime}$.

| $\log 33^{2}+000^{\prime \prime}=z$ | - | - | 5.51055 |
| :--- | :--- | :--- | :--- |
| $\log \mathrm{P}$ | - | - | - |
| $\log 5^{\prime \prime}, 292$ | $\quad$ | $\frac{5.21308}{0.7263}$ |  |

The preceffion therefore in a quarter of a year is 5,292 feconds; and, fince it increares uniformly, it is $21^{\prime \prime}, 168$ annuailly.

We mult now recollect the affumptions on which

Affump. tions on which the computation yrocceds.

## PK E

figure be thought more probable, the preceffion will be Precefif reduced to about $1^{\prime \prime}$ "annually. But even theugh the figure of the earth were accurately determined, we have no authority to fay that it is hemogencous. If it be denfer towards the centre, the momentum of the protuberant matter will not be fo great as if it were equally denfe with the inferior parts, and the precefion will be diminifhed on this account. Did we know the proportion of the matter in the moon to that in the fun, we could eafily determine the proportion of the whole obferved annual preceflion of $503_{3}^{\prime \prime}$ which is produced by the fun's attion. But we bave no unexceptionable data for determining this; and we are rather obliged to infer it from the effect which the produces in difurbing the regularity of the preceffion, as will be confidered immediately. So far, therefore, as we have yet proceeded in this inveftigation, the refult is very uncertain. We have only afcertained unqueftionably the law which is obferved in the folar preceffion. It is probable, however, that this preceffion is not very different from $20^{\prime \prime}$ annually; for the phenomena of the tides flow the difturbing force of the fun to be very nearly $\frac{z^{3}}{3}$ of the difurbing force of the moon. Now $20^{\prime \prime}$ is $\frac{3}{5}$ of $50^{\prime \prime}$.

But let us now proceed to confider the effert of the Effect ${ }^{46}$ monn's action on the protuberant matter of the earth; and as we are ignorant of her quantity of matter, and confequently of her influence in fimilar circumftances the prot with the fun, we flall fuppofe that the difturbing force matter of the moon is to that of the fun as $m$ to 1 . Then the eart (cateris paribus) the preceflion will be to the folar preceflion $\pi$ in the ratio of the force and of the time of its action jointly. Let $t$ and $T$ therefore reprefent a periodical month and year, and the lunar proceffion will $\mathrm{be}=\frac{m \pi t}{\mathrm{~T}}$. This preceffion mult be reckoned on the plane of the lunar orbit, in the fame manner as the folar preceflion is reckoned on the ecliptic. We muft alfo obferve, that $\frac{m \pi t}{\mathrm{~T}}$ reprefents the lunar preceffion only on the fuppofition that the earth's equator is inclined to the lunar orbit in an angle of $23 \frac{1}{\frac{1}{2}}$ degrees. This is indeed the mean inclination; but is fometimes increafed to above $28^{\circ}$, and fometimes reduced to $18^{\circ}$. Now in the value of the folar preceffion the cofine of the obliquity was employed. Therefore whatever is the angle E contained between the equator and the lunar orbit, the preceffion will be $=\frac{n i n t}{T} \cdot \frac{\mathrm{Cof.} \mathrm{E}}{\mathrm{C} \cdot 2 \cdot 2!}$, and it muft be reckoned on the lunar orbit.

Now let $r \mathrm{~B}$ (fig. 8.) be the immoveable plane of the ecliptic, $r E D \cong F$ the equator in its firf fituation, before it has been deranged by the artion of the moon, AGRDBH the equator in its new pofition, after the momentary action of the moon. Let EGNFH be the moon's orbit, of which N is the afcending node, and the angle $N=5^{\circ} 8^{\prime} 4^{\prime \prime}$.
Let Nr the long. of the node be - $\approx$

## PRE

Force of the moon
Solar proceltion (fuppofed $=142^{\circ}$ by obfervation)
Revolution of $\mathbb{C}=27{ }^{\frac{1}{3}}$
Revolution of $=366 \frac{2}{4}$
licvolution of $\mathrm{N}=18$ years 7 months
pre- In order to reduce the lunar preceliion to the eclipin a tic, we mutt recolleet that the equator will have the ire- fame inclination at the end of every half revolution of to the fun or of the moon, that is, when they pafs through the cefuator, becaule the fum of all the momentary changes of its polition begins again each revolution. Therefore if we begleet the motion of the node during one month, which is only $1 \frac{3}{2}$ degrees, and can produce but an infenfible change, it is phan that the moon produces, in one halfrevolution, that is, while the moves from H to $G$, the greatelt difference that the can in the pofition of the equator. 'The point D, therefore, half-way from G to H , is that in which the moveable equator cuts the primitive equator, and DE and DF are each $90^{\circ}$. But $S$ being the folftitial point, $r S$ is alfo $90^{\circ}$. 'Therefore $D S=\gamma \mathrm{E}$. Thercfore, in the triangle DGE, we have fin. $E D:$ fin. $G=$ fin. $E G:$ lin. $D,=E G: D$. There. fore $D=E G \times$ fin. $G,=E G \times$ fin. E nearly. Again, in the triangle $r D A$ we have fin. $A$ : fin. $r D$ (or cof. $r \mathrm{E})=$ fin. $\mathrm{D}:$ fin. $r \mathrm{~A},=\mathrm{D}: r \mathrm{~A}$. Therefore $r A=\frac{D \cdot \operatorname{Cof} \cdot r E}{\operatorname{Sin} . A}=\frac{E G \cdot \operatorname{Sin} . E \cdot \operatorname{Cof} \cdot r E}{\operatorname{Sin} \cdot 23^{\frac{1}{2}}}=$ $m \pi t \operatorname{Sin} . \mathrm{E} \cdot \mathrm{Cof}$. E Cor. $r \mathrm{E}$ $T$ Sin. $r$ Cor. $r$.
This is the lunar preceffion produced in the courfe of one month, eftimated on the ecliptic, not contant like the folar precetfion, but varying with the inclination or the angle E or F , which varies both by a change in the angle $N$, and alfo by a change in the pofition of N on the ecliptic.

We muft find in like manner the nutation SR pro. duced in the fame time, reckoned on the colure of the folltices RL. We have $\mathrm{R}:$ fin. $D S=D: R S$, and $R S=D \cdot f i n . D S=D \cdot f i n$. ahE. But $D=E G \cdot f i n . E$. Therefore RS $=\mathrm{EG} \cdot$ fin. $\mathrm{E} \cdot$ fin. $r \mathrm{E},=\frac{m \pi t \operatorname{Cof} . \mathrm{E}}{\mathrm{T}} \cdot \operatorname{Col} \cdot \gamma$ $\times$ fin. $\mathrm{E} \times$ fin. $r \mathrm{E}$. In this expreflion we mett fubftitute the angle $N$, which may be confidered as conltant du. ring the month, and the longitude $\gamma \mathrm{N}$, which is alfonearly conftant, by obferving that fin. E:fin. $\gamma N=$ fin. $N$ : fin. $r E$. Therefore RS $=\frac{m \pi t}{\mathrm{~T}} \times \frac{\operatorname{Sin} \cdot \mathrm{N} \cdot \operatorname{Sin} \cdot r \mathrm{~N} \cdot \mathrm{Cof.E} \text {. }}{\text { Cof. } r}$ But we mull exterminate the angle $E$, becaufe it changes by the change of the polition of $N$. Now, in the triangle $E N r$ we have cof. $E=$ cof. $r N \cdot$ fin. $N \cdot f i n . ~ r-$ $\operatorname{cof} . \mathrm{N} \cdot \operatorname{cof} . r$, jca- $d b$. And becaufe the angle E is necelfarily obtufe, the perpendicular will fall without the triangle, the cofine of E will be negative, and we fhall have cof. E=bd-acy. Therefore the nutation for one month will be $=\frac{m \pi t}{\Gamma} \times \frac{c \times(b l-a c y)}{b}-$, the node being fuppored all the while in N .

Thefe two expreffions of the monthly preceflion and ered nutation may be confidered as momentary parts of the men- moon's action, correfponding to a certain pofition of arts the node and inclination of the equator, or as the fluxions of the whole variable preceffion and nutation,
$m$ while the node continually changes its place, and in the l'receffor. fpace of 18 years makes a complete tour of the heavens.

Wc nuft, therefore, take the motion of the node as proceffica the fuent of comparifon, or we mult compare the fla and nuthxions of the node's motion with the fluxions of the pre- time conceflion and nutation; therefore, let the longitude of the pared. node be $z$, and its monthly change $=z$; we fhall then have $t: n=\dot{z}: c$, and $t=\frac{n \dot{z}}{c},=\frac{n \dot{x}}{e \sqrt{1-x^{2}}}$.

Let 'T' be $=\mathrm{s}$, in order that $n$ may be 18,6 , and fubftitute for $t$ its value in the fluxion of the nutation, by putting $\sqrt{1-x^{2}}$ in place of $y$. By this fubfitation we obtain $x \pi n_{e b}{ }^{6}$ $\left(\frac{d b x}{\sqrt{1-N^{2}}}-a c x \therefore x\right)$. The flucnt of this is $m \pi n \frac{c}{c b}$ (- $d b \sqrt{1-x^{2}}-\frac{a c x^{2}}{2}$ ). (Vide Simpfon's Fluxions, §77). But when $x$ is $=0$, the nutation mult be $=0$, becaufe it is from the pefition in the equirontial points that all our deviations are reckoned, and it is from this point that the periods of the lunar aetion recommences. But if we make $x=0$ in this expreflion, the term - $\frac{a c x^{2}}{2}$ vaniflies, and the term - $d b \sqrt{1-x^{2}}$ becomes $=-d b$; therefore our fluent has a contant part $+d b$; and the complete fluent is $m \pi n \frac{c}{e b}\left(d b-d b \sqrt{1-x^{-2}}-\right.$ $\left.\frac{a c x^{2}}{2}\right)$. Now this is equal to $m \pi n \frac{c}{e b}(d b \times$ verfed fine, $z-\frac{1}{4} a c \times$ verfed fine $2 z$ ): For the verfed fine of $z$ is equal to ( $1-$ cof. $z$ ); and the fquare of the fine of an arch is $\frac{x}{2}$ the verfed fine of twice that arch.

This, then, is the whole nutation while the monn's afcending node moves from the vernal equinox to the longitude $\gamma \mathrm{N}=z$. It is the expreffion of a certain number of feconds, becaufe $\pi$, one of its factors, is the folar preceffion in feconds; and all the other factors are numbers, or fractions of the radius 1 ; even $e$ is expreffed in terms of the radius 1.

The fluxion of the preceflion, or the monthly preceffion, is to that of the nutation as the cotangent of $r \mathrm{E}$ is to the fine of $r$. This alfo appears by confidering figure 7. Pp meafures the angle $A$, or change of pofition of the equator; but the preceffion itfelf, reckoned on the ecliptic, is meafured by Po, and the nutation by $p o$; and the fluxion of the preceftion is cqual to the fluxion of nutation $\times \frac{\cot .}{\text { line }} \frac{r E}{r}$, but cot. $r E=\frac{a d+b c y}{c x}$; therc. fore $\frac{\cot .}{\text { fine } \frac{\mathrm{E}}{r}}=\frac{a d+b c \sqrt{1-x^{2}}}{c x}$ : This, multiplied into the fluxion of the nutation, gives $\frac{m \pi n}{a b e}\left(\frac{a b d^{2}}{\sqrt{1-x}}+\right.$ $\left.\left(b^{2}-a^{2}\right) d c-a b c^{2} \cdot \sqrt{1-x}\right)$ if fre monthly preceffion. The fluent of this $\frac{m \pi n}{a b e}\left(a d^{2} b z+\left(b^{2}-a^{2}\right)\right.$ $\left.d c x-\frac{2}{2} a b c^{2} z-\frac{t}{2} a b c^{2} x \sqrt{1-x^{2}}\right)$, or it is equal to $\frac{m \pi n}{a b e}\left(\left(d^{3}-c^{2}\right) a b \approx+\left(b^{2}-a^{2}\right) d c \approx-\frac{1}{4} a c^{3}\right.$ fine 2z).

 of?'s reftrations of the retation within $y^{\prime \prime}$.

Tofinl the lumer preceff $n$ dusing half a revolution or the rede, offye, that then $z$ becomes $=\frac{e}{2}$, and the hine of $a$ and of $2 z$ vanifh, $a^{12}$ becomes $i-c^{2}$, and the prece:"ion becomes $\frac{m \pi n}{2}\left(d-\frac{1}{2} c^{2}\right)=\frac{m \sim n}{2}\left(1-3 c^{2}\right)$, and the precefition in IS years is $m \tau n \overline{1-c^{2}} c^{2}$.

We fee, by comparing the nutaticn and preceftion for nine years, that they are as $\frac{46 d}{c}$ to $1-3 c^{2}$ near-
 fponding to $1 \delta^{\prime}$, the obferved nutation, which is about

And thus we fee, that the inequality produced by the n:om in the preceffion of the equinoxes, and, morc rarticularly, the nutation occafioned by the variable obliquity of her orbit, emables us to judge of her thare in the whole phenomenon; and therefore informs us of her diftubing force, and therefore of her quantity of matte:. This phenomenon, and thofe of the tides, are the only fucts which emable us to judge of this matter: and this is one of the circumftances which has caufed this problem to cccupy fo much attention. Dr Bradley, by a nice comparifon of his obfervations with the mathematical theory, as it is called, furnilhed him by Mr IIschin, found that the equation of precellion computed by that theory was too great, and that the theory would agree better with the obfervations, if an ellipic were fubfituted for Mr Machin's little circle. He thought that the florter axis of this cllipfe, lying in the colure of the folltices, flould not excced $\mathbf{1 6}^{\prime \prime}$. Nothing can more cleally fhow the aftonilling accuracy of Bradley's obfervations than this remark: for it refultes from the theoly, that the pole mult really defcribe an ellipfe, having its fhot ter axis in the follitial colure, and the ratio of the axes mutt be that of 18 to 16,8 ; for the mean precefion during a half revolution of the node is $\frac{n i \pi n}{2}\left(d^{2}-\frac{c^{2}}{2}\right)$; and therefore, for the longitule $z$, it will be $\frac{\approx m \pi n}{c}\left(l^{2}-\frac{c^{2}}{2}\right)$; when this is taken from the true precefion for that longitude ( $n^{\circ} 54 \cdot$ ), it leaves the equation of preceftion $\frac{n:+n}{a b}\left(\left(b^{2}-a^{2}\right) d c\right.$. line $=-\frac{1}{+} a b 6$ fine 22 ); therefore, when the node is in the folltice, and the equation greatelt, we have it $=$ $\frac{\text { manacd }}{\text { abe }}\left(b^{2}-a^{2}\right)$. We here recgleat the fecond term as infignitican:-
53 equation of yrecthioti.

PRECIA'; (precius, "early,") the name of the 21 order in Linnæus's fragments of a natural method; confilting of primrofe, an early flowering plant, and a few gener: which agree with it in habit and thructure, though not always in the charater or circumflance exprefled in the title. See Botany, p. 46 r col. 2.
PRECIPITANT, in chemiftry, is applied to any liquor, which, when poured on a folution, feparates what is diflolved, and makes it precipitate, or fall to the bottom of the veifel.

PRECIPITATE, in chemiftry, a fubtance which, having been diffilved in a proper menftruun, is again feparated from its folvent, and thrown down to the botiom of the vettel, by pouring fome other liquor upon it.
PRECIPITATION. See Chemisfry Index.
PRECOGNITION, in Scots law. See Law, Part III. $n^{\circ}$ claxpici 43.

PRECORDIA, in anitomy, a gencral name for the parts fituated aboat the heart, in the forepart of the thorar: as the diaphrignm, peritardiam, and even the heart itfelf, with the fiplean, lungs, \&ic.

PREDECESSOR, properly fignifies a perfon who has preceded or gronc before ancther in the hame office or employment; in which finfe it is diftinguifhed from ancelter.
PREDESTINATION, the decree of God, where- The des by he hath from all eternity unchangeably appointed trine liawhatioever comes to pats; and hath more efpecially ted. fore ordained cotain individuals of the buman race to evcrating

## 1' R I:

evar?utins happinels, and hath pafical i; the reit, and fore-ardane. them t, everlanting micry. The former of thefe are called the $o$ eat, and the later are called the reprobate.

This doatrine is the fubject of are of the mot perpicxing controverties that has nccurred amony mankind. But it is rot aitegether peculiar to the Chrithian Lithth. The opinion, that whitever occurs in the world at larec, or in the lot of private individuals, is the refint of a previous and un.lacrable arrangement by that Supreme lower which prefides over nature, has always beea a farounte npinina among the vulgar, and has been believed by many feculative men. Thus, in that beantiful liens in the fixth book of the Ilial, Hetor, tiking leate of his wife and his chilh, fpeaks thus:

> Andromache! my foul's far better part, Why with untimely forrows heaves thy heart? No hoflile hand can antedate my doom, Till fate condemins me to the filent tom's. Fiis'd is the term to all the race of earth, And fuch the hard condition of our birth. No force can then refilt, no flight can fave, All fink alike, the fearfai and the brave. 1.62.

The ancient Stuics, Zeno and Chaylippus, whom the Jewifh Elfenes leem to have followed, alfertcd the exiltence of a Dity that, acting wifely, but neceffarily, contrived the general iyftem of the world ; from which, by a feries of caules, whatever is now done in it unsvoidably refults. This feries, or concatenation of cautits, they held to be neceffary in every part; and that God himfelf is fo much the fervant of neceflity, and of his own decrecs, that he could not have made the fmalleft cbject in the world otherwife than it now is, much lef's is he able to alter any thing.

According to the worls of Scneca, Eadenn necef. fitas et Deos alligat. Irrivocabilis divina periter atque bumana curfus oebit. Illc ipfe omnium conailior ac rector firipfit quiden fatin fed fequitur. Semprr puict, fome! julfit. "The fame chain of necefity conftrains both gods and men. Its unalterable courfe regulates divine as well as human things. Even he who wrote the Fates, the Maker and Governor of all thinge, fubnits to them. He did but once command, but he always obeys." The floical fate differs, however, from the Chriftian predefination in feveral points. They regarded the divine nature and will as a neceffiry part of a neceffary chan of caufes; whereas the Chriftians confider the deity as the Lord and Ruler of the Univerie, omnip. tent and free, appointing all things according to his pleafure. Being doubtful of the immortality of the Loul, the Stoics could have no idea of the doftrine of election and reprobation; nor did they ever doubt their own freedom or will, or power of doing god as well as evil, as we thall prefently fee the Chrifian predeftinarians have done.

Mahomet introduced into his Foran the doctrine of an abfolutc predeflination of the courfe of human aflairs. He reprefented life and death, profpeity and adverfity, and every event that befals :a m:un in this world, as the refult of a previous determination of the one God who rules over ail; and he found this opinion the beft engine for infpiring his followers with that contempt of danger whick, united to their zenl, has extend-
the hatituple of the

 lethus an Inth, monk, buth lival at Fome during that the chur ho period, and poffereal great celchrity on account of their Mollicm. pisty and louning. lleey talught that the of inion is Eud. fife, whi halers, that huar atme is meeflimily corrupted by od depravity derived ir m our lift parents. They contended, thit men are bom at prefent in a Itate as pare as that ia which $\Delta$ lam was oriegnally created ; and that they are met lefs qual:ifed thon he wats for fulfiling all righteoufials, and for reaching the mofl fublime eminence of piety and vitua? that the external grace of God, which is given untu ail, an 1 attends the peaching of the gofiel, is neccifity to call forth the attention and exertions of men; but that we do not want the afitance of any internal grace to pur. rify the hent, and to give it the firft impulfe toward; what is good. Elaving fled into Africi on account of the Gothe, who at ihat time invade Itaiy, A. 1). 4 Io, Coleftius remained at Carthene as a Prefbyter; but I's. lagius went into the Eaft, where he fetted, ard profered under the patronage of John bithop of Jerafilem, to whom his fentiments were agreeable. On the sugumire contrary, the celebrated Augutine, bilhop of Ifippo, a pectechfirenuoully alleted the depravity of human matiretince the fall of the frit man, the neceffety of a $f_{p}>c i a l$ inte:pufition of divine grace to enable us to do any one grout astion; and conequently, that none could obtain falvation excepting thr fo whem God has thought fit to elect, and upon whom be befows this grace. Tlie difpute was carried on with great zea!. Zozimus billep of Rome decided at firlt in favonr of Pelagias and Coeleftius, whofe followers were called I'clig ans; but he afierwards altered his opinion: an by the detivity of Auguftine, the council of Ephefus was called, at which the opiaion of his anta gonifts was for mally con. demned.

In the courfe of the fame century, there opinions arfumed a varicty of forms and modifications. One paity, called Predffinarimus, carried AuguRine's dotrine fully farther than he himfelf had ventured to do in ex. prefs words; and afietted, that God had not only fredeltinated the wicked to parnifmenent, but alfo that ha had decreed that they fhould commit thofe vety fons on account of which they are hereafter to be punithed.-Another party moderared the doftrine of Pelagius, and werc called Semipelagiass. Their peculiar opinion is exprefied in a different mamner by different writers; but all the accounts fufficiently agree. Thus, fome reprefent them as maintaining that imward grace is not neceflary to the firt beginning of repentance, but only to our progreis in virtuc. Others fiy, that they acknowledged the power of grace, but fait that faith d:pends upon ourlelves, and grod works upon God ; and it is agreed upon all hands, that thef: Sempelagians beld that predeftiation is made upon the forclight of good works. The affitance of duguftinc, though then far advanced in life, was called in to combat there tenets, a•d he wrote feveral treatifes upon the fubject. In all thefe he trenuoufly maintained, that the predeItiantion of the elea was independent of any forefight

of Calvinific Duarines, fiom John Calvin of Gencva. He allested, that the evenlafting enndition of mankind in a future world was determined from all eternity by the unchangeable decree of the Deity, arifing from his fole good pleafure or free will. Being a man of great ability, induftry, and eloquence, Geneva, where he taught, and which was a free flate, foon became the refort of all the men of letters belonging to the reformed churches, and was a kind of feminary from which miffionaries iffued to propagate the I'roteftant doctrines through Europe. Their fuccefs was fuch, that, excepting a part of Germiny, the principles of all the reformed churches are profeffedly Calviniftic or predeninarian.

The opponents of the dofrine of predeftination among the Proteftants ufually receive the appellation of Arminians or Remonflrants. They derive the firlt of thefe appellations from James Arminius, who was, A. D. 1602 , appointed * profeffor of theology at Leyden. He was vinlently oppofed by Gomer his colleague, and died A. D. 160 g . After his death, the controverfy was conducted with great eagerness on both fides. The Cilvinifts, however, gradually prevailed. A fynod was called at Dort, A. D. 1618, to which the moft celebrated divines of different countries were invited. There, in a great meafure by the authority and influence of Murice prince of Orange, the Arminians were cyndernned as heretics; for by this time ambitious and powerful men found themfelves politically interefted in this religious conteft. The Arminians prefented to this fynod a remonltrance, containing a fatement of their faith upon the fubjects in difpute; and from this they derived the appellation of Remonftrants. This fatement contained the following five articles: 1. That God from all eternity predefinated thofe to everlafting falvation whom he forefuw would believe in Chrift unto the end of their lives; and predeftinated obltinate unbelievers to everlafting punifhment. 2. Jefus Chrift died for the whole buman race, and for every individual of it, but believers alone reap the benefit of his death. 3. No man can produce faith in his mind by his own free will, but it is neceffary that man, who is by nature wicked and unfit for acting or thinking aright, fhould be regenerated by the grace of the Holy Spirit, imparted by God for Chritt's fake. 4. This divine grace conftitutes the fuurce, the progrefs, and the fulfiment, of all that is rood in man; but it is not irreliftible in its operation, 5 . Helievers, by the affitance of the Holy Spirit, are abundantly fitted for every good work; but whether it is polible for thafe who have once been buly fuch to fall away, and to perifh finally, is not clear,
and muft be better inģuined into by fearching the fa. cred fcriptures.

In oppolition to thefe, a counter-remonftrance was prefented, containing the opinions of the Calvinifts, which was approved of by the fynod. The fubfance of it was afterwards adopted, and in nearly the fame ex. preffons, into the Confeftion of Faith compiled by the affembly of divines which net at Weflminter, A. D. 1643, and which every clergyman and probationer for the miniftry in Scotland is at prefent requised to fubfcribe previous to his admiffion. To give as clear and calvir as fair an idea as poffible of the Calviniftic doctrine up- doar on this head, we tranfribe the following palhage from prede that Confefion: "God from all eternity did, by the tion, moft wife and holy counfel of his own will, freely and unchangeably ordain whatfoever comes to pafs; yet fo, as thereby neither is God the auther of fin, nor is violence offered to the will of the creatures, nor is the liberty or contingency of fecond caules taken away, but rather eftablithed. Although God knows whatioever may or can come to pars upon all fuppofed conditions; yet hath he not decreed any thing becaufe he forfaw it as future, or that which would come to pafs upon fuch, conditions. By the decree of God, for the manifeftation of his glory, fome men and angels are predeftinated unto everlafting life, and othess are fore-ordained to everlalting death. Thefe angels and men, thus predeftinated and fore-ordained, are particularly and unchangeably defigned; and their number is fo certain and definite, that it cannot be either increafed or dimi. nifhed. Thofe of mankind that are predeftinated unto life, God, before the foundation of the wolld was laid, according to his eternal and immutable purpofe, and the fecret council and good pleafure of his will, hath chofen, in Chrift, unto everlatting glory, out of his mere fiee grace and love, without any forefight of faith, or good works, or perfeverance in either of them, or any other thing in the creature, as conditions or caufes moving him thereunto; and all to the praile of his glorious grace. As God hath appointed the elect unto glory, to hath he, by the eternal and molt free purpofe of his will, fore-ordained all the means thereunto. Wherefore, they who are elected, being fallen in Adam, are redeemed by Chrif, are effectually called unto faith in Chrilt, by his fpirit working in due feafon; are juftifed, adopted, fancified, and kept, by his power through faith unto falvation. Neither are any other redeemed by Chrif, effectually called, juftified, adopted, fanctif. ed, and faved, but the elect only. The reft of mankind, God was pleafed, according to the unfearchable council of his own will, whereby he extendeth or with-holdeth mercy as he pleafeth, for the glory of his fovereign power over his creatures, to pafi by, and to ordain them to dithonour and wrath for their fin, to the praife of his glorious juftice."

There are two kinds of Calvinifts or Predeftinarians, Supr viz. the Supralaprarians, who maintain that God did faria: originally and exprefsly decree the fall of Adam, as a Subl foundation for the difplay of his juftice and mercy ; ans. while thofe who maintain that God only permitted the fall of Adam, are called Sublapfarians, their ffftem of decrees concerning election and reprobation being, as it were, fubfequent to that event. But, as Dr Priefley juftly remarks, if we admit the divine prefcience, there
nas is not, in fion, any difference between the two fichemes; and accordingly that diftinction is now feldom mentiuned.

Nor is the church of Rome lefs agitated by the contelt about predeftination than the firf Proteftants were. The council of Trent was much perplexed how to fettle the matter without giving offence to the Dominicans, who were much attached to the doctrine of Augultine, and polfeffed great influence in the council. After much difpute, the great object caune to be, how to contrive fuch a decree as might give offence to nobody, although it thould decide nothing. Upon the whole, however, they fecm to have favoured the Semipelagisn fcheme. Among other things, it was determined, that good works are of themfelves meritorious to eternal life; but it is added, by way of foftening, that it is through the goodnefs of God, that he makes his own gifts to be merits in us. Catarin revived at that council an npinion of fome of the fchoolmen, that God chofe a fmall number of perfons, fuch as the bleffed virgin, the apofles, \&c. whom he was determined to fave without any forefight of their good works; and that he alfo wills that all the reft fhould be faved, providing for them all neceflary means, but they are at liberty to ufe them or not. This is called the Baxterian fcheme in England, from one of its promoters there. But at a!l events, the council of Trent fcems to have been extremely anxious that any opinions entertaincd among them concerning predeftination might have as little infuence as polible upon practical morality. "Let no man (fay they), while he remains in this mortal ftate, prefume that he is among the number of the elect, and that therefore he cannot fin, or fin without repentance ; for it cannot be known who are elefled without a fpecial revelation from God." Sef. 6.c. 13.

The Jefuitsat firt followed the opinion of Auguftine; but they afterwards forfook it. Molina, one of their order, was the author of what is called the middle fobeme, or the doctrine of a grace fufficient for all meen, but fubject to the freedom of the human will. Jan/enius, a doctor of Louvain, oppofed the Jefuits with great vigour, and fupported the doarine of Auguftine. He wrote in a very artful manner. He declared, that he did not prefume to flate his own fentiments upon
he funjeat le protended only to expla:n an. 1 pab'ina broteninathe fentiments of that great father of the church sit Augulline. But the Jefui:s, in confequence of :hat in. violable fubmifinn to the authority of the pope wlit h they always mintaine!, had fufficient intereit at Rome to procurc the opinions of Janferius to 1 e co:demned there; but with this addition fabjoined, that nothins was therely intended to be done in prefindice of the doctrine of St Augufine. This produced an arfur 1 difpute aloout the pope's infallibility in matters of falt. The Janferifts affimed, that the Pop: had reade a mi. Stake in condemning the opinions of Jonfenitus as diferent from thofe of Augultinc; whercas in truch they are the fame, and the ne cannot be condenmed with. out the other. But the Jefuits affirned, that the pops is no lefs infallible in points of flut than he is in quettions of faith; and he having decidel, that the opinions of Junfenins are different from thofe of $3 t$ All. guttine, every gond Citholic is bound to believe ascordingly that they are difierent. Thefe ditputes have never been fully leitled, and ftill divide the Roman Catholic churches. Some of the ableft fupporters of predeftination have appeared among the Janfenits, and particularly among the gentlemen of Port-Rayal.

With regard to Great Britain, the enlien Englifh reformers were in general Sublapfarians, although fome of them were Supralapfarians. But the rigid Predentinarians have been gradually declining in number in that church, although they till fubferibe the 39 articles of their faith, which are unqueftionablv Calvinitic. The celebrated Scotch reformer Join Kinox having been educated at Genera, eltablithed in his country the doetrine of predeftination in its fricten form: and it has probably been adhered to with more clofenels in Scotland than in any country in Europe.

Of late years, however, the difpute concerning predeftination has affumed a form confider.bly different from that which it formerly poffeffed. Intead of being confidered as a point to be determined almof entirely by the facred fcriptures, in the hands of a number of able writers, it has in a great meafure refolved itelf into a queftion of natural religion, under the head of the philofophical liberty or neceffity of the will (A) ; or.
(A) Dr Priefley, the moft celebrated Neceffarian of the age, has written a whole fection of his Ill:frations, with a view to thow, that between " the two fehemes of Calviniftic predeftination and philofophical neceflity, there is no fort of refemblance, except that the future happinefs or mifery of all men is certainly foreknown and appointed by God. In all other refipects (fays he) they are moft effentially different; and even where they agree in the end, the difference in the manner by which that end is accomplifhed is fo very great, that the in$f_{\text {ixence o }}$ of the two fyftems on the minds of thofe that adopt and act upon them is the reverfe of one another." The Calvinitic doctrine of predeftination, according to a very authentic flatement of that doctrine*, is, that "God, for his own giory, hath fore-ordained zubatfoever comes to pafs." The fcheme of philofophic.1l nece[lity, as fated by an intimate friend and warm admiter of Dr Priefley's, is, "That every thing is preditermined by the Divine Being; that whatever has been, muft have been ; and that whatever will be, muft be ; that all erenhs are preordained by infinite wiflom and unlimited godnefs; that the will, in all its determinations, is guverned by the ftate of mind ; that this ftate of mind is in every inftance determined by the Deity; and that there is a continued chain of caufes and effeets, of motives and actions infeparably connected, and originating from the condition in which we are brought into exiftence by the Author of our being." The author or compier of the fime book affirms. "That all motion indeed originates in the Deity; that the Deity is felf-moved; that he poffeffes the fingular attribute underived of moving himfelf." But it is added in the very fame paragraph from which this hall fentence is quoted, that " the very argument we employ to prove one underived fource of motion,

Points at i.Tive between the ricedeftina rians and their oppa wnts.

God has impreffed on our minds, and the train of circumftances amid!t which his providence has placed us? TVe have already difuffed this point (See Metaphysics) by giving a candid fatement of the arguments on botin fides of the queftion. We fhall treat the fubject of predeftination in the fime manner, avoiding as far as poffible any recapitulation of what has been advanced under the head of Necessiry and LiJoty.

From what has been already faid, it will appear that the points chiefly at infue between the parties are the following: Finf, With what views and purpofes did God craate the world and frame his decrecs concerning nambi :d? Dill le contrive a great unalterable fcleme of crationatad providence only for the fake of manifonting his own gory ind petfections? Or ciju he fuft corfitur the free motions of thofe rational agents whom he iatended to create, and frame his decrees upon the andicuration of what they might choofe or do in all the varicus circumftances in which he intended to phace them:-The fecond and following quentions are lranches of this leading one. DidChilt die for a particular portion of the human race, who thall therefore cctainly be faved? or was his dea'l intended as a benefit to all, from which none are cxcluded excepting thofe who millingly reject it? Is the divine grace certainly ind irrefiltibly efficacious in all thofe minds to which it is given? or does its effeet depend upon the good ufe which men may or may not make of it? Can any good action be done withont it? Do thofe who have once beccired it certainly perferere and sbatan cernal falvation ? or is it poflible for any of them to fall away and perith finally?

12
Argumetits for the duetrine.

- Calviai Refinonf. contral'ig. halum, ad sum lit.

We flaill begin by fating the argument on the fide of the predeninatians, and in the language which they commonly ufe. But it is neceflary to make this previous rematk, that the general * cbjestions to their docthine are, that it is hoftle to all om ideas of the juftice of God, reprefenting him as a partial being, rewarding without menit, and punilhing without fin; that it rencers him the author of evil, deftroys moral dittinctions, makes urelefs every cffort on our pirt, makes every prayer ibfurd, and even the preaching of the gofpel vain; fecing that all things are immutably fixed, and none can believe or be faved excepting the eleet, and they mult cotainly and at all events be fafe. Agamit all this they reafon thus.

The great and everlalling Anthor of all things exifted from eternity alone, independent and effentially perfect. As there was no other, he conld only confider himfelf and his own glory. He mutt therefore have defiened all things in and for limielf. 'lo make him Aty his determinations till he fhould foe what free creatures would do, is to make him decree with uncer-
tainty, and dependently upon them, which falls mort of Ps infirite perfection. He cxifted alone, and his courcils could have no object excepting himfelf; he could only then confider the difplay of his own attributes and perfcetion. In doing this, as the end is more important than the means, Divine Wiflom mult begin its defigns with that which is to come latt in the cxecution of thom ; but the conclufion of all things at the laf judgement will be the complete manifctation of the vifdom, the goodnefs, and juttice, of Gcd: we mutt therefore furpore, that, in the order of things, lic decreed that filt, although with lim, in the order if time, there is nof fint ror fecond, but all is from cternity. When this great defign was laid, the means wore next defign. ed. Creation, and its inhabitants of every crder, form the means by which the author and difpefer of all things accon.plifhes lis will. But creatures in his fight are nothing, and are figuratively faid to be lefs than nothirg. We may entertain proud and elevated conecptions of our own dignity if we pleale; but if we in our defigns regard not the duft on which we tread, or the lives of ants and irfects, the omnipotent Lord of all, from whom we are more infinitely diftant, mult iegard us as at leaft equally inconfidcrable, and on! y valuable as we ferve the arcomplifiment of his great and my:ीerinus purpofea, which cannot be us or our aggrandilement, but himfelf and his own glory.

It is only by this view of the divine conduct that As fome of the attributes of God can be explained, or their ry exiftence rendered poflible. In the feriptures he claims ${ }_{\mathrm{D}}^{\mathrm{p}}$ the attribute of prefience as his diftinguifhing preroga- t tive: lut there can be no prefcience of future contingencies ; for it involves a contradiction to fay, that things which are not certainly to be fhould be certainly forefeen. If they are certainly forefeen, they $m i f f$ certainly be, and can therefore be no longer contingent. An uncertain forefight is alfo an imperfect act, as it may be a miftake, and is therefore inconfiftent with divine perfection. Ou the cther fide the diffenty is cafily explained. When God decrees that an erent fhall take place, its exiftence becomes therccforth certain, and as fuch is certainly forefeen. For it is an ubvious abfurdity to fay, that a thing happens freely, that is to fay, that it may be or may not be, and yet that it is certainly forefeen by God. He cannot forefee things but as he decrees them, and confequently gives them a future certainty of exifence; and therefore any prefcience antecedent to his decree mult be rejected as impoffible. Conditional decrees are farther abfurd, inafmuch as they fubject the purpofes of God to the will and the attions of his creatures. Does he will, or with that all mankind thould be faved, and flall they not all be faved? Infinite perfection can wifh nothing but what it can execute; and if it is fit to wihh, it is alfo fit to execute its wifhes. We are indeed certainly informed by the
and exiftence, is a grofs folecifm in logic; and that the afcription of this power to the Divine Deing is in fur nisthing elfe than the lefo of two palpable alfurdities or rather imppriblitics, if thefe could admit of degress.t."

The piety of thefe affertions will be obviour, we are perfuaded, to every one of our readers; buit to fome it is it it pofille that their confiftency may not be apparent. We wou'd advife all fuch "to perufe once ard again phis Dr Prieftey's Iltuftrations," which, we have the beft author ty to fay, will remove from their minds all l-bena- colf rian prej'idices, convince them "that the hypothefis of neceffity is incontrovertbly trae," and frow them th.it t :Hll the defenders of that hypothefis are in perfect harmony with themfelves and with cae another !

## PRE

Aina- fcriptures, that all fhall not be faved ; and we thereforc as certainly conclude, that God never intended that they thould be fo; for the cowifel of the Lorld fandeth Suft, and the thoughts of bis heart, to all sencrations.

We conclude upon the fame principles, that although the bleffings refulting from the death of Chrit are offered to all, yet that intentionally and actually he only died for thofe whom the Father had chofen and given to him to be faved by him. That Chrift fhould have did in rain is reprefented by the apolle Paul as a great abfurdity (Gal. ii. 21.) : but if he died for all, he muft have died in vain with regard to the greater part of mankind who are not to be faved by him. In to far as fome inferior bleffings are concerned, which through him are communicated, if not to all men, at lealt to all Chriniaus, he may perhaps juftly be faid to have died for all: but with regard to etermal falvation, his defign, to avoid rendering it fruitlefs, could go no farther than the fecret purpofe and eleaion of God. This is implied in thefe words, all that are given me of my; Finter, thine they zever, ant thou gavelt then me. 'to the fe his intercefion is limited; I pray not for the ruorld, lat for thofe that thou buff given me ; for they are thine, and all thine are mine, and mine are thine ( $\mathrm{J} \cap$. xvii. 2, ro.) Univerlal words are indeed ufed with regard to the death of Chrift: but the reafon is obvious, the Jewill religion was co nfi ed to the family and defendants of Abraham. In contradicion to this, the gof: pel is faid to be preached to every creature, and to all the evorl.l; becaute it is not limited to any one race or nation, and becaufe the apnofles receivel a general commiffion to teach it unto all who fhould be willing to receive it. Thefe extenfive expreffions can only be underterod in this manner, becaufe in their frict accep. tation they have nefer been verified. Nor can their meaning be carried farther without an imputation up. on the jullice of God: for if he has received a fufficient fatisfaction for the fins of the whole world, it is not juft that all flould not be faved by it, or at leaf have the offer of falvation made to them, that they may accept of it if they pleafe.

But to return to the divine purpofes and attributes in gencral: it is in vain to afert that God is partial and unjut while he prefers without merit, and predeflinates to punifhnient thefe who have not yet offended. The fame error mifleads men here that has fo often feduced them from the tiue path of ficientilic refearch. Inftead of fulbmitting to the patient and humble offervation of nature, they boldy form fome plaufible hypothefis of their own, and vainly attempt to rec.ncile every appearance to their faroarite fyttem. This mode of procedure never has prowed, and niver will prove, fuccefsful in any branch of true philofophy. We are not entitled to frame to ourfelves certain notions of the jultice of God, and from thefe to decide that thus he muft act and in no o:her manner. He takes no counfel from us concerning his conduct, and we have no right to rejudge his judgments. What he regards as juft or unjult between himelf and his creatures, is a queition ffact not to be known by ingeniou; conjectures, but by the cautous wherrations of the manner in which he acts in the courfe of his provilence, and by attending to what he has declared concerting limfelt in the facred feriptures. If from thefe it thall appear that he does prefer where there is monerit, and reject where there is no crime; it will Voz. XV.
be in vain thereafer to affert that fuch condues is un. Trenchinejuft : the fae will be on our fide of the quention, and we thall leave thofe to account for it who infif that their limited reafon is capable of comprehending all the nyif terious ways of an Infinite leing.

In the courfe of providence, then, we fee the great- Great incen inequalities take place, and fuch as appear nito qualites in gether contraditory to our ideas of juftice. We fee the wrdithe fins of the tathers punifhed in the perfons of the of pry courio children, who often derive debilitated bodies from the is-dence. temperance of their parents, and corrupted manners from the example of their vices. God frequently afficas good men in this life for a great length of time, as in the cafe of Job, only for the manifettotion of his own glory, that their faith and patience nay be made manifelt. Some fins are punifhed with other fins, and often with 2 courfe of fevere miferies in the perions of thofe who never committed them. We maty transfer this from time to eternity; for if God may do for a little time what is inconfiltent with our notions, and with our rules of juftice, he may do it for a langer duration: fince it is as impolible that he can be minult for a day as for all eternity: and the fame inequality of manasemert appears in the great as in the private affairs of this world. During many ages almoft the whole human race were loft in the darkncfs of idolatry : even fince the Chriftian religion came into the world, how few nations have received it ; and of thefe few, the number is fill fmailer of thofe who have enjoged it in tolerable purity. If we confider how many great nations remain under the delufion contrived by Mahomet; if we refleâ upon the idolatry of the Indies and of China, and the fuperfition of the Greek church, and of the church of Rome-we fhall find that very few nations have poffeffed the moft ordinary means of grace. Even the bleflings of civilization, of fcience, and of liberty, are fo marely featered over the face of the earth, that it is to be regarded as a melancloly truth, that with a very few favoured exceptions the whole human race have hitherto been furk in the depth of barbarim, igne ray ce, flavery, and idolatry. When the Arminians think fit to affert, then, that the doctrine of abrulute decrees is contrary to their ideas of the impartiality and juftice of God, we can only anfwer that we are forry for them if they have formed ideas of the character of God which are contrary to the truth. We prefume not * like them to call his attributes before the tribunal of our underfandings ; we only obferve the ways of his providence, and declare that thus flands the fact. If he leaves whole nations in darknefs and corruption, and freely chonfes others to communia the the knowledge of himfelf to them, we need not be furprifed if he at in the fame manner with individuals. For furely the rejecting immenfe empires fur fo many ages is much more unaccountable than the folection of a few individuals, and the leaving others in ignorance and depravity. It is in vain to aliere that be extends his mercy to thofe who make the beft ufe of the dim light which they have. This does not remove the difficulty of a choice and a preference; as it cannot be denied that their condition is very deplorabie, and that the condition of others is much more hopeful: fo that the mylterions cirarine of election and rerrubation is an ungueltinnahle truth under the government of God, feeing that great numbers of men are born in fuch circumfrances that it is morally impolib!e they fhowla not pe-

Yretulna-tifl in them; whereas others are more happily fituated stos. and culightencul.

I6 Nur are we left to common obervation upon this '1helen:-
ghage of Boripture metlett:uatich, point. The language of the facred icriptures is pofitive and clear. The whole reafnning in the ninth chapter to the Romans refolves all the acts of God's jultice and nescy, his kardining as well as his fardoning, into an ab. dilute freedom and in unfearchable depth. Nore pointed exprefliuns for this purpolc can fcarcely be conceived thans thofe actually made ufe of. For the children beins not yot born, militer having dome any gosd or evil, that the parpofe of God accorcing to clection might fand, nat of reobks, but of lime that calluth, it ruas find, The elder flall firve the yoznger. As it is suritch, Jacob lave I loved,' but Efua bave I hated. IWhat fhall rue fay then? Is thare whrightoung. fs with God? Gout forbid. For be faith so Mufes, I will lave marcy on whom I will Eave mercy, "nhi I rull bueve coirptlin on witom I will buve compafion, So then it is not of him that willcth, nor of him that rumeth, bat of Gud thout jourveth meryey for the foripture faith unto Thartoh, Even for this fame purpofe lave I raifod thee up, theit I nivlt fiow my forver in thee, aml that my nane nistit le Achurch dromglout all the earth. Therefore bath

tion an.
fwered. be mercy on aulom be will buve increy, and whom be quill be hurdeneth. If any man thall fitl be fufficiently bold to declare that all this is contrary to what he is phaled to contider as jut and impartial, we can only reply to him in the worls of the celebrated John Calvin
tULifupra. ul' Genevat. Tibi nooleflum ofl ac odiobum, Deum flus fefe of foctre, quan mens tua capiat; aquali auten tuo infircuan concedes, ut fuo judicio fruatur. Et tu in tanto furon, Deimmtioncm whinmfactre audes? "Is it painful to thee that tile power and the works of God exceed thy limited capacity? Thou fomecimes fuffreft thine equal to judge of his own conduet for himfelf, and dareft thou in thy folly to cenfure the ways of God?" Or rather we may reply in thore words of the apofle Paul which immediately folluw the pallage already quoted. Thou avilt fiy than io me, Why doth the yet find fuult? for awho bath rjiled his arill? Nay but, 0 man, sulo art thow that rediegl againgl Gods. Shall the thing formed fuy 10 lim that jormeth', IVty haft hou neade me thows? Hubls not the folter fuser over the cliy'; of the fame lump to nake one veffet anto bonour, and anobler unto diflonour? Let thefe paffages, and even the whele of the chapter now alluded to, be explamed in any minner that is judged proper, thill their import with regard to the prelent argument will remain the fime. If God loved facob fo as to clufe his pofte. fity to be his poople, and rejected or hated Elau and lis pol?erity, and this withe ut regard to them or their fature condat, but merely in confeguance of the purpofe and deign of his election ; if by the fime purpote the (icutiles ware to be grafted upon that dock fiom which theunce favourcd Jews were cuc off; it will tollow, not aly blat the arat and myllerious decree of final clecfion is unferchatly free and abobute, but alfo that all lise ments of grace are granted or withbeld in the fame unlinited and free maner according to the fovereign will and good pleafure of God, independent of any forefight of merit on our part. The words of our Saviour capretis this: Ithatathee O Futher, Lord of henven and sulit, biconfe thay be, thel the fe things from the wife and? prute t, ant batit ratale l bem unio habes: The reaton of which is given in the following words, Even fo, Fithor, for fis it fermad youl ins thy fobt, (Mat. 土i. 26). The pafans: inmednaty preceding this, thows clearly that the
means of grace are not beftowed upon thofe who, it is Prec forefeen, will make a good ufe of them ; nor denied to thore who will make a bad efe of them. Wo unto thee Chorazin, wo unto thee Beibfaida: for, if the mishty avorks which weve done in you bad been done in Tyre and Siwons, they rwould have repentad long ago in fuckcloth and afoes. But the pallages in icripture are immmerable, which declare that the whole character and deftiny of every man is the refult of the counfel and uncontrouled determination of God. The expreffion is often repatad in the book of Exodus; God lardened the lieart of Pharach, So that lie avould not let bis people go, (Exod. iv. 21), ©c. It is faid, that Goul has made the rei ksd mon for the day of evil (Prov. xvi. 4). On the other hand, it is faid, as many believad the golpel as revere apponated to etirnal lifis; (Acts i. 48). Some are faid to be wrilten in the book of life, of the Lamb fain from the foundation of the rworld (Rev. xiii. 8). Every prayer that is ufed, or direcked to be uled, in fcripture, is for a grace that opens our eyes, that turns the heart, that makes us to go, that leads us not into temptation, but delivers us from evil. All thefe expretlions denote that we defire more than a power or capacity to act, fuch as is given to all men. Indeed we do not, and we camot, pray earne\{ly for that vinch we know all men as well as ourlelves pollefs at all times.

The grace of God is the medium by which his fovercign Sure will and abolute decrees are accomplithed. Accurd. cacy ingly, it is fet forth in fcripture by fuch exprefliors as grac clearly denote its fure efficacy; and that it does not depend upon us to ule it or not at our pleafure. It is faid to be a creation; eve are crealed unto good foorks, and que become new creat:ures: It is called a regeneration, or a now bioth; it is called a quickening and a refurrestion, as our former flate is compared to a feeblenefs, a blindnefs, and a death. God is faid to work in us botls to cuill and to do: His people foall be villing in the day of bis power: He rwill wurite bis laws in tivir bearts, and make them to zualk in them. In a paffage already quoted, the human race are compared to a mafs of clay in the liands of the potter, who of the fame lump makes at his pleafure viff ls of honour and difhonour. There pallages, and this latt more particularly, prove that there is an abolute and a conquering power in divine grace; and that the luve of God contrains us, as St Paul expreffes limfelf. Our Saviour compares the union and influence that he commonicates to believers to the union of an head with the members, and of a root with the branches, which imparts an internal, a vital, and an efficacious influence. The outward means may indeed be rejefted, but this overcoming grace never returns empty: thefe outward means coming from God, the relifting of them is fitid to be the rfffing of God, the grieqing or quench. ing of bisforit; and in that fenfe we maly relitt the grace or favour of God; but we can never withitand him when he intends to overcome us; For the foundation of Gold gundeit fore, having this forl, The Lard hroweth then that are bis, ( 2 Tim. ii. 19). Having predillinated us unto hie adoftion of childrin by Ffyus Chrift bimelif, according to the good flafiure of his suill, (Eph. i. 5).

That the faints farll certainly perfevere unto the Perf end is a neceffry confequence of abfolute decrees and of rance efficacious grace: all depends on Crod. He of his owen the fa swill begat us; and with him there is no variablenefs mor Joudorv of turning: whom he loves, he loves to the end: and he has promifed that he will never leave nor forfake thofe to whom he becomes a God. Our Lord

ina- hath f.uid, I siat unto then ctornal life, and they fuall nevel
 28) Hence we mult conclude, that the purpefe and call. ing of God is raithout refentume, (Hel. xiii. 5.) And thercfore, athough good mon may fall into gre:t fins, jet of all thofe who are given by the father to the Son to be faved by him, none are lolt : The conclufion from the whole is, that God did in himfelf, and for his own glory, forchorwa detcrminate number in whom he would be both fanctified and glorified. Thefe hie prady/tinated to be holy, conformuble to the image of his fon: they nre to be cally, not by a general calling in the fenfe of thefe words, minny are calced, but ferw are chofen; but to be callad accordibge to bis putpofe. He jufifigid them upon their cbeying that calling, and in the conclufion he will glon ify them: for nothing can feparate us from the love of Gad in Chrift, (Rom. ix. 19.) And he is mot lefts abfolute in his decree of reprobation than he is in his clection: for ungodlys men are faid to be of old ordained to conkimnation, and to le given wif by God unto rile affections, and to be given outer by him to a reprobsle mind.

Thus far we have defended the doEtrine of predeftination: we procecd next to flate the arguments uffally adduced in farour of the Arminian fyitem.

God is juf, holy and merciful. In speaking of himfelf in feripture, he is pleared to make appeals to the human underltanding, aid to call upon men to reafon with him concerning his wass. The meaning of this is, that mon may examine his actions and his attributcs with that meafure of intelligence which they polfers, and they will be forced to approve of tham; nay, he propofes himielf to us as a pattern for cur imitation. We are required to he holy as he is holy, and merciful as he is merciful: which is a proof that he accounts us not incapable of forming juft notions at leat of thefe attributes. What then can we think of a.juftice that fhall condemn us for a fat that we never committed? that defigns firft of all to be glorified by our bcing eternally miterable, and which afterwards decrees that we fhall commit fins to juftify this previous decree of our reprobation? For if God originally defigns and determines all things, and if all his decrees are certainly effected, it is inconce:vable how there frould be a juftice in punifing that which he himfelf, hy an artecedent and irreverfiole decree, appointed to be done. Or, fetting jultice afide, is it primble that a being of infinite holinefs, and who is of purer cyes than to bebold iniquily, would by an antecedent decree fix our committing formy fris, in fuch a manner that it is not poffille to avoid them? He reprefents himflif in the feriptures as graciaus, merciful, flowe to angur, and alundant in goodmo ss and trutb. It is often faid, that be d fres that r:o $m$ a floald perifn, but that al foonld come to the Lnorel dye of the truth: this is even frid with the folemnity of an oath, As I liwe, faitb the Lord, I tuke nu pleafieve in the deatl) of fincors. What fenfe can thefe words bear if we believe that $G$ dd did by an abfolute decree doom fo many of them to everlafting mifers? If all things that happen arife out of the abfolute dechee of God as their firit caufe, then we mult believc that God takes pleafure both in his own decrees and in the execution of them, confequently that he doth take plecaure in the death of finners; and this in exprefs contradiation to the mott pofitive languarge of ferip-
turc. Fefles all this what are we in think of ti.e i
tuith of God, and of the fincerity of thofe offers of tuth of God, and of the fincerity of thote offers ".f
grace and mercy, with the exhortations and capnfinfations upon them that nccur for frequantly in icripture, if we can imag ne that by ant cedent ast he cectermined that ati thefe fhould be inefief:a $1^{1}$ ? In ore word, are we to regard nur cxillence as a blefing, nad to look up with gratitude to that paternal go di.cis which has placed us in a land of hope, which formed our nature, weak indced and enpofed to many imperfesions, but capalle of riting by virturus cfferts atad by a patient continuance in walldcing to excellatace and to high and immortal felicity ? or, ate we to cuife the hour in which we were hnen under the domiaion of a mater, who is not only fevere, me abfurl, and cren adds infult to crucley; who, after placing us in a gnodly habitation, binds us hand and foot, locks the dior, blocks up the wind.sws, fets fire to the fabric, and then wery mercifully calls upon us to ccme forth left we perifh?
It is not true that rational beings are nothing in the light of their maker. Compared to his Almighty ftrength and uncreated exifence, our powers do indeed diminifh into weaknefs, and our years into a moment: yet although our interefts may be unimportant in themfelves, the attributes of God with which they are annnected are far from being fo. The:e was mo reecflity for his calling us into cxillence; but the infant t.e beRowed upon us that gift, and conferredupon us faculties capable of rifing to happinefs by the contempiation of himfelf and of his works, he became our parent, and granted to us a right to look $u_{i}$ to him for proteition and mercy, and to hope that our exifence and our faculies were not beftowed in vain. Nor will he trample upon the juft and reafonable hopes of the meaneft of his crentures. He is watchful over our interefts; he hath fent his Son to die for us; his providence has been exerted for no other purpofe but to promote our welfare; and there is joy in heaven even over one fimer that repenteth. Let it be allowed, that the univerfe was formed for no other purpofe but to promote the glory of God; that glory can furely be little promoted by the exertion of undiftinguifhing and blind aits of power, in the arbitrary appointment to eternal reprobation of millions of unrefifing and undeferving wretches*. It is not more honourahle to the Deity' to cun. - Correceive of him as the parent, guide, governor, and jutge fpordence of free beings, formed after the likenefs of himelf, with berween powers of reafon and felf-determination, than to con. Price and ceive of him, as the former and condutor of a fyitem l'ricficy. of confcious machinery, of the mover and rontrouler of an univerfe of puppets, many of whom he is peared to make cumpletely miferable? The noof important and fundamental point of reigion, confidered as as fpeculative fience, confits in cur forming hish and jut ideas of God and of his attribhes, that from them we may underfand the maxims of trtie and perfeit morality. But were we to attempt to form our or:a natures upon the idea of the divine character that is given us by the docirine of ablolnte decres, we wrould certanly become impe:ious, partial, and crucl; at leaft we fhould not readily learn the virues of kindnefs, mercy, and conepalfion.
It is true that, feating afide predeftination, it is The diflinot eafy to thow how future contingencies tho:ld be prescience

## PRE

Heneniad- certainly forefen; but it is obvious that fuch forefight tradifory to ou: reafon, but only above it. For ex-Preden involves no contradidion, (fee Metaphysics, $n^{\circ} 308$ ); and if the actiens of men be free, we know from the train of prophecies, which in the facred fcriptures appear to have been made in one age and fulfilled in another, that contingencies are forefeen by that infinite lieing who inhabiteth eternity, and to whom a thoufand years are but as one day. The prophecies concerning the death and fufferings of Chrift were fulfilled by the free ads of the Jewifl priefts and people: Thefe men finned in accomplifhing that event, which proves that they acted with their natural liberty. From thefe and all the other prophecies both in the old and new Telt.1ment, it mult be confeffed that fiture contingences were certainly foreknown, but where to found that certainty cannot be eafily refolved. We doubt not, however, that we may fafely refer it to the infinite perlection of the Divine mind. And it ought to be obferved that this difficulty is of a very different nature from that to which our antagonits are reduced on their fide of the argument. They are compelled to confefs that they camot reconcile their doetrine with the jutice of God, an attribute the nature of which we clearly undertiand, and which is held forth to our imitation; whereas we are only at a lofs how to explain the mode in which the divine prefience is exerted; an attribute which God c'aims as peculiarly his own, and which it is not to be expected that we thould be able in the fmalleft degrec to comprehend. We can go farther than this. Heaven hath given to man two revelations of itfelf. The one confits in the knowledge which we procure by the right ufe of our rational faculties; and the other is befowed by means of the faceed fcriptures. Without intending to derogate from the authority of in. fpiration, it is lair to affert, that we are nore certain that God is the author and befower of our reafon, than that he is the author of the fcriptures; at leat it is cerain that the laft cannot contradiet the firlt, becanfe God cannot contradiat himfelf. By the primary revelation from heaven then, that is, by our reafon, we are informed that God is true, and juft, and good. If an angel from heaven fhould preach a doetrine contrary

Seripture cannor cint tradict the clear dics.ltes of reafon.
to this, we are entitled to fay with the apoftle, let liim be accurfed. If our antagonitts then thonld fucceed in proving that the doctrine of abfolute decrees, which reprefents the Deity as cruel and unjut, is contained in fcripture, the confequence would be, not that we would believe it, for that is impoffible, but that we thould be reduced to the neceffity of rejecting the autherity of the feriftures, becaule they contradior the previous fure revelation of God, our reafon. We believe that the doctrines contained in the feriptures are certainly true, becaufe they were taught by thofe who wruaght miracles and foretold future events in proof of their being inipired by the God of touth. But miracles and prophecy are direct evidences of nothing but the ponver and auftion of their Author; and unlets we know by oulher evidence, that this poweriul and wife Being is likewife the father of truth and juftice, we cannot be fire that the feriptures, notwithf anding their fource, are way thing beter than a tiflue of falfehoods. The very ar:uments therefore by which predentination is fupported, wad to fap the foundation of that revelation from which it adrocates pretend to draw them. The cafe is wery dizurunt when no doctrine is allerted that is not con-
ample, when we are told that Goul can create ration. al beings, that he attends widhont diftraction to the minutelt affairs that pafs in a thoufand worlds, that he knows all things, the pant, the prefent, and the fature, we do not prefume that we comprehend how he can do all this: but there is nothing in it that contradicts our reafon; we ourfelves puflefs a certain degree of power, can attend at once to a certain mumber of objects, can in fime cafes form very fure conjectures about futurity, and we refolve all the reft into the infinite nature and perfections of God.

It is farther to be obferved, that prefcience does not make elfects certain beciufe they are forefeen; but they are forefeen becaufe they are to be: fo that the certainty of the prefcience is not the caufe, but the confequence of the certainty of the event. The Roman republic las falien; but our knowledge or ignorance of that event does not render ir more or lefs true and certain. That it was to fall, was as furcly true before it happened as it is now; and had we known it beforehand, as many men of fenfe probably did, it would neither have fillen fooner nor later on that account. This fhows that the knowledge which an intelligent being has of a paft or future event need not have any influence upon the circumiftances that produce that event.

On fome occafions the feripture takes notice of a con- Conditi ditional prefcience *. God anfwered David, that Sanl al presci would come to Keilah, and that the mon of Keilah ence. would deliver him up: yet hoth the one and the other refled upon the condition of his flaying there; and he - I Sam xxiii. iI 12. going from thence, neither of them ever happened. Such alfo was the $\dagger$ prophecy of Jonah, at the failure $\dagger$ Chap. of which he was fo abfurdly offended: and fuch was Chrill's faying, That thofe of Tyre and Sidon, Sodom and Gomorrah would have turned to him, if they had feen the miracles that he wrought in the towns of Galilee. Since, then, this prefcience may be fo certain that it can nevererr nor miflead the exertions of providence. and fince by this, both the attributes of God are vindicated, and the due freedom of man is alferted, all difficulties feem to be thus eafily removed.

With regard to the puipofe of Chrift's death, he is faid to be the propitiation for the fins of the aubole aurild; and the wicked are faid to diny the Lord that bought them. His death, as to its extent, is fet in oppolition to the fins of Adam; fo that as by the offence of one judgment came upon all men to condemation, fo by the righteoufnefs of one the free gift came upon all men to juftification of life, (Rom.v. r8.) The all nn the one fide muft be as extentive as the all on the other: fo, fince all are concerned in Adam's fin, all muft likewife be concerned in the death of Chrit. To this we may add, that all men are commanded and required to believe that Chrift died for their fins; but no min can be olligred to believe what is not true: he muft therefure have died for all. The following palfages expels clearly the univerf.lity of the rbject of Chrif's death. If any man fint, see have an advorate with the Father, Jefus Clurijl the rightiouss: and he is the propitiation for our fins: and not for ours only, but alfo for the fins of the cobo'e roorld, ( 1 Jo. ii. 1, 2.) The love of Chriff conjtraineth us; lecaule teve thus jutge, that if onc died for all, then wers all dead: asal that be died for all, that they sukich litere

## I R E

na- Roulif not henceforth live unto themfores, ( $=$ Cor. v. 14.) evil. This conclufion is confirmed by the whole nyle PredeninaGod So boved the scorld that he gave his only lugythen Som,
 ecerlifflyg life. (Jo. iii. 16.)
But a proper attention to the mature of man will to fet the jultice of nur argument in a fitll funnger point of view. It is obvious, that ftech an inward frecedom as renders a man the mafter of his own conduct, and able to do or not do what he pleates, is fo neccflaty to the momality of our asions, that without it they are ncither good nor evil, ncither capable of rewards nor puniflhments. Madrien, or menafleep, are not to be charged with the good or cvil of what they do; therefore at leat fome fmail degrec of liberty mult be left us, otherwife why are we praifed or blamed for our conduct? All virtuc and religron, all difcipline and indultry, arife out of this as thair firft principle, that there is a power in us to govern our own thoughts and aations, and to raife and improve our faculties. If this is denied, all efforts, all education, all attention befowed upon ourfelves or others, become fruitlefs and vain. If a man accounts himfelf under an inevitable decree, as he will have litule remorfe for the evil he does while he imputcs it to that inevitable force that confrains him, fo he will naturally conclude that it is to no purpofe for him to flruggle with impoffibilities. Men are fufficiently inclined to throw all cenfure off from themfclves, and to indulge in indolence; and upon the d: ©trine of abfolute predeftination who can blame them, fecing that their effirts can be of no value?

Matter is inaative of itcicif, and only moves in confequence of its being acted upon by fome other being. Man is poffefled of a power to begin motion, and to detcrmine it in any direstion that he may judge proper. This power and this intelligence conftitute his liberty, and form that image of God that is flamped upon his nature. Whether man polfefles this power of acting originally and of himfell, or whether he is incapable of forming any refolution, or making any effort, without being acted upon loy a foreign caule, is not a point to be reatoned on or difputed about ; it is a queftion of tact, which, as far as it can pufibly be known, every man has it in lis power ro determine by the evidence of his own confcioufnefs. We do avcr, then, that every man is confcious that he is a free agent, and that it is not pofible for the moft faunch predeftinarian that has ever yet appeared ferioully and pranically to convince himfelf of the contrary. It is not polfible for a man in his ferfes to believc, that in all thofe crimes which men clarge themfilu's with, and reproach themfitues for, God is the aycnt; and that, properly feaking, they are no more ager, than a fivord is when employed to commit murder. We do indeed, on fime occafions, feel curfelves hurvicd on $f$ impeturufly by violent pafions, that we feem for an indath $t$ have lof our freedom; but on cool reflealion we find, that we boih might and ou ghe to have refrained that hat in its firft commence. meat. We feel that we can divert our thonghts, and overcome ourfelves in moft inftances, if we fet ferioufy about it. We feel tiat knowledge, reflection, and proper fociety, improve the temper and dipofition; and that igunance, negligence, and the fociety of the Wrothlefs and abandened, corrupt and degrade the mind. From all this we conclude, that man is free, and not under incvitable fate, or irrelifible motions to good on
of icripture, which upon any other fuppofition becomes a folcmn and unwort!y mockery. It is full of perfuafoms, exhoutations, reproifs, expofulations, encouragemonts, and terrors. But to what purpe fe is it to feak to dead men, to perfuade the blind to fee, or the lame to run? If we are under impotence till the irrefifitle grace comes, and if, when it comes, nothing can withHand it, what occafion is there for there folemn dif. courics which can lave no effeet ? They camot render us incexcufable, unlels it were in our power to be improved by them; and to imagine that God gives light and bleffings, which can do no good, to thofe whem lie before intended to damn, on!y to make them more incxcufable, and for the purpofe of aggravating thair condemnation, gives fo frange an idea of his claracter as it is not fit to exprefs in the language that maturally arifes out of it.

Our antagonifts feem to have formed ideas of the Some uf divine perfection and fovereignty that are altogether the aets of falle. There is no imperfeation implied in the luppo- Goddefition that fome of the adts of God may depend upon the cunthe conduct of his creatures. Perfection confifts in duat of his forming the wifef defigns, and in executing then by creatures. the molt fuitable means. The author of nature conducts the planets in their orbits with immutable precifion according to fixed rules : but it would be ablurd to pretend to manage free agents, or their affairs, in the fame manner by mathematical or mechanical principles. The providence that is exerted over material obje?s is fixed and Ateady in its operations, becaufe it is fit that material objects which camnot move of themfelves fhould be moved in a regular manner : but free and intelligent beings enjoy a wider range, ard ought not to be confined to a prefribed train of exertions; it may therefore be necelfary that the providence which fuperintends them fhould accommodate iffelf to circumfiances. This, however, is not injurious to the divinc fovereignty ; for God himfelf is the author of that freedom of agency which he is pleafed to watch over. He is not lefs the Lord of the univerfe; and furcly his wifdom and benevolence are more confpicuous when ho brings good out of evil, and renders the perverfe wandererings of the human heart fubfervient to purpofes of mercs, than when he hurls into the immenfity of fpace the moft cnormous mafs of dead and paflive matter fubjected to unerring laws.

As for the inequalities of moral fituntion that are to be obferved in the world, and the giving to fome nations and perfons the means of improvement, and the denying them to others, the feripilmes do indeed al- for cribe thefe wholly to the riches and ficedom of God's grace. Anl, we confets, that the ways of Providence are often dar's and mytterious. In this world there are many things which are hard to be underitood, and many which appear altogether unaccountable; we fee the wicked man profpering in his wicledners, though it impofe mifery upon thonfands; we fee truth hiding its head, and the world groverned by fratid and abfurdity. Still, however, we can venture to afiert, that God beftows upon all what is necellary to enable them to fulfil the obligations expected fron the flate in which they are placed; and it is elfewhere thown, that phyfical eril is among men the parent of moral good. (Sce Pro. radexcr). Got winketh at the times of ignorance;

## PRE

l?etenin- much is required of them to whom much is given; and $\underbrace{\text { tion. }}$ it thall be more tolerable in the day of judgment for the inhabitants of Sodom and Gomorrah than for the enlightened cities of Galice. Thus God will be jut when lie judges; none will meet with condemnation excepting thofe who are inexcufable. For although he grants more to fome than may be abfolutely necellary, yet he grants lefs to none; and where he grants little, he will fuit his judgments to the little which he gave. 'llere is roo injutice in this. If it was the intention of the great Creator that his creation fhould cont-ain within its :mple bo:on crery pofible variety of inteli.gent matures, it was neceffary that there fhould be fomewhere fich a being as man ; and, in forning all polible varicties of numan minds and fituations, it was necefiary that every particular individual fhould exift. Hence a man mar as well complain that he was not formed one of the flaming feraphims that furround the throne of the Eternal, as that hee is not placed in other circumfances in life than thofe which he now occupies; for if little is given, little will be required from him. Thus the deligns of Proridence go on according to the goodnefs and mercy of God. None can complain, though fome have more caufe for joy than others. What happens to individuals may happen to nations in a body ; fome may have higher privileges, and be placed in happier circumtances than others; but none can complain of the wife and juft difpofer of all, who has given enough, although we may have good reafon to complain of ourfelves, for not ufing what was fufficient.

As to the cafe of thofe who are not bleffed with the light of the gofpel, we may confider, that if they have fewer and lefs advantages than others, their nature and capacities muft likewife be inferion ; to which their future itate may be proportioned. God is not obliged to make all men equally perfect in the next world any more than in this; and if their capacity be rendered lef's than that of an ordinary Chrifian, a lower degree of happinefs may fill it. However, we need not be extremely folicitous about their ftate, much lefs calt any ungrateful imputations on the Guvernor of the world for not having dealt fo bnuntifully with them as he has with ourfelves; fince we know that Chrift died for the whole race of mankind ; that every one will at length be 'accepted according to that he has, and not aceording to that he has not; and that to whomfoever much is given, of him flall much be required' (s).

Upon thefe principles, we can eafily explain all the pafiages in the New Teltament enneerning the purpofe, the eleaisn, the forcknowlecige, and the predefination of God. They relate to the defign of calling the Genrile world to the knowledge of the Meflias: This was lept fecret, though hints hid been given of it by feveral of the prophets, fo that it was a myftery ; bur it was revealed when the apofies, in confequence of Chrit's commifion, to go and leach a'l nations, went about preaching the grofpel to the Gentiles. This was a dlumbling block to the Jews, and it was the chicf fubjeat of difpute betwist them and the aponles at the
time when the Epiflles were written: fo that it was neceffary for them to clear up this point very fully, and tn mention it frequently. But in the hegimning of Chrifianity there was $n o$ need of amufng men with ligh and unfearchable fpeculations corcerring the decrees of God; the apofles therefore take up the point in difpute, the calling of the Gentiles in a general manner. They fhow, that Abraham at firf, and Ifanc and Jacol afterwards, were choden by a discriminating farour, that they and their pofferity fhould be in corenant with God; but that, necerthelefs, it always was the intention of Providence to call in the Gentiles, though it was not executed til! thefe hater times.

With this key we can explain coherently the whole of St Piaul's difcourfes upon this fubject, without afferting antecedent and fpecial decrees as to particular perfons. Things that happen under a permidive and directing Providence, may, by a largenefs ot expreftion, be afcribed to the will and counfel of G od; for a permifive will is rally a will, though it is not the areent or caufe of the effect. 'The hardening of Phurabl's beart may be afcrited to God, though it is faid that his beat! bardened iffif, becaufe he took advantage of the refpites which God granted lim from the plagues, to encourage himfelf to longer refiftance. Befides this, he was a cruel and bhoody tyrant, and deferved fuch judgments for his other fins; fo that he may be confidercd as at that time under final condemmation, and only preferved from the firf plaguts, to afford a Ariking infance of the avenging juflice of God. That this is the meaning of the paffage, appears extremely probable from the manner in which Exod. ix. 16. is rendered in the Vatican and Aldus's edit. of the LXX. Inttead of faying, as in our tranflation, "And in very deed for this caufe have I raifd thee up, for to how in thee my power, \&e." God is reprefented in that verfion as faying, "And in very deed for this caufe have I kept the a ive till nory, for to thow," \&ic. Thbon lie cuill be hardweth, is an expreflion that can only be applied to fuch perfons as this tyrant was. It is cbrious that the words of our Saviour concerning thofe zubom his Father had! given him, are only meant of a difpenfation of Providence, and not of a decree; fince he adds, And $I$ have loglt none of them except the fon of perdilion: for it cannot be faid that Yudas. Ifcariot was in the decree, and jet was loft. And in the fame paffage in which God is faid to zoork in us loth to ruill and to do, we are required to zork out our owers falvation avith fear and trenbing. The word ordained to eternal life alfo fignifies fitted and difpofed to eternal life. The quelion, $l l$ 'bo made thee to differ? (: Cor. iv. 7.) refers to thofe extraordinary gifts which, in different degrees and meafures, were befowed upon the firft Chrifians, in which they were unquentionably paflive.

If the decrees of God are not abfolute, neither can Grace lis grace be to efficacions as abfolutely and neceffarily irrcifit to determine our condus, elfe why are we required not to grive Goil's fpirit? why is it faid, ye do altways rfflt the Holj Glofit as your fathers did, fo do ye? How
oflen:
(s) See Difloon Iaw's Confidmations on the Theory of Religion, where this queftion is treated in a very mafterly manner. The work, though lefs known that it ought to be, has great merit, and of the author we have given a bingraphical fketch in our nintlı volume.
hima- often cuonld I bave gatbered jou unter my wings, and ye acould not? IWhat could I buve cono in my vimyard that has not bech done in it? Thefe expreffions indicate : power in us, by which we not only can, but ofiea do, refit the motions of grace. But if the determining efficacy of grace is not acknowledged, it will be much harder to believe that we are efficacioully determined to fin. This fuppofition is (i) contrary hoth to the holinets of God, and to the whole lyle of the facred writings, that it is unnecelliry to accumulate proofs of it. 0 Ifroel, thou hond deglroyed thaystrf, but in ane is the bels: ye: avill not come nuto me that ye may laved life: IV'ly suill yoit dic. O boufe of Ifrael?

As for perfeverance, we may remark, that the mafon ny promifes made in the facred feriptures to them $y$ that oucrecme, that continue Redfiff and faitlffal to the dealh, do certainly infinuate that a man may full from a good fate. The words of the apofle to the Hebrews are very clear and printed: For it is intonyble for tho'e subo avere onee on igltend, and bave taftul of the beatcinIy sith, and evere made partukers of the Holy Ghof, and bave tafted the good woord of Cod, and the powers of the sucrll to come, if they flacll fall away, to renew then again unto repentance (Heb. vi. +.) It is allo faid, The juf fiball live lyy failts: but if he druav (c) buck, my foul float bave no plenfure in bism, (Heb. x. 38.) and it is faid by the prophet, IWben the rickious turneth azvay from bis rightioufiefs and commitctib iniquity, all bis righteoufficfs thal be lath dune foall net le mentioncd; in his fin that be bath fimmed foal be itis, (Ezek. viii. 24). There palfages, with many others, give us every reafon to believe that a good man may fall from a good fate, as well as that a wicked man may turn from a bad one.

We conclude the whole by obferving, that the only dilficulty which attends the queftion arifes from the myferious, and apparently partial and mequal, courfe of the divine govcrument in our puefent flate; but there is an important day approaching, when God will condefcend to remove thefe obicurities, and to vindicate the ways of his providence to man. On that great day, we are well affured, that the queftion will be decided in our favour ; for we know that judgment will be given, not according to any abfolute decree, but, according to the deeds which we ourfelves thall have freely done in tl:e body, whather they have been good, or whether they have been evil.

Thus have we fated, we hope with fairnefs and in:paiti. iity, a fummary of the arguments on both fides of t' is long agitated queltion. We need hard'y add, that it is a queftion involved in confider ble difficulties.Milinn, who was an eminent fhilofopher and divine, as well as the firlt of poets, when he withed to exhibit the fallen angels themelves as perplexel by quellions ahove their comprehenion, fit them to difpute about precellination.
'They reafon'l high, of knowle'ge, will, ind fate, Fised fate, free-will, fore-kuowleige abfolute ; And found 110 end, in wand'ring mazes loft.
Patralife Lof.

The weak fide of the Catvinillic doetrine confits in Prelenina, the impolibility of recenciling the abfolute and unern- 1 ion ditional decree of reprobation with our idzas of the juftice and goodnefs of Cod. The werk tide of the Arminian felome confits in the difficulty of accounting for the cetainty of the divine foreknowledge, upon the fuppe fition of a contingeney of events, or an abfolute frecidom of will in man.

To elude the former of thefe difficulties, fome of the late writers upen philofor hical neceflity, and I)r Prieftly is among the number, have given up the doarine of reprobation, and affirted, that this wolld is only a fate of preparation fer amother, in which all men, of every deleciption and chatactur, that1 attain to final and everlafting happiners, when God foell le all, an lin all.On the other fide, fome of the fupporters of free agenç, and Nicnteffuien * is among the number, have * Leteres been diflofed to deny the divine attribute of prefei- l'erf, ence.

Whatever may be thought of the practical tendency of the two opinions, there is one remark which we think ourfelves bound in jultice to make, although it appears to us to be fimewhat fingular. It is this, that from the carlieft ages down to our own days, if we confider the character of the ancient Stoics, the Jewifh Effenes, the modern Calvinitts, and Janfenifts, wh.en compared with that of their antagonifts the Epicureans, the Sadducees, Arminians, and the Jefuits, we fhall find that they have excelled in no fmall degree in the practice of the moll rigid and refpectable virtues, and have been the highef honour of their own ages, and the beft models for imitation to every age fucceeding. At the fame time, it mult be confeffed, that their virtues have in general been rendered unamiable by a tinge of gloomy and fevere aulterity.

So far as the fpeculative foundation of their principles is confidered, however, neither party feems liable to cenfure in a moral point of view. Each of them withes to fupport, though in a different manner from the other, the honour of the divine character. The Calvinifts begin their argument with the notion of infinite perfection, independency, and abrolute fovereignty, and thence deduce their opinions; maling every difficulty yield to there firt and leading ideas. Their opponents are Mutnal more jealous of the refpeit due to the divine attributes forbearof juftice, truth, holinefs, and mercy, and deduce their ance refentiments from the idea which they have formed of conmonch thefe. Each party lays down general maxims that are admitied by the other, and both argne plaulibly from their firft principles. Dr Burnet, whom we have here followed very clofely, jultly otferves $\dagger$, that + Expofi"thele are great grounds for mutual chanity and for- tion in the bearance."

ence. arifing and growing from the ground only; as corn, hay, Iruit, Exc.

PREDICABLE, among logicians, denotes a general quality which may be predicated, or afferted of feveral things: thus animal is predicable of mankind, beaftr, birds, filhes, \&ic.

PREDICAMENT, among logicians, the fame with eategory. See Category and Philosophy.

IREDICATE, in logic, that which, in a propofition, is afirmed or denied of the fubject. In there propolitions, frow is rubite, ink is not qubite; whitenefs is the predicate which is affimed of fnow, and denied of ink.

IRE-EMPTION, a privilege anciently allowed the king's purveyor, of having the choice and firlt buying of corr and other provifons for the king's houle; but taken away by the ftatute is Car. Il.

PREENING, in natural hiftory, the action of birds cleaning, compofing, and drefling their feathers, to enable them to glide more cafly through the air. For this purpofe they have two peculiar glands on their rump, which fecrete an unctuons matter into a bag that is perforatcd, out of which the bird occalionally draws it with its bill.

PRE-EXISTENCE, a priority of being, or the being of one thing before another. Thus a caufe, if not in time, is yet in nature pre-exifent to its effect.

The $\stackrel{Y}{\mathbf{N}}$.ri-
patetics mair ta ned thecternity of the wuild, Thus God is pre-exiltent to the univerfe. Thus a human father is preexiftent to his fon. The Peripatetics, theugh they maintained the eternity of the world, were likewife dogmatical in their opinion, that the univerfe was formed, actuated, and governed, by a fove. reign intelligence. See Arifotle on the Soul, and our articles Creation and Earit. See alfo the Philofophical Eflays of Dr IFanc Watts, and the Prinsiples of natural and rezealed Rcligion, by the Chevalier Ramfey, where the fubject of the world's cternity is difcuffed. Mr IIame's fpeculations alfo, on this abferufe and arduous dibject, had a greater tendency to diflipate its gloom than that philofopher himfelf could imagine.
Gre-exift ence of the foul caught l.y Ifiatic Fages.

The picexifence of the human foul to its corporenl veliche had been from time immemorial a prevailing opinion among the Afratic fages, and from them was perhaps transferred by I'ythagoras to the philof. Fhy of the Greeks; but his metempfychofis, or tranf- migration of fouls, is too trivial either to be ferionfly propered or refuted. Neverthelefs, from the fentiments of Socrates conceming the immortality of the foul, delivered in his luft interview with his friends, it is cobvious that the cenet of pre-exitilence was a dotrine of the Phatonic fchool. If at any period of life, fay thefe pluilofoplers, yi u thould examine a boy, nf how many ideas, of what a number of principles, of what an extent of knowledge, will you find bim polefed: thele without doubt could wither be felf-derived nor recently acquired. With what avidity and promptitude does he attain the knowledge of arts and fier ces, which appear entitely new to him! thefe rapid and fuccelsful advances in knowledge can only be the efferts of reminifcence, or of a fatuter and more ibdifinct fpecies of recolleation. But in all the other operations of momory, we find retrefpative imprefions attending every nbject or idea which emerges tu her view; nur does the ever fuggeft any thought, word, cr aation, without
informing us, in a manner equally clear and cvident, Pre that thote impreflions have been made upon our fenfes, mind, or inteliect, on fome fremer occalion. Whoever contemplates her progrefs, will eafily difcover, that affociation is her moft faithful and efficacious auxiliary; and that by joining impreflion with impreffion, idea with idea, circumaliance with circumftance, in the order of time, of place, of fimilarity or difimilarity, fhe is capacitated to accumulate her treafures and enlarge her province even to an indefinite extent. But when intuitive principles, or fimple conclufions, are elicited from the puerile underfanding by a train of eafy gucRtions properly arranged, where is the retrofpective ait of memory, by which the boy recognifes thefe truths as having formerly been perceived in lis mind? Whore are the crowds of concomitant, antecedent, or fubfequent ideas, with which thofe recolleations ought naturally to have been attended? In a word, where is the fenfe of perfonal identity, which feems abfolutely infeparable from every att of memory? This hypothefis, therefore, will not fupport pre-erillence. After the Chriftian religion had been confiderally diffufed, and warmly combated by its philofophical antagonifs, the fame doctrine was rifumed and tanght at Alexandria, by Platonic profelytes, not only as a topic conffituent of Pre their matten's philofophy, tut as an anfwer to thofe formidable object:ons which had been deduced from the doarine of original fint, and from the vices which nain, and from the calamities which difurb, human life : hence they Atrenooufly afferted, that all the human race were cither introduced to being prior to Adam, er pre-exiftent in his perfon; that they were not, therefure, reprefented by our firft parents, but actually concurred in their crime, and participated their ruin.

The followers of Origen, and fuch as entertained the notion of Pre-adamites *, might arguc from the doctrine of pre-exiftence with fome degree of planfibility, For the human beings introduced by them to the thatre of probation 1 ad already attained the capacity or dig. nity of moral agents; as their crime therefore was voluntary, their puniflment might be juf. Lut thofe who believe the whole human race created in Adam to be only preexittent in their germs or famina, were even deprived of this miferable finterfinge; for in thefe ho. munculi we can neither fuppofe the moral nur rational confitution unfolded. Since, therefore, their degeneracy was not fpontanenus, neither could their fufferings be equitable. Should it be faid that the cril of original fin was penal, as it extended to nur firlt pareits alone, and merely confequential as feit by their polterity, it will be admitied that the diftinction between penal and confequential evil may be intelligible in human affairs, where other laws, afforments, and combirations than thofe which are timply and purely moral, take place. liut that a moral government, at ore of the molt cardinal periods of its adminiltratinn, thould admit gratuitons or confequential evil, feems to us irreconcileable with the attributes and condur of a wife and jutt legiflator. Confequential evil, taken as fuch, is miery fuftained withont demerit; and canant refult from the procedure of wiflum, berignty, and juitice; but mult fow from necelfity, from ignozance, from cructy, or from caprice, as its only polible fources. But even upon the luppontion of thole who fretend
:xif- that man was mature in all his faculties before the fill remain in full force : for it is admutted by all except the Samian fage, that the confcioufnefs of perional isen-
tity which was felt in the pre-exiftence, is obliterated in a fubl quent tlate of being.

Now it may be densanded, whether agents thus refufcitated for punifhment have not the fate right to murmur and complain as if they bad been perfeely innocent, and only created for that dreadful cataftrophe? It is upon this principle alone that the efferets of punifhment can be cither exemplary or difciplinary; for how is it pofible, that the puniflment of beings unconfcicus of a crime thould ever be reconciled either to the juftice or beneficence of that intention with which their fufferings are inflited? Or how can others be fuppofed to become wife and virtuous by the example of thofe who are neitheir acquainted with the origin nor the tendency of their miferies, but have every reafon to think themfclves afflited merely for the fake of aflicting? To us it feens clear, that the mature and rationale of original fin lie infcrutably retired in the bofom of Providence; nor can we, without unpardonable prefumption and arrogance, form the molt fimple conclufion, or attempt the minuteft difcovery, cither different from or extraneous to the clear and obvious fenfe of revelation. This fenfe indeed may with propriety be extracted from the whole, or from onc paflage collated with atother; but independent of it, as reafon has no premiffes, fhe can form no deductions. The boldnet's and temerity of philofophy, not fatisfied with contemplating pre-exiltence as merely reaaive to human nature, has dared to try how far it was compatible with the glorious and omnifcient God. The Arians, who :lllowed the fubordinate divinity of our Saviour, believed him pre-exiftent to all time, and before all worlds; but the Socinians, who elteemed his nature as well as his perfon merely human, infifted, that before his incarnation he was only pre-exiftent in the divine idea, not in nature or perfon. But when it is confidercd, that children do not begin to deduce inftructions from nature and experience, at a period fo late as we are apt to imagine; when it is admitied, that their progreis, though infenfible, may be much more rapid than we apprehend; when the opportunities of fenfe, the ardour, of curiofity, the avidity of memory, and the activity of undertanding, are re-marked-we need not have recourfe to a pre-exitent flate for our account of the knowledge which joung minds difcover. It may likewife be added, that moral agents can only be improved and cultivated by moral diiciplinc. Such effects therefore of any fate, whether happy or milcrable, as are merely mechanical, may be noxinus or falutary to the patient, but can never enter into any moral economy as patts of its own adminititration. Precxiltence, thcrefore, in this view of it, whether rewarded or punificd, without the continued impreffion of perfunal identity, affiords no folution of original fin.

PREFACE, fomething intreductory to a book, to inform the reader of the detign, method, \&cc. obferved therein, and generally whatever is neceflary to the undealtading of a book.

PRLEFECT, in ancient Rome, one of the chief magiftrates whe goverved in the abfence of the kings, confuls, and emperors.

I his power was greateft under the emperors. His chief care was the government of the city, taking cogVol. XV.
nizance of all crimes committed therein and wihin tos Pre: 1 miles. He judged capitally and finally, ard even prefided in the fenatic. He had the fuperiatendance of the

I'ralsite. peovifions, building, and navigation.
The prefeot if mudern $R$ mine differs little from the ancient prafectus, his authority only extending to 40 miles romind the city.

Preffet of the Pratorium, the leader of the pretorian bands deltincd frr the emperer's guards, conliling, according to Dion, of 10,000 men. This officer, aconrding to Suetonins, was inflituted by Auguftus, and ufually taken fiom among the knights.

By the favour of the emperors his pover grew very contiderable; to reduce which, Conftantine divided the prefecture of the pratorium into four prefestures, and each of thefe again he fubdivided into civil and military departments, though the nane was only referved to him who was invefted with the civil authority, and that of comes belli given him who commanded the coloris.

PREGADI, in hillory, a denomination given to the fenate of Venice, in which refides the whole authority of the republic. At its firf inflitution it was compofed of 60 fenators, to whom 60 more have been added. See Venice.

PREGNANCY, the fate of a woman who has conceived, or is with child. See Midwifery.

PREHNITE, a fone fo named by Mr Werner, infpeator of the mines of Freyburg, brought by Coloncl Prehn from the Cape of Good Hope. In the firf volume of Chemical Annals there is a chemical analyfis of this fone extracted from the Aata Nature Curioforum, Berlin, tom. viii. p. 2 rr. an. 1788, part 2. by Klaproth; from which it appears, that 100 parts of prehnite contain filice Alumine - $43_{\frac{5}{9}}^{2}$ grains. Alumine Lime - - $18 \frac{1}{3}$ Oxyd of iron - - $5 \frac{\frac{3}{3}}{3}$ Water and air

Total
100
Colonel Prehn gave it the name of emerald, and Mr Bruckmann adopted that denomination, but changed his opinion or confidering that it had ncither the hardnef, the bright green colour, nor the property of cryitallhzing in hexagonal prifms like the emerald. The Dutch dealers call it chrijfoprafus of the Cape; but chryfoprafus is nothing but quartz tinged green by the oxyd of nickel. Profeffor Haquet, in thic 4 th volume of the Berlin Tranfactions, has named it crylullized prafus. In the Sth volume, however, Mr Bruckmana conliders it as a cryftallized felt-fpar. Mr Sayce calls it chruforit. Mr Rome de l'ifle claffes it among the fehocrls To this claffincation Mr Flaproth objects, and is rather difpored with Mr Werner to confider it as a \%eolite; on the whole, he thinks it may be conveniently ranked between zeclite and fchoorl. Mr Haffenfratz publifhed in the Fournal de Poyfique for February 1783 an analy fis of the fame fone, under the title of Pierre Silice, ca'cair:, a'umineufe, $\mho_{c}$. Ec. de coaldur verte, Ec. And according to his refults, which are fomewhat different trom thofe of Mr Klaproth, and obtained by a different proce!s, it contains, filice 50 , line 23.4 , alumine $20 \div$, oxyd of iron 4.9 , water 0.5 , magnelia $0.5=100$. The fpeciric gravity of this fone, accerding to the exprimeats of Mr Brifon, is 2.9423. The diffetion of its cryfals, made by Abbé Haüy and Mrr Halfe:ifratz, difcoveed 3 P

## PRE

frejudice. one angle of 60 degrees, as in fchoerls; but it has hitherto been impofible to determine the others. The Abbé Haïy has convinced himfelf, that it bears no refemblance to zeolite in its cryflals. This fone fcratches glafs, and is itfelf fcratched by rock cryftal.

PREJUDICE, or Prejudgment, from pre and judicium, means a judgment formed beforehand, without examination ; the prepofition pre exprefing an anticipation, not to much of time as of knowledge and due attention: thence the fchoulmen have called it anticipation and a preconcived opinion.

Prejudice arifes from the-affociating principle, which we have explained at large in another article (fee Me-
taphysics, Part I. chap. 5.), and it is a weaknefs from which no human mind can be wholly free. Some are indeed much more than others under its influence; but there is no man who does not occafionally det upon principles, the propriety of which he never inveltigated; or who does not hold fpeculative opinions, into the truth of which he never ferioully inquired. Our parents and tutors, yca our very murfes, determine a multitude of our fentiments: our friends, our neighbours, the cuftom of the country where we dwell, and the eftablifhed opinions of mankind, form our belief; the great, the pious, the learned, and the ancient, the king, the prieft, and the philofopher, are charaters of mighty. efficacy to perfuade us to regulate our conduct by their practice, and to receive as truth whatever they may dictate.

The cafe cannot indeed be otherwife. The occafions of acting are fo frequent, and the principles of action are fo various, that were a man to inveftigate accurately the value of every fingle motive which prefents itfelf to his mind, and to balance them fairly againt cach other, the time of asting would in moft inftances pafs away long before he could determine what ought to be done; and life would be wafted in ufelefs fpeculation. The great laws of religion and morality, which ought to be the general and leading principles of action, no man of fcience will take upon truft; but in the courle of a bufy life a thoufand circumfances will occur in which we muRtas with fuch rapidity, that, after being fatisfied of the lawfulncis of what we are about to do, we muft, for the pruderice of it, confide entirely in the general cultoms of our country, or in the practice of other individuals placed in circumfances fimilar to ours. In all fuch cales, though we may act properly, we ât from prejulice.

But the dominion of prejudice is not confined to the actions of the man of bulinefs: it extends over the fpeculations of the philofopher himfelf, one half of whofe knorledge refts upon no other foundation. All human ficinces are related to each other (iee Phizosophy, $11^{\circ}$ 2.), and there is hardly one of them in which a man can become eminent unlefs he has fome gemeral acyuaistance with the whole circle; but no man could ever yet inveftigate for himfelf all thofe propofitions which conftitute the circie of the fciences, or even comprehend the evidence up n which they reft, though he alrnits them perhaps as truths uncontrovertible. He mult therefore reccive many of them upon the authority of others, or, which is the fame thing, admit them by frigulice.
'I'o this cafoning it may be objected, that when a nam aimits as true abitaed propofitions, which, though
not felf-evident, he cannot demonftrate, he admits them not by prejudice, but apon teftimony, which has been elfewhere thown to be a fufficient foundation for human belief (fee Metaphysics, $\mathrm{n}^{\circ}$ I38.) The objection is plaufible, but it is not folid; for teftimony cormmands belief only concerning events which, falling under the cognizance of the fenfes, preclude ali poffibility of miftake; whereas abitract propolitions, not felf-evident, can be proved true only by a procefs of reafoning or by a feries of experiments; and in conducting both thefe, the moft vigorous mind is liable to miftake. When Sir Ifaac Newton told the world that it was the fall of an apple which firft fuggefed to him the general law of gravitation, he bore teftimony to a fact concerning which he could not be miftaken; and we receive his teltimony for the reafons affigned in the article referred to. When he lays down the method of obtaining the fluxion or momentum of the rectangle or product of two indeterminate quantities, which is the main point in his doctrine offluxions, he labours to eftablifh that method on the bafis of demonftration ; and whoever makes ufe of it in practice, without underfanding that demonftration, receives the whole doctrine of the modern geometrical analyfis, not as a matter of fact upon the credit of Sir Iraac's teffimony, but as a fyftem of abftrast thith on the credit of his underflanding : in other words, he is a fluxionit by pre judice.

In vain will it be faid, that in mathematical demonAration there is no room for mitake; and that therefore the man who implicitly adopts the method of fluxions may be conlidered as relying upon the veracity of its author, who had no inducement to deceive him, and whofe comprehenfion was conlefledly greater than his. In fluxionary mathematics, which treat of matters of which it is extremely difficult, if not impoffible, to have adequate and feady conceptions, the moft comprehenfive mind is liable to miftake: and it is well known that the celebrated bifhop of Cloyne wrote his Analy/t to prove that the incomparable author of the method of fluxions had committed two miftakes in his fundamental propofition, which balancing one another, produced a true conclufion by falie reafoning. One or other of thefe great men, of whom the lealt was an eminent mathematician, mult have been bewildered in his reatoning, and have fallen into error; and therefore whoever follows either of them implicitly without perceiving the error of the other, is unqueftionably under the influence of prejudice. This is the cafe with the writer of the prefent article. He perceives not the error of Bifhop Derkeley's reafoning, and yet he admits the doctrine of fluxions on the authority of Sir Ifaac's demonfration. That demonftration, however, he pretends not to underfand ; and therefore he admits the doctrine through prejudice.

We have made thefe obfervations to point out the Impolitit abfurdity of the fafhionable cry againft the harbouring tocradit of any prejudices. To eradicate all prejudices from all priju the human mind is impolfible; and if it were pofible, it ces frol would be very unwife: for we fee that prejudice may exift on the fide of truth as well as on that of falfehood; and that principles profefled and believed by any individual may be ufeful and true, though he was brought to them not by a train of fair and candid reafoning, but through the medium of prepofifefion or authority. Indeed fuch is our nature, and fuch ate the laws of affociation,

## PRE

being corrupted by luxmy, they return, the one to his
e. fociation, that many of our beft principles, and our obligation to perform many of the molt amiable of our dutics in common life, muft cvidently be acquired in this way. From endearing aflociations, and authoritative inflrution, we acquire a knowledge of our duty to our parents, and a facility in perforning it, together with the firlt principles of religion, without a fingle effort of our own reafon. Even when reafon has begun to alfert its power, and flows us the propricty of fuch duties, we are wonderfully affifted in performing them by the amiable prejudices which we had before acquired, and which now appear to be natural to us. He who has never had the advantage of fuch affociations, and who acquires a knowledge of the duties fuggetted by them atter he has come to years of difcretion, and chiefy by the efforts of his own reafon, will feldom, cotcris paribus, perform thofe duties with an energy and delight equal to that of the perfon who has. This re. mark appears to be confirmed by experience; for it is often found, that the children of the great, who have been given out to nurfe in their infancy, and who have feldom been in the company of their parents till their reafoning facultics have been far advanced, are much lefs dutiful and affectionate than thofe in the middle or lower flations of life, who have fcarcely ever been out of their parents company.

Would it then be wife, even if it were praficable, to diffolve all thofe affeciations which tend fo powerfully to increafe the mutual affections of parents and children? We cannot think that it wonld; as we believe it might be eafily fhown that public fpirit fprings out of private affection. Plato indeed held an opiuion very different from ours; for in order to extend that aftcction which is ufually lavithed at home to the whole fate, he propofed that children flould be educated at the public expence, and never be permitted to know the authors of their being. But this is only one of the many vifionary projects of that great man, of which daily expcrience fhows the abfurdity. In modern times, we are certain that lefs derendence is to be had upon the putriotifm of the man who, for the love which he pretends to his country, can overlook or forget his own partial connections in it, than on him who, at the fame time that be withes his country well, is feelingly alive to all the endearments of kindred affection.

Such affection may be called partial, and very probably las its foundation in that which is the fource of all our prejudices: but if it be properly trained in early life, it will gradually extend from our neareft relations to the perfons with whom we aflociate, and to the place which not only gave us birth, but alfo furnifhed our youthful and moit imocent enjoyments. It is thus that the amor patrice is generated (fee Passion and Patriotism), which in minds unfeduced by falfe principles is excecdingly flrong ; and though a partial affection, is of the moft general utility. It is this prejudice which reconciles the Laphander to his freczing frows, and the African to his burning fun ; which attaches the native of the Highlands or of Wales as much to his mountains and rocks, as the apparently happier inhabitant of the fourharn countics of England is in the more fertile and deligheful fpot where he drew his firt breath. And re find in fact, that when a native of Kent and a Scotel Highlander have in fone difiant corner of the world gained a competent fortune without
hop.gardens, and the other to his mountains. Were this prejudice, for fuch it furely is, wholly eradicated from the human mind, it is obvions that large tracts of country which are now full of inhabitants would be totally deferted ; and that the hungry bau barians, to make room for themfelves, would exterminate the proprictors of more favontable climes. limm an affection to our friends and to our country, we naturally contract an affeation for that mode of government under which we live; and unlefs it be particularly oppreflive to ourfelves or any order of citizens, we come as naturally to prefer it to all other modes, whether it deferve that preference or not. This no doubt is prejudice, but it is a beneficial prejudice; for were the mulitude, who are wholly incapable of eftimating the excellencics and defeels of the various modes of government, to become diffatisfied with their own, and rife in a mafs to change it for the better, the moft horrible confequences might jufly be dreaded. Of this truch the prefent fate of Europe affords too melancholy and convincing a proof. The man therefore who, under the pretence of enlightening the public mind and extirpating prejudices, paints to the illiterate vulgar, in aggravated colours, the abufe of that government which has hitherto protected them from the ferocity of each other, is one of the greatelt criminals if his views be felfifl, and one of the wort reafoners if they be difinterefted, that human inagination can eataly conceive.

With the felfifl patriot we have at prefent no concern: but we may with propriety afk the difinterefted lover of truth, whether he thinks it pofible, that in a large community, of which nine tenths of the members are neceffarily incapable of taling comprehenfive views of things, or feeling the force of political reafonings, any form of gnvernment can be acceptable to the people at large, which does not gain their affections through the medium of prejudice? It has been flown by Mr Hume with great Itrength of argument, that goverument is founded on opinion, which is of two kinds, viz, opiaion of intcreft, and opinion of right. By opinion of intereft, he underftands the fenfe of the general advantage which is reaped from government, together with the perfuafion that the particular goverument which is eflablifhed is equally advantageous with any other that could eafily be fettled. The opinion entertained of the right of any government is always founded in its antiquity; and hence arifes the palfinnate regard which under ancient monarchies the people have for the true heir of their royal family. Thefe opinions, as beld by the philofopher converfant with the hiftory of nations, are founded upon reafoning more or lefs conclufive; but it is obvious, that in the minds of the multitude they can have no other foundation than prejudice. An illiterate clown or mechanic does not fie bow one form of government promotes the general intereft more than annther; but he may believe that it does, upon no other cridence than the declamation of a demagogne, who, for ieffill purpofes, contrives to fatter lis pride. The fame is the cale with refpect to the rigits of herditary monarchy. The rnatomit finds nothing more in the greateft monarch than the seaneft peafant, and the moralitt may perlapo frequently find lefs; but the true philofopher acknowled ges his right to the fuvercignty : and thongh he be wak in underf inding, or infirm in years, would, for

PRE

Brejudice. the fake of public peace and the fability of government, maintain him in his throne againft every competitor of the inof fhining talents. The vulgar, however, who would act with this philofopher, are influenced by no fuch views, but merely by their prejudices in favour of birth and family; and therefore it is ridiculous to think of changing the public mind with refpeet to any form of government by pure reafoning. In France a total change in the minds of the people has indeed been effceted, and from the mont violent prejudices in favour of royalty, they have now become more violently prejudised in favour of republicanifm. Bad as their government unquefionably was, the clange that has now taken place is not the effect of calm reafoning and accurate inqquiry (for of that the bulk of mankind appears to be incapable), nor are their prejudices lefs violent than they were before. They are clanged indeed; but no one will deny that prejudice, and that of the moft violent kind, leads them on at prefent; nor can any one allert that their new prejudices have rendered them more happy, or their country more flourithing, than their former ones, which made them cry Vive le Roi under the eyrannic government of Louis XIV.

The influence of prejudice is not more powerful in fixing the political opinions of men, than in dictating their religious creed. Every child of a religious father receives his faith by inheritance long before he be capable of judging whether it be agreeable or difagreeable to the word of God and the light of reafon. This experience flows to be the fact ; and fonnd philofophy declares that it cannot be otherwife. l'arents are appointed to judge for their children in their younger years, and to inftruct them in what they fhould believe, and what they thould practife in the civil and religions life. This is a digtate of nature, and doubtlefs would have been fio in a flate of perfect innocence. It is impoffible that children fhould be capable of judging for themfelves before their minds are lurnihed with a competent number of ideas, and before they are acquainted with any frinsiples and rules of jult reafoning; and therefore they can do nothing better than rim to their parents, and aeceive their directions what they thould believe and what they thould practife.

This mode of tutoring the infant mind, and giving to our inftructions the force of prejudice, beforc reafon can operate with much effect, will, we know, be highlly difplealing to many who chaillenge to themfelves alone the epithet of liberal. With them it will be cramping the genius and perverting the judgment: but we cannot help thinking that fuch an objection, if it fhould be made, would be the offspring of ignozance ; for it requires but very little knowledge of human nature to be able to fee, that if children he not reftrained by authority, and if we do not infinuate a love of good principles into their minds, bad ones will infinuate themfelves, and a little time will give them the force of inveterate prejudice, which all the future efforts of reafon and plitifofophy will find it difficult to eradicate. The iidca of keeping a child ignorant of the being of a God, and the grand duties of morality and religion, till he fhall come to years of difcretion, and then allowing him to reafon them out for himfelf, is an abfurd chinera : it is an experiment which never has been tried, which to us it appears impoflible to try, and which, if it could he tried, could not pofibly produce any good effect, For fup.

## PRE

pofe we had a youth juft arrived at years of difcretion, totally ignorant of all thefe things, and unbiaffed to
$\underbrace{\text { Prcju }}$ any fyltela of opinions, or rather poffeficd of no opinions at all-it would, in the firf place, we fufpect, be abfolutely neceflary to direct his thoughts into a particular train, and for fome perfon to lead him on from one idea to another, till he fhould arrive at fome conclufion: but in all this there is the influence of authority, affociation, and of prejudice.

It being thereforc abfolutely neceffary that fentiments Origin of teligion be inftilled into the minds of children before bigorr? they be capable of difcovering by the ufe of their reafon whether thofe fentiments be juft or not, it need not excite wonder, nor is it any reffection upon eligion, that moll men adhere with bigotry to the creed of their fathers, and fupport that creed by arguments which could carry conviction to no minds but their owil. The love and veneration which they bear to the memory of thofe from whom they imbibed their earlieft opinions, do not pernit them to perceive either the falfehood of thofe opinions, or their little importance, fuppofing them true. Hence the many frivolous dif. putes which have been carried on amongt Chriftians; and hence the zeal with whigh fome of them maintain tenets which are at once contrary to feripture, to reafon, and to common fenfe. A due reflection, however, on the fource of all prejudices ought to moderate this zeal ; for no man is wholly free from that bias which he is fo ready to condemn in others: and indeed a man totally free from prejudice, would be a more unhappy being than the moft violent bigot on carth. In fcience, he would admit nothing which he could not himfelf demonflrate; in bufinefs, he would be perpetually at a ftand for want of motives to influence his conduct : he could have no attachment to a particular country; and therefore munt be without patriotim, and withcut the folaces of friendfhip; and his religion, we are afraid, would be cold and lifelefs.

What, it will be faid, are the authors of a work An ot which profeffes to enlighten the public nind by laying tion? before it a general view of fcience and litelature, beconic fwere at l:at the advocates of prejulice, which is the luse of frience, and the prop of fiterflition? No, we are advocates for no prejudice which is either inimical to fécence or friendly to aufurdity; but we do not think that the moralilt would at wifely who flon!d defert his proper butine's to make himfelf mafler of the higher mathematics, merely that he might not be obliged on truft occafionally to the demonftations of others. The writer of this article is not fkilled in trade; but it is not his opinion that the merchant would form grow rich, who thould never make a bargain till he had previoufy cal. culated with mathematical exactnefs all the probabilities of his gain or lofs. That to diffolve a! the affociations which are the fource of partial attachments of kindred, affection, and private friendfhip, would tend to promote the public happinefs, we camnot politly belicve. And whether or not the experience of the prefent day confirms Mr Hume's opinion, that fir from ende:avouring to extirpate the people's prejudices in favour of birth and family, we thould cherill fuch fentiments, as being abfolutely requifite to preferve a due fubordination in fociety, we pretend not to determinc ; but that men flould be better Chrifians if they were to receive no religious infruction till they fhould be able by their own reafon
dice. to judge of its truth, datily obfervation does not warrant - us to conclude ; for we fee thofe who have feldom lieard of God when children, "live without him in the world" when they are men.
Pernicious prejudices we bave traced to their fource elfewhere, and thown how they may be beft prevented by proper attention in the education of children. Sce Metaphysics, $n^{9} 98$ ). We thall only add here, that the earlics fuch attention is paid, the more effectual it will be found; and that it is mucheafier to keep prejudices out of the mind than to renove them arter they have been admittca. This however mult be fometimes attempted; and where prejudices are ftrong, feveral methods have been recommended for rendering the attempt fuceeffful. The following are tuken monly fiom Dr Watts's improvement of the nilid.

1. Never attack the prejudice direcily, but lead the perfon who is under its iafluence ftep by fep to the truth. Perhaps your neighbour is under the influcnce of fuperfition and bigotry in the fimplicily of his foul; you mult not immediately run upon him with violence, and fhow him the abfurdity or folly of his own opinions, though you might be able to fet them in a glaring light; but you mult rather begin at a diftance, and eftablifh his affent to fome familiar and eafy propofitions, which have a tendency to refute his miftakes, and to confirm the truth; and then filently obferve what impreflion this makes upon him, and proceed by flow degrees as he is able to bear, and you mult carry on the work perhaps at diftant feafons of converfation. The tender or difealed cye cannot bear a deluge of light at once.

Overbafinifs and vehenence in arguing is oftentimes the effer of pride; it blunts the poignancy of the argument, breaks its force, and difappoints the end. If jou were to convince a perfon of the falfehood of the doirrine of tranjubfuntiarion, and you take up the confecrated bread before him and fay, "You may fee, and talle, and feel, this is nothing, bu! lrad; thercfore whil!t you afleert that God comaiands you to belisve it is not tread, you moft wickedly acclife God of commanding yout. tell al lic." This fort of language would only raife the indignation of the perfon againft yon, infead of making any impreffions upon himi. He will not fo much as think at all on the argument you have brought, but he rages at you as a profane wereleh, fetting up your own fenfe and reafon above facred authority; fo th:t though what you affirm is a truth of great evi. dence, yet you lofe the benefit of your whole argument by an ill management, and the unredonable ufe of it.
2. Whate the prejudice; of mankind cannot be conquered at once, but will rife up in arms againf the evidence of truth, there we mult make fone allowances, and yield to them for the prefent, as far as we can fafely do it whout real injury to truth; and if we would lave any fuccefs in our endcavours to convince the world, we mult pratife this complaifance for the bencfit of mankind. Take a חudent who has deeply imbibed the principles of the leripatetics, and imagines certain inmaterial beings, called fubflantial forms th inhabit every herb, fower, mineral, metal, fire, water, \&sc. and to be the fpring of all its properties and operations; or take at Platonift, who believes an anima mundi, " an univerfal foul of the world," to pervade all sodies, to act in and by them according to their nature, and indeed to give them their nature and their fpecial
powers ; perhaps it may be very hard to convinee thefe Prejudice. perfons by arguments, and conftrain them to yield up thofe fancies. Well then, let the one believe his mimecrfal foul, and the other go on with his notion of fuldfantial furms, and at the fame time teach them how by certain original laws of motion, and the various fizes, thapes, and fituations of the parts of matter, allowing a continued divine concourle in and with all, the feveral appearances in nature may be folved, and the variety of effects produced, according to the corpufcular philofophy, improved by Defourtes, ATr Boylc, andSir Ifarac Nezoton; and when they have attained a degree of fkill in this fcience, they will fee thefe airy notions of theirs, thefe imaginary powers, to be fo ufielefs and unneceflary, that they will drop them of their own atecord. The Peripatctic forms will vanilh foom the mind like a dream, and the Platonic fout of the world will cxpir:.

We may give another inftance of the fame practice, where there is a prejudicate fondnefs of particular words an I phraties. Suppofe a man is educated in an unbappy Jorm of ficenh, whereby he explains fome great cloarine of the gofpel, and by the means of this phrafe he has imbibed a very falfe idea of that doetrine; yet he is fo bigotted to his form of words, that he imagines if thofe words are omitted the form is lolt. Now, if we cannot poffibly perfuade him to part with his improper terms, we will indulge them a little, and try to explain them in a fcriptural fenfe, ratier than let him go on in his mitaker ideas. A perfon who has heen bred a $P a$ pif, knows but little of religion, yet he refolves never t depart from the Roman Cathoic fuith, and is obflinately bent againf a change. Now it cannot be unlawful to teach fich an one the true Chrillian, i. c. the Protefant religion, out of the Epifle to the Romans, and fhow him that the fame doctrine is contained in the Cutbolic Prifiles of St Petir, Funes, and Jude; and thus let him live and die a good Chrifian in the belief of the religion taught him out of the New Teftament, while he imagines he is a Romand Cotholic llill, becaufe he finds the doetrine he is taught in the Cathois Epittles and in that to the Romans. Sometimes we may make ufe of the very prejudices under which a perfon labours, in order to convince him of fome particular truth, and argue with him upon his own profeffed principles as though they were truc. Suppofe a $Y_{i}$ a lies fick of a fever, and is forbid flefh by his phyfician; but hearing that rabbits were provided for the dinner of the family, defired caraefly to eat of them ; and fuppofe he became impatient, becaufe his phyfician dad not permit him, and he infited opon it that it could do him no hurt--furely rather than let him perfift in that fancy and that defire, to the danger ol hislife, we might tell him that thefe animals were firangled, a fort of food forbidden by the Jewills law, though we ourfelves might believe that law to be abolifhed.

Where we find any perfon obftinately perfifting in a mitake in oppolition to all reafon, efpecially if the miflake be very injurious or pernicious, and welknow this perfon will hearken to the fentiment or authority of fome favourite name; it is needful fometimes to urge the opinion and authority of that favourite perfon, fince that is likely to be regarded much more than reafon. We are almof afhamed indeed to fpeak of ufing any influence of authority in reafoning or argument; but in fome

Prejudice cafes it is better that poor, filly, perverfe, obftinate
creatures, hould be perfuaded to judge and aet right, YremonAlrantes. by a veneration for the fenfe of others, than to be left to wander in pernicious errors, and continue deaf to all argument, and blind to all evidence. They are but children of a larger fize; and fince they perfift all their lives in their minority, and reject all true reafoning, furely we may try to perfuade them to practife what is for their own intereft by fuch childifh reafons as they will hearken to. We may overaw them from purfuing their own ruin by the terrors of a folemn fhadow, or allure them by a fugar plum to their own happinefs. But after all, we mutt conclude, that whereioever it can be done, it is belt to remove and root out thofe prejudices which obftruct the entrance of truth into the mind, rather than to palliate, humour, or indulge them; and fometimes this mult neseffarily be done, before you can make a perfon part with fome beloved error, and lead him into better fentiments.

On the whole, we would recommend more mutual forbearance and lefs acrimony than is commonly found among writers on difputed fubjects, as the only means by which our differences in religion, politics, and fcience, ever can be healed, and truth certainly difcovered. If men were lefs violent in defending their particular opinions, they would always gain a more patient hearing, they would be lefs fufpected of, and lefs liable to, prejulice, and of courfe more apt either to convince or to be convinced. They would likewife by fo doing fhow, in the mof unequivocal manner, their attention to found philofophy, and above all to genuine Chriftianity; which, though it is far from cncouraging feepticifm, or a temporizing fpirit, recommends, in the ftrongelt terms, among all its profeffors, univerfal charity and mutual forbearance. See Probability, 'I'ruth, and Superstition.

PRELATE, an ecclefiaftic raifed to fome eminent and fuperior dignity in the church ; as bifhops, archbifhops, patriarche, \&c.

PRELIMLNARY, in general, denotes fomething to be cxamined and determined before an affair can be treated of to the purpole.

PRELUDEE, in mufic, is ufually a flourifh or irregular air, which a mulician plays off-hand, to try if his inftrument be in tune, and fo lead him into the piece to be played.

PREMISSES, in logic, an appellation given to the two fift propofitions of a fyllogifm. See Logic.

Premisses, in law, properly fignifies the lind, \&c. mentioned in the beginning of a deed.

PREMIUM, or Pramum, properly fignifes a reward or recompenfe: but it is chiefly ufed in a mercantile fenfe for the firm of money given to an infurer, whether of hips, houfes, lives, \&c. See Insurance.

PREMNA, in botaiy ; a gentis of the angiofpermia order, belonging to the didymamia cliafs of plants. The calyx is bilubed; the corella quadrifid; the berry quadriloc:lar; the feeds folitary.

PRENONSTRANTES, Or PREMONSTRITEN. ses, a religious order of reçular camons inftitued in 1120, by S. Nurbert ; and thence allo called Norbir. tines.

The finf monaftety of this order was built by Norbert in the Ifle of Flance, three leargues to the weit of Laon; which he called Pramonfire, Pramamiratun, and
hence the order itfelf derived its name; though as to the Pren occafion of that name, the writers of that order are divided. At firt the religious of this order were fo very poor, that they had only a fingle afs, which ferved to carry the wood they cut down every morning, and fent to Laon in order to purchafe bread. But they foon received fo many donations, and built fo many monafteries, that in 30 years after the foundation of the order, they had above 100 abbeys in France and Germany: and in procefs of time the order fo inereafed, that it had monafteries in all parts of Chriftendom, amounting to jo00 abbeys, 300 provofthips, a vaft number of priories, and 500 numneries. But they are now greatly diminifhed. The rule they followed was that of St Auguftine, widh fome flight alterations, and an addition of certain fevere laws, whofe authority did not long furvive their founder.

The order was approved by Honorius II. in II26, and again by feveral fucceeding popes. At firft the abftinence from flefh was rigidiy obferved. In $12+5$ Innocent IV. complained of its being neglected to a general chapter. In 1288 , their general, William, procured leave of pope Nicholas IV. for thofe of the order to eat flefh on journeys. In 1460 , Pius II. granted them a general permifion to eat meat, excepting from Septuagefima to Eafter. The drefs of the religious of this order is white, with a fcapulary before the caffeck. Out of doors they wear a white cloak and white hat; within, a little camail; and at church, a furplice, \&c.

In the firit monafteries built by IJorbert, there was one for men and another for women, only feparated by a wall. In 1137 , by a decree of a general chapter, this practice was prohibited, and the women removed out of thofe already built, to a greater diftance from thofe of the men.

The Præmonfratenfes, or monks of Premontre, vulgarly called robite canons, came firt into England, A. D. 1146. Their firf monaftery, called New-houfe, was erected in Lincolnfhire, by Peter de Saulia, and dedicated to St Martial. In the reign of Edward I. this order had 27 monafteries in England.

PRENANTHES, in botany: A genus of the polygamia æqualis order, belonging to the fyngenefia clats of plants; and in the natural method ranking under the $49^{\text {th }}$ order, Compgita. The receptacle is naked ; the calyx calyculated; the pappus is limple, and almoft feffile ; the florets are placed in a fingle feries.

PRENOMEN, Prenomen, among the ancient Romans, a name prenxed to their family name, and anfwering to our Chriftian name: fuch are Caius, Lucius, Marcus, \&ic.

PRENOTION, Prenotio, or Precigrifio, is a notice or piece of knowledge preceding fome other in refpea of time. Such is the knowledge of the antecedent, which mult precede that of the conclufion. It is ufed by Lord Bacon for breaking of an endlefs fearch, which he olferves to be one of the principal parts of the art of memory. For when one endeavours to call any thing to mind, withont fome previous notion or perception of what is lought for, the mind exerts itielf and Itrives in an endlefs manner: but if it hath any fhort notion beforchand, the infinity of the fearch is preiently cut off, and the mind hunts nearer home, as in an inclofure. Thus verfe is eafic: zememberel thon profe; becalle if we nick at an; word in a vorfe, we lave

## PRE

have a previous notion that it is fuch a word as mult fand in a verfe. Hence alfo, order is a manifert help to memory; for here is a previous notion, that the thing fougit for muft be argrecable to order. Bacon's Works Abr. vol. i. p. 136, and vol. ii. p. +73 .

PREPARATION, in a general fenfe, the as of difpofing things in fuch a manner as to render any forefeen event more advantageous or lefs hurtful according to its uature.

Preparation of Difponances, in mufic, is thair difpolition in harmony in fuch a manner, that, by fornething congenial in what preceles, they may be rendered lefs harth to the car than they would be without that precaution; according to this definition, every difcord ought to be prepared. But when, in order to prepare a dilfonance, it is exacted that the found which forms it fhould beforc have formed a confonance, then there is fundamentally but one fingle diffonance which is prepared, vi\%. the fevearh. Nor is even this preparation neceflary in the chord which contains the fenfible note, becaufe then the diffonance being characteriftical, both in its chord and in its mode, the ear has fufficient teafon to expect it: it accordingly does expeet it, and recennife it ; nor is either deceived with refpect to its chord nor its natural progrefs. But when the feventh is heard upon a fundamental found which is not effiential to the mode, it ought then to be prepared, in order to prevent all ambiguity; to prevent the ear, whild liftening to this note, from lofing its train: and as this chord of the feventh may be inverted and combined in feveral different manners, from this arife likewife a number of different ways by which it may fecm to be prepared, which, in the main, always iffue however in the fame thing.

In making ufe of diffonances, three things are to be confidered; viz. the chord which precedes the diflomance, that in which it is found, and that which is inmediately fubfequent to it. Preparation only refpets the two firt; for the third fee Resolution.

When we would regularly prepare a difcord in order to arrive at its chord, we mult choofe fuch a career of the fundamental bafs, that the found which forms the dilfonance may be a protraction into the perlect time of the fame note which formed a confonance formerly fruck in the imperfeet in the preceding chord; this is what we call fincopation. See Sincopation.
Frm this preparation two advantages refult; viz. 1. That there is neceffarily an harmonical connection batween the two chords, fince that connection is formed by the diffonance itfelf; and, 2. That this diffonance, as it is mothing elfe but the continuation of the fune found which had formed a confonance, becomes much lefs harfh to the ear than it would have been with any frund recently ftruck. Now this is all that we expect to gain by preparation. Sec Cadence, Discmrd, and Harmony.

By what has been juff faid, it will appear that there is no other part peculiarly deftined for preparing the dilfonance, except that in which it is heard; fo that if the treble flall exhibit a diffonance, that mult be fincopated; but if the diffonance is in the bais, the bafs muft be fincopated. Though there is nothing here but what is quite fimple, yet have mafters of mulic miExably embroiled the whole matter.

## 487 P R E

Some diffomances may be found which are never prepared: fuch is the fixth fuperadded: fome which are very unfequently prepared; fuch is the diminifhed feventh.

Preparations, in pharmacy, the medicines when mixed together in fuch a manner :ts to be fit for the ufe of the patient. See l'harmacr, Part II.

Preparations, in allatomy, the parts of animal bodies prepared and preferved for anatomical ufes.

The manner of preferving anatomical preparations, is cither by drying them thorouglily in the air, or putting them into a proper liquor.

In drying parts which are thick, when the weather is warm, care muft be taken to pre:cnt putrefaction, Hy-blows, inferts, \&c. This is ealily cone by the ufe of a folution of corrofive fublimate in fpirit of wine, in the proportion of two drams of fublimate to a pound of fpirit: the part thould be moiftened with this liquor as it dries, and by this method the body of a child may be kept bife even in fummer. Dried preparations are apt to crack and moulder away in kceping; to prevent this, their furface thould be covered with a thick varnifh, repeated as often as occafion requires.

Though feveral parts prepared dry are ufeful, yet others mult be fo managed as to be always Alexible, and nearer a natural fate. The difficulty has been to find a proper liquor for this purpofe. Dr Monrofays, the beft he knows is a well rectified colourlefs fpirit of wine, to which is added a fmall quantity of the fpirit of vitriol or nitre. When thefe are properly mixed, they neither change their colour nor the confiftence of the parts, except where there are ferous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows fo firm as to admit of gentle handling, as do alio the vitreous and cryfalline humours of the eye. The liquor of the febaceous glands and the femen are coagulated by this fpirituous mixture; and it heightens the red colour of the injection of the blood-vefiels, fo that after the part has been in it a little time, feveral veffels appear which were before invifible. If you will compare thefe effects with what Ruyfch has faid of his balfam, you will find the liquor abovementioned to come very near to it.

The proportion of the two fpirits muft be changed according to the part prepared. For the brain and humours of the eye, you muft put two drams of finit of nitre to one pound of firit of wine. In preferving other parts which are harder, 30 or 40 drops of the acid will be fufficient; a larger quantity will mak bones flexible, and even diffolve them. The part thus preferved thould be always kept covered with the liquor: therefore great care floould be taken to fop the mouth of the glafs with a waxed cork and a bladder tied over it, to prevent the evaporation of the fpirit; fome of which, notwithftanding all this care, will Ay off; therefore freth muft be added as there is occalion. When the fpirits change to a dark tincture, which will fometimes happen, they thould be poured off, and frell put in their room; but with fomewhat lef acid than at firt.

The glaffes which contain the preparations fhould be of the finent fort, and pretty thick; for through fuch the par:s may be feen very diftincly, and of a true colour, and the objeat will be fo magnified as to

Prepenfed fhow velfels in the glafs which out of it were not to be "

As the glafs when filled with the liguor has a certain focus, it is neceflary to keep the preparation at a
proper diftance from the fides of it, which is eafily done by little ficks fuitably placed, or by furpending it by a thread in a proper fituation. The operator fliould be cautious of putting his fingers in this liquor ofener than is abfolutely necefliary; becaufe it brings on a numbnefs on the Ikin, which makes the fingers unfit fer any nice operation. The bell remedy for this is to wafh then in water mixed with a feiv drops of oil of tattar per deliquium.
Dr Chrith. Jac. Trew prefers the reaified fpirit of grain for preferving anatomical preparations to fppitit of wine, or to compoititions of alcohol, amber, camphor, \&e. becaufe thefe foon clange into a brown collour, whereas the fpirit from malt preferves its limpid ap. pearance. When any part is to be preferved wet, wafh it with water till it is no more tinftured. The water is next to be wafhed away with fpinits, and then the preparation is to be put among firits in a glafs, the mouth of which is to be clofly covercd with a glafs head, over which a wet bladder and leaf-tin are to be tied. Com. Lit. Norimb. 173 1, Canefl. r. Specim. 9 . See alfo Pole's Anatonical Inflrutor, and Aimerican Tranfactions, vol. ii. p. 366.
PREPENSED, in law, denotes fore-thought. In which fenfe we fay prepinfed maitec, \&icc. If, when a man is flain upon at fudden quarrel, there were malice prepenfed formerly between them, it makes it murder ; and, as it is called in fome fatutes, prefenged murther.
PREPOSITION, in grammar, one of the parts of fpech, being an indeclinable particle which yet ferves to govern the nouns that foliow it; fuel as per, pro, propter ; and through, for, with, \&c.
F. Buffier allows it to be only a modificative of a part of fpeech, ferving to circumitantiate a noun.
PREPUCE, in anatomy, the forefinin; being a proIongation of the cutis of the penis, covering the glans. Sec Anatomy, ${ }^{0}$ iot.
PREROGATIVE, in Englifl law, an exclufive or peculiar privilege.
Rogal Prfrogatife, that fpecial pre eminence which the king hath over and ab ve all other perfons, and ont of the ordinary courfe of the common lave, in right of his regal dignity. It fignifies in its etymolo. gy (from prex and roso) fomething that is required or ciemanded before, or in preference io, all others. And hence it follows, that it munt be in its nature fingular and eccentrical ; that it can only be applied to thole rights and capacities which the king enjoys alone in contradiaination to others, and not to thofe which he enjogs in ecmmon with any of his flibiefis: for if once any one prerogative of the crown conld be held in common with the fuljeet, it would ccife to be prerogative any longer. And therefore Finch lays it down as a maxim, that the prerigative is that law in care of the king, which is law in $n$, cafe of the fuljo :ct.
Prer gatives are ciller cirect or incides tidl. The dirig are inch pofitive fublatutisl parts of the royal character and authority, as are rooted in, and fpring from, the king's pilitical perfon, confidered merely ley itfelf, without reference to any other extrinfic cin-
cumiflance ; as, the right of fending ambaffadors, of creating peers, and of making war or peace. But fuch prerogatives as are inciilental bear always a relaticn to fomething elfe, diftinat from the king's perfon; and are inded orly exceptions, in favcur of the crown, to thofe general rules that are eflablififed for the reft of the community: fuch as, that no cofts fhall be recoverel againt the ling ; that the king can never be a joint tenant ; and that his debt flall be preferred before a debt to any of lis fubjeets.
Thefe fubflantive or direct prerogatives may again be divided into three kinds: being fuch as regard, firth, the king's royal charatier or ciignity; fecondly, his royal cithtbs:ity or power; and, laftly, his royal income Thefe are necefliary, to fecure reverence to his perion, obedience to his commands, and an afluerit fupply for the ordinary expences of government; without .11 of which it is imponible to maintain the executive power in due independence and vigour. Yet, in every bratch of thau laree and extenfive dominion, the contititution has interpofed fuch feafonable checks and reltiations, as may ciub it from trampling on thofe liberties which it was meant to fecure and effablifh. The enormons weight of prerogative, if left to itfelf, (as in arbitrary governments it is ), fpreads lavock and defruftion amony all the inferior movements: but, when balanced and brided by its proper counterpoife, timely and judiciouly applicd, its operations are then equable and regular; it invigorates the whole machine, and enables every part to anfiwer the end of its conitrusion.
I. Of the royel dignity. Under every monarchical eftablifhment, it is neceliary to diftinguilh the prince fromi bis fuljeeft, not only by the outward pomp and decorations of majefty, but alfo by afcribing to him certain qualities as inherent in his royal capacity, difinet from, and fuperins to, thofe of any other individual in the nation. For though a philofophical mind will (fays Sir William BlackRone) confider the royal perfon merely as one man appointed by mutual confent to prefide over many others, and will pay him thiat reverence and duty which the principles of fociety dsmand; yet the mafs of mankind will be apt to grnw in. folent and refratory, if taught to confider their prince as a man of no greater perfection than themfelves. The law therefore afcribes to the king, in his high pelliical charafier, not only large powers and emoluments, which form his prerogative and revenue, but likewitie certain attributes of a great and trawfendent nature; by which the people are led to confider tim in the light of a fuperior being, and to pay him that awful refipet which may enable him with yreater eafe to carry on the bufinefs of government. This is what we underland by the royd dignity ; the feveral branches of which we fhall now proceed to enumerate.
I. And, firft, the law afreribes to the king the attribute of fovererignty, or pre-eminency. See Sorsreignty.
2. "The law alfo (according to Sir Willima Blackftone) afrribes to the king, in his politic.l. ca. pacity, abselute perfection. 'The king cann du, no wrong.' Which ancient and fundamental maxim (fiys he) is not to be undertood as if every thing (raraf. acted by the government was of courfe juit and law. ful; but meaiss only two things. Firft, that whatever

## PRE

is exceptionable in the conduct of public affairs, is not to be imputed to the king, nor is he anfwerable for it perfonally to his perple: for this doctrine would totally delltroy that conllitutional independence of the crown, which is necellitry for the balance of power, in nur tree and adive, and therefore compounded, corsftitution. And, ficondly it means that the preroga$t$ re of the crown extends not to do any injury; it is created f,r the benelit of the people, and therefore c.manot be exerted to their prejudice. -" The king, moresiver, (he ubicives), is not oniy incapable of do. ing wromr, but even of thinking wrong: he can never me.n to do :n inproper thing: in him is no folly or weaknels. And, thererefore, if the crown fhould be induced to grant any tranchife or privilege to a fubject concrary to teafor, or in anywife prejudicial to the c mom nnwealch or a private perion, the law will not dippole the king tw have meant either an unwife or an injurinus astion, but dechares that the king was deceived in his grant; and thereupon fuch grant is rendered void, merely upon the foundation of fraud and deception, either by or upin thole agents whom the crown has thought proper to eniploy. For the liaw will not calt an imputation on that magiltrate whom it entrufts with the executive power, as if he was capathe of intentionally difregarding his truft : hut atuributes to mere impolition (to which the moft perfect (if fublunary beings mut itill continue liable) thofe little imadvertencies, which, if charged on the will of the prince, might lefen him in the eyes of his fubjeas."

But this doctrine has been expofed as ridiculous and abfird, by Lord Abingdon, in his D:dication to the collerive Body of the People of En3land. "Let us fee (fays he) how theie maxims and their comments :"qree with the conflitution, with nature, with reafon, with common fenfe, with experience, with fact, with precedent, and with Sir Willam Blackfone himfelf; and whether, by the application of thefe rules of evisence thereto, it will not be found, that (from the want of attention to that important line of diflinction which the conftilution has drawn between the king of England and the crozun of England) what wats atributed th the morarchy has not been given to the monurch, what mieant for the $i_{i n g}$ mip conveyed to the king, what defigned for the thing transferred to the forfon, what intended for theory applied to fragice; and io inconfequence, that whilit the premifes (of the p-rfention of the monarchy) be true, the conclufion (That the hing can do no wrong) be not falfe.
"And, nrit, in reference to the conflitution : to which if this matter be applied (meaning what it expreffes, and i1 it $d$, not it is unworthy of notice), it is fulberfive of a principle in the conftitu:ion, upon which the preferration of the conllitution depends; I mean the principle of refiffance; a principle which, whilft nn man will nuw renture to gainfay, Sir William B'acktone himfi.f ddmate, ' is juffifalle to the perfon of the prince, when the bcing of the thate is endangered, and the pinsle voice proctaims fuch refila ce necefiary :' and thus, by fuch admilfion, both difproves the maxim, and overfets his own comment theienpon: fur to fay that 'the king can do no wrong,' and that 'he is incapabie even of thinking wrong,' and then to admit that 'r ifllance to lais perfon is jultifiable,' are fuch YoL. XV.
jarring contradidions in themfelves, that, until recrn- Feepora** ciled, the neceflity of argument is fufpended.
" With refped then, in the next place, to the agreement of this maxim, and its comment, with natu:c, wi!!t reafon, and wih common fente, I fhould bave thonghe myfelf fufficiently jufufied in appealing to every man's own reflection for decifion, if I had not been made to underltand that nature, reaion, and common fenfe, had had nothing to do with either. Sir Willian Blackftone fays, "That thongh a philofephical mind will confider the royal perfon merely as one man apprinted by mutual confent to prefide over nthers, and will pay him that reverence and duty which the principles of fociety demand, yet the mafs of mankind will be apt to grow infolent and refractory if taught to confider their prince as a man of no greater perlceion than themfelves; and therefore the law alcribes to the king, in his high pulitical chardeter, certain attribute; of a great and tranfeendent nature, by which the peaple are led to confider lim in the light of a fuperior being, and to pay him that awlul reipeft whirh may emable him with greater eafe to carry on the bufinets of government. So that, in order to govern with greater eafe (which by the bye is mere allertion without any proot), it is neceffary to deceive the mafs of mankind, by making them believe, not only what a philofophical mind cannot believe; but w!at it is innpollible for any mind to believe; and therefore, in the inveftigation of this fubject, according to sir William, neither nature, reafon, nor common fenfe, can have any concern. -
"It remains to examine in how much this maxim and its comment agrec with experience, with fan, with precedent, and with Sir William Blackfone himfelf. And here it is matter of molt curious ipeculation, to obferve a maxim laid down, and which is intended for a rule of government, not only withnut a fingle cafe in fuopert of it, but with a Atring of rales, that may be carried back to Egbert the firit monarch of England, in direat oppolition to the doćrine. Who is the man, that, reading the paft hiltory of this country, will fhow us any king that has done no wrong? Who is the reader that will not find, that all the wrong and injuries which the free comftutution of this commy has hiftherio fuffered, have been folely derived from the arbitrary meafures of our kings ? And jet the mafs of mankind are to look upon the king as a fuperior being; and the maxim, that 'the hine can do no wrong?' is to remain as an article of belief. But, without purhing this inquiry any farther, let us fee what encouragement Sir Willian Blackfone himfelf has given ns for our credulity. After itating the maxim, and prefenting us with a molt lively picture, 'of our finvereign lord thus all perfect and inmostal,' what does he make this ali-perlection and immortali $y$ in the end in come tu? His words are thefe: 'For when hing Charles's deluded brother attempted to onfliae the nation,' (ro aurng this, to be fure), "he found it was heyent his power: the people both conld, and rith, refift him: and in confequence of fuch relite ce, obliged him to quit his enter prie and his throne tngether *."
The Sum of all is this: That the crown of Eng? and and the king of England are diltinguifiable, and :ot fynniymus terms: that alfegiance is due to ble croun, and through the crown to the king: that the attributs

Conimel. vol. iv. p. 4ss

## PRE

Prega- of the crown are fovereignty, perfection, and perpetuity; tive. but that it does not therefore follow that the king can do no wrong. It is indeed to be admitted, that in high refpect for the crown, high refpect is alfo due to the wearer of that crown; that is, to the king: but the crown is to be preferred to the bing, for the firit veneration is due to the contitution. It is likewife to be fuppofed that the king ruill do no wrong: and as, to prevent this, a privy council is appointed by the conItitution to aflift the king in the exscution of the government; fo if any wrong be done, 'thefe men,' as Montefquieu expreffes it, 'may be examined and punilled ( A ) $:$ '
"But if any future king fhall think to fcreen thefe cvil counfellors from the jut vengeance of the people, by becoming bis own minifer; and, in fo doing thall take for his fanction the attribute of perfifion, thall truft to the deception of his being a fuperiar being, and cloak himelf under the maxim that the king can do no wrong; I fay, in fuch a cafe, let the appeal already made to the conltitution, to nature, to reafon, to common fenfe, to experience, to fact, to precedent, and to Sir William Blackfone himfelf, fuffice; and preclude the necellity of any further remarks from me ( B )."
'Io proceed now to other particulars : The law determines, that in the king can be no negligence, or laches; and therefore no delay will bar his right. Nullum tempus occurrit regi, is the fanding maxim upon all necafions; for the law intends that the king is always bufied for the public good, and therefore has not leifure to affert his right within the times limited to
tion of blood: for if the heir to the crown were at tainted of trcafon or folony, and afterwards the crown thould defcend to him, this would purge the attainder ippo fa\%. And therefore, when Henry VII. who as e.rrl of Richmond Itood attanted, came to the crown, it was not thought necellary to pais an afo parliament to reverfe this attainder; becaufe, as Lord Bacon in his hiftory of that prince informs us, it was agreed that the aflumption of the crown had at once purged all attainders. Neither can the king, in judgment of law, :ís king, ever be a minor or under age ; and therefore his royal grants and affents to acts of parliament are good, though he has not in his natural capacity attained the legal age of 21 . Dy a flatute, indeed, 28

Hen. VIII. c. 17. power was given to future kings to refcind and revoke all acts of parliament that fhould be made while they were under the age of 24 : but this was repealed by the flatute I Edward VI. c. II. fo fidr as related to that prince, and both flatutes are declared to be determined by 24 Geo. II. c. 24 . It hath alio been ufually thought prudent, when the heir-apparent has been very young, to appoint a protector, guardian, o. regent, for a limited time: but the very neceflity of fuch extraordinary provifion is fufficient to demonitrate the truth of that maxim of common law, that in the king is no minority; and therefore he hath no legal guardian. Sec Regent.
3. A third attribute of the king's majelly is his perpetuity. The law afrribes to him, in his political capacity, an abfolute imnortality. The king never dies. Henry, Edward, or George, may die ; but the king furvives them all. For, immediately upon the deceafe of the reigning prince in his natural capacity, his kingthip or imperial dignity, by ad of law, without any interregmum or interval, is velted at once in his heir; who is ca influnti, king to all intents and purpofes. And fo tender is the law of fuppofing even a poffibility of his death, that his natural dilfolution is generally called his denife; dimifia refis vol coronc: an expreffion which fignities merely a transfer of property; for, as is obferved in Hlowden, when we fay the dernife of the crown, we mean only, that, in confequence of the difunion of the king's body-natural from his body-politic, the kingdom is tranfferred or demifed to his fucceffor, and fo the royal dignity remains perpetuil. Thus, too, when Edward the fourth, in the te, th year of his reign, was driven from his throne for a few months by tle houfe of Lancafter, this temporary transfer of his dignity was denominated his demife; and all procefs was held to be difcontinued, as upon a natural dcath of the king.
II. We are next to confider thofe branches of the royal prerogative which inveft this our fovereign lord with a number of au horties and poqvers ; in the exertion whereof contifts the executive part of government. 'This is wilely placed in a finglc hand by the Britifh conftitu. tion, for the fake of unanimity, frength, and difpatch. Were it placed in many hands, it would be fubject to many wills: many wills, if difunited and drawing different ways, create weaknefs in a govemment ; and to unite thofe feveral wills, and reduce them to ons, is a work of
mure
(A) Except the parliament, which is the grat council of the nation, the judges, and the pecrs, winc, being the hereditary counfellors of the crown, have not only a right, but are bound in fors confcimatio to advile the king for the public good, the conftitution knows of no other counfel than the privy council. Any other connfel, like Cliford, Arlington, Buckingham, Ahley, Lauderdale, and, as the initial letters of thefe names exprefs, is a CADAL, and as fuch thould be fuppreffed. Nat. Bacon, peaking of the lofs of power in the grand counci! of Jords, fays "The fenfe of fate once contracted into a privy-council, is foon recontracted into a cabinct councit, and laft of all into a favourite or two ; which many times brings damage to the public, and both theniflues and kines into extreme precipices ; partly for want of maturity, but principally through the providence of Codover-riling irregnlar courfes to the hurt of fuch as walk in them." Pol. Difc. part. 2. p. 201.
(в) For experiance, fact, and precedent, fee the reigns of king John, Henry III. Edward. II. Riclard 11. Char!es I. and Jimes II. Sec allo MTirror of Fufices ; where it is faid, "that this grand affembly (meaning the now parliament, or then Witterna-gemotte) is to confider the government of God's people, how they may be kept from fin, live in quiet, and have right done them, according to the cultoms and laws; and more clpecially of zurong done by the king, queen, or their children :" to which Nat. Bacon adds this note: "At this tirne the kisg snight do zurong, \&ic. and fo fay Dracton and Fleta of the kings in their time." Difi. part I. p. 37. Lond. $1739^{\circ}$

## PRE [ 49 r$] \quad \mathrm{PRE}$

more time and delay than the exigencies of fate will afford. The king of England is thercfore not only the chief, but properly the fole, magitrate of the nation; all others atting by commifion from, and in due fubordiation to, hin : in like manner as, upon the great revolution in the Roman itate, all the powers of the ancient magiftracy of the commonwealth were concentered in the new emperor ; fo that, as Gravina exprefles it, in ejus unitus porfona veteris rei publica vis atque majeflas per cunnulatas magiflratiurn polffates expriméatur.

In the exertion of lawtill prerogative the king is held to be abfolute ; that is, fo far abfolute, that there is no legal authority that c:an either delay or reffift him. He niay reje ot what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences, he pleafes: unlefs where the contitution hath exprefsly, or by crident confequence, laid down fome exception or boundary; declaring, that thus far the prerogative thall go and no farther. For otherwife the power of the crown would indeed be but a name and a ilaclow, infulicient for the ends of government, if, where its juridition is clearly eftablifhed and allowed, any man or body of men were permitted to difobey it, in the ordinary courfe of haw: we do not now feak of thofe extriardinary recourfes to the firlt principles, which are necelfary when the contracts of fociety are in danger of diffolution, and the law proves too weak a defence againft the violence of fraud or oppreflion. And yet the want of attending to this obvious diftinction has occafioned thefe doctrines, of abfolute power in the prince and of national refiftance by the people, to be much mifunderflood and perverted, by the advocates for flavery on the one hand, and the demagngues of faction on the other. The former, obferving the abfolute fovereignty and tranfeendent dominion of the crown laid down (as it certainly is) molt firngly and emphatically in our law-books as well as our homilies, have denied that any cafe can be excepted from fo general and politive a rule; forgetting how impolible it is, in any practical fy tem of laws, to point out beforehand thofe eccentrical remedies, which the fudden emergence of national difterfs may ditate, and which that alone cen juntify. On the other hand, over-zealous republicans, feeling the abfurdity of unlimited paffire obedience, have fancifully (or fometimes factioufly) gone over to the other extreme: and, becaufe refiftance is jultifiable to the perfon of the frince when the bcing of the tate is endangered, and the public voice prochains fuch refiftance neceflary, they have therefore :lllowed to every individual the right of decermining this expedience, and of employing private force to refift even private oppreffion. A doatrine productive of anarchy, and (in confequence) equally fatal to civil liberty as tyramy itfelf. For civil liberty, rightly underftood, confifts in protecting the rizhts of individuals by the united force of fociety: fociety cannot be maintained, and of courfe can exert no proteation, without obedience to fome fovereign power; and obedience is an empty name, if every individual has a right to decide how far he hinifelf fall ober.

In the exertion, therefore, oi thofe prerogatives which the law has given him, the king is irrefifitle and abfolute, according to the forms of the confitution. And jet, if the confequence of that exertion be manifenty to the grievance or difhenour of the kingdom, the parliareene will call his advifers to a juf and fevere account.

For prerogative confining (as Mr Locke las well de- l'rerrgafined it) in the diccretionary power of :Ating for the tive. public good where the pofitive laws are filent, if that diferctionary power be abufed to the public detriment. fuch prerogative is exerted in an unconfltutional mathner. Thus the king may malke a treaty wih a fooreign fate, which thall itrevocably bind the nation; and yet, when fuch treaties have been judged rernicious, impeachments have purfucd thofe miniliss by whofe agency or advice they were concluded.

The prerogatives of the crown (in the fenfe under which we are now confidering them) refpest either tlic nation's intercourfe with fcreign nations, or its owa domellic government and civil pelity.

With regard to forcign concerth, the hing is the delegate or reprefentative of his people. It is impolitib'c that the individuals of a fate, in their collective capacity, can tranfat the affairs of that fate with arother community equally numerous as themfelves. Unanimity mult be wanting to their meafures, and Atergth to the execution of their counfels. In the king therefore, as in a centre, all tiec rays of his people are united, and form by that union a confiltency, fplendor, and power, that make him feared and refpected by foreign potentates; who would feruple to enter into any engagement, that mult afterwards he revifed and ratified by a popular affembly. What is done by the royal authority, with regard to foreign powers, is the act of the whole nation: what is done without the king's concurrence, is the aft only of private men. And fo far is this point carried by our law, that it hath been held, that fhould all the fubjetts of England make war with a king in league with the king of England, without the royal affent, fuclz war is no breach of the league. And, by the Itatute 2 Hen. V. c. G. any fuhbeft committing acis of hollility upon any nation in league with the king, was declared to be guilty of high treafon: and, though that act was repealed by the Ratute 20 Hen. VI. e. II. fo far as relates to the making this offence high treafon, yet flill it remains a very great offence againt the law of nations, and punifhable by our laws, either capitally or otherwife, according to the circumfances of the cafe.
I. The king therefore, confidered as the reprefen. tative of his people, has the fole power of fending ambaffadors to foreign flates, and receiving ambaffa. dors at home.
2. It is alfo the king's prerogative to make treaties, leagues, and alliances, with foreign ीates and princes. For it is, by the law of nations, effential to the goodnefs of a league, that it be made by the fovereign power ; and then it is binding upon the whole community : and in Britain the fovereigh power, quad hoc, is velted in the perfon of the king. Whatever contracts therefore he engages in, no other power in the kingdom can legally delay, refin, or annul. And yet, lett this plenitude of authority fhould be abufed to the detriment of the public, the conftitution (as was hinted before) hath here interpofed a check, by the means of parliamentary impeachment, for the punifliment of fuch minitters as from criminal motives advife or conclude any treaty, which fhall afterwards be juldged to derogate from the honour and intereft of the nation.
3. Upon the fame principle the king has alfo the fole prenegative of makius war and peace. For it is 3 Q $^{2}$
hedd

## PRE [ 492 ] R E

Preroga- held by all the writers on the law of nature and nations, in due form to all that feel themfelves grieved. See
that the right of making war, which by nature fubfinted in every individual, is given up by all private perfons that enter into fuciety, and is vefted in the fovereign fower : and this right is given up, not only by individuals, but even by the entire body of people that are under the dominion of a fovereign. It would indeed be extremely improper, that any number of fuljects thould have the power of binding the fupreme magitrate, and putting him againg his will in a ftate of war. Whatever hofilities, therefore, may be committed by private citizens, the flate ought not to be affected thereby; unlefs that fhould juttify their proceedings, and thereby Lecome partuer in their guilt. And the rcafon which is given by Grotius, why, according to the law of nations, a denunciation of war ought always to precede the actual commencement of hotilities, is not fo much that the enemy may be put upon his guard (which is matter rather of magnanimity than right), but that it may be certainly cleir that the var is not undertaken ly private perions, but by the will of the whole community; whofe right of willing is in this cafe transferred to the fupreme magifrate by the fundamental laws of fociety. So that, in order to make a war completely effectual, it is neceffary in Britain that it be publicly declared and duly proclaimed by the king's authority; and then, all parts of both the contending uations, from the highent to the loweft, are bound by it. And wherever the ight refides of beginning a national war, there alto mult refide the right of ending it, or the power of making peace. And the fame check of parliamentary impeachment, for improper or inglorious conduc, in beginning, conducting, or concluding a national war, is in general fufficient to rellam the minifters of the crown from a wanton or injurious exertion of this great prerogative.
4. But, as the delay of making war may fometimes be detrimental to individuals who have fuffered by depredations from foreign potentates, our laws have in forme refpects armed the fubject with powers to impel the prerogative; by diresing the minifters of the crown to illiue letters of marque and reprifal upon due demand: thée prerogative of granting which is nearly related to, and plainly derived from, that other of making war ; this being indeed only an incomplete ftate of hoitilities, and generally ending in a formal denunciation of war. Thefe letters are grantable, by the law of nations, wheneycr the fubjeas of one flate are oppreffed and injured biy thofe of another, and juftice is denied by that flate to which the oppreffor belongs. In this cafe, letters of narque and reprifal (words in themfelves fynonymons, and hignif ing a taking in seturn) may be obtained, in criler to feize the bodies or goods of the fubjects of the offending fate, until fatisfacion be made, wherever they liappen to be found. And indeed this cuflom of repriins feenis diftated by mature herelf; for which reafon we find in the mont ancient times very notable infances of i:. Dut here the necelfity is obvious of calling in the
 mase ; elle cvery pisate fufferer would be a judge in his own caufe. In purforance of which principle, it is oeclared by the ftatute $4 \mathrm{Hen}$. V. c. 7. that if any fubjeats of the realm are oppreffed in time of zauce by any foreigners, the king will grant marque

Marque.
5. Upon exacily the fame reafon fands the prerogative of granting fafe-conducts; without which, by the law of nations, no member of one fociety has a right to intrude into another. And theeefore Puffendorff very jufly refolves, that it is left in the power of all fates to take fuch meafores ab ut the admiffion of firangers as they think convenient; thore being ever excepted who are driven on the coafts by neceffity, or by any caufe that deferves pity or compaffion. Great tendernefs is thown by the laws, not only to foreigners in diftrefs (fee Wireck), but with regard alfo to the admifion of firangers who come fpentaneoully: for fo long as their natom continues at peace with ours, and they themfelves behave peaccably, they are under the king's protection ; though liable to be fent home whenever the king fees occation. But no fubject of a nation at war with us can, by the law of nations, come into the realm, nor can travel hinifelf upon the high feas, or fend his goods and merchandize fiom one place to another, without danger of being feized by our fubjecti, unlefs he has letters of fafe-conduct; which, by divers ancient ftatutes, mult be granted under the king's great: feal and inrolled in chancery, or elfe they are of no effect ; the king being fuppofed the beft judge of fuch emergencies, as may deferve exception from the general law of arms. But paffiports under the king's fign-manual, or licences from his ambaffidors abroad, are now more ufaally obtained, and are allowed to be of equal validity.

Thefe are the principal prerogatives of the king refpecting this nation's intercourfe with foreign nations: in all of which he is confidered as the delegate or reprefontative of his poople. But in domeftic affairs, he is confidered in a great variety of characters, and from thence there arifes ain abundant number of other prerogatives.
5. He is a conftituent part of the fupreme legifhative power; and, as fuch, has the prerogative of rejecting fuch povifions in parliament as he judges improper to be paffed. The expediency of whicts conflitution has before been evinced at large under the article Parliament. We fhall enly farther remark, that the king is not bound by any act of parliament, unlefs he be named thercin by fpecial and particular words. The moft general words that can be devifed (any perfon or perfons, bodies politic, or corporate, \&c.) aifect not him in the lealt, if they may tend to reftrain or diminilh any of his rights or interefts. For it would be of mof mifchievons confequence to the public, if the Atrength of the executive power were liable to be curtailed, without its own exprefs confent, by conftructions and implications of the fubject. Yct, where an act of parliarnent is exprefsly made for the preiervation of public rights and the fuppreffion of public wrongs, and does not interfere with the eftablifhed rights of the crown, it is faid to be binding as well npon the king as upers. the fubject : and, likewife, the king may take the benefit of any particular act, though he be not efpecially named.
2. The king is confidered, in the next place, as the generalifimo, or the firf in military command, within the kingdom. The great end of fociety is to protect the wcaknefs of individuals by the united firength of

## PRE [ 493 ] PRE

the community ; and the principal ufe of government is to direft that united Arength in the beft and moft effectual manner, to anfwer the end propufed. Monarchical government is fuppofed to be the fitteltiof any for this purpofe: it follows therefure, from the very end of is infitution, that in a monarchy the military power mult be trufted in the hands of the prince.

Ia this capacity, therefore, of general of the kingdonn, the king has the fole power of raifing and regula. ting ficets and armies. The manner in which they are raifed and regulated is explained under the article MTo nitast State. We are now only to contader the prerogative of enlifing and of geverring them: which indeed was difputed and claimed, contrasy to all reaton and precedent, by the long parliament of King Cha. L.; but, upon the refloration of his fon, was folemnly declarcd by the Ilatute $1_{3}$ Charles II. c. 6. to be in the king alone : for that the fole fupreme government and command of the militia within all his majefty's realms and dominions, and of all forces by fea and lind, and of all forts and places of ftength, ever was and is the undoubted right of his majelty, and his royal predecel: fors, kings and queens of England; and that both or either houfe of parliament camot, nor ought to, pretend to the fame.

This fatute, it is obvious to obferve, extends not only to fleets and armes, but alio to forts and other places of ftrength within the realm ; the fole prerugative, as well of ereati $g$, as manning and governing of which, belongs to the king in his capacity of general of the kingdom: and all mens were formerly fibject to a tax, for building of caftes, wherever the king thought proper. This was one of the three things, from contributing to the performance of which no lands were exempted, and theefore called by the Anglo-Saxons the trinala nectfitas ; fc. pontis reptaratio, arcis conftrucio, at expeditio contra boftion. And this they were called upon to do fo often, that, as Sir Edward Coke from M. Paris aflures us, there were in the time of Henry II. Ir15 cafles fubfriting in England. The inconveniencies of which, when granted out to private fubjects, the lordly barons of thofe times, were feverely felt by the whcle kingdom; for, as William of Newhurg remarks in the reiga of king Stephen, trant in Anslia quodamnodo tot reges vel potius tyranni, quot domini caflelloram ; but it was ielt by none more fenfibly than by two fucceeding princes, king Joha and kirg Henry III. And therefose, the greatelt part of them being demolithed in the baron's wars, the kings of after times have been very cautivus of fuffering them to te rebuilt in a fortified manner : and Sir Edward Coke lays it dcwn, that no febject can build a calte, or houre of ftreng:h imbattled, or other fortrefs defenfible, without the licence of the king ; for the danzer which might enfue, if every manat his pleafure might do it.

It spartly upon the fame, and fartly upon a fifcal foundation, to fecure his marine revenue, that the king has the prerogative of appointing forts and bavens, or fuch places only, for petions and merchandize to pafs into and out of the tea'm, as he in his wiflom fees proper. By the foodallaw, all navigable rivers and lavens were computed among the regalia, and were fubject to the fovereign of the flate. And in England it hath always been held, that the king is lord of the whole flore, and particularly is the guardian of the ports and havens,
which are the inlets and gates of the realm : and therefore, fo carly as the reign of king john, we tind hips feized by the king's ollicers for putting in at a place that was rot a legal port. Thefe legal poris were undoubtedly at firtt alfigned by the crown; fince to each of them a court of portunote is incident, the jurifliation of which muft flow firom the royal authority : the gratt ports of the fca are alfo ref. rred to as well known and eftablifined, by flatute $\&$ Hern. IV. c. 20. which prohibits the landing elfewhere under pain of confication; and the ft tute : Eliz. C. 11. recites, that the franchic of lading and difcharging had been frequently gratited by the crown.
But though the king had a power of granting the franchife of havens and ports, yet he had not the power of refumption, or of narrowing and confuntry their limits when once eftablifhed; but any perfon had a right to load or difcharge his merchandife in any p.ort of the haven: wherely the revenue of the cuftom was much impaired and diminifled, by fraudulent landings in of,foure ard pirate con ners. This occafoned the flatuics of Eliz. c. 11, and 13 and 14 Car. II. c. 11 . § 14. which enable the crown by commifion, to afcertain the limits of all ports, and to affign proper wharfs and quays in each port, for the exclutive landing and loading of merchandife.
The erection of beacons, light-houfes, and fea-marks. is alfo a branch of the royal prerogative: wheroof the firf was anciently ufed in order to ala:m the comery, in cale of the approach of :n encony ; and all of them are fignally ufeful in guiding and preferving veffels at fea by night as well as by day. See Deacon.
3. Another capacity in which the king is confidered in domeftic affirs, is as the furntain of jultice and greneral confervator of the pence of the kingdum. See tl.e article Fountain of Justice.
4. The king is likewife the fountain of honour, of office, :nd of privilege : and this in a different fenfe from that wherein he is Alyled the forn:ain of juftice ; for: here he is really the parent of them. Sce the articies Fonsain of Yosties and Foumain of Howour.
5. Anether light, in which the laws of England confider the king with regard to domeftic concerns, is as the arbiter of commerce. Dy commerce, we at prefue mean domeftic commerce only ; for the hing's prerogative with regard to which fee Regulation of ll ElGHts aiml Mieafares, Money, sc.
6. The king is, lafly, confdered by the laws of Eugland as the head and fupreme govenor of the national church.

To enter into the reafons upon which this prerngative is founded is matter rather of divinity than of law. We fhall therefore only obferve, that by flatute $26 \mathrm{H}=$. VIII. c. '. (reciting that the king's majefy jufly and rightfully is and ought to be the fupreme head of the church of Eugland; and to had been recognied by the clergy of that kingdom in their convocation) it is chated, that the king flatl be reputed the only fupreme head in earth of the church of England ; mad thall hane, annexed to the imperinl crown of this reaim, as weil the title and fiyle thereof, as all jurididtions, authorities, and commodities, to the faid dignity of fupreme head of the church appertaining. And anothcr latute to the fame purport was made, 1 Eliz. c. i.

In virtue of this authority the king convenes, pron

## PRE [ 494 ] PRE

Pretorta- rogues, reftrains, regulates, and diffolves, all ecclefiaftitive calfynods or convocations. This was an inherent pre-
Ircburg. regative of the crown long before the time of Henry Vill. as appears by the fatute 8 Hen. V1. c. I. and the many authors, both lawyers and hiftorians, vonched by Sir Lidward Coke. So that the ftarute 25 Hen. VIII. c. 19. which reftrains the convocation from maling or putting in execution any canons repugnant to the king's prerogative, or the laws, cuftoms, and ft:atutes of the realm, wits merely declaratory of the old common law: that part of it only being new, which makes the king's royal affent actually neceflary to the validity of every canon. The convocation or eccletiaftical Cynod, in England, differs confiderably in its conftitution from the fynods of other Chriftian kingloms: thofe confifting wholly of bifhops; where:s in England the convocation is the miniature of a parliamont, wherein the archbilhop prefides with regal fate ; the upper loufe of bifhops reprefents the houfe of lords; and the lower honfe, cempoled of reprefentatives of the feveral diocefes at large, and of cach particular chapter thercin, refembles the houre of commons with its kinghts of the thire and burgelfes. This corflitution is faid to be owing to the policy of Edward I. who thereby at cne and the fame time let in the inferior clergy to the privileges of forming ecclefiaftical canons (which before they had not), and allo introduced a method of taxing eccletiaflical benefices, by confent of convocation.

From this prerogative alfo, of being the head of the church, aifes the king's right of nomination to vacant bifhopaics, and certain other ecclefialtical preferments.

As head of the church, the king is likewife the derniter efor: in all ecclefiaftical cautes; an appeal lying ultimately to him in clancery from the fentence of every eccleftaftical judge: which right was reftored to the crown by natute 25 Hen. VIII. c. 9 .
111. The Ling's fifcal prerogatives, or fuch as regard his sevenue. Sce the article Reventr.

Prerogatira-Court, an Englith court cttablithed for the trial of all teftamentary caufes, where the deceafed hath left lora notab:/ia within two different dincefes. In which cafe the probate of wills belongs to the archbihop of the provisce, by way of fpecial prerogative. And all caufes relating to the wills, adminiftrations, or legacies of fuch perfons, are originally cognizable herein, before a judge appointed by the archbifhop, call. ed the judge of the frerogative-cuurt: from whom an appeal lies by Itatute 25 Hen. VIlI. c. Ig. to the king in chancery, inftead of the pope as foumerly.

I'RESAGE, in antiquity, denotes an ausury, or fign of fome future event; which was chiefly taken from the fight of birds, the entrails of vietines, Sc. Sec Augury and Aruspices.
l'RESBURG, the capital of the kingdom of Lower Hungary, calied by the inhabitants Pofony and Pre. fiporn, fituated on the Danube, about 46 miles ealt from Vienra, and 75 from Buda. The caltle, in which the regalia are kept, flands on a hill above tle town. Here the fates aflemble ; and in the cathedral, dedicated to St Matin, the king is crowned. The town is not very large, nor well built ; but is very ancient, pleafanty fituated, and enjoys a good air. Its fortifications are only a double wall and ditch. In the lower lububs is a hill, where the king, after his coronation, goes on horfeb.ıck, and brandifhes St. Stephen's fword towards the foul car-
dinal points, intimating, that he will defend his country $I$ againt all its enemies. Befides the cathedral, there are feveral other Popifh and one Lutheran church, with a Jefuits college, three convents, and two hofpitals. It gives name to a country; and is the refidence of the archbilhop of Gran, who is primate, chief fecretary, and chancellor of the hingdom, legatus natus of the Papal fee, and pince of the holy Roman empire. E. Long. 17. 30. N. lat, 48. 20.

PRESBIT'A, perfons whofe eyes are too flat to refraft the rays fufficiently, fo that undefs the object is at fome diftance, the rays coming from it will pafs through the retina before their union, confequently vifion is confufed; old people are ufually the fubjects of this dif. eafe. In order to remedy, or at leaft to palliate, this defect, the perfon thould firlt ufe glaffes which do not margnify, and from them pals gradually to more convex fpectacles, which fhorten the focus:

PRESBYTER, in the primitive Chriftian church, an elder, one of the fecond order of ecclefiatios; the other two being bilhops and deacons. See the articles Dishop and Deacon.

Preibyter or elder is a word borrowed from the Greek tranflation of the Old Teltament, where it commonly fignifies ruler or governor ; it being a note of of: fice and dignity, not of age ; and in this fenfe bilhops are fometimes called prefbyters in the New Taftament. The prelbyters might baptize, preach, confecrate, and adminiter the eucharift in the bifhop's ablence, or in his prefence if $h$ : authorifed and deputed them ; and the bifhops did fcarce any thing in the government of the church without their advice, confent, and amicable concurrence.

The grand difpute between the followers of the Geneva and Roman difcipline, is about the famenefs and difference of prefbyters and bifhops at the tinse of the apofles. See Episcopacy, Independents, and the following article.

PRESBYTERIANS, Proteltants, fo called from Dif their maintaining that the government of the church nati appointed in the New Teftament was by prefoyteries, prir that is, by affociations of minifters and ruling elders, of thy poffeflied all of equal powers, without any fuperiority among them either in office or in order.

The Prefbyterians believe, that the authority of their minilters to preach the gofpel, to adminiter the facraments of baptifm and the Lord's fupper, and to feed the flock of Chrift, is derived from the Holy Ghon by the impofition of the hands of the prebytery ; and they oppofe the independent fcheme of the common rights of Chritians by the fime arguments which are ufed for that purpofe by the Epifcopalians (iee Episcopacy). They aftirm, however, that there is no order in the church as eftablithed by Chrift and his apolfles fuperior to that of preffyters ; that all minifters being ambaliadors of Chrif, are equal by their commifion ; that profoyter and bilbog, though different words, are of the fame import; and that prelacy was gradually eftablifhed upon the primitive practice of making the moderator or fpeaker of the prefoytery a permanent officer.

Thele politions they maintain againt the Epifcopa- Scri lians by the following foriptural arguments. They ob-argt ferve, that the apontles planted charches by ordaining agai bifhops and deacons in every city; that the minifters epif which in one verfe are called bihops are in the next

## PRE [ 495$]$ PRE

fe- perhaps denominatel prefosters; that we nowhere read in the Now 'Tcftament of bifhops, prefbyters, and dea. cons, in any one church; and that therefore we are under the neceflity of concluding biflop and preflyter to be two names for the fame church officer. 'This is apparent from l'eter's exhortation to the elders or froforters who were among the Jewith Chrittians. "The elders (prefbyters) which are among you I cxhort, who am alio an clder, and a witnefs of the fufferings of Chrift, and alro a partaker of the glory that thall be revealed: Feed the flock of God which is among you, taking the overfoght thercot (errovorourits acting as bifoops thereof), met by conftraint, but willingly; not fur filhy lucre, but of a ready mind; nciller as beirg L.ORDS over God's heritage, but being cnfamples to the flock *." F:om this palfage it is evident, that the prefbyters not only fed the flock of God, but alfo governced that Hock with epifcopal powers; and that the apoftle himfelf, as a church officer, was nothing more than a prebbyter or edder. The identity of the office of bilhop and prebyter is till more apparent from Heb. גiii. 7. 17. and I Theff. v. 12.; for the bifhops are thace reprefented as governing the flock, ipeaking to them the word of Gorl, watching for their fouls, and difcharging various ofices, which it is impoffible for any man to perform to more than one congregation.

From the laft cited text it is evident, that the biftops (тролтаниноиs) of the Theffalonian churches had the paf: toral care of no more fouls than they could hold perfonal communion with in God's worthip; for they were fuch as all the people were to knovv, fleem, and lure, as thofe that not orily were over them, but alfo "clofely laboured among them and admonifled them." But dincelian bilhops, whom ordinarily the hundredth part of tienr flock never hear nor fee, cannot be thofe bithops by whom that flock is admonithed, nor can they be what Peter requires the bifhops of the Jewith converts to be, enfamples to the fiock. It is the opinion of Dr. Hammond, who was a very learmed divine, and a zealot for epiffopacy, that the elders whom the apofle 1.v. James defires $\dagger$ the fick to call for, were of the ligheft permanent order of ecclefiaftical officers; but it is felf-evident that thofe elders cannot have been diocefan bifhops, otherwife the fick mult have been often without the reach of the remedy propoded to them.

There is nothing in Scripture upun which the Epifcopalian is more ready to reft hiscaufe than the alleged epicopacy of 'rimothy and Titus; of whom the furmer is faid to have been bithop of Ephefus, and the latter bihop of Crete; yet the Preflyterian thinks it as clear as the noon-day fun, that the prefbytets of Ephefus werc fupreme govemors under Chrift of the Eplefian churches, at the very time that ' Cimothy is pretended to have been their proper diocefan.

In Acts xx. 17, Erc. we 1ead, that "from Miletus P.ul fent to Ephefus, and called the elders (prefoyters) of the church. And when they were come to him, he faid unto them, Ye know, from the firlt day that I came into Afia, after what manner I have been with you, at all feafons. And now I know that ye all, among whom I have gone preaching the kingdem of God, fhall fee my face no more. Wherefore 1 take you to record this day, that I am pure from the blood of all men. For $I$ have net hhuned to declare unto you all the coundel of God. Take heed thercfore unto
yourflees, and to ail the flock over which the Holy Chot hath made you overfeers (eromoteve lifheps), to feed the church of God, which he hath purchafed with his own biond. For I lanow this, that after my dep:rture fhall grievons wolves enter in among you, not fpaling the flock. Alfo of you owafelves thall men atite, fpeaking perverfe things, to draw away difeiples after them. Therefore watch, and remember, that by the rpace of three yeari, I ceafed not to warn every one night and day with tears. And now, brethren, I recommend you to God, and to the word of his grace," \&c.

From this paffitge, it is evident that there was in the The prifo city of Ephefus a plurality of paltors of equal authority $\mathbf{\text { ors of of }}$ F: without any fuperior paftor or bifiop over them; for the phe.vs us apoftle dirents his difcourfe to them all in common, and equal augives them equal power over the whole flock. Dr Flammond indeed imagines, that the elders whom Paul called to Miletus were the biflops of Afia, and that he fert for them to Ephefus, becaufe that city was the metropolis of the province. But were this opinion wellfounded, it is not conceivable that the facred writer would have called them the elders of the church of Epbefur, but the elders of the churbs in gencral, or the elders of the churches in A/ut. Befides, it is to be remembered, that the apoftle was in fuch hafte to be at Jerufalem, that the facred hiftorian meafures his time by days; whereas it mult have required feveral months to call together the bithops or elders of al! the cities of Alia; and he might certainly have gone to mect them at Ephefus in lefs time than would be requifite for their meeting in that city and proceeding thence to him at Miletus. They mult therefore have been cither the joint paltors of one congregation, or the paftors of dilfercnt congregations in one city: and as it was thus in Ephefus, fo was it in Philippi; for we find the apolle addrefling his epiftle "to all the faints in Chrift Jelins which are at Philippi, with the bifhops and deacons." Froun the paliage before us it is likewife plin, that the prefbyters of Ephefus had not only the name but the whole pozer of bithops given to them by the Holy Ghoft; for they are enj ined to do the whole work of
 to rule as well as feed the church of God. Whence we fee, that the apoltle makes the power of governing infeparable from that of preaching and ruatching; and that according to him, all whoare preachers of Gol's word, and watchmen of fouls, are neceflarily rulers or gover. nors of the church, without being accountible for their management to any pselate, but only to their Lord Chrift from whom their power is derived.

It appeats therefore, that the apoitle Paul left in the Tinintly charch of Ephefu;, which he bad planted, no other fuc- no hifour cell res to himielf than prifoyter-lifhops, or Prefoyterian miniters, and that he did not devolve his power upon any prelate. Timothy, whom the Epifopalians allese to have been the firf bifhop of Ephefus, was prefent when this fettlement was made * : ind it is furely not to * Acts xnt be luppofed, that, had he been their bilhop, the apoitle 5 . would have devolved the whole epifcopat power upon the preßyters before his face. If cuer there was a feafon fitter then another for pointing out the duty of this fuppefed bifhop to his diocefe, and his prefoyte-s duty to him, it was furely when Paul was taking lis final leave of them, and difcourfing fo pathetically con-

cerning the duty of overfers, the coming of ravenous wolves, and the confequent hazard of the flock. In t? is farewell difcourfe, he tells them that " he had not flumned to declare unto them all the counfel of Grod." But whit what truth could this have been faid, if obsdience to a diocefan bifhop had been any part of their Juty eilher at the time of the apotte's fpeaking or at any future period? He forelav: that ravenous wolves vould enter in among them, and that even fome of themfelves foruld arife feaking pervelfe things; and i!, as the Epifonpalians allege, diocefan epiferpacy was the remedy provided for thofe evils, is it not frange, pafing ftrange, that the infpired preacher did not forelie that Timothy, who was tanding befide him, was deffined to hill that important office; or if he did forefee it, that he omited to recommend him to his future charge, and to give him proper influtions for the difchange of his duty?

Lut if Cimothy was not bifhop of Ephefus, what, it may be akked, was his office in that city? for that he ralided there for forte time, and was by the apotle invefted with authority to ordain and rebuke prebyters, aie facts about which all parties are agreed, and which indeed cannot be controverted by any reader of Paul's eyitles. To this the Prefoyterian replies with confidence, that the power which Timothy exercifed in the church of Ephefus was that of an evingelift $t$, and not a fixed ptelate. But, according to Euebius, the work of an evangelit was, "to lay the foundations of the faich in barbirous nations, and to conflitute among them palurs; alter which he falfed on to other countuies." Accordingly we find, that Timothy was refident for a time at Philippi and Corinth $\ddagger$ as well as at Ephefus, and that he had as much authority over th.ofe churches as over that of which he is faid to have been the fixed bithop. "Nou, if Timotheus come, fee that he may be with you without fear, for he worketh the work of the Lord, as I alfo do. Let no man thercfore defire lim." This text might lead us to fupFufe, that l'imothy was bifiop of Coninth as well as of Efhefus; for it is Aronger than that upon which his efilcopacy of the latter church is chiefly built. The apolite fays, " I befrught thee * to ahide Itill at Ephefins, when I went into Macedonia, that thou mighteft charge forne that they teach no other doctrine." But had Timothy been the fixed bithop of that city, there would furely have been no necellity for befecting him to abide with his fock. It is to be obferved, too, that the frit epiltle to Timothy, which alcne was written to lim dairg lis refidence at $\mathrm{E}_{\mathrm{I}}$ hefus, was of a date prior to Patl's meceirg with the elders of that church at Miletus: for in the efittle he liepes to come to him fhort] H , whereas l.e tel’s the cllers at Miletus that they thould fee his fice no mose. Tl is being the cale, it is evident that Timotlyy was left by the apofle at $\mathrm{E}_{\mathrm{t}}$ liefus ouly to fupply his place dusing his temporaty ablence at Macedonia, and that he could not polfibly have been contioued fixed bifhop of that church, fince the epifcopal powers were afterwards cemmitted to the preßytels by the Holy Ghe ft in his prefence.

The isentity of the oflice of billop and prefoyter heing thus clearly eftablifhed, it follows, that the prefloyt inte is the lighoft permanent office in the church, and that cuery fiethful pattor of a fonek is fieceefor wo the apofles in every thing in which they were to have

## PRE

any fucceffors. In the apoftolic office there were int- Prt deed fome things peculiar and extraordinary, fuch as their immediate call by Chrift, their infallibility, their being witnefies of our Lird's refurredtion, and their unlimited jurifdition over the whele world. Thefe powers and privileges could not be conveytd by impolition of hands to any lucceflors, whether called prefbyters or bifhops; but as rulers or office-bearers in farticular churches, we have the conteflion of " the very chiefelt apotles," Peter and John, that they were nothing mote than prefbyters or pailh minifters. This being the cafe, the difpute, which in the early past of the paffing century was fo warmly agitated cencerning the validity of Prefbytirian urdination, may be fuon de. cided : for if the ceremony of ordination be at all effential, it is obvious that fuch a cetemony performed by prefoyters mult be valid, as there is no higleer order of eccleliantics in the church by whom it can be performed. Accordingly we find, that Timolly himfelf, though faid to be a bifhop, was ordained by the laging on of the hands of a prebytery. At that ordination indeed St Paul prefided, but he could prefide only as primus in paribus; for we have feen that, as permanent oficers in the church of Chrift, the apoltles themfelves were no more than prefbyters. If the apoliles hinds were impofed for any other purpofe, it muft laze been to communicate thofe charifrata or miraculcus gifts of the Ho:y Spirit, which were then fo frequent; but which no modern prefbyter or bifhop will pretend to give, unlefs his underltanding be clouded by the groffef ignorance, or perverted by the moft frantic enthufiafm.

But if the office of bifhop and prebyter was origi- Ril nally the fame, how, it will be afked, came diocefan epif- er enpacy to prevail fo univerlally as it is confeffed to have done before the convertion of Conftantine and the civil eftabliftment of Chriltanity in the Roman empire? To give a fatisfactory anfwer to this queftion is certainly the moft arduous talk which the advocate for prefoytery has to perform; but it is a talk not infurmountable.

From many pafarges in the New Teftament *, it is * evident, that when the apofles planted churches in dif. derent cities, they generally fettled mere than one pa-2. ftor in the fame church, to feed and govern it with ${ }^{2}$ jcint authority. The propriety of this conft tution is obvious. In thofe days, when the difciples of Chrift were perfecuted for their religion, and often obliged to meet in the "night for fear of the Jews," they could not rith any degree of prudence alemble in large numbers; and therefore, liad there been no more thar one paftor in a city, the Chriftian ce nverts, though, when atfembled, they might have ame unted to but a fmall congreyation, conld not all have erjoyed the be: nefit of public worflip on the fame day; at laft it is obvious that they could not pofifibly have alfembled for this purpefe to often as their want of inftustion, and the duty of "breaking of bread and of prayer," requised them to meet. It was therefore wih great wifdom that the apoflles ordained feveral prefoyters in the fime church; but as thefe preflyters would have occafion to meet frequently, and to deliberate on the Gate of the flock which it was the'r duty to feed, and over which they had al! equal athority, they would be under the necefitity of electing one of their own number

## PRE <br> RE

te- number to be prefident or moderator of the preftytery; that order might be preferved, and all things done with decency. At firf there is seafon to believe that chofe prefidents held ther office no longer than while the profbyteries fat in which they were elefted. Among the apoftics themfelves there was no inxed prefident. Peter indeed appears to have been moft frequently ad. mitted to that bonour; but there is one very memoxv, rable occation on record $t$, when James the Lord's brotleer prefided in anafiembly of apofles, elders, and brethren, held at Jerufalem, to detcrmine the queflion concerning the neeeflity of circumcifing the Gentiles, and commanding them to keep the law of Mofes.
Upon this model were the primitive prefbyteries formed. They confifted of feveral preflyters poffefied of equal porrers, who at their meetings appointed one of their own number to difcharge the office of moderator or temporary prefident; but to this prefident they gave no prelatical powers or negative voice over the deliberations of his brethren; for, as Jerome informs us, ing the clurch was then governed comnuni prefoterorum con-
ame. cilio, "by a common council of preßuyters." It appears, however, that when an apofile, an apofolical man, or an evangelift, fixed his refidence in any city, and took upon birmelf the paftoral care of part of the flock, his co-prefoyters, from refpeft to his fingular gifts, made him their conftant and fixed moderator. Hence Timothy, during his abode at Ephefus, was moderator of the prefbytery; and hence too Mark the evangelift, who refided many years in Alexandria, has been called the firft bithop of that church, though he appears to have been nothing more than permanent moderator. We advance this upon the authority of Jerome, one of the molt learned fathers of the Chriftian church, who informs us, that upon the death of the evangelift, the prefbyters of Alexandria, for more than 200 years, chofe their bifhors from their own number, and placed them in the epifcopal chair, without dreaming that they ought to be raifed to a higher order by a new confecration;-Prefoteri unume ex fe elegum in excelfiori gradu collocatum, epijcopum nominabant. As this pratice of making the moderator of the prefbytery of Alexandria 2 permarent officer, was thought a good expedient te guard the infant churches againft fechifms and divifions, thofe churches gradually adupted it. For, as Jerome tells us, Pofquam unufquifque cos quos baptizaserat, fuos putabat effe, non Chrifit, in toto orle decretiam ef., ut unus de preflyteris elefius, fuperponeretur cateris, aid quern omnis ccilifise cura pertinerel, et fobifmatumn fomina sollerentur.
The advantages which, in difplaying his talents and authority, the perpe:ual prefident or fpeaker of any affembly has over his colleagues in office, are fo obvious, that whon the practice of eleating their moderators for life bscame univerfal among the prefoyteries of the primitive cluarch, it is eafy to conceive how ambitious men might fo magrify the dificulties and importance of their ftation, as to intreduce the cutom of filling it by a new confecration of the bilhop elect. But when this was done, diocefan epifcopacy, with all its powers and prerogatives, would follow as a thing of courre, until " by little anad litile (as Jerome expreffes himfelf) the whole paftn:al care of the flock was devolved upon one man."

Our limits will not permit us to trace more minutely Vol.. XV.
the rife and progrefs of this cecteflo ti ni wion taiot, as the Prefyterian calls it ; but the reader whe withcs for fuller information, after Atudying the icmain so tlic four firt cemturies of the Chriftian chu:ch, rafj cominte An Inquiry into the Confitution, IIjcipiline, arillicu? ? of the Primitive Church, faid to late been wition by : Peter King, afterwards lord chane llor of Englenai. As an impartial lover of truth, he will con weil to con. fult alfo a book intite 1 An cri:inal Drasyle of thic l'imitive Cburch, which was publithed as ansariver to :l.e. Inquiry; ald lie may read with much advantare to himfif A Ietter ficm a parcelial liknp to a frelatical sentioman, with An Apoiogy for the charch of Sco:land, both wioren by Mr Willifon fome time minillerin Dundee, and both evincing confderable learning and great ingenuity in their pious auther.

Of the churclies at prefent firmed upon this mic. Thecluref del, we believe, that without hefitation, we may falciy oi suluand afirm the church of Scotand to be in general the noof refpeftable. Her mude of worfhip is fimple and $f$. lemn; her eftablifhed faith agrecable to che confeffions of moft other Proteftant clurches; her judicato:its are calculated to maintain the rights of the people; and her pattors are confeffedy men of liberal and en. lightened minds. On thefe accounts i: appears to us, that we cannot more properly concluce this anticle than with a thort view of leer conflitution, as being that in which our Preßbterian readers wiil find the:nfelves moft interefted.

No one is ignorant, that from the firt dawn of reformation in Scotland, till the cra of the revolution, there was a perpetual fruggle between the court and the people for the eftablithment of an Epifcopal or a Prefbyterian form of church government: The forn cr model of eccle fiaftical polity was patron:fed by the houfe of Stuart on account of the fupport which it gave to the prerogatives of the crown; the later was the $f_{\mathrm{d}}$ vourite of the majority of the people, perhaps not fo much on account of its fuperior claim $t$, apoffiiial in. Aitution, as becaufe the laity are mixed with the clergy in church judicatories, and the two orders, which under epifcopacy are kept fo diftina, incorporated, as it were, into one body. In the Scottifl church, every regulation of public worfhip, every a\{ of difcipline, and eyery ecclefia:tical cenfure, which in nther churches flows from the authority of a diccefon bifhop, or fiom a convocation of the clergy, is the joint work of a cer- on tain number of clergymen and $1_{1}$ ymen asting together by ciciz). with equal authority, and deciding every queftion by an win and plurality of voices. The laymen who thus furm and lyazu: effential part of the ecclefialtical courts of Scothand, are called raling ellers; and hold the fame office, as we'd as the fame name, with thefe bretliren * who joined els. nv. with the apofles and elders at Jerufalem in deiermining the important queftion concerring the n:ecefity of impuling upon the Gentile converts the ritual obficia: ces of the haw of M fes. 'Ibefe lay elders pal enjnined Timothy $\psi$ to account wathy of doable homour, if they flould rule well, and difiha: ge the duties cur it Tim. w. which they were feparated from the mullitude of tacir brethren. In the clarch of Scotland evers parifh has two or thres of thoofe liy-elders, whe are grave and $f$ rious perf $n$ chofen from ammen tha he dids of famitics, of known orthoduxy and feady anllerense th the wis finip, difupline, and government of the dum. Fe-
ing fullemty ergaged to we their utmont ancaravors for the fuppetical of wice and the cheriking of piety and vitue, ard to c:ercife difcipline faithfully and diliscorly, the minifler, in the prefence of the congrectation, ficts them apart to their office by folemn rayer ; and conc'uJes the ccremony, which is fornetimes cailed ordiation, wilh exhorting both elders and pecple to their refpective ciuties.

The kirk-fefition, which is the lowert ccciefiafical jucicatory, conlifts of the minifter and thofe elders of the congregation. 'Tlic mininer is $c x$ officio moderator, but las no negrative voice over the decifion of the feflion; ncr indeed has he a right to vote at all, unlefs when the voices of the elders are equal and oppofite. He may indeed enter his proteft againf their fentence, if he think it improper, and appeal to the judgment of the prefbytery; but this privilege belongs cqually to cvery elder, as well as to every perfon who may believe himfelf aggrieved by the proceedings of the feffion. The deacons, whofe proper office it is to take care of the poor, may be precent in every fefion, and offer their counfel on all queftions that come before it ; but except in what relates to the diffribution of alms, they have no decifive vote with the minifter and elders.
The next judicatory is the prefoytery, which confifts of all the paftors within a certain diftric, and one ruling elder from each paifh commifioned by his brethren to reprefent, in corjonction with the minifter, the feffion of that parifh. The prefbytery treats of fuch matters as concern the particular churches within is limits; as the examination, admiffion, ordination, and cenfuring of miniters; the licenfing of probationers. rebuking of grofs or contumacions finners, the directing of the fentence of excommunication, the de. ciding upon references and appeals from kirk-fefions, refolving cafes of confcience, explaining difficulties in deatrine or difcipline; and cenfuring, according to the word of Cod, any herefy or erroneous doetrine which lawh been cither publicly or privately maintained within the tounds of its jurifdiction. Whatever advantages may arie from this equality, we cannot altol gether approve of that patt of the confitution which gives an equal vote, in queftions of herefy, to an illiterate mechanic and his enlightened paltor. We are perfuaded that it has been the fource of much trouble to many a pious clergyman; who, from the laudable defire of explaining the frriptures and declaring to his flock all the counfel of God, has employed a variety of expreffions of the fame import, to illuftrate thofe articles of faith, which may be obfcurely expreffed in the eftablifhed fandards. The fact however is, that, in prefbyteries, the only prerogatives which the paftors have over the ruling elders, are the power of ordiation by impofition of hands, and the privilege of having the moderator chofen from their body.

From the judgment of the prefbytery there lies an afpeal to the proviacial fynod, which ordinarily meets twice in the year, and exercifes over the prefbyteries within the province a jurifdistion fimilar to that which is velled in each prebytery over the feveral kirk-feffions within its bounds. Of thefe fynods thcre are in the whrch of Scotland fifteen, which are compofed of the members of the feveral prefinterics within the refpective provinces which give names to the fynods.

The higheat authority in the clurch of Scotland is
the $\begin{gathered}\text { cencral affembly, which cenfits of a certain number }\end{gathered}$ of miniters and ruling elders delegated from each prefbytery, and of comm.fioners from the univerfities and royal boroughs. A prefbytery in which thereare fewer than tweive parifles, fends to the general affembly two minilters and one ruling elder : if it contain between 12 and 18 minifters, it fends three of thefe, and one ruling elder: if it contain betwcen 18 and 24 minitters, it fends four minithers and twis ruling eiders; and of 24 miniters, when it contains fo many, it fends five with two ruling elders. Every royal borough fends one ruling elder, and Edinburgh two; whofe election muat be at:telled by the kirk- eflions of their refpective boroughs. Every univerfity fends one commiffioner from its own body. The commiffioners are chofen annually fix weeks before the meeting of the affembly; and the ruling elders are often men of the firt eminence in the kingdom for rank and talents. In this affembly, which meets once a year, the king prefides by his commiffioner, who is always a nobleman; but he has no voice in their delibe. rations. The order of their proceedings is regular, though fometimes the number of members creates :a confufion, which the moderater, who is chofen from among the minifters to be, as it were, the fpeaker of the houfe, has not fufficient authority to prevent. Appeals are brought from all the other eccletialical courts in Scotland to the general affembly; and in quefions purely religions no appeal lies from its determinations. - In the fuberdination of thefe affemblies, parochial, prefbyterial, provincial, and national, the lefs unto the greater, confifts the external order, Atength, and ftedfattnefs of the church of Scotland.

PRESCIENCE, in theology, previfion, or foreknowledge ; that knowledge which God has of things to come. - The dratrine of predeltination is founded on the prefcience of God, and on the fuppofition of all futurity's being prefent to him. See Predestination.

PRESCRIPTION, in medicine, is the affigning a proper and adequate remedy to the difeate, froman examination of its fymptoms, and an acquantance with the virtues and effects of the materia medica.

Prescription, in law, is a title acquired by ufe and time, and allowed by law ; as when a man claims any thing, becaufe he, his anceitors, or they whofe eflate he hath, have had or ufed it all the time whereof no memory is to the contrary: or it is where for continuance of time, ultra memoriam bominis, a particular perfon hath a particular right againft another.

There is a difference between prefcription, cuftom, and ufage. Prefeription hath refpea to a certain perfon, who by in'endment may have continuance for ever; as for inftance, he and all they cubofe oftate be batb in fuch a thing, this is a prefcription: but, Cufon, is local, and always applied to a certain place; as, time out of mind there bas been fuch a cufoom in fuct a place, \&c. And preficipition belongeth to one or a fizu only; but cuffom is common to all. Ufige differs from both, for it may he either toperfons or pluces; as to inlabitunts of a torun to bave a zuay, \&c.
A cuftom and prefeription are in the right; uffge is in the pofifion; and a prefcription that is good for the matter and fublance, may be bad by the manner offecting it forth: but where that which is claimed as a cufoom, in or for many, will be good, that regularly will be fo when claimed by preficipition for one. Preferigtion is to

## PRE

be time out of mind; though it is not the length of time that berets the right of prefcription, nothing being done by time, although every thing is di ne in time; lut is is a profumplion in lawv, that a thing cannot continuc fo leng quict, if it zuas againft right, or injurious to another.

Prescription, in Scotch law. Sce Law, p. Gg8, and 725.

Prescription, in theoligg, was a kind of argument pleaded by Tertullian and others in the 3 d century againtt crroneous doctors. This mode of arguing has been defpifed by fome, both becaufe it has been ufed by l'apifts, and becaufe they think that truth has no need nf fich a fupport.

PRESENCE, a term of relation, ufed in oppofition to :abfence, and fignifying the exiftence of a perfon in a ocrtain place.

Prishant Tenfe, in grammar, the firt tenfe of a verb, exprelling the prefent time, or that fomething is now performing; as foribo, I write, or am writing. See Grammar.

PRESENTATION, in ecclefiaflical law. See PAtronage.

Presentaquon of the Virgin, is a fealt of the Romifh church, celebrated on the 23 it of November, in memory of the Holy Virgin's being prefented by her parents in the temple, to be there educated. Emanuel Comnenus, who began to reign in 1143 , makes mention of this feaft in his Conftitution. Some imagine it to have becn eflablifhed among the Greeks in the 11 th century; and think they fee evident proofs of it in fome homilies of Genrge of Nicomedia, who lived in the time of Photius. Its inftitution in the Weft is afctibed to Gregory XI. in 1372. Some think it was inflituted in mennory of the ceremony pratifed among the Jews for their newborn females; correfponding to the circumcifion on the oighth day for males.
Presea tation of our Lady alfo gives the title to three orders of nuns. The firft, projected in 1618, by a maid named Joan of Cambray. The habit of the nuns, according to the vifion fle pretended to have, was to be a grey gown of natural wool, \&c.; but this projeet was never accomplithed. The fecond was eftablithed in France, abont the year 1627 , by Nicholas Sanguin, bifhop of Senlis ; it was approved by Urban VIII. This order never made any great progrefs. The third was eftablified in $166_{4}$, when Frederic Borromeo, being apofolical vilitor in the Valteline, was intreated by fome devout inaids at Morbegno to allow them to live in community in a retired place; which he granted, and erected them into a congregation, under the title of consrezation of our Lady. They live under the rule of St Auguftine.

PRESENTMENT, in law. See Prosecurion.
A prefontment, generally taken, is a very comprebenfive term; including not on'y prefentments properly io called, but alfo inquilitions of office, and indiaments by a grand jury. A prefentment, properly fpeaking, is the notice taken by a grand jury of any offence from their own kno rledge or obfervation, without any bill of indictment laid before them at the finit of the king : As the prefentment of a nuifance, a libel, and the like; upon which the officer of the coant mult afterwards frame an indiatment, hefore the party prefented can be put to anfwer it. An inquitition of office is the af of is jury, fummoned by the proper oflicer to inquire of
matters selating to the crown, upon evidence lail le- frefihes, fore them. Some of thefe are in themfelves convictions, and cannot afterwands be traverfed or denied; and therefore the inquef, or jury, ought to hear all that can loc alleged on both lides. Of this nature are all inquifitions of $f_{c} / \frac{d e}{} f_{c}$; of flight in perfons uccufed of felony; of deodands, and the likc ; and prefentments of petty offences in the therif's tourn or court-leet; wherenpon the prefiding oficer may fet a finc. Othes iuquifitions may be afterwards traverfed and cxamined ; as particularly the coroncr's inquifition of the death of a man, when it finds any one guilty of homicide; for in fuch cafes the offender fo prefented mult be arraigned upon this inquifition, and may difpute the truth of it; which brings it to a kind of indiament, the molo ufial and effectual means of profecution. See IxdictMENT.
PRESIDENT, Preses, is an officer created or elected to prefide over a company or affembly; fo calleck in contradiftinction to the other members, who are iermsed refilents.

Presinsary of the United States of America. The officer in whom the executive power is vefted by the conftitution. He mult be a natural born citizen of the United States, he muft be at leaft thirty five years of age, and have refided fourteen years in the United States. He is chofen by electors appointed by the different States, equal in number to the Senators and Reprefentatives in Congrefs, whofe votes, fealed up, are tranfmitted to the Prefident of the Senate, who upens and counts them in prefence of the whole Congrefs, and the whole majority of votes decides. He holds his office for four years, and is conmander in chief of the army and navy of the United States, and of the militia when called into the actual fervice of the United States; and by and with the confent of the Senate he has power to appoint ambafladors and other public minifters; he can fill up vacancies which happen during the recefs of the Scnate; he can convene and adjourn the Congrefs; receive ambaffadors; take care that the laws be faithfully executed; and commiffion all the officers of the United States: but like all the officers of the United States, he thall be removed from office on impeachment for, and convistion of, treafon, bribery or other high crimes and mifdemeanors.

Vice-President of the United Stutes, is chofen by the electors at the fame time and in the fame manner with the Prefident. Sce above. He is the Prefident of the Senate, but has no vote unlefs they be cqually divided. The powers and duties of the Prefident of tie Unitcd Statos devolve on him in cafe of the remoral of the Prefident until a new Prefident be elcted.

PRESS (Prelum), in the mechimic atts, a machine made of iron or wood, ferving to fqueze or complef any body very clole.

The ordinary preffes conlint of fix members, or Fieces ; viz. two fat fmooth planks; between which the things to be preffed are laid; two ferews, or worms, fafiencd to the lower plank, and pafing through two holes in the upper ; and two nuts, in form of an S , ferving to drive the upper plank, which is moveable, againlt the lower, which is table, and without motion.
$P_{\text {RESSES }}$ ufed for expreling of Liquors, are of various kinds; fome, in molt refpefts, the fame with the common preffes, excepting that the under flank is per-

A very ufcful machine for a pref, in the procefs of cyder-making, has been lately contructed by Mr Anftice, who, with his well-known zeal for the improve. ment of mechanics, pormits us to lay before our readers the following defuription of it.
Ma:
fCClさV.
AA, $n^{\circ} 1$, two pieces of timber, 21 feet long, 12 by 6 inches, laill fide by fide at the ditance of 12 inches,
and fecured in that fituation by blncks placed between and bolts paffing through them; this frame forms the $b: d$ of the machine: BB , two nprights, 12 feet long, 6 by \&inches, mar riced upon them, and fecured in their pofition by pins and iron fquares. CC, two uprights, fire feet long, fix by 10 inches, morticed near the end of the under frame, and fecured as before. D, a lever, 17 feet long, 12 by 13 inches, turning on a large bolt which palfes through the fhort uprights, alfo through iron fraps, which fecure them to the bed infide, and a Ainup of iron which paffes over the end of the lever, and which makes the turning point in the line of its lower fide, and not through its middle. E, a lever 20 feet long, fix by eight inches at its largef part, and tapering towards the other end: this lever turns on a bolt in the uprights BB. F. 1, 2, 3, 4. four pieces of oak (which he calls reedles, 10 feet long), four by two and an half inches, morticed loofely into the upper lever, and hung thereto by bolts, fo as to fiwing perpendicularly, and play in a long mortice or channcl cut through the large lever to receive them. Thefe needles bave inchholes pretty clofely bored through them (in a direction crofing the machine), from the lower ends, as far upwards as the great lever will reach, when it is as high as it ca: go. G, a bod to receive what is to be preffa.c. H, a frame to fupport a winch worked by a 1 andle at I. At the end of the fmall lever two blocks or pulleys are fixed, one above and the other below it; a rope of about half an inch diameter is then faftened to the cieling (or continuation of the uprights of the winch frame if neceffary) at K ; then paffed through the upper block on the lever, from thence paffed through a block at L , and then goes with four turns round the winch, from whence it is carried throngh the block under the lever, and fattens to the machine at $M$; by this moans, if the winch be turned one way, it raifes the end of the fmall lever if the other depreffes it.

To work the machine. If we fuppofe the great lever bearing on the matter to be prefied, an iron pin mult be fut into one of the holes in the needles above the great lever; and when the fmall lever is worked as fir as it will go, either up or down, another bolt is to be put into the hole, which comes nearelt above the great lever on the other fide of the uprights BB, and the winch then turned the contrary way, by which means the preffing goes cn whether the fmall lever rifes or fall. Before the refiftance is very great, the needles fartheft from the fulcrum of the fmall lever are ufed; after that the nearelt are employed, which doubles the power of the machine. In tailing the great lever, or luwering it to its bearing, the needles mort diftant from the fulcrum of the fimill lever, are ufed under inftead of coer it. As the rope is liable to fretch and get Wack, be palfes it, after taking two turns on the winch, through a pulley, to which is fulpended a weight
of half a hundred, and then takes two tur more before it is carried through the other block, by which means the flack is confantly gathered in, and the weight holds on without increafing the friction, as by hanging under the winch it counteracts the preffure upwards on its axis.

The power of this machine is very great, being as to $113^{5}$ nearly, and capable by a trifling addition of any other proportion. It is applicable to many pur pofes befide cyder-prelling, and is more fimple, and leis liable to injury, than any other which has tallen under our obfervation. Perhaps, however, it would be an improvement to uie, intead of the ropes and pulleys, by which the lever E is moved, a fmall wheel or pinion of 10 or 12 teeth, on the axis of the winch $W\left(n^{8} 2.\right)$, and a fiff beam en down from the lever, having on its lower end an iron rack, of which the tecth take into thofe of the pinion. The action of thefe tecth would, in our opinion, be lefs diminifhed by friction and obliquity, than the pulleys are by friction and the fiffnefs of the rope; and the machine would retain all its other advantages.

Press ufed by Foiners, to keep clofe the pieces they have glued, efpecially panels, sic. of wainfcot, is very fimple, confifting of four members; viz. two fcrews, and two pieces of wood, four or five inches fquare, and two or three feet long; whereof the holes at the two ends ferve for nuts to the fcrews.
$P_{\text {fe's }}$ ufed by Inlayers, refembles the joiner's-prefs, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a treffel, being fultained by two legs or pillars, jointed into it at each end. This prefs ferves them for fawing and cleaving the pieces of wcod required in marquetry or inlaid work.

Founder's Press, is a ftrong fquare frame, confifting of four pieces of wood, firmly joined together with tenons, \&c. This prefs is of various fizes, according to the fizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; fo as that, by driving wooden wedges between the mould and the fides of the prefles, the two parts of the mould wherein the metal is to be run may be preffed clcfe together.

## Printing-Press. See Printing-Prefs.

Rolling-Pres, is a machine ufed for the taking off prints from copper-plates. It is much lefs cemplex than that of the letter-printers. See its defcription and ufe under the article Roling prefs Pringing.
$P_{\text {Kess }}$, in Coining, is one of the machines ufed in itriking of money; differing from the balance, in that it has only one iron bar to give it motion, and prefs the moulds or coins; is not charged with lead at its extreme, nor drawn by cordage. See Coining.

Bimder's Culting. Pirfss, is a machine ufed equally by book-binders, ftationers, and patteboard-makers ; confifting of two large pieces of wood, in form of cheeks, connected by two ftrong wooden fcrews; which, being turned by an iron bar, draw togecher, or fet afunder, the cheeks, as much as is neceflary for the putting in the books or paper to be cut. The cheeks are placed lengthwife on a wroden fand, in the form of a cheft, into which the cuttings fail. Afide of the cheeks are two pieces of wood, of the fame length with the fcrews, ferving to direst the cheeks, and prevent their opening unequally

## 1 R E

urequally. Upon the cheeks the plough moves, to which the cutting knife is faftened by a ferew; which las its key, to difmount it, on occalion, to be tharpened.

The pleugh corfitits of ieveral parts; among the reft a wooden ferew or worm, which, catching within the ruts of the two feet that fuftain it on the checks, brings the knife to the book or paper which is faftened in the prefs between two boards. This fcrew, which is pretty lorg, lias two directorics, which refemble thofe of the ficcess of the pre's. To make the plongh fide fquare and even en the cheeks, fo that the knife may make an equal paring, that foot of the plough where the knite is not fixed, flides in a kind of gronve, faltened along one of the cheeks. Laltly, the knife is a piece of ftel, fix or feven inches long, Bat, thin, and fharp, terminatirg at one end in a point, like that of a fierd, and at the other in a fquare form, which ferves to fatten it to the plough. See Boor. Binding.

As the long knives ufed by us in the cutting of books or papers, are apt to jump in the cutting thick books, the Dutch are faid to ufe circular knives, with an edge all round; which not only cut more fteadily, but laft longer without grinding.

Press, in the $W$ ooilen Manufazory, is a large wooden machine, ferving to preis cloths, ferges, rateens, \&c. thereby to render them fmooth and even, and to give them a glofs.

This machine coniffs of feveral members; the principal whereof are the cheeks, the nut, and the worm or forew, accompanied with its bar, which ferves to turn it round, and make it defcend perpendiculatly on the middle of a thick wonden plank, under which the fuffs to be freffed are placed. The calender is alfo a kind of prefs, ferving to prefs or calender linens, filks, \&c.

Liberiy of the Press. See Labratr of the Prefs. $_{\text {a }}$.
PRESSING, in the manufactures, is the violently fqueezing a cloth, ftuff, \&c. to render it fmooth and gloffy.
There are two methods of preffing, viz. cold and hot.

As to the former, or cold preffing: After the Auff has been fonured, fulled, and fhorn, it is folded fquare in equal plaits, and a fkin of vellum or pafteboard put between each plait. Over the whole is laid a fquare wooden plank, and fo put into the prefs, which is ferewed down tight by means of a lever. After it has lain a fufficient time in the prefs, they take it out, removing the pafteboards, and lay it up to keep. Some only lay the fuff on a irm table after plaiting and pafteboarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of prefling hot is this: When the funf has received the above preparations, it is fprinkled a little with water, fometimes gum-water; then plaited equally, and between each two plaits are put leaves of palteboard; and between every fixth and feventh plait, as well as over the whole, an irnn or brafs plate well beated in a kind of furnace. This done, it is laid upon the prefs, and forcibly fcrewed down. Under this prefs are laid five, fix, \&ec. pieces at the fame time, alt furnifhed wi:h their pafteboards ard iron plates. When the plates are well cooled, the fuffs are taken out and fitched a little together to keep them in the plaits.

This manner of preffing was only invented to cover the defects of the futts; and, accordingly, it has beca frequently prohibited.
Prassinci, or mmprefung. Seer Imeressing.
PRESSION, or PRESSURE, in the Cartefian Philofophy, is a fuppefed impulfive kind of motion, or rather an endeavour to move, imprefied on a fluid medium, and propagated throngh it.
pressume ofair. See Peematics.
Praisure of Fluils. See Hydrostatics and Paeumatics.
PREST, is ufed for a duty in money, to be paid hy the theriff on his account, in the exchequer, or for money left or remaining in his hands: $2 \& 3$ Edw. V1. c. 4 .
 that is, promptus, expelitus; for that it hinds thefe who receive it, to be ready at all times appointed, being commonly meant of foldiers.

PRESTATION Money, is a fum of meney paid yearly by archdeacons and other dignitaries to their bifhop, pro extcriori jurijdisione.

Prestation (prieffatio), was anciently ufed for ether parments: Et quictifint de preflatione muragii. Chart. Hen. VII. Sometimes alfo for pourveyance.

PRESTEIGN is a town in Radnorfhire, dilant 149 miles weef-north-weft from London, in the direct road to Aberyftith, and throeghout South Wales, in N. Lat. $52^{\circ} 12^{\prime}$, bounded to the north, and northealt by Hercfordthire. Is is a ne:it well built town, with clean and regular frcets, and is the refidence of many gentecl families. The neighbourhond abounds with all the comforts and conveniencies of life. It is feated on a gravelly foil on the banks of the river Lug, and at the. head of a very fertile va'e: the mountains to the weft and north-welt of the turn forming, as it were, all amphitheatre round it. The name of it in Welfh is Slan-Andras, which is fuppofed to be derived from the church, which is dedicated to Saint Andrew. The town is divided into four wards, which have each a feparate jurifdičion, feparate officers, levies, \&c. The curfew-bell of William the Conqueror fill remains in this place, and is rung every night. It is a borough by prefeription, and is governed by a bailiff annually clected, and fworn in by a fleward appointed by the crown. The living is a retory and vicarage united, and reported to be worth from L. 5 co to L. 600 per annam; the parifh lying in two counties. Here is an excellent free fchool well endowed. The county hall, the county ganl, the conntry bridewell, and houre of correslion, are kept in this place. The markets are held on Saturdays; and there are two fairs in the year. About a century and a lalf ago Prefteign was confiderably larger; liad a good woolten manufactory, of which the very large buildings now fanding (formerly belonging to clothiers) bear ample teftimony, but a fire, fucceeded by the plague, in the town about the year $1 G_{3} G$, reduced the fame, and with it, its confequence as a manufacturing town. The healthinefs ot its lituation cannot be better afcertained than by the regifter of births and burials. The parifl embraces at leaft a circte of 19 miles; and the average of burials for the laft feven years was only 26 petfons per amum, and that of births for the fame time was 42 ; and of the former upwards of 18 were from 80 to 100 years old.

PRES-

## PRE

PRESTER (John, or Jean), an appellation formerly given to an emperor of the Tartars who was overcome and Silled by Jengliz Khan. Since that time it has been given to the emperor of Abyfinia or Ethiopia; however, in Ethiopid itfelf this name is utterly unknown, the emperor being there called the grand ne$s^{\prime \prime \prime}$.

Prester, a meteor, cunfifting of an ealialation thrown from the clouds downwards with fuch violence, as that by the collifion it is fet on firc. The word is Greek wpnsnp, the name of a kind of ferpent; called alfo diffas, to which this meteor is fuppored to bear a refemblance. The prefter differs from the thunderbolt in the manner of its inflammation ; and in its burning and breaking every thing it touches with greater violence.

Prester, a word ufed by fome to exprefs the exter nal part of the neck, which is ufually inflated in an. ger.

PRESTIMONY, in canon law, is derived a prafiasione quotidiana; and is, by fome, defined to be a kind of benefice, ferved by a fingle prieft. Others fay, it is the incumbency of a chapel, without any title or collation; fuch as are molt of thofe in caftes, where prayers or mafs are faid; and which are mere unendowed oratories. Whence the term is alfo applied, in the Romifh church, to certain perpetual offices beftowed on canons, religious, or others, for the faying of malles, by way of augmentation of their livings. Others think it is a leafe, or concefion of any ecclefiaftical fund or revenue, belonging to a monaftery, to be enjoyed during life. Du Moulin calls it a profane benefice, which, however, has a perpetual title, and an eccletiaftical office, with certain revenues attached to it; which the incumbent is allowed to fell, and which may be poffcffed without tonfure; fuch as the lay church-wardens of Notre-dame. He adds, that, in propriety, the canonries of chapds are benefices of this mateure. The mott probable opinion feems to be, that preftimony is a fund, or revenua, appropriated hy the founder for the fubfiftence of a prieft, without being erefted intu any title of benefice, chapel, prebend, or prinry ; and which is not fubject either to the pope or to the ordinary, but whereof the patron, and thofe who have a right from him, are the collators, and nominate and confer pleno jure.

PRESTO, in the Italian mufic, intimates to perform quick; as prefif/mo does extremely quick.

PRESTON, a town of Lancafhire in England, feated on the tiver Ribble, over which there is a handfome thone bridge. Here is held a count of chancery, and other offices of juftice for the county palatine of Lancafter. It is noted for the defeat of the rebels here in 1715, when they were all made prifoners, and fent up to London. W. Long. 2. $=6$. N. Lat. 53.45 .
prestre. See Vauban.
PRETENSED or pretenden right, in law, is where one is in polfeflion of lands and tenements, which another, who is out, claims and fues for. Here the pretenfed 1 ight is in him who fo claims or fues.

PRETERITE, in grammar, a tenfe which exprefles the time paft, or an action completely finifhed; as, forijff, "I have writen." See Perfect and Gramhar.

Preterition, or rretermesion, in rhetoric,
a figure whereby, in pretending to pafs over a thing un- Pr touched, we make a fummary mention thereof. I will not fay be is valiant, be is learsed, be is juff, \&c. The moit artful praifes are thofe given by way of preterition. See Oratory.
PRETEXT, a colour or motive, whether real or feigned, for doing fomething.

Toga PRETEXTA, among the ancient Romans, a long white gown, with a border of purple round the cdges, and worn by children of quality till the age of puberty, viz. by the boys till 17 , when they changed it for the $\operatorname{tog} a$ viritis: and by the girls till marriage.

PRETIUM sepulchri, in old law books, \&c. thofe goods accruing to the church wherein a corps is buried. In the Irifh canons, lib xis. cap. 6. it is ordered, that along with every body that is buried, there go his cow, herfe, apparel, and tire furniture of his bed; none of which may be difpofed of ntherwife than for the payment of debts, \&c, as being familiars and domeftics of the deceafed.

PRETOR, a magittrate among the ancient Romans, not unlike the lord chief juttices, or lord chancellor in England, or both in one ; as being vefted with the power of diftributing juftice among the citizens. At firt there was only one pretor; but afterwards, another being created, the firlt or chief one had the title of prator urbanus, or the "city pretor :" the other was called percegrinus, as being judge in all matters relating toforeigners. But, belides thefe, there were afterwards created many provincial pretors; who were not only judges, but alfo atifited the confuls in the government of the provinces, and even were invefted with the government of provinces themfelves.

PRETORIAN guards, in Roman antiquity, were the emperor's guards, who at length were incredfed to 10,000: they had this denomination, according to fome, from their being Itationed at a place called Pratorium: their commander was fy yled prafeitus pretorii.

PRETORIUM, or Pratorium, among the Romans, denoted the hall or court wherein the pretorlived, and wherein he adminitered jultice.

It likewife denoted the tent of the Roman general, wherein councils of war, \&c. were held: alfo a place in Rome where the Pretorian guards were lodged.

PREVARICATION, in the civil law, is where the informer colludes with che defendants, and fo makes only a tham profecution.

Prevarication, in our laws, is when a man falfely feems to undertake a thing, with intention that he may deftroy it; where a lawyer pleads booty, or ath by collulion, sic.

It alfo denotes a fecret abufe committed in the exer. cife of a public office, or of a commiffion given by a privare perfon.
r RIAM, king of Troy, was the fon of Lanmedon, He was carried into Grecce after the taking of that city by Hercules; but was afterwards ranfomed, on which he obtained the name of Prian, a Greek word fignifying ", ranfomed." At his return he sebuilt Iliuni, and extended the hounds of the kingdom of Troy, whith became very flourilhing under his reign. He married Hecuba, the daughter of Cifeus king of Thrace, by whom he had 19 children; and among the reft Paris,

## P R I

fimus who carried c£ Helen, and occafioned the ruin of Troy, fever, which difirrearing was fuccected by a diforder which is fuppofed to have been facked by the Grecks about ra $8_{4}$ B. C. whea Priam was killed by Pyrrhus the fon of Achilles at the foot of an altar where hic had taken reluge, after a reign of 52 years. Sce Trov.
PRIAl'ISMUS, or PRIAPISN, is an erection of the penis without any concomitant pain, or the cenfent of other parts. It is thus called, becaufe the perfon in this fate refembles the lewd god Priapus. Collius Aurelianus fays it is a palfy of the feminul veffels, and other nerves dillributed to the parts about the penis, by the dittenfion of which this diforder is produced. It is of the fame nature as the fatyriafis. See Medicine, $n^{\circ} 372$.

PRIAPUS, in Pagan worlhip, the fon of Bacchus and Venus, who prefided over gardens and the molt indecent actions. He was particularly adored at Lampfacus, a city at the mouth of the Hellefpont, faid to be the place of his birth; and his image was placed in gardens to defend them from thieves and birds deftutive to fruit. He was ufually reprefented naked, with a fern countenance, matted hair, and holding either a wooden fivord or fickle in his hand, and with a monftrous privity; from whence downard his body ended in a faapelef's trunk. The facrifice offered to this obfcene deity was the afs; either on account of the natural uncomelinefs of this animal, and its propenfity to venery, or from the difappointment which Priapus met with on his attempting the chaflity of Vefla, while that goddefs was afleep, when the efeaped the injury defigned her by her being awaked by the braying of old Silenus's afs.

PRICE (Rev. Richard), D. D. L. L. D. fellow of the Royal Society of London, and of the Academy of Sciences, New England, was born at Tynton in Glamorganthite, February 22, 1723. His father was a diffenting minifter at Biidgend in that country, and died in 1739. At eight years old he was placed under a Mr Simmons of Neath; and in four years removed to Pentwyn in Caermarthenfhire underthe Rev. Samuel Jones, whom he reprefented as a man of a very enlargred mind, and who firt infpired him with liberd fentiments of religion. Having lived as long with him as with Mr Simmons, he was fent to Mr Griffith's academy at Talgarth in Breconlbire. In 1740 he loft his mother; and on this he quitted she academy and came to London. Here he was fettled at that academy, of which Mr Eames was the principal tutor, under the patronage of his uncle the Rev. S. Price, who was copaftor with Dr Watts upwards of 40 years. At the end of four years he left this academy, and refided with Mr Streatfeld of Stoke Newington in the quality of domeftic chaplain, while at the fame time he regularly affifted Dr Chandler at the Old Jewry, and occationally afinted others. Having lived with Mr Streatifeld ncar 13 ycars, on his death and his uncle's he was induced to change his fituation, and in 1757 married Mifs S. Blundell of Leicefterflhire. He then fettled at Hackney, but being flourtly after chofen minifler at Newington Green, he lived there until the death of his wile, which was in 1786, when he returned to Hackney. He was next chofen afternoon-preacher at the meeting-houfe in Pocr Jewry-flreet, but this he refigned on being elected paftor of the Gravel-pit meeting Hackney, and aftemonn-preacherat Newington Green. Thefe he refigned with a farewel-fermon in February 179r. Shortly after he wàs attacked with a nervous
in his bladder, which reduced him to fuch a degree

Price. that, worn out with agony and difeafe, he died without a groan on the igth April 179t. He lift his property to a filter and two neplews.

Dr Kippiz, fpeaking of lis learning and purfuit-, obferves*, that "his chicf aim was to lay a foundation - Aherefo fre folid knowledre, by an application to fciences of the at his 1 no nobleft kind. It was on the great and fundamertal neral, 8 vo. principles and obligations of morality, on the higher pecies of mathematics, on the fublimer parts of patural philofophy, on the true bafis of government, and en the queltions which relate to the efleriti.l welfare and dignity of man, that his Rudics were employcd; and in the profecution of thefe fludies he not only enriched his own mind, but was enabled to become of eminent fervice to his country ard to the world. In his moral writings he has laboured with diftinguihed ability to build the fcience of ethics on an inmutable batis; and what he has advanced will always ftand high in eltimation as one of the ftrongelt efforts of human reafon in favour of the fyltem he has adopted. For myrelf (adds Dt Kippis), I fcruple nct to fay, that I regard the treatife referred to as a rich trealure of valuable information, and as deferving to be ranked among the frit productions of its kind. With refpeat to his other ethical works, every one muft admire the zeal, earneftnefs, and frength, with which he endeavours to lead men into pious views of God, $\subset$ f providence and prajer ; and to promote the excrcife of devout and amiable difpofitions. In confequence of his profound knowledge in mathematical calculations, he was qualified at a particular critis for teing of fingular utiity to his. fellow-citizens. A number of ichemes for infurance for lives, and the bentfit of furvivorhip, promifing mighty advantages, were riling up in the retropolis. Thefe ruinous fchemes would have been carried to great excefs had not Dr Price flepped forward and difpelled the delufion. Gratitude will not allow us to forget the ability and fitit with which he awakened the attention of his countrymen to the reduction of the nat:onal debt. With him it was that the fcheme of the prefent miniter for that purpofe is underfood to have originated. What crowned the whole of his charatter was, its beir.g an, affemblage of the mof a miable and excellent private virtues. His piety was fincere, humble, and fervent; his foul pure and elevated; in his views dilinterefted and noble; and in his manners mild and gentle: the applaufe of his talents and virtues will be tranfmited to future ages, and he will be united in the catalogue with the mott eminent benefactors of mankind."
This is the panegric of a friend; but with few abatements it will be admitted by every candid reader. In. morals Dr Price's principles were thofe of Cudworth and Clarke; and by many who have themfelves adopted a very different theory, he is allowed to have defended thofe principles with greater atility than any other writer in the Englifh language (fee Moral Pbilofofly, $n^{\circ}$ 14.) In metaphytics he was perhaps too great an admirer of llato, from whom lie has borrowed a doctrine concerning ideas which we confefs ourfelves unable to comprehend. He was a firm believer in the immateriality of the foul; but, with Dr Law, the late learned bihop of Carlife, he thought, that from death to the refinrection of the body it remains in a dermant or

## PRI

Price. quiefcent fatc. He contended for its indivifibility, but maintained at the fame time its extenfion; which furnifhed Dr Priefley with fome advantages in their celebrated controverfy, which his own acutencfs would never have obtained. In propagating bis political principles, which were republican, he fometimes expreffed himfolf with undue vehemence; and he was a zealous enemy to all religious eftablifhments which, in his opinion, encroach upon that liverty wherewith Chrift has made us free. His faith refpecting the Son of God was what has been called fometimes low Arianifnt and fometimes Somiarianifn. From a very early age he elaimed the privilege of thinking for himfelf on every fubject. His father was a rigid Calvinit, and fpared no pains to inftil his own theological dogmas into the tender mind of his fon; but young Richard would often flart his doubts and difficulties, and fometimes incur the old man's difpleafure by arguing againlt his favourite fyftem with an tngenuity that perplexed, and a folidity that could not be eatily overturned. He had once the misfortune to be caught reading a vclume of Clarke's fermons, which his father in great wrath fnatched from him and threw into the fire. Perhaps he could not have taken a more effectual method to make the book a favourite, or to excite the young man's curiofity after the other works of the fame author ; and it is by no means improbable that this orthodox bigatry contributed more than any other circumftance to lay the foundation of his fun's Arianifm.

But whatever may be thought of Dr Price's fpeculative opinions, whether political or religions, his virtucs in private life have never been called in queftion. Of his practical religion it is impoffible to fipeak in terms too ligh. There was a fervour even in his public prasers which indicated the ftrongeft fenfibility as well as fincerity in himfelf, and communicated its warmth to thrfe who joined with him. But in his family devotions he gave atill fuller fcope to the pinus emotions of his foul, and proved to thofe friends who were occalionally prefent at them how decply he felt religiots impreffions, and how happily be blended in this as well as in other things the cool decifions of the underfanding with the amiable and exalted fenfibilities of the heart.

But it was not in devotion only that thefe renfibilities were diplayed. He was as exemplary in aff: Etion to his relatives as in love to his Maker. Of this he gave a friking though private inflance before he fist quitted his native place to try his fortune in London. His father liad left to an elder brother by a former manriage a very confiderable fortune; to Richard he left a mere trifle; and to each of two fifiers fill lefe. Our author divided his thare between his fifters, referving to himfelf only a few pounds to defray the expences of his journey, and trufting for his future fupport to the bleffing of God upun his talents and his induftry. As in early life he was an affeclionate and generc us brother, in old agc he was a loving and attentive hufband. His wife, who for a conliderable time before her death was almot wholly helplefs, found during the laft years of her life hardly any enjosment except in a game at whitt; and though our Doctor difliked cards as a wafte of time, and never touched them on any other occafin, to amufe licr be would fit down every evening to the card-table, and play till it was late, with
a cheerfulnefs and good humour which charmed every perfon who had the happinefs of viewing him in that endearing fituation.

Yct, though thus attentive to the oblizations of domeftic lifc, he did not fuffer his private afiections to encroacl upon his focial duties. His talents and his labours were ever ready at the call of friendfhip; nay, fo much did his nature abound with the milk of humaa hindnefs, that he conld not refif without extreme reluc. tance even troublefome and unrafonable folicitations. His hours of ftudy and retirement ware frequently broken in upon by applications for affiftance and advice, efpecially matters relating to annuities and life-infu. rances; and in this way he facrificed much of his perfonal convenience to individuals of whom he knew but little, and from whom he wonld accept of no pecuniary tecompenfe. His gool nature in this refpeet amounted almoft to a foible; and fubjected him to importunities and lofs of time, of which he would fometimes comp plain as interfering materially with more important and more generally ufetul ftudies.

Whillt he thus obliged the rich by his mental talents, he fuccoured the poor with his earthly fubtance. A fifth part of his anuual income was reqularly devoted to chatitable purpofe; ; and he was landably anxious to diltribute it in fuch a way as might produce the greateft good. In the practice of this, and indeed of all his virtues, he was utterly devoid of oftentation. Simplicity and humility were among the ftrong features of his character. No man was ever lefs fenfible of his own excellence, or lefs clated by his uwn celebrity; and in no man was the dignity of artlefs manners and unaffefed modefty more happily di played.

His face was the true index of his mind. It beam. ed with philanthropy; and when lighted up in converfation with his friends, affumed an apect peculiarly pleafing. His perfon was flender, and rather below the common fizc, but poffeffed of great mufcular itrength and remarkable astivity. A habic of deep thought had given a ftoop to his figure, and he generally walled a brifk pace with his eyes on the ground, his coat buttoned, one hand in his pocket, and the other fwinging by his fide.
It is natural to fuppofe that fuch a man as Dr Price, fome of whofe writings were cranlated into frreign languages, would be very generally refpected in the republic of letters, and have many carrefpendents. The fuppofition is well founded. In 1763 or 1754 he was chofen a fellow of the Royal Society, and contributed largely to the tranfactions of that learned body; in 1769 he received from Aberdeen a diplomal creating him DD. ; and in 1783 the degree of L.L.D. w.as comferred upon him by the college of Yale in Connericut. As in 1770 he had re ufed an American degree which had been conveyed to !im by Dr Framklin, his acceptance of one 13 years afterwards can be attributed only. to his very great regard for a 1 epubiican form of government; which was a peonliar trait in his charater, and fhows what firong attachments the vignonus mind will imbibe by thinking always on the fime fubje.9s, and in the fame track. Among his on refpondents, the moft eminent in his own country were the l.rte Lord Charham, Lerd Stanhope, Lord L:nffowime, the late bithops of Califle and St A faph, and the prefent bithop of Landaff; Mr Hume, Mr Hari, of Sis-

## PRI

lifoury，Dr Gregory of Edinburgls，and the celcbrated Mr Howard，who lived with him on terms of the great－ eft intimacy；in America he correfjonded with Dr Franklin，Dr Chauncey，Mr Adams，and others；and in France with the celebrated Turgot，the Duke de Rochefoucault，and feveral of the firt national alfembly． One of his female correlpondents fieiched his charafter with grat jufnefs many years ago mader the fictitious but well applied name of Simplicius；and with this cha－ rater we thall clote thefe fhort momoirs．
＂While the vain man is painfully friving to out－ fhine the company and to attract the admiration by falfe wit，forcen compliments，and fudied graces，he mult furely be mortified to obferve how conitantly Sim－ plicius engages their attention，refpe？，and complacen－ cy，withut having once thought of himfelf as a perfon of any confequencc amons thom．Simplicius imparts his fupcrior knowledge，when cailed upon，as eafily and naturally as he would tell you what it is o＇clock；and with the fame readinefs and good will informs the molt ignorant or confers with the mof learned．He is as willing to receive information as to give it，and to join the company，as fat he is able，in the molt tritling converfation into which they may happen to fill as in the moft firious and fublime．If he difputes，it is with as muchs candour on the mof important and interefting as on the molt infignificant fubjects；and he is not lefs pa－ tient in hearing than in anivering his antagonit．If you talk to him of himfelf or his works，he accepts praife or acknowledges defects with equal meeknefs，and it is im：－ pofible to fufpect him of affectation in either．We are more obliged by the plain unexaggerated expreflions of his regard，than by the compliments and attentions of the moft accomplifhed pattern of high breeding；be－ caufe his benevolence and fucerity are fo ftrongly mark－ ed in cvery look，word，and action，that we are convin－ ced his civilities are offered for our fakes，not for his orn，and are the natural effects of real kindnefs，not the Atudied ornaments of behaviour．Every cne is de－ firous to flow him kindnefs in return，which we know will be accepted juft as it is meant．All are ready to pay him that deference which he does not dcfire，and to give him credit for more than he affumes，or even more than he pofeffes．With a perfon ungraceful，and with manners unpolithed by the world，his behaviour is always proper，eafy，and recpectable；as frec from con－ t？raint aid fervility in the higheft company，as from lnughtinefs and infolence in the loweft．His dignity ariles from his humility；and the fweetnefs，gentlenefs， and franknefs of his manners，from the real goodnefs and rectitude of his heart，which lies open to infpertion in ail the fearlefsncfs of truth，without any need of dif－ guife or ornament．＂

Such was Dr Price．－Of his public principles men will think difierently；of his private worth there can be but one opinion．He will live in the memory of his friends till memory has lof her power．To poftenity his works will be his monument．They are：A Re－ view of the principal Quettions and Difficulties in Mo－ rals， $3 v 0,1758$ ；Dilfertations on I＇rovidence，\＆c．8vo， ${ }^{1767}$ ；Obfervations on Reverfionary Payments，\＆ic． \＆ivo，1771；Appeal on the National Debt，\＆e．8vo， 1573；Obfervations on the Nature of Civil Liberty， aric；on Matcrialifm and Necelity，in a correfpon－ Vol XV．
dence betwecn Dr Price and Dr Prieficy，t770；co An． nuities，Affurances，Population，Sce．8vo，1779；on the Population of England， 1780 ；on the Putulic Debis，ドi－ nances，Loans，\＆c．8vo， $178_{3}$ ；en Revertionary Pay－ monts， 2 vols， 1783 ；on the importance of the Ameit can Revolution， 1784 ：befides Sermons，and a variety of papers in the Philofophical Transactions on aftrosorri－ cal and other philofophical fubjects．

PRIDL：，inordinate and inreafonable felf eftecm， $\mathrm{a}^{*}$－ tended with infolence and rude treatment of others．－－ It is frequently confounded with vamity，and fomectimes with dignity；but to the former paffion it has no re－ femblance，and in many circumfances it differs fiom the latter．Vanity is the parcnt of loquacious bealling： and the perion fubject to it，if his pretences be admit－ ted，has no inclination to infult the comp：ny．The proud man，on the other hand，is naturally filer．t，and， wrapt up in his own importance，he feldon fpeaks but to make his audience feel their infcriority．It is this circumfance which dillinguifhes pride from dignvity， and conftitutes its finfulness．Every man poffeifed of great powers of mind is confcious of them，and feels that he holds a higher rank in the fcale of exiftence than he whofe powers are lefs．If he recollect，at the fame time，that he has nothing which he did not receive，and that his fupcriority is owing to the good pleafure of Him who forms his creatures differenily，as the potter forms his clay；he will be fo far from infulting his in－ feriors，that when neceflarily in company with them， he will bear with their foibles，and，as far as is proper， make them lofe fight of the difance which the laws of God and man have for ever placed between them and hin．This condefoenfion，however，if he be a man of dignity，will never lead him to join with them in any mean or dirty action．He will even excufe in them many things which he would condemn in himf：lf，and give them his good wifhes，after they have forfeited his efteem．Such a character is amiable and refpectable， and what every man fhould labour to obtain．From the weaknefs of human nature，however，it is too apt to d．c－ gencrate into pride．

To a man of great intellcetual powers and various crudition，the converfation of ordinary perfons affords neither inftrustion nor amuEmert ；and fuch converfi－ tion，when often repeated，mut，from the nature of things，become tedious and irkfome．But it requires great command of temper and of manners to prevent uneafinefs long felt from fometimes betraying itfelf by external fymproms，fuch as peevith cxprettions，a for－ bidding look，or ablence of mind；and thefe are the in－ fallible indications of contempt for the compary，the very worlt ingredient in the paffion of pride．If this contempt be often excited，it will be formed into a ha－ bit ；and the proud man will be fo much under its influ－ ence，as to infult his inferiors，and fometimes his equals， without forming the refolmtion to infult cither the one or the other．Such ？charater is hatcful to every company，and is fo far from indicating truc dignity of mind in him to whom it belongs，that it is obvioufly aflocinted with meannefs，and indicates a comfcioufneis of fome radical defect．He who pofiefles real and con－ $f_{\text {picuous merit has no necafion to deprefs others for the }}$ purpofe of raifinch himfeif；his fupcriority wiil be cheer－ fully acknowledged：but when a man of undoubted

## I R I

eminence in onc refpeat, is fo fwollen with pride as to make him wifh to appear great in all refpects, he has ne other means of enforcing his ill-founded claim, than difplaying his acknowledged fuperiority, with fuch infolence as may drive at a diltance from him every perfon by whom he is confcious that in many inftances he might be more than rivalled. Whoever is proud of knowledge, would do well to confider how much knowledge le wants.

The fame obfervations which we have made on pride of parts will apply to every other fpecies of pride, fuch as pride of birth, office, or riches, \&c. The peace and order of fociety require difference of rank, accompanied with different degrees of authority; and he who inherits a title or office from his anceftors, may without pride be confcious of his fuperionity, provided be forget not that fuch fuperiosity is conferred on families and individuals, not for their own fakes, but for the good of the community. The peer, who keeps this circumfance in mind, may maintain his fation, and reprefs the forward petu'ence of the plebeian, without giving offence to any thinking man; but if he dwell upon his rank with too much complacency, he will in procefs of time be apt to conlider himefelf and his family as fupe. ior by nature to thofe upon whom no title has been conferred, and then his pride will become intolerable. If we could trace our defcent, fays Seneca, we fhould find all flaves to come from princes, and all princes from flaves. To be proud of knowledge, is to be blind in the light ; to be proud of rirtue, is to poifon ourfelves with the antidote; to be proud of authority, is to make cur rifc our downfall. The beft way to humble a proud man is to neglect him.

PRIDEAUX (Humphry) was born at Padfow in Cornwall in 1648 , and was honourably defcended by both parents. Three years he fludied at Weflminfter under Dr Bufoy; and then was 1 emoved to Chriftchuch, Osford. Here he publifhed, in 1676, his AMarmora Oxonienfia ex Arandelamis, Seldenianis, aliifque conflata, cum prepptuo Commentario. This introcluced him to the lord chancellor Finch, afterwards earl of Nottingham, who in 1679 prefented him to the rectory wist Clements near Oxford, and in 168 I bellowad on him a prebend of Norwich. Some years after he was engaged in a controverfy with the Papifts at Norwich, oncerning the validity of the orders of the church of England, which prodaced his book upon that fubject. In r 683 he was inffalled in the archateaconry of Suffoll: ; to which he was collated by Dr Lloyd, then bithap of Norwich. In 1691, upon the death of Dr Edward Pozocke, the Hebrew profefforfup at Oxford being vacant, was offered to Dr Prideaux, but he refufed it. In 1697, he publiflied his Life of Mahomet, .nd in 5702 was inftalled dean of Norwich. In 1710 he was cut for the ftone, which interrupted his fludies for more than a year. Some time after his return to London, he proceeded with his Connection of the Hiftory of the Old and New Teftament; which he had begun when he laid afide the defign of witing the Fiflory of Appropriations. He died in 2724 .
\{'handter's 'fravels in Afia Minur.

PRIENE, an ancient town of Afia Minor. It is now called Samfint, and Samfun-kateff, which do not however appear to be very recent. It was taken in 1391 by Bajazet, who fubdued Ionia. It had formerly, without including the citadel, three gateways; onc
of which was towards Kelibefh, an adjoining village; and without it are vaults of fepulchres. The entrance was not widc. A part of the arch, confilting of a fingle row of maffive ftones, ftill remains; but thofe on which it refts are fo corroded by age, broken, or diforted, as to feem every moment ready to yield and let down their load. A ragged way leads to a fecond opening in the wall oppolite to this, and about a mile from it; beyond which are likewife vaults of fepulchres. Between thefe was a gate facing to the plain; and on the left hand yoiag out of it is a hole, refembling the mouth of an oyen, in the fide of a fquare tower; and over it an infcription in fmall charaters, exceedingly difficult to be read. It fignifics, that a certain Cyprian in his fleep had beleld Ceres and Proferpine anayed in white ; and that in three vifions they had enjoined the worfhip of a hero, the guardian of the city, and pointed out the place where, in obedience to them, he had erected the god. This was probabiy fome local hero, whofe little image was fet in the wall, and whofe name and memory have perithed.

PRIEST, a perfon fet apart for the performance of facrifice, and other offices and ceremonies of religion. Before the promulgation of the law of Mofes, the firft born of every family, the fathers, the prinees, and the kings, were priefts. Thus Cain and Abel, Noah, A. bralam, Melchizedec, Job, Ifaac, and Jacob, offered themfelves their own facrilices. Among the Ifraelites, after their exod from Egypt, the priefthood was confined to one tribe, and it confifted of three orders, the bigh-prieft, priefs, and Levites. The priellhood was made hereditary irit the family of Aaron, and the firt. born of the oldelt branch of that family, if he had no legal blem fh, was alvays the high-prieft. This divine appointment was obferved with confiderable accuracy till the Jews fell under the dominion of the Romans, and had their faith corrupted by a falfe philofnphy.Then, indeed, the high-priefthood was fometimes fet up to fale, and inftead of continuing far life, as it ought to have done, it feems from fome palfuges in the New Teftament, to have been nothing more than an anmal office. There is fufficient reafon, however, to blieve, that it was never difpofed of but to fome defcendant of Aaron, capable of filling it, had the oider brauches been extinct. (For the confecration and offices of the Jewifh priefthood, we refer our readers to the books of Mofes). In the time of David, the inferior prielts were divided into 24 companies, who were to ferve in rotation, each company by itielf, for a week. The order in which the feveral courfes were to ferve was determined by lot ; and each con:fe was in :all fucceeding ages called by the name of its original ch:ef.-A! nations have had their priefs. The Pagans had prifls of Jupiter, Mars, Bacchus, Hercules, Ofiris, aud This, \&cc.; and fome deities had pritfeffes. The Midhometans have pricfts of different orders, calleci fohiek and muyii ; and the Indians and Chinele have their Lramins and bonzes.

It has been much difputed, whecher, in the Chrifian church, there be any fuch oflicer as a prigh, in the proper fenfe of the word. The church of Rome, which holds the propitiatory facrifice of the mafs, has of courfe her proper pri fthood. In the church of England, the word priflt is retained to denote the fecond onder in her hierurchy, but we believe with very different fignifieations, according to the different opinions entertained of the

Lord's

## PR I [ 507 〕 1 I

nie Lord's fupper. Some few of her divines, of great learning, and of undoubted Proteftantifm, maintain that the Lord's fupper is a con:memorative and eachariflical facrifiee. Thefe confider all who are authorifed to admini. fer that facrament as in the frifelt fenfe prighs. Uther; hold the Lord's fupper to be a feafl upon the one facrilice, once offered on the crofs; and thefe too muft confider themfives as clothed with fome kind of pricllhod. Greit numbers, however, of the Englith clergy, perhaps the majority, agree with the church of Scotland, in maintaining that the Lord's fupper is a rite of no other moral import, than the mere commemoration of the death of Clarift. Thefe cannot confider themfelves at priefls in tha rigid fenfe of the word, but only as frefopiers, of which the word prief is at contration of the fame import with eld r. See Supren of the Lord.

PRIME vis, among phyficians, denote the whole alimentary dot; including the ofophagus, flomach, and inteltines, with their appendages.

PRIMAGE, in commerce, a fmall duty at the water-fide, ufually about 12 d . per ton, or 6d. per bale, due to the mafter and matiners of athip.

PRIMARY, firft in dignity, chicf, or principal.
Phimasi Qualities of Bodies. Sce Metafhysics, $n^{\circ}$ 152.

PRIMATE, in church-polity, an archbihop, who is invefted with a juriftiction over other bimops.

PRIME, pRimus, an appellation given to whatever is firlt in order, degree, or dignity, among feveral things of the fame ar like kind; thus we fay, the prime miniller, prime colt, \&c.

Prime is fometines ufed to denote the fame with decimal, or the tenth part of an unit.

Prime-Figure, in genmetry, one which cannot be divided into any other figures $m$ re fimple than itfelf, as a triangle among planes, and the pyramid among folids.

For prime numbers, in arithmetic, fee the aricle Number.

Prive of the Moon, is the new moon when the firt arpears, which is about three days after the change.

Prame Vertial, is that vertical circle which paffes through the poles of the meridian, or the eaft and weft points of the horizon; whence dials projected on the plane of this circle are called prime vertical, or morth-and--umb dinls.

Prime, in the Romifh church, is the firt of the canonic.l hours, fucceeding to lands.

Prime, in fencing, is the fritt of the chief guards. Sce Guard.

PRIMER selsin, in feodal law, was a feodal burden, only incident to the king's tenants in capite, and not to thofe who held of inferior or mefne lords. It was a right which the king lad, when any of his tenants in capite died feized of a knight's fee, to receive of the heir (provided he were of full age) one whole year's profits of the londs if they were in immediate poffeffon, and half a year's profits if the lands were in reverfion expectant on an eftate for life. This feems to be little more than an adlitioral relief, (fee Relier); but grounded upon this fendal reafon, That, by the ancient law of feods, immediately upon dhe death of a vall.ll the fuperior was entitled to enter and
take feilin or pofichion of the land, by way of from Pri - ins tection againt intruders, till the heir appeared to claim it, and receive invenfiture : and for the time the lord fo held it, l.e was entitled to rake the profits; and unlefs the heir clamed within a year and day, it. was by the frict hw a foffitur:. This practice low ever feen:s not to have loag oblained in England, if ever, with regard to conures under inforior lords; but, as to the king's tenures in cup.t., $t$ is prima fojina was exprefsly declared, under Ilen. III. and Ed. II. io belong to the king by prerogative, in contridiftinction to other lords. And the king was cntitled to cnter and roccive the whole protits of the land, till livery was fucd; which foit being commonly within at year and day next after the deaih of the tennm, the:ef re the king ufed to take at an average the firfljruits, that is to fay, one ycat's profits of the land. And this after kards gave a handle to the popes, who clamed to be feodal lords of the church, to claim in like manner from every clergyman in England the firf yedr's profits of his benefice, by way of primilie, or firft iruits.- All the charges ariling by primer feifin were taken away by 12 Car. 11. c. 24.

PRIMING, in gunnery, the train of powder that is laid, from the opening of the vent, along the gutier or channel on the upper part of the breecle of the gun: which, when fired, conveys the flame to the vent, by which it is further communicated to the charge, in ordet to fire the piece. This operation is only uled on hipboard at the proof, and fometimes in garrifon ; for, on all other occalions, tubes are ufed for that purpofe.

Primng-IFirc, in gunnery, a fort of iron needle employed to penetrate the vent or tonch-hole of a piece of ordnance, when it is loaded: in order to difcover whether the powder contained therein is thoroughly clry and fit for immediate fervice; as likewife to fearch the vent and penetrate the cartridge, when the guns are not loaved with the loofe powder.

Priming, among painters, fignifies the laying on of the firit colour.

PRIMIPILUS, in antiquity, the centurion of the firf cohort of a legion, who had the charge of the IKoman eagle.

PRIMITTIA, the firt-fruits gathered of the earth, whereof the ancients made preients to the gods.

PRIMITIVE, in grommar, is a roat or original word in a language, in contradifinction to derivitive; thus, God is a primitive ; god'y, a derivative ; and godlike, a comppound.

PRINOGENITURE, the right of the frit-born, has among moft nations been very confiderable. The firlt-born fon in the patriarchal ages had a fuperiotity over his brethren, and, in the abrence of his father, was prieft to the family. Among the Jews, he was conf:crated to the Lord, had a double portion of the inheritance, and fincceeded in the government of the family or kingdom. It is, however, remarkable, and unqueftionably thows the connedion between this infitution and the bith and office of our Saviour, that if a wo man's firft child was a girl, neither the, nor the childrea that came after her, were confecrated.

In evcry nation of Furope, the right of primogeniture prevails in fome degree at prefent, but it did net

Primerge-

## PR I

Primoric, Praula.
prevail always. The daw which calls the elder-born to the crown, preferably to all others, was not introduced into Frince till very late; it was unknown to the firft race of kings, and even to the fecond. The four fons of Clovis thared the kingdom equally among themfelves; and Louis le Debonnaire did the fame: it was not till the race of Hugh Capet, that the prerogitive of fuccefion to the crown was appropriated to the firft-born.

By the ancient cufom of Gave!-kind, fill preferved in fome parts of Britain, primogeniture is of no account; the paternal effate being equally fhared by all the fons. And it has been a matter of violent and learned difpute, whether, at the death of Alexander 3I1. Baliul or Duce was, by the law as it then ftood, heir to the crown of Scotland. The former had uncoubtedly the sight of primogeniture, but the latter $f$ food in one degree of nearer relation to the deceafed fovereiga: and the Scottifh barons, mot being able to detcrmine whofe claim was belt founded, refered the queftion to EJward I. of England, and thereby inrolved their country in a long and uinous war. Sce Scotland.

PRIMORIE, is a mame given by the Slavi to that tratt of fea-coalt which lies between the two rivers Cettina and Narenta, the firt of which is the Neftus and Tiluras, and the fecond the Narus, of the ancients; comprifing what was properly called Dalmatiat two ages before our era, and which was known to the Greeks of the low times under the name of Paratalafia. Appian informs us, that the Ardei or Vardei poffelfed many citiestlere, part of which they feized before the invafiou of the Romans, and part they built themfelves. We learn alfo from the Tabula Pentingeriana, that after the conquel many of thofe cities remained, and were inhahited by the conquerors, who alfo founded new fettlements. And indeed were thefe prools wanting, the numet ous inferiptions found near the fea, and fometimes among the hills, would render it at lealt probable. The coult is extremely pleafant, the foil fertile, and the fituation mofe convenient for commerce with the inland provinces. By bad management, however, much groumd has been loft near the fea, by its being covered with \}ravel, and by imprudent cultivation of the hills, the impetuous fury of the mountain torrents has rendered a part of it uninhabitable. Macarka is now the only town in the territorys and it appears to have rifen out of the ruins of the ancient Rataneum of Pling. It formed a part of the Narentan fate for feveral ages, and aiterwards, together with the relt of Primorie, paffed under the obedience of vatious Chrifian princes. It afterwat ds became fubject to the Ottoman Porte, and at liat voluntarily fubjected itfelf to the Venetian republic. See Dafmatia and Macarska. See alfo Fortis's Travels in:o Dalnatia, p. $265-35$.

PrIAlULA, the Prinrose: A genus of the monogyinid order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 2 af order, Pracic. The involucrum lies under a fimple umbel ; the tube of the coroll cylindrical; with the mouth or I mb patulous. This genus, including alfo the polyanthas and auricula, furnithes an excellent collection of low, hibrous-rooted, hetbaceous flowery peremials.

1. The primula veris, or fpring primrofe, las thick and rery fibreus roots, crowned by a clufter of large
oblong indented rough leaves, and numerous nowerftalks, from about three or four, to five or fix inches high; each terminated commonly by one flower.-The varieties are, common yellow-flowered primtofe of the woods-white primrofe-paper-white-red-double red -double ycllow, and double white.-All thefe flower abundantly in March and April, and continue for a month or fix weels.

The cowflip primrofe, or cowitp, has very thick fibrous roots, crowned by a clufter of oblong, indented round leaves, and upright, firm, flower-tialks five or fix inches high, terminated each by a clufter of fmall flowers. 'Ihe varisties are, Common fingle yellow cowflip of the meadows-double yellow cowflip -farlet cowlip-hofe and-hofe cowllip; one flower growing out of the bofom of another, the lowermoft lerving as a calyx; all of which varieties have the flower-ftalks crowned by many flowers in branches.They flower in April and May, continuing in fucceffion a month or fix weeks.
2. The polyanthus, has thick fibrous roots, increafinco into large bunches, crowned with a cluiter of large oblong indented rough leaves; amidlt them upright flower-ftalks fix or eight inches high, terminated moltly by a clufter of feveral fpreading flowers of many different colours in the varieties. The principal are, purple, red, gold, orange-coloured, \&c. They all flower beautifully in April and May, and frequently again in autumn; and fumetimes even in winter, if the feafon is mild. The polyanthus is one of the noted prize-flowers among the florifts; many of whom are remarkably induftrious in raifing a confiderable variety of different forts, as well as in ufing every art to blow them with all requilite perfection; for, among the virtuofi, a polyanthus muft pofiefs feveral peculiar properties in order to be admitted in their colledions. 'The chief properties required in a forit's polyanthus are, 1. The ftem or flower-ftalk fhall be upright, moderately tall, with ftrength in proportion, and crowned by a good regular branch of flowers on fhort pedicles, ftrong enough to fupport them nearly in an upright pofition. 2. 'The florets of each branch fhould be equally large, fureading open fith, with the colours exquifite, and the ftripes and variegations lively and regular. 3. The eye in the centre of each floret thould be large, regular, and bright; and the anthere, by the flnifts called the thrum, thould sife high enough to cover the mouth of the tube or hollow part in the middle of the florets, and render then what they call thrumecyel; but when the ftyle clevates the figma above the anthera, the eye of the tube generally appears hollow, fhowing the figna in the middle, like the head of a pin, and is rejected as an incomplete flower, thongh its otlier properties fhould be ever fo perfect. 'This pin-eyed polyanthus, however, though lejected by the florifs, is the fower in its mof perlect Itate, and great numbers of them are of as beautiful forms and culours as the thrum-eyed varicties.
3. The auricula lass a thick fibrous root, crowned by a clufter of oblong, fenly, broad, ferratel, fmootls leaves, refembling the thape of a bear's ear; and amidit them upright flo:er-ftalks from about three or four to fix or eight inches high, termimated by an umbellate clufter of beautiful flowers, of many different colours

## PRI

m, colours in the varieties. All of thefe have a circular cye in the middle of cach flower, and of which there are different colours; whence the auriculas are diftinguithed into yellow-eyed, white-cyed, Eec. Tlie petals of moft of the kinds are powdered with an exceeding fine fariza or mealy powder, which contributes gratly to the beaty of the flower. They all flower in Aptil or May, continuing a month or fix weeks in beauty, and ripering plemy of fecds in June.

Culture. All the varieties of the common fpring primore multiply fo fall by the roots, that it is fcarce worth while to raife them from feeds. However, though many fingle kinds may be raifed from feed, yet parting the roots is the only method by which the double kind can be preferved; and the fame thing is to be obferved of ail the reft.

PRLALUM mobile, in the Ptolemaic aftronomy, the ninth or highell fphere of the heavens, whofe centre is that of the world, and in compariton of which the earth is but a point. This they will have to contain all other fpheres within it, and to give motion to them, turning iticif, and all them, quite rcuad in 24 hours.
pRince, Princeps, in poity, a perfon invefted with the fupreme command of a Atate, independent of any fuperior.

Princts alfo denotes a perfon who is a fovereign in his own territ ries, yet hoids of fume other as his fuperior; fuch are the princes of Germany, who, though abfolute in their refpective ptincipalities, are bound to the emperor in certain fervices.

Prince alfo denotes the ilfue of princes, or thofe of the royal family. In France, before the revolution, they were called princes of the blood, and du:ing the fore continuance of the conftitution of 179 , Fiench; rin:ces. In Eng. land the king's children are called fons and daugbeers of England ; the cldent foa is created prince of Wiles; the cadots are created dukes or earls as the king pleaics; and the title of all the children is royal highnaes; ail fubjeits are to kneel when admitted to kiis their laand, and at table out of the king's prefence they are ferved on the knee. See Rorat. Family

Pracicr of the Senite, in oid Rome, the perfon who was called over firft in the roll of fenators, whenever it was renewed by the cenfors : he was always of confular and cenforian dignity. See the article Senate.

Princes's hletal, at mixture of erpper and ainc, in imitation of gold. See Chemistry, ${ }^{\circ}{ }^{\circ} 1154$.

Princetown. See Nezu jerser.
Prince of Wa'es's Ifand, or Polu Penany, is fituated in the entrance of the ftraits of Malicca, in 100 degrees of eaft longitude, and in five degrees of north laticude. It is about feven leagues in length and three in bre:Idth. Its northem extremuty runs nearly parallel with the main lard at a d ftunce of about two miles, by which a fine chamel is formed, where the greateft fleets might tide in perfeot fafe $y$, the height of the furrounding mountains acting as a barrier againlt the frrce of the prevailing winds. The climate, confidering its vicinity to the equator, is remarkably mild. Eigh:y degrees is abnut :he mean height of the thermomerer at noon, which, during the winht, is feld mabove 70. Its healthful. nefs is certainly not dirpafied by that of any European fettlement on the coatt. Out of a garrifon of 300 troops (natives of Hindoftan), mot one died for the fpace of 14 momhs; a fingular fad to be experienced
by a new fettlement in an uncleared country. Tlis freat falubrity is perhaps the efiect of a confant ventilation, fupported by almof continued bat gen:le breczes, added to the drynefs of the foil, the uniform but gradual clevation from the fa to the foot of the hills preventing thof flarmations of water which, in tropical latitu les, are fo higt!ly projudicial to the has.ath of man.

A vidge of beautiful mountains, decply indented with valleys, and covered with evergreens, divides the illand longitudinally. Innumerableswulets receive their origin from thefe mountains, and are remarlable for the tramparency and coolnefs of thair waters. The foil, which is light and findy near the fea, gradualiy changes to a rioh clay as it approacles to the high lands. There the fiugar.cane grows with the utmolt luxuriance, and the molt plentiful crops of rice are everywhere produed. The gardens have alre:ady furnilhed the inhabitants with cabbages and potatoes: and when indultiy fhall have reached the tops of the mountains, it will be no furptife to fee in the plantatiens mof of the produftions of Europe is Lisi: utmolt perfection. In desorating the landicapes of this. little illand, nature has been peculiarly lavifh. An ar. femblage of flowering trees and flarubs in perpetual blollom, and endlefs in the variety of their ipecics, form the firlt thade. Thefe are overtopped by foreft trees of an immenfe height, which fpread their raft branches on every fids, and are covered with the richeff foliage. Here Atrangers feel with rapture the effect of the breezes, which, from whatfoever quarter they blow, are ftrongly impregnated with the fragrance of the groves.

The original animal produstions of this ifland are very limited. Of quadrupeds, the wild hog, deer, and fquirrel, nearly comprehend the whole : but the a'fence of the tiger and le pard, wh, fe numbers and feroci:y almoit render the ofpp.fite thores uninhahituble, amply compenfates for this deficiency. The flying fox and fquirel are natives of this illand ; the former a nondefeript, and a great natural curiofity. Of birds there are alfo but few, and oaty one which is memarkable for the melody of its notes. Tha crow and fparruw, the never-failing attendents on population, have but laiely made their app arance. Theg are now, however, apishly increaling and multiplying. All tha domeftic arimais arrive here at great perfection.

The fea which furrounds the inland, afoocis a vart varicty of fin of the molt delicious flavour, and its thores anbundance of the fineft turtle and oyfers. In no litution indeed are the conveniencies and luxuries of life enjoyed in greater profufion. The advantages of the inland in a political and commercial view, are too obvious to require to be pointed out.

Patnce: William's Sound, fituated on the north we? coall of America, and fo named by Captain Cook in 1778. The men, women, and childen of this found are all clothed in the fame manner. Their ordinny drefs is a fort of clofe frock, or tather robs, which fomatimes reaches only to the lnees, but sene ally down to the ancles. Thefe frocks are compofd of thefkins of various animals, and are commonly worn with the hairy fide outwards. The meri ofton paint their faces of a black colour, and of a bright red, and fome... times of a bluifh or leaden hue; but not ia any regu-

## PRI

Prince, lar figure. The women puncture or fain the chin ${ }^{\text {Priacipal. }}$ with black, that comes to a point in each of their cheeks. Their canoes are of two forts; the one large and open, the other fmall and covered. The framing comfifis of flender pieces of wood, and the outtide is compofed of the fins of feals, or other fea animals, flretched over the wood. Their we:apons, and implements for hurting and fifning, are the fame as thofe ufed by the Greenlanders and Eqquimaux. Many of their fpears are headel with iron, and their arrows are genera!ly pointed with bone. The food they were feen to eat was the fiech of fome animal, either roatted or broiled, and dried fill. Some of the former that was purchafed had the appearance of bear's Peth. They aifo eat a larger fort of fern-root, either baked or drened in fome other method. Their criak, in all probability, is water; for, i:2 their calnoes, they brought foow in wooden ret?els, which they fwallowed by muthfuls. Dur knowledge of the animnls of this pariof the Ancrican contionent is enrively derived from the lkins that were brought by the natives for falc. Thefe were principally of bears, common and pine martins, fia otters, feals, racoons, fmall ermines, foxes, and the whitith cat or lyax. The birds frund here were the halcyon, or great Ling's-filher, which had fine bright colours; the white he aded cagle, and the lumming-bird. The fifh that were principally brought to market for falc wore tordk and halibut. The rocks were alinolt deftitute of thell-fifl ; and the only other a ninal of this tribe that was obferved was a red lifh crab, covered with very large fines. Few vegetables of any kind were obferved ; and the trecs that chiefly grew about this found were the Canadian fpruce pine, fome of which were of a confiderable fize. E. Long. 115. 21.N. Lat. 59. 33.

PRINCIPAL, the chief and moft necoffary part of a thing. The principal of a college or hall is the mater thereof.

In commerce, principal is the capital of a fum due or ient; fo called in oppofition to intc:cft. See Inte. rest.
it alfo denotes the firf fund put by partners into a common flock, by whech it is dillinguifhed from the calls ut accuini 115 afterwards required.

Principal, in mufic. Dec Fundameatal, in mufic, and Gemeratur, in mufic.

Prucipal, in law, is either the actor or abfolute perpetrator of the crime, who is called a principal, in the firt degree ; or he who is precent, aiding and abet-
not fail of their mifchievons effect. As by laying a trap or pit-fall for another, whereby he is killed ; letting out a wild bealt, with an intent to do mifchief; or exciting a madman to commit murder, fo that death thereupon enfues: in every onc of there cafes the party offending is guity of murder as a principal, in the firt degree. For he cannot be called an accoffory, that neceffarily pre-fuppofing a principal ; and the poifon, the pit-tall, the beaft, or the madman, cannot be held frincipals, being only the inffuments of death. As therefore lie mult be certainly guiity, either as principal or acceffory, and cannot be fo as acceffory, it follows that he muft be guilty as principal; and if principal, then in the firf degree; for there is no other criminal, much lefs a fuperior in the guilt, whom he could aid, ab:t, or alliff.

Pranclofl Point, in perfpeaive, is a point in the perfpective plane, upon which a line drawn from the cye, perpendicular to the plane falls.

This point is in the interlection of the horizontal and vertical plane ; and is alfo called the point of Jight , and poiat of the eje. Sce Perspective.

Principit Ray, in porfpective, is that which paffes perpendicularly from the fpectatoz's eye to the perfipective plane, or picture.

Whence the point where this ray falls on the plane, is by fome alfo called the prinzipal point, which other writers call the centre of the pidure, and the point of concurrence.

PRINCIPATO, the name of a province of Italy, in the kingdom of Naples, which is divided into two parts, called by the Italians the Principato Ultra and the Principato Citra, that is, the Hither and Farther Principato. The Hither Principato is bounded on the north by the Farther Principato and part of the Terra-di-Lavoro, on the weft and fouth by the Tufcan Sca, and on the eaft by the Dafilicat:. It is about 60 miles in length, and 30 in breadth; the foil is fertile in wire, corn, oil, and faffron; and they have a great deal of filk, befides feveral mineral fiprings. The capital town is Salemo. The Farther Principato is bounded on the ucrtla by the county of Molefe and the Ter-ra-di-Lavoro, on the weft by the Tufcan Sea, on the fouth by the Hither Principatn, and on the eaft by the Cipitanata. It is about 37 miles in length, and 30 in breadth. The Appennine mountains render the air cold; and the foil is not very fertile either in corn or wine, but it produces chernuts, and pafiures in great plenty. Benevento is the capital town.

PRINCIPLE, principium, in general, is ufed for the caufe, fource, or orizin of any thing.

Principle, in himan natu:e. See Disposition.
Principle in feience, is a truth, admitted without froof, from which other truths are inferred by a chain of reafoning. Principles are of two kinds, primary and general; and to the laft the name of asioms is ufually given on account of their importance and dignity. An axiom or gencral principle, when the terms in which it is exprefled are undertood, muft be a felfevident truth; but from its very nature it cannot be a $f_{1}, f$ truch. Our firft traths are all particulur. A chitid knows that two particular lincs, each an inch long, are cqual to one another, belore he has fomed any gen:ral notions of length and equality. "Things cqual to one and the fame thing are equal to one another," is the

## 1 R I

e, firft of Euclid's axioms; and an axiom it undouhtedly is, but to no man has it been a fiyf truth. It is, it we may ufe the expreflion, a genus or clufs of truths comprehending under it numberlefs individuals. Were a fuill-grown man introduced into the world, without a fingle idea in his mind, as we may fuppofe Adam to have been, he would inftantly perccive, upon laying together three pieces of wood each at frot long, that they were all equal in length; and if he were to cut another to the fame length with any one of them, he would find upon trial, that it was of the fame length with them all. After a few fimple experiments of this kind, he would, by a law of human thuught, iffer that all things equal in length or in any other dimenfion, to :any one thing, are in that dimention equal to one another.

It was not therefore widh fuch weaknefs as fome have imagined, that Hobles affirmed thofe propofitions commonly called axioms, not to be primary but fecondary principles. A primary prineiple deferves not the name of an axiom, as it is only a particular truth in.cluding in it no other truth. There is not one of Euclid's axioms which has not been the refult of induction, though we remember not the time at which the induction was made. That the whole is greater than any of its parts is a general truth whicl no man of common lenfe can controvert; but every one difoovered that truth by ooferving ulat his body was larger than his head, his foot, or his hand; that a mountain is larger than a mole-hill in the midule of it ; and that a piece ol timber meafuring what in called a yard is longer than any one of the divifions marked upon it, and termed inches. The particular obfervations are made through the fenfes and treafured up in the memory; and the intellect, by its confitution, compares them together, marks in what they agree and diaigree, and thence draws its aximms or $g$.neral principles. He, therefore, who thould admit the truth of an axiom, and deny the evidence of fenfe and perception, would act as abfurdly as he who accepts paynent in a bank-bill, and relufes it in the individual pieces of gold or filver which that bill repeefents. General axioms are of infinite ufe in the purfuits of feience; but it is not becaure they crate new truths; they only thorten the procefs in the difcovery of fuck as might be found, with labour, through the medium of particular propofitions. Sce Campbelt's Philofothy of Rhctoric and 'Tatham's Chast und Scnie of Truth.

Pranciples, in Phyfics, are often confounded with clements, or the firftand fimpleft parts whereof natural bodiss are compounded, and into which they are again retolvable by the turce of fire.

PR1NGLE (Sir Julin), an eminerit phyfician and phulof pher, was a younger fon of Sir John Pringle of Stitchel, in the thire of Roxburgh, Baronet; took the degree of M. D. at Leyden, 1730 ; and publitled there $D_{1 j e r t a t i o ~ I n a u g u r a l i s ~ d e ~ M a r c o r e ~ S e n i t i, ~ f t o . ~ A f t e r ~}^{\text {at }}$ having been fome years profellor of mural phil fophy at Edinbureh, he vias in June $17+5$ appointed plyfician to the duke of Cumberland, and phyfician-general to the holsital of the forces in Flanders, where the eatl of Stair appears to have been his patron. In February 1746, Dr Pringle, Dr Armitrong, and Dr Barker, were nominated phyficians ts the hofpital for laze, maimed, and fick foldiers, behind Buckingham-

## 511 1 R I

houfe; and in April $\begin{aligned} \text { mad2, Dr Pringle was appeinted Pinsic. }\end{aligned}$ plyylician in ordinary to the hing. In 1550 lie priblifhed "Obfervations on the Nature and Cure of ERoffital and Gaol Fcvers, in a Leticr to 1)r Mend," 8 ro (reprinted in 1755) ; and in 1752 he favoured the public with the relult of his lorg experience in an admirable treatife under the title of "Obfervations on the Diforders of the Army in Canp and Garrifon," Svo. On the ${ }^{1}$ the of April 1752, he manicd Charlotte, fecond daughter of Dr Oliver, an eminent physician at Bath. In 1756 he was apprinted jointly with Dr Wintringham (now Sir Clifton Wintringham, Bart) phyfician to the hofpital for the fervice of the ine ofs of Great Britin. After the aeceflion of his prefent majefty, Dr Pringle was appointed phytician to the qucen's houfehold, $177^{61}$; phyfician in ordinary to the queen int $1_{7} \sigma_{3}$, in which year he was aumited of the collese of phy ficians in London; and on the 5 th of June if 66 , he was advaaced to the dignity of a baronet of Great Britain. In $177^{2}$ he was elected prefident of the Royal Society, where his fpeecles for five fuccefive years, on delivering the prize-medal of Sir Godirey Copley, gave the greatelt fatisfaction. Sir John Pringle in 1777 was appointed phyfician-extraordinary to the king. He was alfo a fellow of the College of Phyficians at Edinburgh, and of the Royal Medical Society at Paris; member of the Royal Academies at Paris, Stockholm, Gottingen, and of the Phildophical Societies at Edinburgh and Faerlem; and continned prefident of the Royal Society till November 1778 ; after which period he gradually withdrew from the worl\}, and in 1781 quitted his elcgant houfe in P.ll Mall (where he had long diftinguined himfelf as the warm. friend and patron of literary men of every nation and profefion), and made an excurfion to his native country. He returned to London in the latter end of that year ; died greatly belnved and refpected Jamuary 18. 1782 ; and having no childen, was fucceeded in eftate, and alfo (agrecably to the limitation of the patent) in title, by his nephew, now Sir James Pringle, Darl. Among this worthy phyfician's communications to the Royal Socicty, the fellowing are the principal: 1. "Some Experiments on SubRanes relifling l'utrefaction," Phil. Tranf. No 495, p. 580 ; and N ${ }^{\circ} 496$, P. 525,550 ; reprinted, wilh additions, in Martin's Abridgment, vol. xi. p. I 365 . 2. "Account oi tome Perfons feized with the Gand Fever by working in Newgate, and of the manner by which the Infeation was communicated to one entire Family," vol. xlviil. p. 42. At the requelt of Dr Hales, a copy of this ufeful paper was inferted in the Gentleman's Nagazine, ${ }^{1753}$, P. 7 I , before its appearance in the Tranfactions. 3. "A remarkable Cafe of Fragility, Fiexibility, and Diffolution of the Bones," ib. p. 397. 4. "Aecount of the Earthquakes felt at Brulfels," vol. xlix. p. $54^{\text {t. }}$ 5. "Account of finking of a River near Pomtypool, in Monmouthlhire," ib. P. $5+7$. G. "Accnunt of an Earthquake felt leb. 18. 1756, aling the cont of England, between Margate and Dover," ib. p, 579. 7. "Account of the Earthquake felt at Glafgow and Dumbarton; alfo of a Shower of Duft falling on a Ship becween Shecland and Iccland," ib. 1. 509. \& "Several Accounts of the Fiery Meteor which arpeared on Sunday, November 26. 1758, between eight and nine at night," vol. 1. p. 218. 9. "Account of the Vis.

Trinor tues of Soap in difiolving the Stone, in the Cafe of ed their beneficial infuence, if typography had fill been the Rcverend Mr Matthew Simpfon,", ib. p. 22 I. 10. "Account of the Effects of Electricity in Paralytic Cafee," ib. P. 48 it . And fee a letter to him on that fubject from Profeffor Winthorp. "Some Account of the Succefs of the Vitrum Ceratum Antimonii,", was printed in the Elinburgh Medical Effays, vol. $r$.

PRINOS, in botary: A genus of the monogyniz order, belonging to the hexandria clafs of plants; and in the natural method ranking under the 43 d order, Drmofre. The calyx is fexfid; the corolla monopetaluns, and rotaccous; the belly hexafpermons.

PRINTER, a perfon who compoles and takes impreflions from movcable charaters ranged in order, by means of ink, and a prefs.

PRINTING, the art of taking imprefions from charasers or figurcs, moveable and immoveable, on paper, linen, filk, \&c. 'There are three kinds of printing: the one from movcable letters, for books; another from copper-plates, for piftures; and the lait from blocks, in which the reprefentation of birds, flowers, \&c. are cut, for printing calicoes, linen, \&ic. The firt is called ce:mmon or letter fecfs frinting; the fecond, voling-prefs printing ; and the laft, calico, \&cc. printing. The principal difference between the three confifts in this, that the firft is caft in telicvo, in diftinet pieces; the fecond engraven in creux; and the third cut in relieve, and generally famped, by placing the block up. on the materials to be printed, and friking upon the back of it.

Of the above branches, Letter-press PRINT.

ING is the mont curious, and deferves the moft particular notice: for to it are owing chiefly our deliverance from igmonnce and error, the progress of learning, the revival of the fcicaces, and numberlefs improvements in arts, which, without this moble invention, would have been eidher loit to mankind, or confined to the knowledge of a few. "To the art of printing (fays an elegant effayeft*), it is acknowledged we owe the refommation. It has been junly remarked, that if the books of Luther had been multiplied only by the flow precefs of the hand writing, they mint have béen few, and would have been eafily tupprelted by the combination of wealth and power: but, poured forih in abundance from the prefs, they fpread over the land with the rapidity of an intadation, which acquires additional force from the effiots ufed to obfrute its progrefs. He who undertook to prevent the diiperion of the books once iffued fiom the prefs, attempted a tafk no lefs arduous than the defruction of the hy: dra. Refifance was vain, and religion was refurmed: and we who are chielly interefted in this happy revolution nuult icmember, anidit the praifes befowed on Luiher, that his endenvours had bec:a ineffectual, unaffifted by the invention of Faullus.
"How greatly the caufe of religion has been promo. ted by the art, mult appear, when it is confidered, that it has placed thofe facred books in the hand of every individual, which, belides that they were once locheal up in a dead language, could not be procured without great difficulty. The numerous comments on them of every kind, which tend to promote piety, and to form the Chritian philofopher, would probably never have been cumpofed, and certainly would not have extenct-
unknown. By that ant, the light, which is to illinminate a dark world, has been placed in a fituation more advantageous to the emiffion of its rays: but if it has been the means of illußratiry the doctrines, and enforcing the practice of religion, it has alio, particularly in the prefent age, fruck at the root of piety and moral virtue, by propagating opinions favourable to the fceptic and the voluptuary. It has enabled modern authors, wantonly to gratify their avavice, their vanity, and their mifanthrcpy, in diffeminating novel fyftems fubverfive of the dignity and happinefs of human nature: but though the perverfio: of the art is lamentably remarkable in thoe volumes which iflue, with of fenfive profufion, from the vain, the wicked, and the hungry, yet this good refults from the evil, that as truth is great and will prevail, the maft derive frefh lutre, by difplaying the fuperiority of her ftrength in the confict with fophitry.
"Thus the art of printing, in whatever light it is viewed, has deferved refpest and attention. From the ingemity of the contrivance, it has ever excited mechanical curiofty; from its intimate connegion with learning, it has juitty claimed hiforical notice; and from its extenfive infuence on morality, politics, and religion, it is now become a fubject of very important fpeculation.
"But however we may felicitate mankind on the ine Its go venticn, there are perlhaps thofe who wifh, that, toge- efiee
ther with its compatriot art of manofachuring gunpow- ovelh, ther with its compatriot ari of manufacturing gunpow- overt, der, it had not yet been brought to light. Of its effects ance, on literature, they affert, that it has increafed the number of books, till they diltract rather than improve the mind; and of its malignant influence on morals, they complain, that it has often introduced a falfe refinement, incompatible with the fimplicity of primitive picty and genuine virtuc. With refpe $\mathfrak{I}$ to its literary ill comfequences, it may be faid, that though it produces to the world an infuite number of worthiefs publicatims, yet true wit and fine conppofition will nill retain their value, and it will be an ealy tafk for critical difcermment to felect thefe from the furrounding mafs of ablurdity : and though, with refpect to its moral effects, a regard to truth extonts the confeflion, that it has diffufed immorality and irreligion, divulgect with cruel impertinence the fecrets of private life, and fpread the tale of feandal through an empire; yet thefe are evils which will either thrink away unobferved in the triumphs of time and truth over falfehood, or which may, at any time, be fuppreffed by legilhative interpofition."

Some writers have aferibed the origin of this ars to Hiftum the Eatt, and affixed a very early period to its inven- the in tion; particularly P. Jovius, (Hif. lib. xiv. p. $2=6$. ed. tion e Florent. 1550), froni whom Otorius and many others printi. have emlraced the fame opinion. But thefe have evidentiy confounded the European mode of printing with the engraved tablets which to this day are uled in Chira. Ohe invantion of thefe tablets has been aticribed by many writers even to an earlier period than the commencement of the Chriftian era; but is with more probablility afigned, by the very accurate Phil. Cotuplet, to the year 930. The Hiloria Sineryis of Abdalla, written in Perlic in $\mathbf{1 3}^{17}$, fpeaks of it as an art in very common ufe. Mrerman, vol. i. p. 16.2 18, 219 , vol. ii. p. 185 . N. 'irigault afferts that the Chince practifed the art of
printing

## PRI [ 513$] \quad$ PRI

ing. printing five centuries before. Count Ferre Rezzonico found at Lyons plates with words and names engraven by a Nurem!erger 1380.
The hontur of having given rife th the European method has been clamed by the cities of Harlem, Mentz, and Strajoury. And to eash of thefe it may he atfribed in a qualitied fenfe, as they made improvemeats upon one annther.
I. The firlt telimony of the inventor is that recorded by Hadrian Junins, in his Dataria, p. 253 , ed. Lugd. Bat. 1585 ; which, though it hath been rejected by many, is of undoubted authotity. Junius had the relation ir m two reputable men ; Nicolus Galius (A), who was his fchoolmafter; and Quirinius Talefins, his intimate and correfpondent. He afcribes it to Laurentius, the fon of John (Edituus, or Cuftos, of we rathedral at HARLEM, at that time a refpectable office), upon the tefimony of Cornelius, fome time a fervant to Laurentius, and afterwards bookbinder to the cathedral, an office which had before been performed by Francifcan friars. His narrative was thus: "That, walking in a wood near the city (as the citizens of opulence ufe to do), he began at frit to cut fome letters upon the rind of a beech-tree ; which for fancy's fake, being impreffed on paper, he printed one or two lines, as a fpecimen for his grand-children (the fons of his daughter) to follow. This having happily fucceeded, he meditated greater things (as he was a man or ingenuity and judgment) ; and firt of all, with his fon-inlaw Thomas Peter (who, by the way, left three fons, who all attained the confular dignity), invented a more glutinous writing-ink, becaufe he found the common ink fank and fpread; and then formed whole pages of wood, with letters cut upon them; of which fort I have feen fome effays, in an anonymous work, printed only on one fide, intited, Specuium nofre falutis; in which it is remarkable, that in the infancy of printing (as nothing is complete at its firf invention) the back fides of the pages were patted together, that they might not by their nakednefs betray their deformits. Thefe beechen letters he afterwards changed for leaden ones, and thefe again for a mixture of tin and lead [Aanneas] as a lefs flexible and more folid and durable fubtance. Of the remains of which types, when they were tumed to walte metal, thofe old wine.pots were calt, that are fill preferved in the family-houfe, which looks into the market-place, inhabited afterwards by his great-grandfon Gerard Thomas, a gentleman of repution; whom I mention for the honour of the family, and who died old a few years fince. A new invention never fails tn engage curiofity. And when a commodity never before feen excited purchafers, to the advantage of the inventor, the admiration of the art increafell, dependents were crilarged, and workmen multiplied ;

Vol. XV.
the firt calamitous incident! Amorg thefe was one John, whether, as we fufped, he hid ominoufly the name of Faufus (a), unfaithfin and malucky to his malter, or whether it was really a perfois of thit name, I thall ne much inquire ; being mavilling to molett the filent thades, who fuffer from a contioufnefs oi their pant actons in this life. This man, bound by oath in keep the fecret of printing, when he thouglit he had learned the art of juining the letters, the method or cafting the types, and ooher things of that nature. taking the moit convenient time that wis pollible, on Chriftmas eve, when every one was cuftomarily employed in Juttral facrifices, fcizes the collection of types, and all the implements his matter had got together, and. with one accomplice, marches off to Amiterdam, theree to Cologne, and at lan fettled at Ment\%, as at an afylum of lecurity, where he might go to work with the tools he had tlolen. It is certain, that in a year's time, viz. in 1442, the Dotrinate of Alexander Galins, which was a grammar much ufed at that time, together with the Truas of Peter of Spain, came forth there, from the fame types as Laurentius had made uie of at Harlem."

Thus far the narrative of Junius, which he had frequently heard from Nicolitus Gabius; to whom it was related by Cornelius himfelf, who lived to a great age, and ufed to burft into tears upon reflecting on the lofs luis malter had fuftained, not only in his fubfiltence, but ia his honour, by the roguery of his fervant, his former affociate and bedfellow. Cornelius, as appears by the regifters of Harlem cathedral, died either in 1515 , or the beginning of the following year; fo that he might very well give this information to Nicolaus Galius, who was fchoolmafter to Hadrian Junius.

Though this circumftance is probable as to the main fact, yet we muft fet afide the evidence of it in fome particulars. I. The firt obvious difficulty is noticed by Scriverius; " that the types are faid to be made of the rind of beech, which could noi be frong encugh to bear the impreffion of the prefs:" though this is removed, if, inflead of the bark, we fubfitute a bough of the beach. The idea of the bark, when Junins wrote this, was perhaps flrong in his mind, from what Virgil tells us (E.cl. v. 13.) of its being ufual to cut words in the barl of a beech; and thence he was eafily led to make a wrong application of it here.
2. The letters were at firft woolen; and are faid to be afterwards exchanged for metal types; from which the wine-pots were formed, remaining in the time of Junius. According to tradition, printing was carried on in the fame houle long after the time of Laurentius: thefe pots might therefore be formed from the watte metal of the printing-houfe, after the ufe of fiffile lypes became univerfal.- But Laurentius feems to have carried the art no farther than Separate wooden types. What is a
remarkable
(A) Galius feems to be the fame who is called Claes Lottynfz. Gael, Scabinns Harlemni, as it is in the Farit of that city, in the years 1531, 1533, and 1535. Quirinius in the fame Fafti is called Mir Quiryn Dirkfoon. He was many years amanuenfis to the great Erafmus, as appears from his epifle, 23 d July 1529 . tom. iii. Oper. p. 1222. He was afterwards Scabinus in 5537 \& feq. and Conful in 1552 a feq. But in the troubles of Holland he was cruelly killed by the Spanifh foldiers, May 23.1573. There are fome letters of Hadrian Junius to this Talefius, in the Epif:le Juniana, p. 198.
(в) John Fauf, or Fiff, is by many fuppofed to have derived his name from faufus, "happy ;" and Dr Faufus feems to carry an air of grandenr in the appellation: but very erroneoully. Fobn Fuuf, or Fuf, is no more than Jolne Hand, whence our name Fijl.

Trintiner. remarkabic confirmation of this, Henry Spicchel, who wrote, in the 16 th century, a Dutch foem intitled Hentfigen', cxprolfes himfut thus: "Thou firt, Laurentius, to fapply the defect of wonden tablets, adaptedit rusocent types, and afterwards didth conneet them with a thread, to imitate writing. A treacherous fervant furreptitionly obtainad the honeur of the difiovery. But truth itfelf, though dellitute of common and wice-fpread fame ; truth, l fay, fill remains." No mention in the poem of mitul types; a circumilance which, had he been robbed of fuch, as well as of woolien ones, would fcarcely have been palfed over in fi'ence.

When Laurentius firt devifed his rough fpecimen of the art, can only be gueffed at. He died in in4e, after laving publified the Speculum Belgicum, and two editions of Donatus, all with different rwooden types; which it is probable (confidering the difficulties he had to encounter, and the many artits whom he muft neceffarily buve had occafion to confult) coll him fome years to execute; fo that the firf effiny might be abont 1430, which nearly agrees with Petrus Scriverius, who fays the invention was about 10 or 12 ycars before $144^{\circ}$. See Laurentius.
3. What was the fpecimen he firft diverted himfelf with in cutting, at the difance of three centuries, one would think impofible to be difcovered. And jet Joh. Enfchedius, a printer, thinks he was fo happy as to find it, being an old parchment Horarium, printed on both fides, in eight pages, contaning the Letters of the Alphabet, the Lord's Prayer, the Apofles Creed, and three flort prayers. And Mr Meerman having
fhowu this to proper artilts who were judges of thefe matters, they gate it as their opinion that it agreed exactly with the defcription of Junius. It is conformable to the firfedition of the Dutch Spoculum Salvationis, and the fragments of both Donatrs's of Holland, both which are the works of the fame Laurentius, and were preceded by this. In thefe types, which are certainly moveable, cut, and uneven, there is a rudenefs which Mr Meerman has not obferved in any other inftances. There are no numbers to the pages, in fignatures, no direction-woords, no divilions at the end of the lines; on the contrary, a fyllable divided in the middle is feen, thus, Spiritū, in p. 8. 1. 2, 3. There are neither diftincions nor points, which arefeen in the other works of Laurentius; and the letter $z$ is not marked with an accont, but with a dot at the top. The lines throughout are uneven. The thape of the pages not always the fame; not (as they fhould be) redangular, but fometimes rhomb-like, fometimes an ifofele trapeziunn; and the performance feems to be left as a fpecimen both of his piety, and of his ingenuity in this effay of a new invented art. Mr. Meerman has given an exald cngraving of this fingular curiofity.
But, whatever elfe may appear doubtful in the narrative of Junius, it is very clear, that the firte eflays of the art are to be attributed to Laurentius, who ufed only feparate wooden types. See the article Laurentivs.
II. Some of Laurentius's types were folen from him Clain by one of his fervants (c), Folm Geinsfleich fenior; Ment who fled therewith to MENTZ. Having introduced
(c) Authors diffcr as to the perfon who committed this robbery. It is clear from all accounts that his name was Oohn; but what his furname was is the difputed point. Junius, after fome hefitation, afcribes it to John Fuft ; but with injutice: for he was a wealthy man, who affilted the firlt printers at Mentz with money; and thugh he afterwards was proprietor of a printing-office, yet he never, as far as appears, performed any part of the bufinefs with his own hands, and confequently he could never have been a fervant to Laurentius. Nor is the conjecture of Scriverius better founded, which fixes it upon Joln Gutenberg, who (as appears by authentic tenimonies) relided at $S$ traburg from ${ }^{1}+36$ to 144 , and during all that pcriod employed much fruitlef's labour and expence in endeavouring to attin this art. Mr Mcerman once thought, "it might be either John Meidenbachius, (who, we are told by Seb. Munfter and the author of Chronographbia Moguntinenfis, was an adititant to the firt Mentz printers) ; or John Peterfheimius (who was fome time a feivant to Fuft and Schoeffer, and fet up a pinting houfe at Francfort in 1459) : or, lafty, fome other perfon, who, being unable through poverty to earry on the butinefs, difeovered it to Geingfecich at Mentz." But more authentic intelligence afterwards convinced hin there wele tro perfons of this name; and that John Geinsfleich feniort was the difloneft fervant, who was born at Mentz, and who in the papers publithed by Kchlcrus, we find there in the year 1441, and not before: for though he was of a good family, yet he was poor, and feems to have been obliged, as well as his brother, to feek his livelihond in a foreiga country; and perhaps was cort tent to be under Laurentius, that, when he had learned the art, he night follow it in his own. But, to leave conjecture, we may produce fome certain teftimonies.

1. It is what Junius himfelf fays, that the perfon who fole the types did it with a view to fet up elfewhere; nor is it likely that he would either make no ufe of an a t he had feen fo profitable to Laurentius, or that he would teach it to another and fubmit to be again a fervant.
2. The Limbeth Record (which is printed below, from Mr Atkyns) tells us, that "Mentz gained the art by the brother of one of the workmen of FIarlem, who learned it at home of his brother, who after fet op for himfelf at Mentz." By the ftricteft examination of the beft authorities, it is phain, that by thefe two lrethers the two Geinsfleiches muft be meant. But as the younger (Gutenberg) was never a fervant to Laurentius, it mult be the fenior who carried off the types, and infructed his brother in the art; who firft applied himfelf to the bufinefs at Straflurg, and afterwards joined his clder brother, who had in the mean time fettled at Mentza

What

## P R I

the art from Hariem into this his native city, he fet with all diligence to carry it on; and publifle. 1 , in 1442, Alfarindi Galis Dagrimale, Perai His"ani Traitatus; two works, which, being finall, bell fuited lis circunflances; and for which, being much uled in the fchools, he might reafonably expect a profitable fale. They were executed with swooldin types, cut after the model of thofe he had Aolen.

In $14+3$ he hired the houfe $\overline{3}$ um 3 ungen; and was affited with money by Fust, a wealthy perfon, who in return had a thare of the bufinefs: and about the fame time Jobn Mridenhachius was admitted a partner, as were fome others wh fe names are not trammitted to our times; and in $1+44^{\text {thes }}$ were joined by Gutenperg, who for the purpofe quitted Strafoung. Wonaen types being found not fufficiently durable, and not an fivering expectation in other refpects, the two brothers firf iuvented cut metal yp:s. But while thefe were preparing, which mult have been a work of time, feveral works were prin:ed, both on evooden feparate types and on cwoorlen Uocks; whic! were well adapted to fmall bnoks of frequent u'e, fuch as the Tabuht Alphabetica, the Cubbolioo:, Donati Grammatica, and the Confefionalia.

From the abovementioned printers in conjunction, after many fimaller ellays, the Bible was publifhed in 1450, with lurge cut metal types (0). And it is no wonder, confidering the immenfe hbour this work cont, that it fhoul! be feven or eight years in completing. In this fame year the partnerihip was diffolved, and a new one entered into, in Auguf, between Fuft and Gutenberg;

## 515 ]

## I' R I

the former fupp'ying the moner, whe latter Rkill, for d'rint ing. their common benelit. Y:arious dificulties arifing, occafioncua lan-fuit for the money which Funt had ad vanced; which was determund againll Cutemberg. A diffolution of thic parmerfhip enlued in $1+55$; and in 1457 a maunificent edition of the P'alter vais puldilhed by Fuff and Schucfer, with a remankable commendation, in whech they alliumed to them:lves the merit of a new
 imprimendi ac churad.rizavith. This book was uncommonly elegrant, ann in fome meafure the wak of Gutenberg; as it was fur years in the prefs, and came out bit is months. ffer the partnet llip was difiolved between him and Fuff.

The latter en minued in poliefion of the priming. office: and Guchlerg, by the pecuniary affittance of Conrad Humery fyndic of Mentz ( E ), and nthers, opened another office in the fame city; whence appcared, in 1460, with ut the printer's nime, the Catholions fo de F̈unua, with a pompons colophon in praife of its beauty, and afcribing the honour of the invention to the city of Mentz. It was a very handfome book, though inferior to the Pfaler which had been publiflied in 1457 by Fuft and Schoeffer. Both the Pialter and $C$ thrlich were printed on cut metal types ( F ). It may not be improper to obfervc here, that as the Pfalter is the earlieft book which is known to have a genuine dite, it became a common practice, after that publication, for printers to claim their own performances, by adding their names to them.
III. The progrefs of the art has been thus traced $3 \mathrm{~T}_{2}$ through

What is ftill flronger, two chronologers of Strafburg, the one named Dan Spelinus, the nther anonymous (in Meerman's Documenta, $\mathrm{n}^{\circ}$ Lexxy. exxxis), tells us exprefsly, that John Geinsfleich (viz. the fenior, whom they ditinguithed from Gutenberg), having learsed the art by being fervant to its firf inventor, carried it by theft into Mentz his native country. They are right in the fact, thourh mifaken in the application of it; fir they make Stiaburg the place of the invention, and Mentelius the inventor, from whom the types were folen. But this is plainly an error: for Geinsfleich lived at Mentz in 1441 , as appears from undoubted teftimonies; and could not be a fervant to Mentelius, to whom the before mentioned writers afcribe the invention in 1440, though more ancient ones do not attempt to prove that he began to print before 1444 or 1447 . Nor will the narrative agree better with Gutenberg, who was an earlier printer than Mentelius; fince, among the evidences preduced by him in his law fuit, 1439 , no Geinsfleich fenior appears, nor any other fervant but Laurentius Beldek. The narration therefore of the theft of Geinsfeich, being fpread by various reports through the world, and fubfifting in the time of thefe chronologers, was applied by them (on ferve the caufe they wrote for:) tn Straburg; but ferves to confirm the truth, fince no writer derives the printing foils from any cther country than Holland or Allatia. The chronologers have likewife, inflead of Frft, called Gutenberg the wealthy man; who, from all circumkances, appears to have been poor. They alfo call Schoeffer the fon-indaw of Mentelius; when it is clear that he married the daughter of Fuft.
(D) Miny writers have fuppofed that this was the edition of w!ich fome copies were fold in France, by Fut, as n:ar:ufcrints, for the great price of 500 or 600 crowns, which he afterwards lowered to fo, and at litit to lef's than 40. But it was the fecond and more expenfive edition of 1462 , that was thus difpofed of, when Fuil Wemt to Daris in 1466 , and which had coft 4000 florins before the third quaternion (or quire of four fheets) was printed. Merrman, vol. I. p. 6 151, 152.
(E) At the death of Gutenberg, Conrad Humery took poffefion of all his printing materials; and engaged to the archbithop Adolphus, that he never would fell thein to any one but a citizen of Mentz. Ther were, however, fonn dupe fed of to Nicholas Bechtermuntze of Altavilla, who, in $1+60$, publilhed Vocaburiume LatinoTeatoni:ann, which wat printed with the fame types which had been ufed in the Catholicon. This very curious and farce Vocub:lury wis th wn to Mr Meerman, by Mr Bryant, in the Duke of Martbornugh's valuable library at lilenh inn. It is in quartn, 35 lines long, contains mane extracts from the Catholicon, and is called I.: quo, thom the preface beginni: $g$ with thofe words. Mefrnan, vol. II. p. 96 .
(F) Gutenbe:s never infed :iny other than either rwooden or cut motal types till the year 1462 . In 1465 he was admitied inter Auli os ly the clector Adruphus, with an annual penfion; and died in Febuary 4 t 68 . His clier brother Geinsfleich died in 1462 . Their cpitaphs are printed by Mr Meerman, vol. II p. 154, 225 .

Invention of call types.
through its ficond period the invention of cut metaltypes.
But the honour of completing the difcovery is due to Peter Schoeffer (g) de Geinfheim.

A very clear account of this final completion of the types is preferved by Trithemius (H). Paft bee inventis fuccefferunt fubiliora, iuveneruntque modum tundendi formas ommium Latini alphaleti literarun, quas ipf matrices nominabant: ex quibus rurfum aneos five fanneos charact.res fundibant, ad onnam preffiram fufficientes, quos prius manibus foulpebant. Et reveraficuti ante xxx ferme annos ex ore Peiri Opilionis de Gern/bein, civis Moguntini, qui gener erat primi artis inventoris, audivi, margam a primo inventionis fue lice ars impreforia babuit diffcultatem.-Petrus autene memoratus Oitio, tunc famulus pollea gener, ficut diximus, inventoris primi, Jobannis Fuft, bono ingeniofus at prudens, faciliorent modum fundendi characteres excogitavii, ct artem, ut nunc eft, complevit.

Another ample teftimony in favour of Schoeffer is given by Jo. Frid. Fauftus of Afchaffenburg, from papers preferved in his family: "Peter Schoeffer of Gernf. heim, perceiving his mafter Fuft's defign, and being himfelf ardently defirous to improve the art, found out (by the good providence of God) the method of cuting (incidendi) the characters in a matris, that the letters might eafily be fingly caft, intead of being cut. He privately cut matrices for the whole alphabet; and when he fhowed his mafter the letters caft from thefe matrices. Fuft was fo pleafed with the contrivance, that he promifed Peter to give him his only daughter, Chriftina, in marriage ; a promife which he fon after performed. But there were as many difficulties at firlt with thefe letters, as there had been before with avoolen ones; the metal being too foft to fupport the force of the impreffion: but this defect was foon remedied, by mixing the metal with a fubftance which fufficiently hardened it (1)."

Fuit and Schoeffer concealed this new improvement, by adminiftering an oath of fecrecy to all whom they intrufted, till the year 1462 ; when, by the difperfion vf their fervants into different countries, at the facking of Mentz by the archbilhop Adolphus, the invention was publicly divulged.

The firft book printed with thefe improved types was Durandi Rationale, in 1459; at which time, however,
they feem to have had only one fize of cafl letters, all the larger characters which occur being cut types, as appears plainly by an infpection of the book From this time to 1466, Fuft and Schoeffer continued to print a confiderable number of books; particularly two famous editions of Tully's Ofucs. In the earlieft books, they printed more copies on sellum than on paper, which was the cafe both of their Ribles and Tulley's Offees. This, however, was foon inverted; and paper introduced for the greatel part of their impreflions; a few only being printed on vellum for curiofities, and for the purpofe of being illuminated. How long Fuft lived, is uncertain; but in 147 I we find Schoeffer was in partnerfhip with Conrad Hinlif and a kinman of his mafter Fuft. He publifhed many books after the death of his father-in-law ; the laft of which that can be difcovered is a third edition of the Pfstitr in 1490 , in which the old cut types of the firf edition were ufed.
IV. With regard to the claim of STRASBURG : Clain It has been already mentioned, that Gutenberg was Stran engaged in that city in different employments; and, among others, in endeavouring to attain the art of printing. That thefe endeavours were unfuccefsful, is plain from an anthentic judicial decree of the fenate of Strafburg in 1439, after the death of Andrew Drizehen (k).

But there are many other proofs that Gutenberg and his partners were never able to bring the art to perfeftion.

1. Wimphelingius*, the oldeft writer in favour of * $E_{P}$ Straburg, tells us, that Gutenberg was the inventor of "a new art of writing," ars impreforia, which might alfo be called a divine benefit, and which he happily completed at Mentz ; but does not mention one book of his printing : though he adds, that Mentelius printed many volumes correctly and beautifully, and acquired great wealth; whence we may conclude that he perfected what Gutenberg had in vain ellayed.
2. Wimphelingius, in another book $\dagger$, tells us, the ait of prining was found out by Gutenberc income ar printing was found out by Gutenberg incomplete ; Epifc which implies, not that he practifed the art in an im-gent perfect manner (as Lanrentius had done at Harlem), ${ }_{\text {Meen }}^{1508}$ but rather that he had not been able to accomplilh what ut fuy he aimed at.
3. Gutenberg, when he left Straburg in 1444 or the
(G) In German, Belooffer ; in Latin, Opilio; in Englifh, Shepherd.-He is fuppofed by Mr Mcerman to have been the firit engraver on copperplates.
(H) Anna'es Hitfaugienfes, tom. ii. ad ann. 1450.-As this book was finifhed in 1514, and Trithemius tells as he had the narrative from Schoeffer himfelf about 30 years before; this will bring us back to 1484 , when Schoeffer mult have been advanced in years, and Trithemius about 22 years old, who died in 1516 . See Voff. Hift. Lat. I. i. c. 10. Falr. Med. \& Infim. Nt. 1. g.
(1) See Meerman, vol. I. 9. 183. who copied this teftimony from Wolfus, Montment. Typograph. vol. i. p. 468. fcq.
(к) Their firftattempts were made about 1437 with zwooden types. Mr Meernan is of opinion that Geinsfleich junior (who was of an enterprifing genius, and had already engaged in a variety of projects) gained fome little infight into the bufinefs by vifiting his brother who was employed by Laurentius at Huerleim, but not fufficient to enable him to practife it. It is certain that, at the time of the law-fuit in 1439 , much money had been expended, without any profit having arifen; and the unfortunate Drizehen, in $143^{\circ}$, on his death-bed, lamented to his confeffor, that he had been at great expence, without having been reimburfed a fingle obohus. Nor did Gutenberg (who perfifted in his frwitlefs endeavours) reap) any advaniage from them; for, when he quitted Strafburg, he was overwhelmed in debt, and under a necefity of felling every thing he was in poffeffion of. [Meerman, vol. I. p. 198-202.] All the depolitions in the law-fuit abore-mentioned (with the judicial deeree) are printed by Mr Meerman, vol. II. p. 58-88. N.

## l'R I <br> [ 517]

the following rear, and entercd into partnermip with Geinsfleich fenior and others, had oceation for his brother's allittance to enable him to complete the art; which fhows that his former attempts at Strafourg had man been unfuccelisful $\ddagger$.
4. Thefe particulars are remarkably confirmed by T'rithemius, who tells ns, in two different places\|, that Gutenberg fpent all his fubftance in quelt of this art ; and net with fuch infuperable difficulties, that, in de:im. Ppair, he had ncarly given up all hopes of attaining it, eer- till he was affifted by the liberality of Fuft, and by lis brother's fkill, in the city of Mentz.
5. Ulric Zell fays * the art was completed at Mentz; but that fome books had been publifhed in Holland o. earlier than in that city. Is it likely that Zell, who was a German, would have omitted to mention Strafburg, if it had preceded Mentz in printing?

There is a little doubt therefore that all Guterberg's labours at Strafburg amounted to no more than a fruitlefs attempt, which he was at laft under the neceffity of relinquifhing: and there is no certain proof of a dingle book having been printed in that city till after the difperfion of the printers in 1462, when Mentellius and Eggeftenius fuccefsfully purfued the bufinefs.
In fine, the pretenfions of Straffurg fall evidently to be fet afidc. And as to the other two cities, Harlem and Mentz, the difputes between them feem ealily cleared up, from the twofold invention of printing above. mentioned: the firft with feparate wooden types at Hailem, by Laurentius, about 1430, and after continued by tis family; the other with metal types firft cint, and afterwards caf, whicls were invented at Mentz, but not ufed in Holland till brought thither by Theodoric Martens at Alof about $\mathbf{1}+7 \mathbf{2}$.
From this period printing macle a rapid progrefs in molt of the principal towns of Europe. In $1+90$, it reached ConRantinople; and, aceording to Mr Palmer, p. 28r, \&c. it was extended, by the middle of the next century, to Africa and America. It was introduced into Ruflia about 1560: but, from motives either of policy or fuperlition, it was fpeedily fuppreffed by the ruling powers; and, even under the prefent enlightened emprefs, has fcarcely emerged from its obficurity. - That it was early practifed in the inhofpitable regions of Iceland, we have the refpectable authority of Mr Bryant: "Arncrim Jonas was born amidft the fnows of Iccland ; yet as much prejudiced in favour of his country as thufe who are natives of an happier climate. This is vilible in his Crymogra; but more particularly in his Anatome Blefkiziana. I have in my poffeflion this curious little treatife, written in Latin by him in his own country, and printed Typis Holenfibus in Iflaudiâ Boreali, anno 1612. Hola is placed in fome maps within the Arctic circle, and is certainly not far removed from it. I believe it is the farthent north of any place where arts and fciences have ever refided." Obfervations and Inquiries relating to various parts of Ancicnt Hiftory, 1767, p. 277.

It wasa confant opinion, delivered down by our hiforiithe ans, as hath been obferved by Dr Middleton, that the Att of Printing was introduced and firit practifed in England by William Caxton, a merccr, and citizen of London; who, by his travels abroad, and a refidence of many years in Holland, Flanders, and Germany, in the affairs of trade, had an opportunity of informing himelf of the whole
method and process of the art; and by the encouragement of the great, and particularly if the abbot of Weftminfter, firft fet up a prefs in that abbey, and began to print hooks foon after the year 1471 .
This was the tradition of our writers; till a book, which had fearce been obferved before the Reforation, was then taken notice of by the curious, with a date of its impretlion from Oxford, anno 1468, and was confidered immediately as a clear proof and monument of the excrcife of puinting in that univerlity feveral years before Caxton began to deal in it.

This book, which is in the public library at Cambridge, is a fmall volume of 41 leaves in to, with this title; Expofilio Sancti Jeromimi in Simbolume Apofolmatm ad Papam Laurentium: and at the end, Explicit expofitio, Ec. Impreffa Oxonic, Es finita Anno Domini m.ccec.lxvit. xvir die Deetmbris.

The appearance of this book has robbed Caxton of The firft a glory that he had long poffelfed, of being the author primtingof printing in England; and Oxford has ever fince prefs fiun carried the honour of the firlt piefs. The only difficulty in Englane: was, to account for the filence of hiftory in an event fo memorable, and the want of any memorial in the univerfity ittelf concerning the eftablilhment of a new art a. monglt them of fuch ufe and benefit to learning. But this likewife has been cleared up by the difcovery of a record, which had lain obfcure and unknown at Lam-beth-palace, in the Regilter of the Sce of Canterbury; and gives a narrative of the whole tranfaction, drawn up at the very time.

An account of this record was firft publified in a thin quarto volume, in Englifin; with this sitle: "The O. riginal and growth of Printing, collected out of Lifory and the Records of this Kingdom: wherein is alfo demontrated, that Printing appertaineth to the 1 'rerogative Royal, and is a Fiower of the Crown of England. By Richard Atkyns, efq.-Witehall, April the 25, 1664. By order and appointment of the right honourable Mr Secretary Morrice, let this be printed. Tho. Rycaut. London : Printed by John Streater, for the Author. 1054 ." 4 to.

It fets forth in fhort, "That as foon as the art of printing male fome noife in Europe, Thomas Bourchicr, archbifhop of Cantelhury, moved the then king (Henry VI.) to ufe all pofible menns for procuring a printing-mould (for fo it was then called) to be brought into this kingdom. The king (a good man, and much given to works of this nature) readily hearkened to the motion ; and, taking private advice how to effert his delign, concladed it conld not be brought about without great fecrecy, and a confiderable fum of money given to fuch perfon or perfons as would draw off fome of the workmen of Harlem in Holland, where John Gutenberg had newly invented it, and was himelf perfonally at work. It was refolved, that lefs than 1000 merks would not produce the defired effect; towards which fum the fuid archbifhop prefented the king 300 merks. The money being now prepared, the management of the delign was committed to Mr Robert Turnour ; who then was mafter of the robes to the king, and a perlon mof in favour with him of any of his condition. Mr Turnour took to his alfiftance Mr Caxton, a citizen of good abilities, who traded much into Holland; which was a credible pretence, as well for his going, as fay in the Low Countries. Mr Turnour was in difguife

## PRI

$\underbrace{\text { Printing. (his beard and hair Chaven quite off) ; but Mr Caxton }}$ appeared known and public. They, having received the faid fum of 1000 merks, went firft to Amflerdam, then to Lesden, not daring to enter Harlem itfelf: for the town was very jealous, baving impriloned and apprehended divers perfons who came from other parts for the fame purpofe. They faid till they liad fpent the whole thoufand merks in gifis and expences: fo as the king was fain to fend 500 merks more, Mr Thurnour laving written to the king that he had almoft done his work; a bargain, as he laid, being litruck betwixt him and two Hollanders, for bringing off one of the underworkmen, whofe name was Frederick Corfells (or rather Corfellis), who late one night fule from his felluws in difguife into a velfel prepared before for that purpofe; and $f$, the wind favouring the detign, brought himifafe to Loudon. It was not thought fo prudent to fet him on work at London: but, by the archbilhop's means (who had been vice-chancellor and afterwards chanceller of the univerfity of Oxon) Ci rfellis was carried with a guard to Oxon; which guard contantly watched, to prevent Corfellis from any peffible eicape, till he had made gond his pronife in teathing them how to print. So that at Oxford printing was firt let up in England, which was before there was any printing-prefs or printer in France, Spain, Italy, or Germany (except the city of Mentz), which claims feniority, as to printing, cven of Harlem itfelf, calling her city, Urbem Moguntinam artis typorrafhica inventricem frimam; though it is known to be otherwife, that city gainng the art by the brother of one of the workmen of Marlem, who liad learnt it at home of his brother, and after fet up for limfelf at Mentz. This prefsat Oxon was at lealt ten years before there was any printing in Europe, except at Harlem and Mentz, where it was but new-born. This prefs at Oxford was afterwards tomd inconvenient to he the fole printing-place of England; as being too far from London and the fea. Wherefore the king fet up a prefs at St Alban's, and another in the city of Weflminiter, where they printedfe veral books of divinity and $p b y$ fic: for the king (for reafons bel known to limfelf and council) parmitted then no lacu-books to be printed; nor did any printer exercife that art, but only fuch as were the king's Tworn fervants; the king himfif baving the price and eniofuncent for printing books.-By this means the art grew fofamous, that anno primo Richard III. c. 9. when an act of parliament was made for reftraint of aliens for uling any handicrafts here (except as fervants to natives), a fpecial provifo was inferted, that ftrangers might bring in printed or written books to fell at their pleafure, and exercife the ant of printing here, notwithRanding that ad: fo that in the fpace of 40 or 50 years, by the indulgence of Edward IV. Edward V. Richard Ill. Hemy VII. and Henry Vill. the Englilh proved to good proficients in printing, and grew io nurnerous, as to furnifh the king dom with books; and fo fikiful, as to pint them as well as any beyond the feas: as appears by the ad 25 Hen. VIIL. c. 15 . which abrogates the faid provifo for that reafon. And it was firther enacted in the faid fitute, that if any perfon bought ioreign books bound, he fhould pay 6s. 8d. per book. And it was further provided and enached, that in cafe the faid printers or fellers of books were unreafenble in their prices, they fhonld be moderated l.y the lord chancellor, lord treafurer, the two lords
chief juftices, or any two of them; who alfo had power $P$ to fine them 3 s. 4 d . for every book whofe price thould be enhanced. - But when they were by charter corporated with booklinders, bookfeliers, and founders of lithers, 3 \& 4 Philip and Mary, and called the Company of Stationers-they kick'd againft the power that gave them life, \&c. - Queen Elifubetl, the firf year of her reign; grants by patent the privilege of fole prinuing all looks That touch or conarin the common laws of England, to Tottel a fervant to her majefty, who kept it entire to his death; alter him, to one Yeft Weirt, another fervant to her majefty; after him, to Weight and Norton; and after them, king James grants the dame privilege to More, one of the fignet ; which grant continues to this day, sc.".
From the authority of this record, all our late wri. Wh ters declare Coricllis to be the firft printer in England; Mr Antheny Wond, the learned Mr Maittaire, Palmer, and one John Bagford, an indultrious man, who had fir publifhed propofais for an Hitory of Printing, (Phil. cer. Tianf. tor April 1707). But Dr Middleton has called in queftion the authenticity of this account, and has urged feveral objections to it, with the view of fupporting Caxton's title to the precedency with refpeet to the introduction of the art nito this conntry; of which we thall quote one or two, with the anfwers that have been made to then.
Objection 1.-_" The filence of Caxton concerning a fact in which he is faid to be a principal actor, is a fuffictent con utation of it : for it was a conflant culom with him, in the prefaces or conclufions of his works, to give an hillotical account of all his labours and tranfactions, as far as they concerned the publifhing and printing of books. And, what is ftill fronger, in the continuation of the Polychronicon, compiled by himfelf, and carried down to the end of Henty the fixth's reign, he makes no mention of the expedition in queft of a printer: which he could not have omitted, had it been true ; whillt in the fame book he takes notice of the invention and beginning , f printing in the city of Mentz."
Aniwer.-As Caxton makes no mention in his Polychronicon of his cexpedition in quefl of a printer; fo neither dies he of his bringing the art onto England, which it is as much a wonder he flould moit as the other. And as to his faying that the invention of printing zuas at Meentz, he means, of printing on fufle feparate types. In this he copies, as many others have, from the Fifciculus Timporum; a work written in $1+70$, by Wernerus Rolevinch de Laer, a Carthufian monk, a MS. copy of which was in the library of Gerard Jn. Vonias (fie lib. iii. de Hifor. Latin. c. G.); and afterwards continued to the year 1474, when it was firf printed at Cologne typis Arnolditer Huernen. It was repubiihed in 1481 by Heinricus Wirczburgh de Vach, a Cluniac monk, without mentioning the name either of the printer or of the place of publication. It is plain that Cix. ton had one at leant, or more probably both, of thefe editions before him, when he wrote his continuation of Polychronicon, as he mentions this wolk in his prefice, and adupts the fentiments of its edit 1. (Sise Mifer. man, vol ii p. 37.and his Documenta, No VII. XXIV. and XXV.)

Obj. 2. "There is a far ther circumanarice in Cantmn's hifory, that it feems inconfiftent with the record; fir we find him Rill beyond fea, about whive years aftur

## P R I

g. the fuppofed tranfations, " leaming with great charge and rruuble the art of princing" (Ricale of the Hiforivs of Ticye, in the end of the 2 d and 3 d books) ; which he might huse done with cafe at home, if he had got Corfellis into his hands, as the record imports, fo miny years before : but he probably learnt it at Colngue, where he relided in 1471, (Reculi, \&c. ibid.), and whence b oks had been tirft printed with date the year before."

Auf.-Caxton tells us, ia the preface to The Hifory of Troy, that he began that tranllation March $1.14 G S$, at Bruges; that he proceeded on with it at Ghent; that he finithed it at Cologne in 1475 ; and printed it, probably, in that city with his own types. He nas 30 years abroad, chiefiy in Holland ; and lived in the count of Margaret duchefs of Burguniy, Litter of Edward IV. It was therefore much eafier to pint his hook at Cologne, than to crofs the fea to learn the art at Oxford. But further, there was a fpecial occation for his printing it abread. Corfellis had brought over to far the art of printing as he had learned it at Harlem, which was the method of printing on suooten fiparate types, having the face of the letter cut upon them. But the art of eafing metal types being divulged in $1+62$ by the workmen of Mentz, Caxton theught proper to learn that advantageous branch before he returned to England. This method of calting the types was fuch an improvement, that they looked on it as the original of printing; and Caxton, as moft o:hers do, afcribes that to Meniz. - Caxton was an allitant with Turnoar in getting off Corfellis ; but it is nowhere fuppofed that he came with him into Englard. (See Meerman, vol. ii. p. 34. B.)

Obj. 3.-"As the Lambeth record was never beard of lefore the pubication of At'lyn's book, fo it has never lince been feen or produced by any $m$ m ; though the regifters of Canterbury have on many occafions been diligently and particulatly fearched for it. They were examined, without doubt, very carefully by archbilhop Parker, for the compiling his Antiquities of the Britifh, Church; where, in the life of Thomas Bourchier, tho he congratulates that age on the noble and uleful invention of printing, yet he is filent as to the introduction of it into England by the endeavours of that archbifhop: nay, his giving the honour of the invention to Straburg clearly thows that he knew nothing of the ftory of Corfellis conveyed from Harlem, and that the record was not in being in his time. Palmer himfelf owns, "That it is not to be from there now; for that the late carl of Pembroke alfured him, that he hademplojed a perfon for fome time to fearch for it, but in vain:" (Hif. of Printing, p. 314.) On thefe grounds we may pronounce the record to be a forgery; though all the writers abovementioned take pains to fupport its credit, and call it an cutbentic picice.

Atkyns, who by his manner of writing feems to have been a bold and vain man, might $p$. fibly be the inventor: for he had an iniereft in impofing it upon the world, in order to confirm the argument of his book, that prining avas of the procogative royal; in oppofition to the company of flazioners, with whom he was engaged in an expenfive luit of law, in defence of whe king's pratents, under which he claimed fome exciufive powers of printing. For he tells us, p. 3. 'That, upon confidering the thing, he could not but think that a public
perfon, mere eminent than a mercer, and a public purfe, mult needs be concerned in fo public a good: and the more he confidered, the macte inquiliuve he was to find out the eruth. So that he had lommed his hypothefis before he had found his record; which he publithed, be fays, as a friend to tru:h; nat to fuffer one man to be intitled to the worthy atchicyements of another; and as a friend to himfelf, not to lole e ne of his belt arguments of entitling the king to this aft.' But, it Athyms was not linifelt the conriver, he was imporid upon at lealt by fome more crafty man; who imagined that his intereft in the caufe, and the warnuth that he fhow-d in profecuting it, would induce him to fwallow for genuine whatever was oflered of the hind."
Auf.-On the other hand, is it likely that Mr Alkyns would dare to forice a record, to be laid before the king and council, and which his :ddverfaries, with whom he was at law, could difirove :-(2.) He fays he received this hiftory froni a pertion of honour, who was fome time kee rer of the Lambet! library. It was eafy to have confuted this eridcuce, if it was falie, when he publithed it, April 25. 1664.-(3.) Jo! 12 Bagford (wh) was born in England 1651, and znight know. Mr Atkyns, who died in 1677), in his Hittory of Printing at Oxford, hlames thofe who doubted of the authenticity of the Lambeth Ms.; and tells us that he knew Sir John Birkenhcad had an authentic copy of it, when in 1665 [which Bagford by fome miftake calls i $6 \sigma_{4}$, and is fol. lowed in it by Meciman] he was appri ted by the houfe of commons to dravi up a bill relating to the exercife of that art. This is confi:med by the Journals of that houfe, Friday Ock. 27. 1665 . vol. VIII. p. 622. where it is ordered, that this Sir John Birkenhead fhould carry the bill on that head to the houfe of lords for their confont. - The act was agreed to in the upper houle cin Tuefay Oet. $3^{1 \text {. and received the royal affent on the }}$ fame day; immediately atter which the parliament was prorogued. See Gourrals of the Houfc of Lorils, Vol. XI. p. 700 . Is it probable, then, that after Mr Atkyns had publithed his book in $\Lambda_{\text {p:il }} 166_{4}$, the parli,ument thought propcr, the next year, to inquire into the right of the king's frerogative; and that Sir Juhn Birkenhead took care to inffect the original, then in the cufody of archbirhop Sheldon: and, finding it not fufficient to prove what Mr Atkyns had cited it for, made no report of the MS. to the honfe; but only moved, that the former law thould be re, ewed. The MS. was probably never returned to the proper keeper of it ; but was afterwards burnt in the fire of London, Sept. 13. 1666.-(4.) That printing was practifed at Oxford, was a prevailing opinion long before Atkyns. Bryan Twyne, in his Aislogia pro Antiquitate Acad. mice Oxonienfis, publifhed 1608 , tells us, it is fo delivered down in ancient ruvitings; having heard, probably, of this Lambeth NIS. And king Charles I. in his letters patent to the Univerity of Oxford, March 5 . in the eleventh of his reign, 1635 , mentions printing as brought to O.xford from abroad. As to what is objected, "that it is not likely that the prefs fhould undergo a ten or eleven years flecp, viz. from 1468 to 1479 ," it is probably urged wichout foundation. Corfellis might print feveral books without date or name of the place, as Ulric Zell did at Cologne, from 1467 to 1473 , and from that time to 1+94. Corfellis's name, it may be faid, appears not in any of his publications; but neither does

## P R I

p. 34.; vol. II. p. 21-27, \&c.

Further, the famous Shakefpeare, who was born in 1564, and died in 1616 , in the Second Part of Henry VI. aft iv. fe. 7 . introduces the rebel John Cade, thus upbraiding Lord Treafury Say: "Thou haft moft traite. roully :or rupted the youth of the realm, in creating a grammar-fchool: and whereas, before, nur forefathers had no other book but the feore and the tally, thou haft caufed Prining to be ufed; and, contrary to the king, his crown, and dignity, thou haft built a paper-mill."Whence now had Shakefpeare this accufation againt lord Say? We are told in the Poetical Regiter, vol. II. p. 231. ed. Lond. 172 t, that it was from Fabian, Pol. Vergel, Hall, Hollingthed, Grafton, Stow, Speed. \&c. But not one of thefe afcribes printing to the reign of Henry VI. On the contrary, Stow, in his Annals, printed at London 1560, p. 686, gives it exprefsly to William Caxton, 4 771. "The noble frience of printing was about thistime found out in Gcrmany at Magunce, by one John Guthumburgus a knight. One Couradus an Almaine brought it into Rome: William Caxton of London mercer, brought it into England about the year 1471, and firft practifed the fame in the Abbie of St Yeter at Weftminfter; after which time it was likewife practifed in the Abbies of St Augufine at Canterburie, Saint Albons, and nther monalteries of Eng. land." What them flall we fay, that the above is an anachronilm arbitrarily put into the mouth of an ignorant fellow out of Shakefpeare's head? We might believe fo, but that we have the record of Mr Atkyns confirning the fame in king Charles II.'s time. Shall we fay, that Mr Atkyns borrowed the fory from Shakefpeare, and publifhed it with fome improvements of moncy laid out by Henry VI. from whence it might he received by Charles II. as a prerogative of the crown ? But this is improbable, fince Shakerpeare makes Lord Treafurer Sly the inftrument of importing it, of whom Mr Atkyns mentions not a word. A notiacr difference there will fill be between Shakefpeare and the Lambeth MS.; the poet placing it before 1449, in which year Lord Say was beheaded; the MS. between $145+$ and r'459, when Bourchier was archbithop. We mult fay, thea, that lord Say firt laid the fcheme, and fent fome one to Harlem, though withont fuccefs; but after fome years it was attempted happily by Bourchier. And we mult conclude, that as the generality of writers have overlooked the invention of printing at Harlem with wooden types, and have afcribed it to Mentz where netal types were firft made mie of; fo in England they have paffed by Corfellis (or the firt Onford Printer, whoever he was, who printed with runden types at Oxford), and only mentioned Caston as the original artif who printed with metal types at TVeRniufter. [See Meerman, vol. ii. 7, 8.] It is frange, that the learned commentitors on the great dramatic poct, who are fo minutely particular upon lefs important occafions, fhould every one of them, Dr Johnfon excepted, pafs by this curions paffage, leaving it entirely unnoticed. And how has Dr Johnfon trifted, by flightly remarking, "that Shakefyeare is a little too early with this accufatinn!"-The great critic had undertaken to decipher obfolete words, and inveftigate unintelligible phrafes; but never, perbasps, beftowed a thought on Caxton or Corfellis, on

But, independent of the record altogether, the book ftands firm a; a monument of the exercife of printing in Oxford fix years older than any book of Caston's with a date. In order to get clear of this Arong fact Dr Middleton,

1. Suppofes the date in que?tion to have been falfified originally by the printer eiticer by defign or miltake; and an X to have been dropped or omitted in the age of its impreffion. Examples of this kind, he fays, are common in the hiftory of printing. And, "whilh 1 am now writing, an unexpected infance is fallen into my hands, to the fupport of my opinion; an Inausuration Speceb of the Woodzuardian Profefor, MTr Majon, juft freth from the prefs, with its date given 10 years earlier than it fhould have been, by the omifion of an $x$, viz. mbcexxiv; and the very blunder exemplified in the laft piece printed at Cambridge, which I fupprle to have happencd in the firft from Oxford." -To this it has been very properly anfivered, That we fhould not pretend to fet afide the authority of a plain date, without very ftrong and cogent reafons; and what the Doctor has in this cafe advanced will not appear, on examination, in carry that weight with it that he feems to imagine. There may be, and have been, miltakes and forgeries in the date both of books and of recerds too; but this is never allowed as a reafon for fufpecting fuch as bear no mark of either. We cannot from a blunder in the laft book printed at Cambridge, infer a like blunder in the firt book printed at Oxford. Befides, the type ufed in this our Oxford edition feems to be no fmall proof of its antiquity. It is the German letter, and very nearly the fame with that ufed by Fuft [who has been fuppofed to be] the firlt printer; whereas Caxton and Rood ufe a quite different letter, fomething between this German and our old Englifh letter, which was foun after introduced by De Worde and Bynfon.
2. "For the probability of his opinion (he fays), the book itfelf affords fufficient proof: for, not to infilt on what is lefs material, the neatncfs of the letter, and icgularity of the page, \&c. above thofe of Caxton, it has one mark, that feems to have carried the matter beyond probable, and to make it even certain, viz. the ufi of fignatures, or letters of the alphabet placed at the botion of the page, to fhow the fequel of the pagcs and leaves of each book; an improvement contrived for the direction of the booklinders; which yet was not pracifed or invented at the time when this hook is fuppofed to be printed; for we find no fignatures in the books of Fauft or Schoeffer at Mentz, nor in the improved or beantiful impretions of John de Spira and Jenion at Venice, till feveral years later. We have a brok in our library, that feems to fix the very time of their invention, at leat in Venice; the place where the art itell received the greateft improvements: Baldi lectura fiper Codic. Ec. printed by Yobn de Colonia and Yo. Mantbem de Ghervetzem anzo mocccexxim. It is a large and fair volume in folin, zuithout fignatures, till about the niddlle of the book, in which they are firt introduced, and fo continued forward: which makes it probable, that the firft thought of them was fuggefted during the impreffion; for we have likewife Letaura Bartbolis fuper Codic. sc. in two noble and besutiful volumes in folio, printed

## PRI

the year before at the fame place, by Vindelin de Spira, without them : yet from this time forward they are gerally found in all the works of the Venetian printers, and from them propagated to the other printers of Europe. They were u'ed at (L) Cologne, in 1475; at 1 'aris, $147^{6}$; by Caxton, not before 1480 : but if the dito ovesy had been brouglit into England, and prasifed at Oxford 12 years before, it i, not probable that he would have printed fo long it Weftminter without them. Mr Palmer indeed tells us, p. 54, 180, that Anthony 7.urot was ctcemed the inventor of fignatures ; and that they are found in a Terence printed by him at Milan in the year 1470, in which he firt printed. I have not feen that Ference; and can only lay, that I have cbferved the want of them in fome later works of this, as well as of other excellent printers of the fame place. But, allowing them to be in the Terence, and Zarot the inventor, it confutes the date of cur Oxford book as effectually as if they were of hater origin at Venice; as I had reafon to imagine, from the teltimony of all the books that I have hitherto met with."-As to there proofs, firlt, the neatnefs of the letter, and the regularity of the page, prove, if any thing, the very reverfe of what the Doctor afferts. The art of printing was almoft in its infancy brought to perfection ; but af terwards debafed by later printers, who confulted rather the cheapnefs than the neatnefs of their work. Our learned difiertater cannot be unacquainted with the labours of Fuf and Jenfon. He mult know, that though other printers may have printed more correctly, yet foarce any excel them, either in the neatnefs of the letter, or the regularity of the page. The fame may be obferved in the Englifh priaters. Caxtrn and Rood were indifferently good printers; de Worde and Pynfon were worfe; and thofe that follow them moft abominable. This our anonymous Oxford printer excels them all; and for this very reafon we thould judge him to be the moll ancient of all. Our differtator lays great ftrefs on the ufe of fignatures. But no certain conclufion can be drawn either from the ufe or non-ufe of thefe leffer improvements of printing. They have in diferent places come in ufe at different times, and have not been continued regularly even at the fame places. If Anthony Zarot ufed them at Milan in 1470, it is certain later printers there did not follow his example ; and the like might happen alfo in England. But, what is more full to our purpofe, we have in the Bodleian library an Refop's Fibles printed by Caxton. This is, it is believed, the firft hook which las the liaves numbered. But yet this improvement, though more ufeful than that of the fignatures, was difuled hoth hy Caxton himfelf and other later printers in England. It is therffore not at all furprifing (if true) that VOL, XV.
the fignatures, though invented by our Oxford printer, might not immediately come into general ufe. An 1 coniequently, this particular carrics with it no fuch certain or effectual confutation as our diflertator boalis of.
3. What the Dofur thinks farther confirms his opinion is, "1'hat, from the time of the pretended date of this book, anno 468 , we have no other fruit or production from the prefs at Oxford for 1 a years next following; and it cannot be imagined that a prefs, eltablifhed with fo much pains and expence, could be fuffered to he folong idle and ufelefs." - To this it may be anfiwered, in the words of Oxonides, ift, 'That his books may lave been lof. Our firt printers, in thofe days of ignorance, met with but fmall encouragement; they printed but few books, and but few copics of thofe books. In after-times, when the fame books were reprinted more correaly, thofe firf editions, which were not as yet become curiofities, were put to common ufes. This is the reafon that we have fo few remains of the firft printers. We have enly four books of Theodoric Rood, who feems by his own verfes to have been a very celebrated printer. Of John Lettou-William de Machlinia, and the fchoolmafter of St Alban's, we have fcarce any remains. If this be confidered, it will not appear impofilile that our printer fhould have followed his bulinefs from 1468 to 1479 , and jet time have defroyed his intermediate works. But, 2dly, We may account ftill another way for this diftance of time, without altering the date. The Civil Wars broke ont in 1469 : this might probably oblige our Oxford printer to thut up his preis; and both himfelf and his readers be othcrwife engaged. If this were the cafe, he might not return to his work again till r479; and the next year, not meeting with that encouragement he deferved, he might remove to fome other country with his types.

Dr Middleton concludes with apologifing for his " Spending fo much pains on an argument fo inconfiderable, to which he was led by his zeal to do a piece of juttice to the momory of our worthy countrymian William Caxton; nor fuffer him to be robbed of the glory, fo clearly due to him, of having $j$ frgt imported ixto this kingciom an art of great ufe and bereit to mankind: a kind of merit that, in the fenfe of all nations, gives the beft title to true praife, and the beft claim tu be commemorated with honour to polterity."

The fad, however, againt which he conterds, but The real which it feems impofible to overturn, does by no means clains of derognte from the honour of Caxton, who, as has been Caxton and fhown, was the firf perron in England that prantifed the Corfellis art of printing with fufle types, and confeanently the firl refpcatirewho brought it to perfection; whereas Coriellis printed with feparate cut types in avood, being the only method 3 U which

Printive. $\longrightarrow$

Printing. Which he had lamed at IFarlem. Into this detail, therefore, we have been led, not fo much by the importance of the queftion, as on account of feveral anccdotes connected with it, which feemed equally calculated In fatisfy curiofity and afford entertainment.

Caxton had been bred very reputably in the way of trade, and ferved an apprenticellip to one Robert Large a mercer; who, after having been fheriff and lord mayor of London, died in the year $1+41$, and left by will, as may be feen in the prerogative-office, $x \times 111$ merks to his apprentice Wiliam Caxton: a confiderable legacy in thofe days, and an early teftimonial of his good character and integrity.

From the time of his maftel's death, he fpent the following thirty years beyond fea in the bufinefs of merchandife: where, in the year 1464 , we find hin employed by Edward IV. in a public and honourable negociation, jointly with one Richard Whitehill, Efq; to tranfact and conclude a tieaty of commerce between the king and his brother-in-law the duke of Burgundy, to whom Flanders belonged. The enmmition fyles them, tmbaffatores, procuratores, numios, $\xi^{\circ} d$ putatos fpecials; and gives to both or either of them full powers to treat, Sc.

Whoever turns over his printed works, muft contrad a refpeet for him, and be convinced that he preferved the fame character through life, of an honeft, modeft, man; greatly indufrious to do good to his country, to the belt of his abilities, by fpreading among the people fuch books as he thought ufeful to religion and good manners, which were chiefly tranllated from the French. The novelty and ufefuluefs of his art recommended him to the fpecial notice and favour of the great ; under whofe protection, and at whofe expence, the greateft part of his works were publifhed. Some of them are addreffed to king Edward IV. his brother the dulee of Clarence, and their fifter the duchefs of Burgundy; in whofe fervice and pay he lived many years before he began to print, as he often acknowledges with great gratitude. He printed likewife for the ufe, and by the exprefs order, of Henry VII. his fon prince Arthur, and many of the principal nobility and gentry of that age.
It has becn generally afferted and believed, that all his books were printed in the abbey of Weltnininter; yet we have no affurance of it from himfelf, nor any mention of the place before the year $1+77$ : fo that he had been printing feveral years without telling us *here.
There is no clear account left of Caxton's age : but he was cei tainly very cld, and probably above fourfocre, $2 t$ the time of his death. In the year $1+7$ : he complained of the infirmities of age creeping upon him, and feebling his body : yet he lived 23 years after, and purfued his bufinefs, with extraordinary diligence, :a the abbey of Wefminfer, till the year 1494, in which he died; not in the year following, as all who wite of him: affirm. This appears from fome verfes at the end of a book, called "Hilton's Scale of Per. festion," printed in the fame year:

[^4]
## 1 R I

Wheneof th' autor Walter Hilton was And Wynkyn de Worde this hath fett in print In William Caxfons hows fo fyll the cafe, God reft his foule. In joy ther mot it fynt. Impreffics anno falutis moccelaxaxiiii.
Though he had printed for the ufe of Edward IV. and Henry VII. yct there appears no ground fur the notion which Palmer tal:es up, that the firft printers, and particularly Caxton, were fworn fervants and printers to the crown; for Caxton, as far as can be obferved, gives not the leaft hint of any fuch character or titie; though it feems to have been inftituted not long after his death; for of his two principal workmen, Richard Pynfon and Wynkyn de Worde, the one was made printer to the king, the other to the king's mo. ther the Lady Margaret. Pynfon gives himfelf the firlt title, in The Initation of the Life of Cbrifl; printed by him at the commandment of the Lady Margaret, who had tranflated the fourth book of it from the French, in the year $150 f$ : and Wrakyn de Worde aflumes the fecond, in The feven Penitential Pfalizs, expounded by Bifhop Fifher, and printed in the year 1509. But there is the title of a book given by Palmer, that feems to contradict what is here faid of Pynfon: viz. Pfalteriuv ex mandato vilioriofifimi Anglza Regis Henrici Septimi, per Guli linum Fanque, impreforem regizm, anno mDun; which being the only work that has ever been found of this printer, makes it probable that he died in the very year of its imprefion, and was fucceeded immediately by Richard Pyufon. No book hath yet been difeovered printed in Scotland in this feriod, though the Englifh printers were able to export fome of their wotks to other countries. See Henry's Hfiory of Great Britain, vol. v. p. 471.

Before $1+65$, the uniform character was the old Go- Differ thic or German; whence our Blajk was afterwards chara formed. But in that year an edition of Lactantius was printed in a kind of Semi-Gothic, of great elegance, and approaching nearly to the prefent Roman type; which laft was firft ufed at Rome in 1467 , and foon after brought to great perfection in Italy, particularly by Jenfon.

Towards the end of the fifth ceniury, Aldus invented the fralic charader which is now in ufe, called, from his name, Alline cr curforts. This fort of letter he contrived, to prevent the gean number of abbieviations that were then in ufe.

The firf elfays in Greek that c.an be difonvered are a few fentences which occur in the edition of Tul 1y's Offues, 465 , at Mentz; but thefe were mierably incorrect and barbarous, if we may judge from the fipecimens Mr Maitaire has given us, of which the following is one :

> Oтьсатаакартнаката иая รатютюка.

In the fame year, 1465 , was publifhed an edition of Lactantius's Iylitutes, prinied in monafir:o Sublacenfi, in the kingdon of Naples, in which the quotations from the Greek authors are printed in a very neat Greck letter. They feem to have had but a very fimall $q: a n-$ tity of Greek types in the monaltery; for, in the firft part of the work, whenever a long fentence occurred, a blank was left, that it might be written in with a pen: after the middle of the work, however, all the Greek that occurs is printed.

## PRI <br> $\left[\begin{array}{ll}{[53}\end{array}\right]$ <br> PR I

The firl frinters who fettled at Rome were Conrad Sweynhein and Arno!d Pannartz, who in:raduced the prefent Roman type, in 1466, in Cicero's Fisifole Fiamiliares: in $1: 09$ they printed a beautiful edition of Aw'us Gerlizs, with the Greek quotations in a fair chatrufer, w thout aceents or firits, and with very few abbreviations.

The firl whole book that is yet known is the Greek Commar ( $f$ Confantine Leraris, in quarto, revifed by Demettius Cretenlis, and priuted by Dionylius Palavifiners, at Milat, $1+76$. I: $1+8 \mathrm{x}$, the Greek Pfilter was printed here, with a Latin tranilation, in fulio; as was Eitop's Fables in quarto.

Fervice foon followe the example of Mian ; and in 1486 were publith 2 in that city the Greek Pfaller and the Batrachomyomachia, the former by Alexander, and the latter by La niens, both natives of Crete. They were p:in:ed in a very uncommon character; the latter of them with accents and fpirits, and alfo with finotia.

In 1488 , however, all former publications in this languag: were celipled by a fine edition of Homer's Works at Florence, in tolin, printed by Demetrius, a aative of Crete. Thus printing (fays Mr Matiaire, P. 185.) fecms to have attained its $a \because \mu n$ of perfection, after having exhibited molt beautiful fpecimens of Latin, Greek, and Hebrew.

In 1493 , a fine edition of Ifiorates was printed at Milan, in folio, by Henry German and Sebatian ex Pantremu?o.

All the above works are prior in time to thofe of Aldus, who has been erroneoufly fuppofed to be the frft Greek printer: the beauty, however, correctnefs, and number of his editions, place him in a much higher rank than his predeceffors; and his characters in general were more elegant than any beiore uled. He was born in 1445 , and died in 1515 .

Though the moble Greek books of Aldus had raifed an univerfal defire of reviving that tongue, the French were backward in introducing it. The only peces printed by them were fome quotations, fo wretchedly performed, that they were rather to be guefled at than read; in a character very rude and uncouth, and without accents. But Francis Tilfardis:roduced the fudy of this language at Panis, by his Eifoce " grouzzupax, in 1507 ; and that branch of printing was afterwards juccefffully pratifed by Henry, Robert, and Henry Steflens. See the article Stephess.

The earlieft edition of the whole Bible was, frictly fpeaking, the Completenfian Polyglote of Cardinal Nimenes; but as that edition, though finifhed in 1517 , was not publifhed till 1522, the Veretian Septuagint of 1518 may properiy be called the firft edition of the arwo': Greek Bible; Erafmus having publifhed the New Teltament only at Lafit in 1516.

A ve:y fatisfatory account of Hebrew printing is thus given by Dr Kennicntt in his Annur Accounts of the Ciollationt of Hebrez MTSS. p. 112. "The method which feems to have been originally nbferved in printing the Hebrew Bible was juf what mignt have been expefted: 1. The Pentateuch il: 1482 . 2. The Prior Prophets, in $1 \frac{1}{8} 8$ 4. 3. The Potterior Proplrets, in 14.96. 4. The Hagiographa, in $1+87$. And, atter the four great parishad been thus printed feparately (each with a comment), the whole text (withont a coniment) was frinted in one volume in 1438 ; and the teat continued
to be printed, as in thefe firft editions, fo in feveral others for 20 or 30 years, without Marginal Keri or Mafora, and with greater arguments to the more ancient MSS. till about the year 2520 fome of the Jews adopted
$\underbrace{\text { L'rintirg }}$
$\qquad$ -
later MSS. and the: Mafora; which abiurd preference has obtained ever fince."
Thus much for the ancient editions given by Jews.
In 1642 a Hebrew Bible was printed at Mantua under the eare of the molt learned Jews in ltaly. This lible had not been heard of amnng the Chriltians in
this country, nor perhaps in any other; thouzh the Hible had not been heard of amnng the Chriltians in
this country, nor perhaps in any other; though the natare of it is very extraordinary. The teat indeed $i$; nearly the fame with that in other modern editions; but
at the botrom of cach page are various readings, amcuntnearly the fame with that in other modern editions; but
at the botrom of cach page are various readings, ancunting in the whole to abnve 2000, and many if them of great confequence, cellected fiom manufcripts, printed great confequence, cellected fiom manufcripts, printch
editions, copies of the Talmud, and the works of the moft renowned Robbies. And in one of the notes is this remark:-" That in feveral pallages of the Heb:ew Bible the differences are fo many and fo great, that they know not which to fix upon as the true readings." We camnot quit the fubjeet without obferving, on Dr Kennicott's authority, that as the firt printed Bibles are more correct than the latter ones ; fo the variations between the firf edition, printed in 1488, and the edition of Vander Hooght, in 1705 , at Amfterdam, in 2 vols Svo, amount, upon the whole, to above 1200 ! See further Bosuyer and Niciols, p. 112-117.
When the art of printing was firf difcovered, they Anecdotes only made ufe of one fide of a leaf: they had not yet of early
found out the expedieat of imprefling the other. When printidg. only made ufe of one fide of a leaf: they had not yet of early,
fonnd out the expedie:t of imprefling the other. When printidg. their editions were intended to be curious, they omitted to print the fift letter of a chapter, for which they left a blank fpace, that it might be painted or illumina-
ted at the option of the purchafer. Severai ancient voleft a blank fpace, that it might be painted or illumina-
ted at the option of the purchafer. Severai ancient volumes of thefe early times have been found, where thefe letters are wanting, as they negleated to have them painted. When the art of printing was firt eftablifled, it was the glory of the learned to be correctors of the prefs to the eminent printers. Phyficians, lawjers, and biflops
themfelves, occapied this department. The printers then the eminent printers. Phyficians, lawyers, and bifiops
themfelres, occapied this deparment. The printers then added frequently to their narnes thofe of the correciors of the prefs; and editions were then valued according to the abilities of the ecrrestor.
In the productions of early printing may be diftinguithed the various fplendid editions they mad of Pri-
mers or Prayer-baks. Thes were embellifhed with cuts guithed the various fplendid editions they made of Pri-
mers or Prayer-baoks. They were embellifhed with cuts finithed in moft elegant tafte: many of them were lu. dicrous, and feveral were obfene. In one of them an angel is reprefented crowning the Virgin Mary, and angel is reprefented crowning the Virgin
God the Fary, and
himfelf alliting at the ceremony. We have feen in a book of natural hifory the Supreme Be-
ing reprefented as reading on the feventl day, when he have feen in a book of natural hifory the Supreme Be-
ing reprefented as reading on the feventh day, when he refted from all his works. Sometimes St Michael is feen overcoming Satan; and fonetimes St Anthony apfeen overcoming Satan; and fonetimes St Anthony ap-
pears attacked by various devils of molt hidens forms. 'The Pranter of Salifory', 1533 , is full of cents: at the
bottom of the ticle page ther- is the collowing rematrab'e 'The Prymer of Salifury', 1533 , is full of cuts: at the
bottom of the title page ther- is the following remankab'e prayer: the prets, and echions wore then valued accordirg to

> God be in my Bede,
> And in my Unuerfandynge.
> God be in my Eyen,
> And in my lookynge.

## Method of

 printing.God be in my Mouthe, And in my Spekynge. God be in my Herte, And in my thinkinge.
God be at myn ende, And at my departynge.
The workmen employed in the art of printing are of two kinds : compofitors, who range and difpofe the letters into words, lines, pages, \&x. according to the copy delivered them by the author; and preffimen, who apply ink upon the fame, and take off the impreffion. The types being caft, the compofitor difzibutes each kind by itfe'f among the divifions of two wooden frames, an upper and an under one, called cafes; each of which is divided into little cells or boxes. Thofe of the upper cafe are in number 98 : thefe are all of the fame fize; and in them are difpofed the capitals, fmall capitals, accented letters, figures, sic. the capitals being placed in alphabetical order. In the cells of the lower cafe, which are 54 , are placed the fmall letters, with the points, fpaces, \&c.. The boxes are here of different fizes, the largeft being for the letters moft ufed; and thefe boxes are not in alphabitical order, but the cells which contain the letter oftenelt wanted are neareft the compofitor's hand. Each cafe is placed a little allope, that the compolitor may the more eafily reach

Plate
$\operatorname{cccc} x \mathrm{y}$ the upper boxes. The infrument in which the letters are fet is called a compofing fick ( $\mathrm{n}^{\circ} \mathrm{I}$.), which confits of a long and marrow plate of brafs or iron, Scc. on the right fide of which arifes a ledge, which runs the whole leng tho f the plate, and ferves to fuftain the letters, the fides of which are to reft againlt it ; along this ledge is a row of holes, which ferve for introducing the forew a in order to lengthen or thorten the extent of the line, by moving the dliders $b$ s farther from or nearer to the thorter ledge at the end $d$. Where marginal notes are required in it work, the two fliding pieces be are opened to a proper diftance from each other in fuch a manner as that while the dittance between $d c$ forms the length of the line in the text, the diftance between the two fliding-pieces forms the length of the lines for the note's on the fide of the page. Before the compofitor proceeds to compofe, he puss a rule or thin nip of brafsplate, cut to the length of the line, and of the fame height as the letter, in the compofing-fliek, againt the ledge, for the letter to bear againft. Things thus prepared, the compofitor having the copy lying before him, and his ftick in his left hand, his thumb being over the flider $c$; with the right he takes up the letters, fpaces, \&ic. one by one, and places them againtt the rule, while he fupports them with his left thumb by preffing them to the end of the flider $c$, the other hand being conftantly em. Floyed in ietting in other letters: the whole being performed with a degree of expedition and addrefs not eafy to be imagined.

A little being thus compofed, if it end with a word or fyllable, and exactly fill the meafure, there needs no further care; otherwife, more fpaces are to be put in, or elie the diftance leffiened, between the feveral words, in order to make the meafure quite full, fo that every line may end even. The fpaces here uled are pieces of metal exactly fhaped like the fhanks of the letters: they are of various thickneffes, and ferve to fupport the letsers, and to preferve a proper difance between the
words; but not reaching fo high as as the letters, they make no impreflion when the work is printed. The firit line being thus finifhed the compofitor proceeds to the ne:st ; in order to which he moves the brafs-rule from behind the former, and places it before it, and thus compofes another line againftit after the fame marner as before; going on thus till his ीlick is full, when he empties all the lines contained in it into the gally.

The compolitor then fills and empties his compofingflick as before, till a complete page be formed; when he ties it up with a cord or pack-thread; and fetting it by, proceeds to the next, till the number of pages to be contained in a theet is comp'eterl; which done, he carries them to the impoting, flone, there to be ranged in order, and faftened toget her in a frame called a cljafo; and this is termed impofing. The chafe is a reangular irn frame, of different dimenfions acerrding to the fize of the paper to be printed, having two crofs-pieces of the fame metal, called a long and hort crofs, mortifed at each end fo as to be taken out occali mally. By the different fiturations of thefe crofles the chafe is fitted for different volumes: for quartos and octavos, one traverfes the middle lengthwife, the other broadwife, fo as to interfect each other in the centre : for twelves and twentyfours, the fhort crofs is thifted nearer to one end of the chafe; for folios, the long crofs is left entirely out, and the thort one left in the midale; and for broadfides, both croffes arc fet afide. To drefs the chafe, or range and fix the pages therein, the compofitor makes ufe of a fet of furniture, confiling of flips of wood of different dimenfions, and about half an inch bigh, that they may be lower than the letters: fome of thefe are placed at the top of the pages, and called bead-ficks; others between them, to form the inner margin; others on the fides of the croffes, to form the outer margin, where the paper is to be doubled; and others in the form of wedges to the fides and bnttoms of the pages. Thus all the pages being placed at their proper diftances, and fecured from being injured by the chafe and furniture placed about them, they are all untied, and faltened together by driving fmall picces of wood called quoins, cut in the wedge-form, up between the flanting fide of the joot and the fide fticks and the chafe, by means of a piece of hard wood and a mallet; and all being thus bound falt together, fo that none of the letters will fall ont, it is ready to be committed to the preffmen. In this condition the work is called a form; and as there are two if thefe forms requircd for every fheet, when both fides are to be printed, is is necelfary the diftances between the pages in each form fhould be pliced with fuch exactuefs, that the impreffion of the pages in one form fhall fall exacly on the back of the pages of the other, which is called regifler:

Asit is impoffible but that there muft be fome miftakes in the work, eithe: through the overfight of the compofitor, or by the cafual tranfpofition of letters in the cales; a fleet is printed off, which is called a proof, and given to the corrector; who reading it over, and rectifying it by the copy, making the alterations in the margin, it is delivered back to the compofitor to be corrected.

The compofitor then unlocking the form upon the correcting-ftore, by loofening the quoins or wedges which bound the letters together, rectifies the miftakes

## PR I [ 525 ] PR I

ng. by picking out the faulty or wrong letters with a flender fharp-pointed Acel-bodkin, and putting others into their places. After this another proof is made, fent to the author, and corrected as before; and lafly, there is another proof culled a revife, which is made in order to fee whether all the miftakes marked in the laft proof are corrected.

The prefinan's bulinefs is to work off the forms thus prepared and correfied by the compofitor; in doing which there are four things required, paper, ink, balls, and a prefs. To prepare the paper for ue, it is to be firft wetted by dipping feveritl thects toge her in water: thefe are atterwards laid in a heap over eacls other; and to make them take the water equally, they are all preffed clofe down with a weight at the top. The ink is made of oil and lamp-black; for the manner of preparing which, fee Printing-INK. The balls, by which the ink is applied on the forms, are a kind of wooden funnels with hardles, the cavities of which are filled with wool or hair, as is alfo a piece of alum !cather or pelt nailed over the cavity, and made extremely foft by foaking in urine and by being well rubbed. One of thefe the preffman takes in cach hand; and applying one of thes to the ink-block, daubs and works them together to diftribute the ink equally ; and then blackens the form which is placed on the prefs, by beating with the balls upon the face of the letter.

The printing-prefs, reprefentect $n^{\circ} 2$, is a very cuXv, rious though complex machine. The body confifts of two firong cheeks $a$, placed perpendicularly, and joined together by four crofs pieces; the cap $b$; the head c, which is moveable, being partly fuflained by two iron pius or long bolts, that pats the cap; the till or fhelf $d d_{1}$ by which the fpindle and its apparatus are kept in their proper porition ; and the winter $c$, which bears the carriage, and fuftains the effort of the prefs beneath. The fpindle $f$ is an upright piece of iron pointed with fteel, having a male ficrew which gees into the female one in the lead about four inches. Through the eye $g$ of this fpindle is fallened the bar $k$, by which the preffman makes the impreffion. The frindle paffes through a hole in the middle of the till; and its point works into a brafs pan or nut, fupplied with oil, which is fixed to an iron plate let into the top of the platten. The body of the fpindle is futtained in the centre of an open frame of polifled iron, $1,1,2,2,3,3$, fixed to it in fuch a manner as, without obfructing its free play, to keep it in a fteady direction; and at the fame time to ferve for fufpending the platten. This frame confifts of two parts; the upper called the garter, 1, 1; the under, called the crane, 2, 2. Thefe are connected together by two fhort legs or bolts, 3,3 ; which being fixed below in the two ends of the crane, pals upward, through two holes in the till, and are rcceived at top into two eyes at the ends of the gatter, where they are fecured by forews. The carriage $/ l$ is placed a foot below the platten, having its fore-part fupported by a prop called the fore-flay, while the other refts on the winter. On this carriage, which fuftains the plank, are nailed two long iron bars or ribs; and on the plank are nailed thort pieces of iron or ncel called cramp-irons, equally tempered with the ribs, and which flide upon them when the plank is turned in or out. Under the carriage is fixed a long piece of iros called the $\int p i t$, with a double
wheel in the middle, round which leather-girts atre faf. brintre. tened, nailed to cach end of the plank: and to the outbide of the fpit is fixed a rounce $m$, or handle to turn. round the wheel. Upon the plank is a fquare frome or coffin, in which is inclofed al polifhed fone on which the form $n$ is laid; at the end of the coflin are threc frames, viz. the two tympans and frifket : the tympans o are fquare, and made of three Rips of very thin wood, and at the sop a piece of irn ftill thinner; that ealled the outcr tympan is faltened with hinges to the coffin: they are both covered with parchment ; and between the two are placed blankets, which are neceflary to tal:e off the impreffion of the letters upon the paper. The friket $p$ is a fquare frame of thin iron, faftened with hinges to the tympan: it is covered with paper cut in the neceffary places, that the fheet, which is put between the friket and the great or oulward tympan, may rcceive the ink, an I that nothing may hurt the margins. To regulate the margins, a flect of paper is fatened upon this tympan, which is called the tympan heect; and on each fide is fixed an iron point, which makes two holes in the fheet, which is to be placed o:3 the fame points when the imprefion is to be made on the other fide. In preparing the prefs for working, the parchment which covers the outer tympan is wetted till it is very foft, in order to render the impreffion more equable ; the blankets are then put in, and fecured from flipping by the inner tympan: then while one prefiman is beating the letter with the balls $q$, covered with ink taken from the ink-block, the other perfon places a fleet of white paper on the tympan-theet; turns down the frifket upon it, to keep the paper clean and prevent its flipping; then bringing the tympans upon the form, and turning the rounce, he brings. the form with the fone, \&c. weighing about 300 lb . weight, under the platten; pulls with the bar, hy which means the platten preffes the blankes and paper: clofe upon the letter, whercby half the form is printed; then eafing the bar, he draws the form nill forward; gives a fecond pull; and letting go the bar, turns back the form, takes up the tympans and frifket, tales out the printed theet, and lizys on a frelh one; and this is repeated till he has taken off the impreffion upon the full number of fleets the edition is to confint of. One fide of the fheet being thus printed, the form for the other is laid upon the prefs, and worked off in the fanc manner.
Chinefe Printinc, is performed from wooden planks or blocks, cut like thofe ufed in priating of callico, paper, cards, sec.

Rolling-prefs PRINTAG, is employed in taking off prints or impreflions from copperplates engraven, ctched, or fcraped, as in mezzotintos. See Engraving.

This art is faid to have been as ancient as the year 1540, and to owe its origin to Finiguerra, a Fherentine goldimith, who pouring fome melted brimitone on an engraven plate, found the exact impreflion of the engraving left in the cold brimfone, marked with black taken out of the frokes by the liquid fulphur: upon this he attempted to do the fame on filver plates with wet paper, by rolling it fmoothly with a roller ; and this fucceeded: but this art was not ufed in Ens. land till the reign of king James I. when it was bronght from Antwerp by Speed. The form of the rolling
prefs

## PRI

Iriming. prefs, the compofition of the ink ufed therein, and the
manner of applying both in taking off prints, are as foll.w:

Plate
cclexv.
parts, the body and carriage: the body confifts of two wooden cheeks PP, placed perpendicularly on a lland or foct LM, which fuftains the whole prefs. From the foct likewife are four other perpendicular pieces $c, c, c, c$, joined by other crofs or jocrizontal ones $d, d, d$, which ferve to fuftain a im oth even plank or table HIK, about four feet and a half long, wo feet and a half broad, and an inch and a half thick. Into the cheeks go two wooden cylinders or rollers, DE, FG, ahout fix inches in diameter, borne up at each cnd by the checks, whofe ends, which are leffened to about two incles diameter, and called tramions, turn in the cheeks abuut two rieces of wood in form of halfmoons, lined with polifhed iron to facilitate the motion. Laltly, to one of the trunninns of the upper roller is faltened a crofs, contiling of tro levers $A B$, or fieces of wood, traverfing each other, the arms of which crof, ferve inftead of the bar or handle of the letter-prefs, by tuming the upper roller, and when the plank is between the two rollers, giving the fame motion to the under one, by drawing the plank forward and backward.

The ink ufed for copperplates, is a compofition zade of the itones of peaches and apricots, the bones of theep and ivory, all well burnt, and called Frankjout llach, mixed with nut-oil that has been well boiled, and ground together on a marble, after the fame mamer as painters do their colours.

The method of printing from copperplates is as follows : They take a mall quantity of this ink on a rubber made of linen-rags, ftrongly bound about each other, and therewith fmear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being fufficiently inked, they firt wipe it over with a foul rag, then w th the palm of their left land, and then with that of the right; and to dry the hand and lorward the wiphg, they rub it from time to time in whiting. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the addrefs of the workman contifts. The plate thus prepared, is laid on the plank of the prefs; over the plate is laid the paper, firlt well moiltened, to receive the impreflion; and over the paper two or three folds of Hannel. Things thus difpofed, the arms of the crofs are pulled, and by that means the plate with its furniture palfed through between the rollers, which pinching very llrongly, yet equally, prelles the moiltened paper into the lirokes of the engraving, whance it licks out the ink.

Prints, the imprefions talen from a copperplate. Sce the lalt article, and Engraving.

From the facility of being multiplied, prints have derived an advantage over paintings by no means inconfiderable. They are found to be more durable; which may, however, in fome degree be attributed to the different methods in which they are preferved. Many of the belt paintings of the early naters have generally had the misfortune to be either painted on walis, or depefited in large and unfrequented, and confequently damp and deftructive, buildings; whillt a print, pafing,
at diftant intervais, from the porte ferille of one collector to that of another, is preferved without any great exertion of its owner: And hence it happens, that whilft the pietures of R.phael have mouldered from their walls, or deferted their canvas, the prints of his friend and cotemporary Mark Antonio Raim andi continue in full perfection to this day, and give us a lively idea of the beautics of thofe paintings, which, without their affift. ance, had been I ft to us for ever ; or at leaft, could have been only known to us, like thofe of Zeuxis and Apelles, by the delcriptions which former writers on there fubjects have left us.

Independent of the advantages which prints afford us, when confidered as accurate reprefentations of paintings, and imitations of fuperior productions, they are no lefs valuable for their pofitive merit, as immediate reprefentations of mature. For it mult be recoliected, that the ant of engraving las not always been confined to the copying other productions, but has frcquently iffelf afpired to originality, and has, in this light, produced more inttances of its excellence than in the other. Albert Durer, Golizius, and Jembrant, amongft the Dutch and Germans; Parmigiano and Della Bella amongit the Italians, and Callot amongit the French, have publifhed many prints, the fubjects of which, there is great reafon to fuppofe, were never painted. Thete pints may therefore be conlidered as original pictures of thole malters, deficient only in thofe particulars in which a print muft neceflarily be inferior to a printing.

The preceding diftindtion may perhaps throw fome light on the proper method of arranging and clating a collection of prints, which has been a matter of nofmall difficulty. As an art imitating ano:her, the principal Thould take the lead, and the defign, compolition, and drawing, in a print, being previous requifites to the manmer of execution and finifhing ; prints engraved after paintings fhould be arranged under the name of the painter; and every perfon who looks upon engraving only as auxiliary to painting, will confequently adopt this mode of arrangement. But when engraving is confidered as an original art, as imitating nature without the intervention of other methods, then it will certainly be proper to regulate the arrangement according to the names of the engravers.

PRIOR, in general, fomething before or nearer the begiming than another, to which it is compared.

Prior, more particularly denotes the fuperior of a convent of monks, or the next under the abbot. Sec Abiot.

Priors are either claufral or conventual. Convontual are the fame as abbots. Cluuflual prior, is he who governs the religious of an abbey or priory in commentum, having his jurifdiction wholly from the abbot.

Grant Prior, is the fuperior of a large abbey, where feveral fuperiors are required.

Prior (Matthew), an eminent Englifh poet, was born at London in 1664. His father dying while he was very young, an uncle a vintner, having given him fome education at Weftminfter fchool, took him home in order to breed him up to his trade. However, at his leifure hours he profecuted his fludy of the claffics, and efprecially of his favourite Horace. This introduced

## PRI

troduced him to fome polite company, whofrequented his uncle's houle; among whom the earl of Dcrfe: took particular notice of him, and procured him to be fent to St John's college in Canbridge, where, in 1686, he took the degree of A. B. and atterwards became fellow of that college. Upon the revolution, Mr Prier was brought to court by the eall of Durfet; and in 1690 he was made fecretary to the earl of Berkele 5 , plenipotertiary at the Hague; as he was afterward to the ambafiador and plenipotentiaries a: the treaty oi Ryfisick in 1697; and the year following to the earl of Po:tland, ambafador to the court of France. He was in 1697 made fecretary of fiate for Ireland; and ia $1 ; 00$ was appoinced one of the lords commilfioners of trade and planations. In 1-10, he was fuppofed to have had a thare in writing The Examizer. In 1-1t, he was made one of the commifit ners of the cuftums; and was fent miniter plenipotentiary to France, for the negociating a peace with that kirg. dom. Suon after the acceltion of George 1 . to the thrine in 1714 , he prefented a memorial to the court of France, reqairng the demolithing of the canal and new works at Mardyke. The year following he was recalled; and upon his arrival was taken up by a warrant from the houre of commons, and Aristly examined by a committe of the privy-council. Robert Walpole, Efq; mored the havie of commons for an impeachment aga nft him; 2nd Mr Prior was ordered into clofe cuftody. In $17^{-1}$, he was excepted rut of the at of grace; huwever, t: he clole of that year, be was fet at liberty. The remain ler of his days he fpent in trancuillity and retiremem ; and d ed in $t: 21$. Ifis poems are weil known, and jufly admired. He is fad to have writien the following epituph for himfelf:
"Nobles and heralds, by your leave, Here lie the bones of Mit hew Prior, The fon of Adam and of Eve: Let Bourbon or Natau go hisher."
Aiten $P_{\text {KIORIEs, }}$ were cells of the religions houfes in England which belonged to iercign monateries: for whien manors or tithes were giver. $t$ f reign convents, the monks, either, to increafe their own rule, or rather to have faithful therards of their reventes, buili a fmall convent there for the recertion o! fuch a number as they thoughi proper, and conftituted priors over them.Within thefe cell:s there was the lame diltination as in thefe priorics which were cells fubordinate to fome great abbey ; fome of thefe were conventual, and, having pricrs of their own clioofing, thereby became entire focieties within themfeives, and received the revenues bclonging e) their feveral houfes for their own ufe and benent, paying only the ancient apport (A), acknowle. Jgment, or cbrention, at firf the furplufage, to the fureign houfe; but otbers depended entirely on the foreign tinufes, who appointed and removed their priors at plea-ure. There ir-nimitted all their reventes to the f reicn head houfes; for which reafon their eftates were generally feized to carry on the wars between

England and France, and refored to them again on return of peace. Thefcalien priories were moft of them founded by fuch as had inreign abbeys founded by themfelres or by fome of their family.
The whole number is not exafly afeertained: the Monafticon hath given a lift ef 100 : Weever, p. 338. §ays 110.

Some of thefe cells were made indizenous or denizo:1, or endenized. The alien priories were firt feized by Edwarl I. 1285 , on the breaking out of the war between France and England; and it appears from a roll, that Edward 11. aliio feized them, thoush this is not mentioned by our hiftorians; and in thicie the att of reftitution I Ed. Ill. feams to reter.

In 1337, Edwa:d III, envificated their enates, and lct out the priories themfelves with all their lazds and tenements, at his pleafure, for 23 years; at the end of which term, paace being concluded between the two nations, he refored their eftates 1361 , as appears by his leters patent to that of Montacutc, county of $\sqrt{ }$ onmerfet, printed at large in Rymer, vo!. vi. F. 311 and tranflated in Weever's Furcrul ALonamants, P. 3.39. At other times he granted their lands, or lay pention; out of them, to divers noblemen. They were alfo fequeftered during Richari II.'s reign, and the head monafteries abroad had the king's lieence to fell their lands to other religious houres or to any particular perfons who wanted to endow others.

Henry IV'. began his reign with fhowing fome favour to the alien priories, reft-ring all the conventual ones, only referving to himiclf in time of war what they paid in time of pace to the toreign abbeys.
They were all difolved by aft of parliament 2 Henry V. and all their eftates vefted in the crown, except fome lands granted to the college of Fotheringhay. The at of diffolution is not printed in the fattute books, but it is to be found entire in Rymer's $F_{\circ}-$ dera, IX. 283 . and in the Parliament Rolls, vol. iv. p. 22. In geacral, there lands were appropriated to religious ufes. Henty VI. endowed his foundations at Eton in Cambridge with the lands of the al:en priories, in purfuance of his father's delign to appropria:e them all to a noble college at Osford. Oihers were granted in fee to the prelates, nobility, or priva:e perfons. Such as remaired in the crown were granted by Henry VI. 1440 , to a rcbifhop Chichley, Eic. and they became part of his and the royal fuundations. See Soms Account of Alion-frioris, Scc, in two volumes oetaro.
PRIORITY, the relation of fomething confidered 25 prior to another.

Priority, in law, denotes an antiquity of tenure, ia comparifon of another lefs ancient.

PRISCIANUS, an eminent grammarian, born at Crefarea, taught at Coeftantinople wih great repuration about the year 525 . Laurentins Valla calls Prifcian, Donatus, and Servius, triunviri in re grannatica ; and thinks none of the ancients who wrote after them fit to be mentioned with them. He compofed a work De arte grammatica, which was firlt printed by Aldus
(A) Apportus or apporfagium (from fortare), an acknowledgment, oblation, or obvention, to the mother bouf or church. Da Cange.

Wrifil in- at Venice in ${ }^{1}+76$; and another $D$ e naturalibus quefitonibus, which he dedicated to Chofrces king of Perlin: befide which, he tranflated Dionyfius's defcription of the world into Latin verfe. A perfon who writes falle Latin, is proverbially faid to " break Prifcim's hcad."

PRISCILLIANISTS, in church-liftory, Chriftian heretics, fo called from their leader 1rifcillian, a Spaniard by birth, and bifhop of Avila. He is faid to have pranifed magic, and to have maintained the principal errors of the Manichees ; but his peculiar tenet was, That it is lawful to make falfe oaths in order to fupport ore's caufe and intere?.

PR1SM, an obinng folid, contained under more than four planes, whofe bafes are equal, parallel, and alike fituated. See Oprics, $1^{\circ}{ }^{142}$.

P'RISON, a goal, ot place of confinement.
Lord Ccke obferves, that a prifon is only a place of fafe cuftody, fatoa cufforia, rot a place of puaifhment. If this be fo, and it cannot be queftioned, prifons ought not to be, what they are in moft parts of Europe, loathrume dungeons. Any place where a perfon is confined may be faid to be a prifon; and when a frocefs is iffued againlt one, he muft, when arrefled thereon, either be committed to prifon, or be bound in a recoznizance with fureties, or elfe give bail, accerding to the nature of the cafe, to appear at a certain day in court, there to make anfwer to what is alledged againf him. Where a perfon is taken and fent to prifon, in a civil cafe, he may be releafed by the plaintiff in the fuit ; but if it be for treafon or felony, he may not regularly be difcharged, until he is indicied of the falt and aequited. See Indictment, and the next article.

PRISONER, a perfon reftrained or kept in prifon upon an ation civil or criminal, or upon commendment: and one may be a prifoner on matter of record, or matter of fact. A prifoner upen matter of record, is he who, being prefent in court, is by the court committed to prifon; and the other is one carried to prifon upon an arreft, whether it be by the fheriff, confable orother officer.

PRISTIS, the SAwFISH, is generally confidered as a fpec es of the fqualus or /hark gcnus, comprehending under it feveral varieties. Mr Latham, however, is of opinion that it ought to be confidered as a dillind genus itfelf, and that the characteriftics of the feveral varieties are fufficient to conflitute them diftinct fpecies. According to him therefore the prijits is a genus belonging to the order of amptibia nontes; and its characiers are as follow: A long plane beak or finout, with Spines growing like teeth out of both edges; four or five fpiracula, or breathing apertu: es, in the fides of the neck: the body is oblong and almoft round, with a rough coriaceous fkin; the month is fituated in the lower part of the head; and the noftrils, before the mouth, are lalf covered with a membranaceous lobe; behind the eys are two oval holes; the ventral fins ap. proach one another, and in the male are placed about the organs of generation ; there are no fins at the anus. Of this genus our author enumerates five fpecies.

1. Prifus antiqu, rum. The head is rather flat at top ; the cyes large, with yellow irides; bchind each is a hicle, which fome have fuppofed may lead to an organ of heaing. The mouth is well furnilhed with teeth,
but they are blunt, ferving rather to bruife its prey than to divide it by cutting. Before the mouth are two foramina, fuppofed to be the noftrils. The roArum, beak, or floout, is in general about one-third of the total length of the fifh, and contains in fome is, in others as tar :1s 23 or 24 fpines on each fide; thefe are very ftout, much thicker at the back-part, and channelled, incliniug to an edge forwards. The fins are feven in number-viz. two dorfal, placed at fome diftance from each other-two pectoral, taking rife juf behind the breathing-holes, which are five in num-ber-two ventral, fituated almoft underne.th the firft dorfai-and lafty the caudal, occupying the tail both above and beneath, but longelt on the upper part. 'ithe general colour of the body is a dull grey, or brownifh, growing paler as it approaches the belly, where it is nearly white. 2. Petiinalus, which, with the former fpecies, grows to the largelt fize of any that have yet come under the infpection of the naturalit, fome feecimens meafuring 15 feet ia length. The pectinatus differs from the priftis antiquorum, in having the foout more narrow in proportion at the bafe, and the whole of it more flender in all its parts; whereas the firft is very broad at the bafe, and tapers confiderably from thence to the point. The fpines on each fide alfo are longer and more flender, and vary from 25 to 34 in the different fpecimens: we have indeed been informed of one which contained no lefs than 36 fpines on each fide of the fnout; but we muft confel's that we have never been fortunate enough to have feen fuch a fpecimen. 3. Cufpidatus, of which our author has feen only two fpecimens, the one about a foot and a half in length, and the other more than two feet and a half. In both of thefe were 28 fpines on each fide; tut the diftinguifhing feature is in the fpines themfelves, being particularly flat and broad, and flaped at the point more like the lancet ufed by furgeons in bleeding, than any other figure. We believe that no other anthor has hitherto taken notice of this fpecies. 4. Microdow, of which the total length is 28 inches, the fnout occupying 10 ; from the bafe of this to that of the pectoral fins four inches; between the pectoral and ventral fins fix. The two dorfal fins occupy nearly the fame proportions in refpect to cach other; but the hinder one is the fmalleft, and all of them are greatly hollowed out at the back-part, much more fo than in the two firt ipecies. The fnout differs from that of every other, in feveral particulars: it is longer in proportion, being more than ons-third of the whole fifl. The fpines do not fland out from the fides more than a quarter of an inch, and from this circumfance feem far lefs capable of doing injury than any other feccies yet known. 5. Cirratus, of which, continues our allo thor, we have only met with one fpecimen, which was brought from Port Jackfon in New Holland. It is a male, and the total length about 40 inches: the fnout, from the tip of it to the eye, it : the fpines widely different from any of the others; they are indeed placed, as ufual, on the edge, but are continued on each fide even beyond the eyes. The longer ones are fiender, flarp, fomewhit bent, and about 20 in num. ber; and between thefe are others not half the length of the primal ones, between fome three or four, between others as far as fix; and in general the middle one of thefe fmaller feries is the longeft : befide thefe a
, ers feries of minute ones may be perceived beneath, at the very edge. In the fnout likewife another fingularity ve. occurs:-about the middle of it, on each lide, ne:1r the edze, ariles a llexibee, ligamentous eord, about three inches and a half in length, appearing not unlike the beards at the mouth of fome of the gadus or ond genus, and no doubt as pliant in the recent flate. The colour of the fill is a pale brown: the breathing apertures four in number: the mouth furnithed with five rows of minute, but very harp teeth. Sec Plate CCCCXVI. where the fnout marked I is that of the prillis antiquorum ; that marked 2 , of pertinatus; and that marked 4, of microden : the entire fith is the cirratus.

I'RIVATEERS, are a kind of private men of war, the perfons concerned wherein adminifter at their own cofts a pait of a wat, by fitting out thefe thips of force, and providing them with all military fores; and they have, infead of pay, leave to keep what they take from the enemy, allowing the admiral his thare, \&ce.

Privateers may not attempt any thing againt the laws of nations; as to affault an enemy in a port or haven, under the protetion of any prince or republic, whecher he be friend, ally, or ncuter; for the peace of fuch places mut be inviolably kept: therefore, by a treaty made by King William and the States of Hol. land, before a commiflion fhall be granted to any privatecr, the commander is to give fecurity, if the thip be not above 150 tons, in L. 1500, and if the fhip exceeds that burcien, in L. 3000, that they will make fatisfaction for all damages which they thall conmmit in their courfes at fea, contrary to the treaties with that ftate, on pain of furfeiting their commifions; and the thip is made liable.

Befides thefe private commifions, there arc feecial commifions for privateers, granted to commanders of thirs, \&cc. who take pay; who are under a marine difcipline; and if they do not obey their orders, may $\mathrm{b}=$ punilhed with death: and the wars in later ages have given occafion to princes to ifine thefe commif. fions, th annoy the enemies in their commerce, and hinder fuch fupplics as might frengthen them or lengthen out the wat; and likewiie to prevent the feparation of thips of greater force fiom their fleets or fquadro: s.

Ships taken by Britifh privateers were to be divided into five parts; four parts whereof to go to the perfons interelled in the privateer, and the fifth to his ML-icfty : and as a farther encouragement, privateers, \&cc. deftroying any French man of war or privateer, fhall receive, for every piece of ordnance in the flip fo taken, L. Ic reward, sic.

By a particular fatute lately made, the lord admiral, or commifi ners of the admiralty, may grant conmillions to commanders of privateers, for taking thips, icc. which being adjudged prize, and the tenth part paid to the admiral, sce. wholly belong to the owners of the privateers and the capiors, in proportions agreed on hetwe: $n$ themfelves.

PRIVATI IT, in a general fenfe, denotes the abfence or want of fomething; in which ferfe darknefs is on! the priva ion of lighr.

PRIVA?IVE, in grammar, a particle, which, prefiaed to a werd, changes it into a coatrary fence. Thus, Yol. XV.
among the Grceks, the $\alpha$ is ufed as a primitive; as in a-9roc, albrif, acophahes, \&cc. - The Latins have the'r privitive in; as incorrizibilis, infectimabilit, \&c.-The Englith, French, \&c. on occation borrow both the Latin and Greek privatives.

PRIVERNUM, (Livy, Virgil); a tswn of the Volfci, in Latium, to the eaft of Setil. Privernates, the people. Whofe ambaffadors being afked, What punifhment they deferved for their revolt? anfwered, What thofe deferve who deem thenifelves worthy of libetty. And again, being aiked liy the Romian oonful, flould the puniflment be remitted, What peace was to be expected with them? If you grant a gnod peace, you may hope to have it fincere and halting; but if a bad one, you may well expest it ot thore continuance. At which aniwer, the Romans were fo far from being difpleafed, that by a vote of the people they had the frecdom of the city granted them. Pri. vornas, atis, the epithet. The town is now called Piperno Vechis, fituated in the Campania of Rome. E。 Long. 10. O. N. Lat. 41. 30.

## privet, in botany. Sce Ligustrum.

PRIVILEGE, in law, fome pecular bencfit granted to certain pesfons or places, contrary to the ufual courfe of the law.
Privileges are faid to be ferforal or ral.
Prifonal privileges are fuch as are extended to peers, ambalidors, members of parliament, and of the convocation, \&c. See Lords, Ambassador, Parliament, Arrest, \&ic.

A real privilege is that granted to fome particular place; as the king's palace, the courts at Weltminder, the univerfities, \&cc.

Privilages of the Clergy. See Clergy.
PRIVY, in law, is a partaker, or perion havisg an interelt, in any action or thing. In this fenfe they fuy, privies in blond: every heir in tail is privy to recover the land intailed. In old law-books, merchants privy are oppofed to merchants frangers. Coke mene tions four kinds of privies. Privies in blood, as ths heir to his fother; privies in reprefentation, as executors and adminiltrators to the deceafed; privies in eft.te, as he in reverinon, and he in remainder; donor and dionee; leflor and leffee: lafly, privy in tenure, as the lord by efcheat ; i.e. when land efclieats to the lord for want of heirs.

Privr-Council. See Couscil. The king's will is the fole contituent of a privy-coumelor; and it alio regulates their number, which in ancient times was about twelve. Afterwards it increafed to fo large a number, that it was found inconvenient for fecrecy and difpatclı; and therefore Chares II. in $\mathbf{6 7 9}$, limited it to 30 ; whereof 15 were priacipal officers of ftate, and to he counfellors ex officio; and the other 15 were compofed of 10 lords and five commoners of the king's choofing. Since that time however the number has been much augnented, and now comtinues indetinice. At the fame fine allo, the ancient office of lord prefident of the conncil was revivet, in the perlion of Amthony earl of Shaftefbury. Priyy-counfellos atie made by the king's nomisation, without cither patent or grant; and, ort taking the neceifary oaths, they be-com- immedately privy-counfellors during the lie of the king that chocies them, but fulje? to remowit at lis ditcretion.
his wicretion.

## PRI [530 ] <br> 1 R O

Pixy.
Any matural born fubject of England is capable of nothing thall be done upon it; and by 9 Ann, cap. 16. being at member of the privy-council ; taking the pro- it is enacted, that any perfons who fhall unlawfully atper oaths for feurity of the government, and the teft for feecrity of the churel. Dy the ald of fettlement, 12 and 13 W. III. cap. 2, it is cnacted, that no perfon born out of the dominions of the crown of England, unlefs born of Englifh parents, even though naturalized by parliament, fhall be capable of being of the prive-council. The duty of a privy-counfellor appears from the oath of office, which confilts of feven articles. 1. To advife the king according to the belt of his cunning and difcretion. 2. To advife for the king's honour and good of the public, without partiality, through aflection, love, meed, doubt, or dread. 3. To keep the king's counfel fecret. 4. To avoid corruption. 5. To help and frengthen the execution of what thall be there refolved. 6 . To withfand all perfons who would attempt the contrary: And, laflly, in general, 7. To obferve, keep, and do all that a good and true counfellor ought to do to his fovereign lord.

The privy-council is the primum mobile of the flate, and that which gives the motion and direction to all the inferior parts. It is likewife a court of juftice of great antiquity ; the primitive and ordinary way of government in England being by the king and priyycouncil. It has been frequently ufed by all their kings for determining controverfies of great importance: the ordinary judges have fometimes declined giving judgment till they had confulted the king and privycouncil; and the parliament have frequently referred matters of high moment to the fame, as being by long experience better able to judge of, and, by their fecrecy and expedition, to trantiof fome fate affairs, than the lords and commans. At prefent, the privy-council takes cognizance of few or no matters except fuch as cannot well be determined by the known laws and ordinary courts; fuch as matters of complaint and fudden emergencies: their conftant bufinefs being to confult for the public good in affairs of fate. This power of the privy-council is to inquire into all offences againt the goverament, and to commit the offenders to fafe cultody, in order to take thar thial in fume of the coutts of law. But their jurifdiction berein is only to i:.quire, and not to punifh ; and the perfons committed by them are intitled to their babeas corpins by fatute 16 Car. I. cap. IO. as much as if committed by an ordinary jultice of the peace.

In plantation or admiralty caufes, which arife out of the juridiation of the kingdom, and in matters of lunacy and idiocy, the privy-council bas cogrizance, cven in queflions of extenfive property, being the court of appeal in fuch caufes; or, rather, the arpeal lies to the ling's majelly hirrfelf in council. From all the deminions of the crown, exceping Great Britain and Ireland, an appellate juriddiction (in the laft refort) is vefted in this tribunal; which ufually exercifes its judicial authority in a committee of the whole privy coun(il, who hear the allegations and proofs, and make their report to his majefty in council, by whom the judgment is finally given.

Arciently, to litike in the houfe of a privy-counfellor, or clfewhere in his prefence, was grievoully punifhed: by 3 Hen. VII. cap. I 4 - if any of the king's fervarts of his houfehold confpire or imagine to take away the life of a privy-counfellor, it is felony, though
tempt to kill, or flall unlawfully affault, and frike, or wound, any privy-counfellor in the execution of his of fice, fhall be felons, and fuffer death as fuch. With advice of this council, the king iffues proclamations that bind the fubject, provided they be not contrary to law. In debates, the loweft delivers his opinion firft, the king laft ; and thereby determines the matter. A council is never held without the prefence of a fecretary of Itate.
'The diffolution of the privy-council depends upon the kings pleafure ; and he may, whenever he thinks proper, difcharge any particular member, or the whole of it, and appoint another. By the common law alfo it was diflolved ipfo fatio by the king's demile, or deriving ail its authority from him. But now, to prevent the inconveniences of having no council in being at the acceffion of a new prince, it is enatted, by 6 Ann, cap. 7. that the privy-council thall continue for fix months after the demife of the crown, unlefs fooner determined by the fucceffor. Bluck/j. Conn. book i. p. 229, \&c.

The officers of the privy.council are four clerks of the council in ordinary, three clerks extraordinary, a keeper of the records, and two keepers of the councilchamber. See President.

Privr Scal, a feal which the king ufes previoufly to fuch grants, \&ce. as are afterwards to pafs the great feal.
The privy feal is alfo fontetimes ufed in matters of lefs confequence, which do not require the great feal.

Lord Privr Seal. See Ketyer of the Privy Seal.
Clerks of the Privr Seal. See Clerk.
Prat Chamber. See Chamber.
PRIZE, or Prise, in maritime affairs, a veffel taken at feal from the enemies of a fate, or from pirates; and that either by a man of war, a privateer, \&c. having a commifion for that purpofe.

Veffels are looked on as prize, if they fight under any other ftandard than that of the fate from which they have their commiffion; if they have no chaterparty, invoice, or bill of lading aboard; if loaded with effects belonging to the king's enemies, or with contraband goods.

In Britifh hips of war, the prifes are to be divided amorig the oficers, feamen, \&sc. as his majefty hall appoint by proclamation ; but among privateers, the divifion is according to the agreement between the owners.

By fat. 13. Gen. II. c. 4. judges and oflicers, failing of their duty in refper to the condemnation of prizes, forleit L. 500 , with full colts of fuit ; one moiety to the king, and the other to the infermer.

PROA, flying, in mavigation, is a name given to a vefiel ufed in the fouth feas, becaufe with a brifk trade-wind it fails near 20 miles an hour. In the confruction of the proa, the head and Atern are exactly alike, but the fides are very difierent; the fide intended to be always the lee fide being flat; and the windward fide made rounding, in the manner of other velfels; and, to prevent her over-fetting, which from her fmall breadth, and the Araight run of her leeward fide, would, without this precaution, infallibly happen, there is a frame laid ont to her from windward, to the end of which is faftened a $\log$, fafhioned into the fhape of a fmall boat, and made hollow. The weight of the

abl- frame is intended to balance the proa, and the fmall boat is by its b:oyancy (as it is always in the w.ter) to prevent her overietting to windward; and this frame is nfually called an outioger. The body of the veffel is made of two pieces joined endwife, and fewed together with bark, for there is no iron ufed about her; the is about two inches thick at the bottom, which, at the gunwale, is reduced to lefs than onc. The fail is mide of mating, and the maft, jard, boom, and outriggers, are all made of bimboo. See Anjon's Voyage, quar:o, p. 341.

PROBABILLTTY is a word of nearly the fame import with likelihood. It denotes the appearance of truth, or that evidence arifing from the preponderation of argument which produces opinion. (See Opinion.) Locke clates all arguments under the heads of demonfratige and probable: Hume with greater accuracy divides them into demonf:ations, proofs, and probabilities. Demoneration produces fcience; proof, belief; :and probability, opinion.

Hardly any thing is fufceptible of frict demonfration befides the mathomatical friences, and a few propofitions in metaphyfical theolegr). Phyfics reft upon principles capabl:, fome of them, of complete proof by experience, and others of nothing more that probability by analogical reafoning. What has uiform'y happened, we expect with the fulleft confidence to happen again in fimilar circumftances; what has frequently happened, we likewife expect to happen again ; but our expectation is not confident. Uniform experience is proof; frequent experience is probability. The ftrnugeit man has alzuzys been able to lift the greaielt weight; and therefore, knowing that one man is Rronger than another, we expect, with confidence, that the former will lift more than the latter. The beit difciplined army has generally proved victorious, when all other circumitance were equal. We therefore expect that an army of veterans will, upon fair Fround, defeat an equal number of new levied troops: but as fidden panics have fometimes feized the oldent foldiers, this expectation is accompanied with doubt, and the utmolt that we can fay of the expected event is, that it is prosablc; whereas in the competitions between the two men, we look upon it as norally certsin. (See Nietarhysics, part 1. chap. vii. fec. 3.) When two or three perfons of known veracity attelt the fame thing as confifent with their knowledge, their tefimony amounts to proof, if not contradicted by the teftimony of others ; if contradifed, it can, at the utmoft, amount only to probabili:y. In common language we talk of circumffuattial p:oofs and prefumptive proois; but the expreffions are improper, for fuch evidence amounts to nothing more than probability. Of probability there are indeed various degres from the confines of certainty down to the confines of impoffibility; and a variety of circumfances tending to the f.tme point, though they ammint not to what, in Atriennefs of language, thould be calle 1 proof, afford to the mind a very high degree of evijence, upon which, with the addition of one direa teitimony, the laws of many countries take away the life of a man.

Probasialt of an Eucht, in the Dotrine of Chancis, is greater or leff according to the number of chances by which it may happen or fail. (See Expectation). The probatility of lfe is liable to the rules of computation. In the Encyclopedie Nethodique, we find a table of the
probabilities of the duration of life, cenfructed from that which is to be found in the ferenth volumee of the Supplemens i l'Hifoire de MI. de Buffon; of which the fol.

Iroulat: Irntay. lowing is an abridgrement.

Of 23,994 children born at the fame time, there will irubably die

PROBATE of a will or teftament, in law, is the exhibiting and proving of laft wills and teftaments before the ufficer delegated by the government of the place where the party died.

PROBATION, in the univerfities, is the examina. tion and trial of a fudent who is about to take his degrees.
Probation, in a monaftic fenfe, fignifies the ycar of a novitiate, which a religious muft pafs in a convent, to prove his virtue and vocation, and whether he can bear the feveritics of the rule.

Probation, in Scots law. See Law, p. 714.
PROBATIONER, in the churcls of Scotland, a ftudent in divinity, who bringing a certificate from a profeffor in an univerfity of his good morals, and his haring performed his exercifes to approbation, is admitted to undergo feveral trials; and, upon his acquiting himfelf properly in thefe, receives a licence to preach.

PROBATUMI Est (It is proved), a term frequent$1 y$ fubjoined to a receipt for the cure of fome difeafe.

PROBE, a furgeon's inftrument for examining the circumftances of wounds, ulcers, and other cavities, fearching for Rones in the bladder, \&cc.

PROBITY means hon fly, finccrity, or veracity; and confifs in the habit of acions ufeful to fociety, and in the conftant obfervance of the laws which juflice and confcience impofe on us. The man who obeys all the laws of fociety, with an exact punctuality is not therefore a man of probity; laws can only refpect the external and definite parts of human conduat, but prohity refpents our more private actions, and fuch as it is imponible in all caics to define; and it appears to be in morals what charity is in religion. Irchiity teaches us to perform in focicty thofe actions which no external power can oblige us to periorm, and is that quality in the humar mind from which we claim the periormance of the rights commonly celled imparfict. Sec Mural Philosoray.

Probicm PROBLEM, in logic, is a propofition that neither I appears abfolutely true nor falfe; and, confequently, may be afferted either in the affirmative or negative.

Problem, in geometry, is a propofition, wherein fome operation or confruction is required; as to divide a lire or angle, erect or let fall perpendiculars, \&cc. See Genmetry.

PROBOSCIS, in natural hifory, is the trunk or frout of an elephant, and fome other animals and infects.

Flies, gnats, \&c. are furnifhed with a probofcis or trunk; by means of which they fuck the blood of animals, the juice of vegetables, \&c. for their food.

PROBUS (Marcus Aurelius), from the fon of a gardener, became, by lis great valour as a foldier, and his eminent virtues, emperor of Rome, to which dignity he was raifed by the army. After having fubdued the barbarons nations that had made incurfions into different parts of the empire, where they conmitted horrid cruelties, and govemed with great wifdom and clemency, he was maffacred in the 7 th year of his reign, by fume foldiers who were weary of the public works at which he made then labour, in 282 .

POCATARCTIC CAUSE, in medicine, the pre exithing, or predifpofing caufe or occafion of a difeafe.
PROCELEUSMATICUS, in the aneient poetry, a foot confifing of four fhort fyllables, or two pyrrhychiufes; as bominibus.

PROCELLARIA, in ornithology ; a genus of birds, belonging to the order of anferes. The beak is fomewhat comprefied, and without teeth; the mandibles are equal, the fuperior one being crooked at the point; the feet are palmated, the hind claw being fer. diie, without any toe. Mr Latham (See his Index Orn:tholggicur, p. 820.) enumerates 24 ipecies, which are principally diftinguifhed by their colour. The mon remarkable are,

1. The cinerea, or petrel. The fize of this bird is rather fuperior to that of the common gull : the bill very tuong, much hooked at the end, and of a yellow rolnur. The noftrils are compofed of two large tubes, lodged in one theath : the head, neck, whote under fide of the body, and tail, are white: the back and coverts of the wings afh-coloured : the quill. feathers dufky : and the legs yellowifh. In lieu of a back toe, it has only a fort of fpur, or tharp ftraight nail. Thefe birds feed on the blubber or fat of whales, \&c. which being foon ennvertible into nil, fupplies them conftantly with means of defence, as well as provilion for their young, which they calt up into their mouths. They are likewife fiid to feed on forrel, which they ufe to qualify the metuous diet they live on. This fpecies inhabits the ifle of St Filda; makes its appeance there in November, and contimues the whole year, except September and Onober; it lays a large, white, and very brittle egg; and the young are hatched the middle of June. No hird is of fuch ufe to the inanders as this: the fulmar fupplies them with oil fur their lamps, down for their heds, a delicacy for their tables, a balm for their wounds, and a medicine for their ditempers. The fulmar is alfo a certain prognofticator of the change of the wind: if it comes to land, no weft wind is expected for fome time; and the contrary when it returns and keeps the fea. The whole genus of petrels have a peculiar faculty. of frouting from their bills, to a confiderable diftance,
a large quantity of pure oil ; which they do, by way of Proc in defence, into the face of any one that attempts to take them: fo that they are, for the fake of this panacra, feized by furprife; as this oil is fubfervient to the abovementioned medical purpofes. Martin tells us, it has been 1:fedin London and Edinburgh with fuccefs in theumatic cafes. Frederick Martens, who had opportunity of feeing valt numbers of thefe birds at Spitzbergen, obferves, that they are very bold, and refort after the whale filhers in great flocks; and that, when a whale is taken, they will, in fpite of all endeavours, light on it and pick out large lumps of fat, even when the animal is alive : That the whales are often difenvered at fea by the multitudes of them flying; and that when one of the former are wounded, prodigious multitudes immediately follow its bloody track. He adds, that it is a moft gluttonous bird, eating till it is forced to dif. gorge itfelf.
2. The pufinus, or thear-water, is 15 inches in length; the breadth 31 ; the weight 17 ounces: the bill is an inch and three quarterslong; nof trils tubular, but not very prominent: the head, and whole upper fide of the body, wings, tail, and thighs, are of a footy blacknefs; the under tide frum chin to tail, and inner coverts of the wings, white : the legs weak, and compreffed fidewife; dufky behind, whitiih before. Thefe birds are found in the Calf of Man; and, as Mr Ray fuppofes, in the Scilly ines. They refort to the former in February; take a fhort poffefion of the rabbet-burrows, and then difappear till A pril. They lay one egg, white and blunt at each end ; and the young are fit to be taken the beginning of Augut ; when great numbers are killed by the perfon who larms the ifle : they are falted and barrelled; and when they are boiled, are beaten with potatoes. During the day they keep at fea, filhing; and towards evening return to their young; whom they feed, by difcharging the contents of their ftomachs into their mouths; which by that time is tur ned into oil: by reafon of the backward fituation of their legs, they fit quite erect. They quit the ifle the latter end of Anguf, or beginning of September; and, from accounts lately received from navigators, we have reafon to imagine that like the form-finch, they are difperfed ovet the whole Atlantic ocean. This fpecies inhabits alfo the Orkney ines, where it makes its neft in holes on the earth near the fhelves of the rocks and headlands: it is called there the lyre; and is much valued, both on account of its being a food, and for its feathers. The inhabitants take and f.le them in Augult for winter provifions, when they boil them with cabbage. They alfo take the old ones in March; but they are then poor, and not fo well tafted as the young : they appear firft in thofe inlands in February.
3. The pelagica, or formy petrel, is about the buikof the hout-ivallow : the length fix inches; the extent of wings, 13. The whole bird is black except the coverts of the tail and vent-feathers, which are white: the bill is hooked at the cad : the nofrils tubular : the legs flender, and long. It has the fame faculty of fypouting oil from its bill as the other fpecies: and Mr Brumich tells us, that the inlabitants of the Ferroe iflcs make this bird ferve the purpofes of a candle, by drawing a wick through the mouth and rump, which being lighted, the flame is fed by the fat and oil of the body. Except in breeding.time, it is always at fea; and is. feen all over the vaft Allantic ocean, at the greatef
diftance:
laria. diftance from land ; often following the veffels in great
flocks, to pick up any thing that falls from on board: for trial fake, chopped fraw has been flung over, which they would ftand on with expanded wings ; but were never oblerved to fettle on or fwim in the water: it prefiges bad weather, and cautions the feamen of the approach of a tempeft, by collecting under the fern of the thips: it braves the utmoft fury of the form, fometimes tkimming with incredible velocity along the hollows of the waves, fumetimes on the fimmis: Clufius makes it the Camilla of the fea.

V'al mare per medium fuffu fu/penfo tumenti
Ferret iter, celeres nec tingeret aquore plantas. Virg.
She fwept the feas; and, as fle fkimm'd along,
Her flying feet unbath'd on billows hung. Dryden.
Thefe birds are the cypfelli of Pliny, which he places among the apodes of Arillocle ; not becaufe they wanted feet, but were kaxoroda, or had bad or ufelefs ones; an attribute he gives to thefe fpecies, on a fuppofition that they were almof always on the wing. In Augult 1772, Mr Pennint found them on the rocks called Macdonald's Table, off the north end of the ifle of Skie; fo conjectures they brced there. They lurked under the loofe ftones, but betrayed themfelves by their twittering noife.

In Mr White's Gournal of a Voyage to Neru Soutb Wales we have a figure of the fuliginous petrel, with a whitifl beak; which he takes to be a variety of the Proctlaria IEquinocialis of Linnæus. It is nearly of the fize of a raven; its colour is a deep footy brown or blackifh ; on the chin theere is a fmall patcl of white running down a little on each lide from the lower mandible; the beak is of a yellowifh white. See Plate CCCCXVI. Captain Bligh, in his Veyage to the Soutb Seas, in S. Lat. 60. I. and IV. Long. 71. 45. faw both petrels and pintadas; fome of which he took with baited books.

PROCESS, in law, denotes the proceedings in any caufe, real or perfomal, civil or criminal, from the original writ to the end thereof.

In a more limited fenfe, procefs denotes that by which a man is called firt into any temporal court.

It is the next ftep for carrying on the fnit, after fuing out the original writ. See Suit and Writ.

It is the method taken by the law to compel a compliance with the original writ, of which the primary ftep is by giving the party notice to obey it. This notice is given upon all real pracipes; and alfo upon all perfonal writs for injuries not againf the peace, by fummans; which is a warning to appear in court at the return of the original writ, given to the defendant by two of the fheriff's meffengers called funmonirs, either in perfon, or left at his houfe or land: in like manner as in the civil law the firft procefs is by perfonal citation, in jus rocando. This waming on the land is given, in real actions, by erecting a white ftick or wand on the defendant's grounds (which flick or wand among the northern nations is called the baculus munsiatorius), and by fatute 31 Eliz. c. 3. the notice muft alfo be proclairned on fome Sunday bcfore the door of the parifh-church.

If the defendant difobeys this verbal monition, the next procefs is by writ of attachment or pone; fo called from the words of the writ, pone per vadiunn et falvos flegios, "put by gage and fafe pledges A. B. the de-
fendant," \&e. This is a writ not iffring out of chancery, but ont of the conirt of cominon-pleas, being grounded on the non-appearance of the defendant at the return of the original writ; and thereby the theriff is commanded to attach him, by taking gage, that is, celtain of his goods, which he thall forfert if he doth not appear ; or by making him lind fafe fied es or fureties, which thall be amerced in catc of his non appearance. This is :lfo the firft and immediate procefs, without any previous fummons, upon actions of trefpafs. ai et armis, or for other injuries, which, though not forcible, are yot trefjalfes againft the peace, as circit and confpiracy; where the violence of the wrong requires a more fpeedy remedy, and thercfore the origina! writ commands the defendant to be at onee atuched, without any precedent wanting.

If, after attachment, the defendant neglects io appcar, he not only forfeits this fecurity, but is moreover to be farther compelled by writ of diflingas, or dilltefs ir finite: which is a fubfequent procefs iffuing from the court of common pleas, commanding the heriff to difrain the defendant from time to time, and con:inually afterwards, by taking his gcods and the profits of his lands, which are called ifues, and which he forfeits to the king if he doth not appear. But the ilfues may be fold, if the court thall fo direst, in order to defray the reafonable cofts of the plaintiff. In like manner, by the civil law, if the defendant abfoonds, fo that the citation is of no effest, mittifur advorfarius in poffefloinent boncrame ejus.

And here, by the common as well as the civil haw, the procefs ended in cafe of injuries without force: the defendant if he had any fubftamce, being gradually fripped of it all by repeated diltreffes, till he rendered obedience to the king's writ ; and, if he had no lubtance, the law held him incapable of making fatisfaction, and therefore looked upon all further procefs as nugatory. And hefides, upon feodal principles, the perfon of a feudatory was not liable to be attached for injuries merely civil', lef thereby his lord flould be deprived of his perfonal fervices. But, in cafes of imjury atcompanied with force, the law, to punifl the breach of the peace and prevent its difturbance for the future, provided alfo a procefs againtt the defendant's perfon, in cat he neglected to appear upon the former procefs of attachment, or had no fubfance whereby to be attached; fubjecting his body to imprifonment by the writ of cafius ad refpondichinai. But this immunity of the defendant's perfon, in cafe of peaceable though fraudulent injurics, producing great contempt of the law in indigent wrongdoers, a cafias was alfo allowed, to arrett the perfon in actions of account, though no breach of the peace be fuggetted, by the fatutes of Marlbridgc, 52 Hen. III. c. 23 . and Wefme 2.13 Edw. I. c. 11 . in ations of debt and detinue, by ftatute 25 Edw. III. c. 1\%. and in all actions on the cafe, by fatute ry Hen. VLI. c. g. Before which latt flatute a prastice hat been introduced of commencing che fuit by bringing all original writ of trefpafs quare claufum frogit, by breaking the phaintif's, clofe, vi et armis; which by the old comman law fub jected the defendant's perfon to be arrelted liy writ of capias: and then afterwards, by connivance of the court the plaintiff might proceed to profecute for any othe lefs forcible injury. This practice (through) cutumra ther than neceflity, and for faving fome trouble andee

## PRO

Frocefs. pence, in fuing out a fpecial original adapted to the particular injury) fill continues in almoft all cafes, except in actions of debt; though now, by virtue of the fatutes above cited and otheis, a copicius might be had upon almoft every fuecies of complaint.

If therefore the defendant, being fummoned or attached, makes default, and neglects to appear; or if the fheriff returns a nibil, or that the detendant bath nothing whereby lie may be furmmoned, attached, or diftrained, the coppas now ufually iffues: being a writ commanding the fheriff to take the body of the defendant, if he may be found in his bailiwick or countr, and him fafely to keip, fo that he may have him in court on the day of the return, to arfircr to the plaintiff of a plea of debt, or trefpats, sec. as the cafe may be. This writ, and all others fubequent to the original writ, not iffing out of chancery, but from the court into which theoriginal was rcturnable, and being groundcd on what has prafed in that court in confequence of the fheriff's return, are called jullici.al, not original, writs; they ilfue under the private feal of that coart, and not under the great feal of England; and are teffich, not in the hing's name, but in that of the chief jutice only. And thefe feveral writs being grounded on the theriff's return, muft relpectively bear date the fame day on which the writ immediately preceding was returnable.

This is the regular and orderly method of procefs. But it is now ufual in practice to fue out the capias in the firt inflance, upon a fuppofed return of the theriff; cfpecially if it be furpected that the delendant, upon notice of the acion, will atfond; and afterwards a fictitious original is drawn up, with a proper return thereupon, in order to give the proceedings a colour of resulatity. When this cafias is delivered to the fheriff, lic by lis under-fheiff grants a warrant to his inferior officers or bailiffs to execute it on the defendant. And, if the theriff of Oxfordfhire (in which county the injury is fupprefed to be committed and the action is hid) can1.0t find the defendant in his jurifdiation, he returns that he is not found, non eft inventas, in his bailiwick; whereupon another writ ifiues, called a teffation cafias, dirceted to the herifi of the county where the defendant is fuppred to refide, as if Berkfhire, reciting the former writ, and that it is teflificd, teflutann ef, that the defindant lurhs or wanders in his bailiwick, where he is commanded to take him, as in the former capias. But bere alfo, when the adtion is brought in one comaty and the defendant lives in another, it is ufual, for faving trotble, time, and expence, to make out a teflatum capius at the firlt ; fuppofing not only an original, but alfo a former capias, to have been granted; which in fact niever was. And this fietion, being beneficial to all parties, is readily acquiefced in, and is now become the fettled practice ; being one among many infances to illuftrate that maxim of law, that in fifionc juris conflyit cruitas.
But where a defendant abfoonds, and the plaintiff would proceed to an outlawry againt hint, an original writ mun then be fued out regularly, and atter that a copicis. And if the fheriff camot find the defendant upon the firlt writ of capias, and returns a non ef irvoiatus, Wicre iflies out an alias writ, and after that a p wries, to the fanie effect as the furmer : only after theee words " we commant you," this chafe is inferted, "as welave formerly," or, "as we have often commanded you;"-
"ficut alias," or, "ficut pluries, precepinims." And if a non eff inventus is returned upon all of them, then a writ of exigent or exigi fucias may be fued out, which requires the fleriff to caufe the detendant to be proclaimed, required, or exacted, in five county-courss fucceliively, to render himfelf; and if he does, then to take him, as in a capias: but if he does not appear, and is returned quinto exadus, he fhall then be outlawed by the coroners of the county. Alfo by flatute 6 Hen. VIII. c. 4. and 3 Eliz. c. 3 . whether the defendant dwells within the fame or another country than that wherein the exigens is fued out, a curit of proclumation thall iffue out at the fame time with the $c x i g e n t$, commanding the fleriff of the county, wherein the defendant dwells, to male three proclamations thereof in places the mof notorious, and mon likcly to come to his knowledge, a month before the outlawry thall take place. Such outlawry is puting a man out of the protection of the law, fo that he is incapable to bring :n action for redrefs of injuries; and it is alfo attended with a forfciture of all one's goods and chattels to the king. And therefore, till fome time after the conqueft, no man could be outlawed but for felony: lan in Bracton's time, and fomewhat carlicr, procels of ontlawry was ordained to lie in all actions for trefpuffes wi of armis. And fince, by a variety of fututes ( he fame which allow the writ of copias before-mentioned) rrucefs of ontlawry doth lie in divers actions that are merely civil; providing they be commenced by original and not by lill. If after outlawry the defendant appears publicly, he may be arrefed by a writ of cafias uthog stum, and cornmitted till the outlawry be reverfed. Which reverfal may be had by the defendant's appearing perfonally in court (and in the king's bench without any perfonal appearance, fo that he appears by attomey, according to fatute $4 \& 5$ W. \& M. c. 18.) and any plaufible caute, however flight, will in general be fufficient to reverfe it, it being confidered only a a procefs to compel an appearance. But then the defendint mult pay full cofts, and put the plaintiff in the fame condition as if he had appeared be. tore the writ of exigi facias was awarded.

Such is the firt piocefs in the court of common pleas. In the king's bench they may alio (and frequently do) proceed in certain caufes, particularly in attions of cjectment and trefpafs, loy original writ, with attachment and capias thereon; returnable, not at Weftminfter, where the common pleas are now fixed in confequence of nagna charta, but ubicunque fuerimus in Ang Fia, whercfuever the king thall then be in England; the king's bench being removable into any part of England at the pleafure and diferetion of the crown. But the more ufual method of proceeding therein is without any original but by a peculiar fpecies of procefs intitled a bill of Middlifex ; and therefore fo intitled, becaufe the court now fits in that county; for if it fat in Kent, it would then be a bill of Kent. For though, as the jultices of this coust have, by its fundamental conflitution, power tu determine all offences and trefpalfes, by the common law and cuflom of the realm, it needed no original writ from the crown to give it cognizance of any mifdemefnor in the county wherein it refides; yet ac, by this court's coming into any county, it immediately fuferfeded the ordinary adninifration of juntice by the general commifions of eyre and of oyer and terniner, a procefs of its own became ncceflary, within the county

## FRO [ 535 ] PRO

it fat, to bring in fuch perfons as were accused of com-
minting any forcible injury. She bill of Middlefex mitting any forcible injury. The bill of Middlefex (which was formerly always founded on a plaint of tretpals quatre clinton freoit, entered on the records of the court) is a kind of capias, directed to the flerif of that county, and commanding hin to take the defendant, and lave him before his lord the king at Weltmintler on a day prefixed, to anfwer to the plaintiff of a plea of trefpals. For this acenfation of trefpars it is that gives the court of king's bench jurifdistion in other civil cafes, fine, when once the defendant is taken into cuftody of the marthal, or prifon-keeper of this court, for the fuppofed trefpafs, he, being then a prifoner of this court, may here be prosecuted for any other facies of injury. Yet, in order to found this jurifdiction, it is not neceliary that the defendant be actually the marflall's prifoner; for, as foo as he appears, or puts in bail, to the procels, he is deemed by fo doing to be in fuck cuttody of the marthal as will give the court a jurifliction to proceed. And, upon there accounts, in the bill or process, a complaint of trefpafs is always fuggented, whatever elfe may be the real caufe of action. This bill of Middlefer mut be ferved on the defendant by the sheriff, if he finds him in that county : but if he returns, non eft inventus, then there iffues out a writ of latitat, to the Sheriff of another counts, as Berks; which is fimilar to the teflatum capias in the common pleas, and recites the bill of Middlefex and the proceedings thereon, and that it is teftified that the defendant latitat af difourrit, lurks and wanders about in Berks; and therefore commaids the theriff to take him, and have his body in court on the day of the return. But as in the common pleas the teflatum capias may be feed out upon only a luppefed, and not an actual preceding, capias; fo in the king's bench a latitut is usually fued out upon only a supposed, and not an actual, bill of Middlefex. So that, in fact, a latitat may be called the frt process in the court of king's bench, as the teflatum capias is in the common pleas. Yet, as in the common pleas, if the defendant lives in the county wherein the action is laid, a common capias fuffices; fo in the ling's bench likewife, if he lives in Middlefex, the process mut til be by bill of Middlefex only.

In the exchequer the frt process is by whit of quo minus, in order to give the court a jurifdiction over pleas between party and party. In which writ the plaintiff is alleged to be the king's farmer or debtor, and that the defendant lath done him the injury complanned of, quo minus fifficiens exiflit, by which he is the lets able to pay the king his rent or debt. And upon this the defendant may be arrefted as upon a capias from the common pleas.

Thus differently do the three courts feet out at firft, in the commencement of a fuit, in order to intitule the two courts of king's bench and exchequer to hold plea in fubjects causes, which by the original conftitution of Weitminfter-hall they were not empowered to do. Afterwards, when the cause is once drawn into the refpecfive courts, the method of purfuing it is pretty much the fame in all of them.

If the fheriff had found the defendant upon any of the former writs, the capias latitat, \&cc. he was anciently obliged to take him into cultody, in order to produce him in court upon the return, however fall and minute the cause of action might be. For, not
laving obeyed the original fummons, he hat flown a l'roects. contempt of the court, and was no longer to be trusted at large. But when the fimmons foll into ditufe, and the capias became in lite the firn process, it was thought hard to imprifon a man for a contempt which was only fiappofed : and therefore, in common cafes, by the gradual indulgence of the courts (at length autholife by tlatute 12 Geo. I. c. 29. which wats amended by ftatute 5. Geo. II. c. 27. and made perpetual by flatate 2 I Geo. II. c. 3.) the theriff or his officer can now only perfonally terse the defendant with the copy of the writ or proce $f$ s, and with notice in writing $t$, appear by his attorney in court to defend this action; which in effect reduces it to it mere fummons. And if the defendant thinks proper to appear upon this motie, his appearance is recorded, and he puts in fareties for his future attendance and obedience; which fire. ties are called common bail, being the fane two imagenary perfons that were pledges for the plaintiff's piofecution, John Doe and Richard Roe. Or, if the defendant does not appear upon the return of the writ, or within four (or in Come cafes eight) days after, the plaintiff may enter an appearance for him, as if he had really appeared; and may file common bail in the defendant's name, and proceed thereupon as if the defer. dant had done it himfelf.

But if the plaintiff will make affidavit, or affert upon oath, that the caufe of action amounts to ten pounds or upwards, then in order to arrelt the defendant, and make him put in fubftantial fureties for his appearance, called flecial bail, it is required by ftaiu'e I 3 Car. II. flat. 2. c. 2, that the true caufe of action fiould be expreffed in the body of the writ or process: cire no fecurity can be taken in a greater fum than L. 40. 'This feature (without any foch intention in the makers) had like to have outed the king's bench of all its jurifdiction over civil injuries without force: for, as the bill of Middlefex was framed only for actions of trefpafs, a defendant could not be arrefted and held to bail thereupon for breaches of civil erniracts. But to remedy this inconvenience, the officers of the king's bench devifed a method of adding what is called a clause of co eli mm to the ufual complaint of trefpafs; the bill of Middlefex commanding the defendant io be brought in to anfwer the plaintiff of a plea of treljpafs, and also to a bill of debt: the ecmplaint of trefpals giving connizance to the court, and that of debt authorities the arreft. In imitation of which, lord chief justice North, a few years afterwards, in order to fave the fuitors of his court the trouble and expense of fuing cut ferial originals, directed, that in the common pleas, befides the usual complaint of breaking the plaintiff's clepe, a clause of ae atom might be alpo added to the w: it of capias, containing the true cause of action; as, "that the raid Charles the defendant may answer to the plain. tiff of a plea of trefpafs in breaking his clone: and alto, ac etiam may anfwer him, according to the cuitom of the court, in a certain plea of trefpafs upon the care, upon promiles, to the value of L. $2 \approx$, Se." The fum fworn to by the plaintiff is marked upon the back of rile writ; and the meriff, or his officer the bailiff, is then obliged actually to arrelt or take into cufody the body of the defendant, and, having io done, to return the writ with a cepi corpus indorfed thereon. See Arrest.

When the defendant is regularly arrefted, he mut

Procefs. either go to prifon, for fale cultody; or put in fpecial bail to the fheriff. For, the intent of the arreft being only to compel an appearance in court at the return of the writ, that purpofe is equally anfivered, whether the lhcriff detains his perfon, or takes fufficient fecurity for his appearance, called lail ( $f \mathrm{rcm}$ the French word baillor, "to deliver)," becaufe the defendant is bailed, or delivered, to his fureties, upon their giving fecurity for his appcarance; and is fuppofed to continue in their friendly cuftody inftead of gring to gaol. See Bais. The method of putting in bail to the flaeriff is by entering into a bond or obligation, with one or more furcties, (not fictitious perfons, as in the former cafe of common bail, but real, fubftantial, refponfible bondfinen), to infure the defendant's appearance at the return of the writ ; which obligation is called the latilbond. The fheriff, if he pleafes, may let the defendant go without any fureties; bitt that is at his own peril: firr, after once taking him, the fleriff is bound to keep lim fafely, fo as to be forthoming in court; otherwite anation lies againft him fur an efeape. But, on the other land, he is obliged, by fatute 23 HIen . VI. c. 10. to take (if it be tendered) a fufficient bail-bond; and, by fatute 12 Geo. I. c. 29 . the theniff fhall take bail for no other fum than fuch as is fworn to by the Iflimiff, and indrofed on the back of the writ.

Upon the teturn of the writ, or within four days after, the defendant muft appear according to the exiency of the writ. This appearance is effected by putting in and junitying bail to the alion; which is commonly called fuling in bail above. If this he not done, and the b, ii that were taken by the theriff bolore are refponlible perfons, the plaintill may take an affignment from the therift of the bail-bond (under the flatute 4 \& 5 Anu. c. 16) and bring an ataion thereupon againit the therif’s bail. But if the bail fo accepted by the theriff be infolvent perfon", the plaintiff may procead againt the theriff himelef, by calling upon hini, firlt to returin the witit (if not already done), and afterwasds to bring in the body of the defendant. And if the theriff does not then caufe fuflicient bail to, be put in alove, he will himfelf be refponfible to the p! hintiff.

The bail above, or bail to the action, mult be put in either in oren court, or before one of the judges thereof: or clfe, in the country, before a commifioner appoimed for that purpofe by virtue of the fatute 4 W . E: M. c. A. which muft be tranfnited to the court. Thefe bail, who mult at lealt be two in number, mult enter into a recognizance in court, or before the judge or commifioner, whereby they do jointly and feveraliy undentate, that if the defendint be condemned in the action, he fhall pay the cofts and condemration, or render himelf a prifoner, or that they will pay it for him : which recognizance is tranfmitted to the court in a llip of parclument, intitled a bail-picce. And, if requircd, the bail muft jufify thenfelves in court, or before the commiflioner in the country, by fweating themfelves houfekecpers, and each of them to be worth double the fum for which they are bail, after payment of all their debts. This anfwers in fome meafure to the fipulatio or futiflatio of the Roman laws, which is mutu llly given by each litigant party to the other: by the phanitif that he will profecute his fuit, and pay ti:e colls if he lofes his caufe; in like manacr as our lhw
fill requires nominal pledges of profection from the plaintiff: by the defendant, that he fhall continue in court, and abide the featence of the judge, much like our fpecial bail; but with this difference, that the fidejuffores were there abfflutely bound udicatum folvert, to fce the colls and condemnation paid at all events: whereas ou: fpecial bail may be difcharged, by furrendering the defendant into cuflody within the time allowed by law; for which purpole they are at all times entitled to a warrant to apprehend him.

Special bail is required (as of courie) only upon ac. tions of debt, or actions on the calc in trover, or for money cue, where the plantiff can fwear that the c:arfe of action amounts to ten pounds : but in actions where the damages are precarious, being to be affefed ad libiturn by a jury, as in attions for words, ejectment, or trelpafs, it is very feldom poffille for a plaintiff to fwear to the amount of his caufe of action; and therefore no fpecial bail is taken therem, unlefs by a judge's order, or the particular directions of the court, in tome peculiar frecies of injuries, as in cafes of mayhem or atrocious battery; or upon fuch fecial circumftances as make it abfolutely neceflary that the defendant floould be kept within the reach of juftice. Alio in actions :againt heirs, executors and adminifrators, for debts of the deceafed, fpecial bail is not dem:andable; for the action is not fo properly againt them in perfon, as againt the effects of the deceated in their polieflion. But ipecial bail is required even of them, in atations for a deraflavit, or wafting the gonds of the deceafed; that wrong being of their orn committing.

Thus much for procefs; which is only meant to bring the defendant into court, in order to conteft the fuit, and abide the determination of the law. When he appears either in perfon as a prifoner, or out upon lail, then follow the pleadings between the parties. Sce Pleadings.

Procrs upon an Indiament. See Prosecution. The proper procefs on an indictment for any petty mifdemefnor, or on a penal Ratute, is a writ of venire facias, which is in the nature of a fummons to caufe the party to appear. And if by the return to fuch venire it appears that the party hath lands in the county whereby he may be deftrained, then a difteres infinite Thall be iffued from time to time till he appears. But if the fleriff returns, that he hath no lands in his bailiwick, then (upon his non-appearance) a writ of cafias fhall iffue, which commands the fleriff to take his body, and have him at the next aflizes; and if he cannot be taken upon the firft capias, a fecond and a third fhall iffue, called an alias, and a pluries capias. But, on indistments for treafin or felony, a capias is the firt procefs : and, for treafon or homicide, only one thall be allowed to ifliue, or two in the cale of other felonies, by flatute 35 Edw. III. c. 14. though the ufage is to iffue only one in any felony; the provifions of this flatute being in moft cafes found impracticable. And fo, in the cafe of miflemefnors, it is now the ufual practice for any judge of the court of king's bench, upon certificate of an indifment founl, to award a writ of colias immediately, in order to bring in the defendint. But if he abfouds, and it is thought proper to fu:fue him to an outlamy, then a greater cxactne s is neceflary. For, in fuch ca'e, after the feveral writs have iffied in a regular number, according to the nature of the re-
fpative
rs. fpestive crimes, without any effect, the offender flali be put in the exigen! in order to his cuttawry: that is, he fhall be exacted, prochumed, or required, to fur render, at five county-conrts; and if he be returucd quinto cxacius, and does not appear at the fith exaction or requilition, then he is adjudged to be ourlunead, or put out of the protecion of the law ; fin that he is incapable of taking the bencfit of it in any refpes, cither by bringing attions or otherwife.

The puniflement, for outlawrics upon indiaments for mifdemenors, is the fime as for outlawries upon civil actions; viz. forfeiture of goods and chattels. But an outhavery in trafon or felony anounts to a ennvigion and attainder of the offence charged in the indiefment, as much as if the offender had been found guitey by his countrs. His life is, however, hill under the protedion of the law, as hath elfewhere been oblerved; (fee HomiciDe) : that though anciently an ourlawed felon was faid to have caput lupinam, and might be knoc!ed on the lead like a wolf, by any one that mould meet him; becaule, having renounced all law, he was to be dealt with as in a latate of nature, when every one that flould bind ham might fay him: yet now, to avid fuch inhumanity, it is holden that no man is intilld to kill him want mly or wilfully; but in tu doing is guilty of murder, unlefs it happens in the endeavour io apprehend hin. For any perfon may arreft an ottlaw on a criminal profecution, cither of his own head, or by writ or warrant of sapias ut. lngatum, in order to bring him to execution. But fuch outhawrs may be frequently reverfed ly writ of error, the friceedings therein being (as it is fit they flonld be) exceedingly nice and circumfantial; and if any fingle minute point be omitted or mifconducted, the whole outhwry is illeral, and may be reverfed: upon which reverfal the party accufed is admitted to plead to, and defend himielf againt, the indiotment.

Thus much for proceis to bring in the offender after indictment found; during which nage of the profecution it is that writs of certiorari facias are ufually had, though they may be had at any time before trial, to sertity and remove the indicment, with all the proceedings thercon, from any inferior court of criminal jurifdicion into the court of king's bench; which is the fovere gn ordinary court of juftice in cautes criminal. And this is frequently done for one of thefe four purpofes; either, t. To confider and determine the validity of appeals or indietments and the proceedings thereon; and to quath or confirm them as there is caufe; cr, 2 . Where it is furmiled that a partisl or infufficient trial will probably be had in the coutt below, the indiament is removed, in order to have the prifoner or defendant tried at the bar of the court of king's bench, or before the jultives of ni:/i prius: or, 3. It is for removed, in order to plead the king's pardon there: or, 4 . To iffue proce's of outlawry ayainf the ofiender, in thofe counties or places.where the procels of the inferior judges will not reach him. Such writ of certiorari, when ilfued and delivered to the iafericr court for removing any record or ether proceeding, as well upon isdiement as otherwife, fupertedes the jusifdiation of fuch inferior court, and makes all fubfequent proceedings therein entirely errontous ard illegral; un Befs the court of king's bench remarads che reiord to the court below, to be there tried and determincd. A Vot.. XV.
ceriociari may be granted at the inftance of cither the profecutor or the defendar.t: the former as a matter of right, the laticr as a matter of diferetion; and therefore it is feldom granted to remove indiatments from the juRices of gaol-delivery, or after iffue joines, or conteflion of the fate in any of the courts below.

At this nage of profecution alfo it is, that indict. monts found by the grand jury againt a pect, mult, in confequence of a writ of certiorari, be ceritiied and tranfnitred into the court of parliament, or into that of the lord high fteward of Great Britain ; and that, in places of exclufive jurifdision, as the two univerfities, indionnents mutt be delivered (upon challenge and claim of cognizance) to the courts therein efablithed by charter, and confirmed by aft of parliament, to be there refpeetively tried and determined. Sec Plfa.

Process, in chemillry, the whole courfe of an ex. periment or ferics of operations, tending to produce fomething new.

Process, in anatomy, denotes any protuberance or eminence in a bone.

PROCESSION, a ceremony in the Romifh church, confining of a formal march of the clergy and penple, putting up prayers, sic. and in this manner vifiting fome church, \&ic. They have alfo procellions of the hof or facramerit, \&c. Sec Host.

PROCHEIN AMy, in law, the perfor next akin to a child in monage, and who, in that refpect, is allowed to at for him, and be his guardian, \&c. if he hold land in fuccage.

To fue, an intant is not allored to make an attorney; but the court will admit his next friend as plaintiff, or his guardian as defendant.

PROCKIA, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. 'The calyx is triphyllous, befdes two leafets at the barc. There is no corolla; the berry is quinqueangular, and poisfearmous.

PROCLAMATION, a public notice given of any thing of which the magitrate thinks proper to advertife the people.

Proclamations are a branch of the king's prcroga. tive *; and have then a binding force, when (as Sir See PreEdvard Coke obferves) they are grounded upon and regative. enforce the laws of the realn. For, though the ma$k i n g$ of laws is entirely the work of a diftinet part, the legilative branch of the fovereign power, yet the manner, time, and circumftances of putting thofe laws in execution, muft fequently be left to the diferetion of the executive magitiate. And thenefore his confitutions or euifis, coacerning thofe points which we call proclamations, are binding upon the fubject, where they do not cither contradict the old laws, or tend to eflablith new ones; but only enforce the execution of fuch laws as are already in being, in fuch manner as the ling thall judge necefury, Thus the eftablifbed haw is, that the ling may prohibit any of his fubjects from leaving the realm: a prechamation thersfore torbidd ng this in general for three weeks, by lay ing an embargo upon all thipping in time of war, will be equally binding as an at or parliament, hecaufe fomded upon a prion law. But a proclamation ta laty in embaso in time of peace upon ald vefficls laden with wheat, (though in the time of a public fearcits), being contrary to law;
'roclathation.

## FRO [ 538 ] R O

and particulariy to ftatute 22 Car. II. c. 13 . the advifers of fuch a proclamation, and all perfons acting under it, found it necelfary to be indemnified by a fpecial aft of parliament, 7 Geo. III. . c. 7. A proclamation for difarming Papits is alfo binding, being only in execution of what the legillature has firt ordained: but a proclamation for allowing arms to Papilt, or for difarming any Proteftant fubjects, will not bind; becaule the firft would be to affume a difpenfing power, the latter a legiflative one; to the vefting of cither of which in any fingle perfon the laws of England are abfolutely frangers. Indeed, by the fatute 31 Hen. VIII. c. 8 . it was enacted, that the king's proclamations Thould have the force of acts of parliament : a fatute, which was calculated to introduce the molt defpotic tyranny ; and which mult have proved fatal to the liberties of the kingdom, had it not been luckily repealed in the minority of his fucceffor, about five years after. By a late af of parliament the king is empow. ered to raife regiments of Roman Catholics, to ferve in the prefent war.

PROCLUS, furmamed Diadocus, a Greek philofopher and mathematician, was born in Lycia, and lived about the year 500 . He was the difciple of Syrianus, and had a great fhare in the friendhip of the emperor Anaftafius. It is faid, that when Vitalian laid fiege to Conftantinople, Proclus burnt his fhips with large brazen fpeculums. This philofopher was a Pagan, and wrote againft the Chriftian religion. There are fill extant his Commentaries on fome of Plato's books, and other of his works written in Greek.

PROCONSUL, a Roman magiftrate, fent to govern a province with confular authority.

The proconfuls were appointed out of the body of the fenate; and ufually as the year of any one's confulate expired, he was fent proconful into fome province.

The proconfuls decided cafes of eqnity and juftice, either privately in their pretorium or palace, where they received petitions, heard complaints, granted writs under their leal, and the like; or elfe publicly, in the common hall, with the ufual formalities obferved in the court of judicature at Rome. They had befides, by virtue of their edicts, the power of ordering all things relating to the tribunes, taxes, contributions, and provifions of com and money, \&c. Their office lafted only a year. See Consul.

PROCOPIUS, a famous Greek hitorian, born in Cæfaria, acquired great reputation by his works in the reign of Jultinian, and was fecretary to Belifarius du. ring all the wars carried on by that general in Perfia, Africa, and Italy. He at length became fenator, obtained the title of illuflrious, and was made pretor of Conftantinople.

PROCRE $\triangle$ TION, the begetting and bringing foith young. See Generation and Semfn.

PROCTOR, a perfon commifioned to manage another perion's caufe in any court of the civil or eccle. fialtical law.

Proctor, in the Englifo univerfities. See Univer. sıry.

PROCURATION, an att or intrument by which a perfon is empowered to treat, tranfact, receive, \&c. in another perfon's name.

PROCURATOR. See Proctor.
PRODIGALITY, means extravagance, profufion, walte, or excefive liberality, and is the oppofite ex.
treme to the vice of parfimony. Dy the Roman law, if a man by notorious prodigality was in danger of wafting his eflate, he was looked upon as non compor, Prognc and committed to the care of curators, or tutors, by the piator. And by the laws of Solon, fuch prodigals were branded with perpetual infamy.

PRODUCI, in arithmetic and geometry, the factum of two or more numbers, or lines, \&c. into one another : thus $5 \times 4=20$ the product required.

PROEDRI, among the Athenians, were magiftates, who had the firft feats at the public affemblies, and whofe office it was to propore at each affembly the things to be deliberated upon and determined. Their office always ended with the meeting. Their number was nine, folong as the tibes were ten in number.
PROFANATION, the acting difrefpectfully to facred things.

PROFANE, a term ufed in oppofition to boly; and in general is applied to all perfons who have not the facred character, and to things which do not belong to the fervice of religion.

PROFESSION means a calling, vocation, or known employment. In Knox's Effays, vol. Ift, page 23t, we find an excellent paper on the choice of a profeffion, which that elegant writer concludes thus: "All the occupations of life (fays he) are found to have their advantages and difadvantages admirably adapted to preferve the juft equilibrium of happinefs. This we may confidently affert, that, whatever are the inconveniences of any of them, they are all preferable to a life of inaction ; to that wretched liftleffnefs, which is conftrained to purfue pleafure as a bufinefs, and by rendering it the object of fevere and unvaried attention, deftroys its very effence."

Among the Romanifts profeflion denotes the entering into a religious order, whereby a perfon offers himfelf to God by a vow of inviolably obferving obedience, chatity, and poverty.

PROFESSOR, in the univerfities, a perfon who teaches or reads public lectures in fome art or fcience from a chair for the purpofe.

PROFILE, in architecture, the draught of a building, fortification, \&c. wherein are exprelfed the fevcral heights, widths, and thicknelles, fuch as they would ap. pear were the building cut down perpendicularly from the roof to the foundation. Whence the profile is alfo called the faion, fometimes ortbograpbical faicon, and by Vitruvius alfo fiagraphy.

Profie, in this fenfe, amounts to the fame with elvation; and ftands oppofed to a plan or ichnografhy.

Profile is alfoufed for the contour or out-line of a figure, building, member of architecture, or the like; as a bafe, a cornice, \&c. Hence prcfling is fometimes ufed for defigning, or defcrioing the member with rule, compafs, \&c.

Profile, in fculpture and painting.-A head, a portrait, \&c. are faid to be in frofile, when they are reprefented fidewife, or in a fide-view; as, when in a portrait there is but one fide of the face, one cye, one cheek, \&c. flown, and nothing of the other.-On als moft all medals, the faces are reprefented in profile.

PROFLUVIUM, in medicine, denotes a flux, or. liquid evacuation of any thing.

PROGNOSTIC, among phyficians, fignifies a judgement concerning the event of a difeafe, as whether it thall end in life or death, be fhort or long, mild or malignant, \&c.

PROGRAMMA,

PROGRAMMA, anciently fignified a letter fealed with the king's feal.

Programma is alfo an univerfity term for a billet or advertifement, pofted up or given into the hand, by way of invitation to an oration, \&c. containing the argument, or fo much as is neceflary for underftanding chercof.

PROGRESSION, in general, denotesa regularad. 1rugref. vancing, or going forward, in the fame courfe and manner.
Progression, in mathematics, is cither arithmetical or geometrical. Continued arithmetic proportion is, where the terms do increafe and decreafe by equal differences, and is called aribinetic proseffion:

$$
\text { Thus }\left\{\begin{array}{ll}
a, a+d, a+2 d, a+3 d, & \text { \&c. increafing } \\
a, a-d, a-2 d, a-3 d, & \text { sc. decreafing }
\end{array}\right\} \text { by the dilfeıence } d \text {. }
$$

In numbers $\left\{\begin{array}{r}2,4,6,8,10, \\ 10,8,6,4,2, \text { increafing } \\ 10 . \text { decreafing }\end{array}\right\}$ by the difference 2.
Geomtric Progreffion, or Continued Gcometric Proportion, is when the terms do increafe or decreale by equal ratios: thus,

Sce the article Fluxions, Geometry, and Series.

## PR.O J E C T I LES.

THIS is the name for that part of mechanical philofophy which treats of the motion of bodies any how projected from the furface of this earth, and influenced by the action of terreftrial gravity.

It is demonftrated in the phyfical part of aftronomy that a body fo projected mult defcribe a conic fection, having the centre of the earth in one focus; and that it will defcribe round that focus areas proportional to the times. And it follows from the principles of that fcience, that it the velocity of projection exceeds 36700 leet in a fecond, the body (if not refifted by the air) would defcribe a hyperbola; if it be juft 36700 , it would defuribe a parabol: ; and if it be lefs than this, it would defcribe an ellipfis. If projected directly upwards, in the firt cafe, it would never return, but proceed for ever; its velocity continually diminithing, but never becoming lefs than an affignable portion of the excefs of the initial velocity above 36700 feet in a fecond; in the fecond cafe, it would never return, its velocity would diminifh without end, but never be extinguithed. In the third cafe, it would proceed till its velocity was reduced to an affignable portion of the difference between 36700 and its initial velucity; and would then return, regaining its velocity by the fame degrees, and in the fame places, as it lof it. Thefe are necelfary confequences of a gravity directed to the centre of the earth, 2nd inverfely proportional to the fquare of the diftance. But in the greatelt projections that we are able to make, the gravitations are fo nearly equal, and in directions fo nearly paraliel, that it would be ridiculous affeation to pay any regard to the deviations from equality and parallelifm. A bullct rifing a mile above the furface of the carth lofes only $\nabla_{-\sigma^{\prime}}^{5}$ of its weight, and a horizontal range of 4 miles makes only 4 of deviation frem parallelifm.

Let us therefore affume gravitation as equal and parallel. The errors arifing from this affumption are quite infenfible in all the ufes which can be made of this thenry.

The theory itfelf will ever be regarded with fome veneratio: and affection by the learned. It was the firft fruits of mathematical philofophy. Galileo was the firf who applied mathematical bnowledge to the
motions of free bodies, and this was the fubject on which he exercifed his fine genius.

Gravity muft be confidered by us as a conftant or conftantor uniform accelerating or retarding force, according as it uniform. produces the defcent, or retards the atcent, of a body. A conftant or invariable accelerating force is one which produces an uniform acceleration; that is, which in equal times produces equal increments of velocity, and therefore produces increments of velocity proportional to the times in which they are produced. Forces are of themfelves imperceptible, and are feen only in theieffects; and they have no meafure but the effect, or what meafures the effect; and every thing which we can difcover with regard to thofe meafures, we mult affirm with regard to the things of which we alfume them as the meafures. Thercfore,

The motion of a falling body, or of a body project confeed directly downwards, is uniformly accelerated; and quences of that of a body projected directly upwards is uniformly this fact, retarded: that is, the acquired velocities are as the times in which they are acquired by falling, and the extinguilhed velacities are as the times in which they ate extinguifhed.

Cor. 1. If bodies fimply fall, not being projected Eoroliaries downwards by any external force, the times of the falls drawn are proportional to the final velocities; and the times from if. of afcents, which terminate by the action of gravity alone, are proportional to the initial velocities.
2. The fpaces defcribed by a heavy body falling from reft are as the fquares of the acquired velocities; and the differences of thefe fpaces are as the differences $n$ ह the fquares of the acquired velocities: and, on the other hand, the heights to which bodies projeged upwards will rife, before their motions be extinguithed, are as the fquares of the initial velocitics.
3. The fpaces defcribed by falling bodies are proportional on the fquares of the times from the beginniner of the fall; and the fpaces defcribed by bodics projeetcal direetly upwards are as the fquares of the times of the afcents.
4. The face defcribed hy a body filling from relt is cue half of the fpace which the bedy would have uniformly defcribed in the fame time, with the velocity ac-

## PROJECTILES.

quired by the faill.-And the height to which a body will rife, in oppofition to the attion of gravity, is one hulf of the fpace which it would uniformly defcribe in the fame time with the initial velocity.

In like manner the difference of the fpaces which a falling or riling body defribes in any equal fucceffive parts of its fall or rife, is one half of the face which it would uniformly defcribe in the fame time with the difference of the initial and final velocities.
This propofition will be more conveniently expreffed for our purpole thus:

A body moving uniformly during the time of any fall with the relocity acquired thereby, will in that time defcribe a fpace double of that fall; and a body projecied directly upwards will rife to a height which is cne half of the fpace which it would, uniformly continued, defribe in the time of its afcent with the initial velocity of projection.
Thefe theorems have been already demonfrated in a popular way, in the article Mechanice, fect. vi. §14,15, 16, \&cc.and in Gunerry. But we would recommend to our readers the 39 th prop. of the firf book of Newton's Principia, as giving the moot general invertigation of this fubjeat; equally eafy with thefe more loufe methods of demonfration, and infinitely fuperior to them, by being equally applicable to every variation of the accelerating force. See an excellent application of this propofition by Mr Robins, for defining the motion of a ball difcharged from a cannon, in the article Gunnery, $n^{\circ}$ 15. See another in Oprics, $n^{\circ}{ }^{127}$. for defining the

The force of gravity in faltiang bolics can be aftertained. motion of light in refraction, \&cc.
5. It is a matter of obfervation and experience, that a heavy body falls 16 feet and an inch Englith meafure in a fecond of time; and therefore acquires the velocity of 32 feet 2 inches per fecond. This cannot ba afeertained direnty, with the precifion that is neceffary. A fecond is too fmall a portion of time to be exactly meafured and compared with the fpace deferibed; but it is done with the greateft accuracy by comparing the motion of a falling body with that of a pondulum. The time of a vibration is to the time of falling through half the length of the pendulum, as the circumference of ha circle is to its diameter. The length of a pendulun caa be afcertained with great precifion ; and it can be lengthened or fhortenei till it makes jult 86,400 vibrations in a day: and this is the way in which the ipace fallen through in a fecond has been accurately afcertained.

As all other forces are afcertained by the accelera. tions which they produce, they are conveniently meafured by comparing thcir accelerations with the acceleration of gravity. This therefore has been allumed by ail the later and beft writers ou mechanical philofophy, as the unit by which every other force is meafured. It gives us a perfiedly diftinat notion of the force which retains the moon in its orbit, when we fay it is the 3 goonl part of the wcight of the monn at the furface of the earth. We main by this, that if a builet were liere weighed by a fprings fteel-yard, and pulled it out In the mark 3500 ; it it were then thken $t$, the diAunce of the moon, it wonld puill it out only to the mark 1. And we make this affertion on the authority of our having obferved that a body at the diflance of the moon falls from that difance ${ }^{\frac{1}{6}-\sigma}$ part of 16 feet in a feccad. We do not, tinerefore, compare the forees, which
are imperceptible things; we compare the accelerations, which are their indications, effects, and meafures.

This has made philofophers fo anxious to determine Twol with precifion the fall of heavy bodies, in order to have of det an exact value of the accelerating power of terreftrial minin gravity. Now we mult here obferve, that this meafure vy bo may be taken in two ways: we may take the face through which the heavy body falls in a fecond; or we may take the velocity which it acquires in confequence of gravity having acted on it during a fecond. The latt is the proper meafure; for the lait is the immediate effect on the body. The action of gravity has changed the flate of the body-in what way? by giving it a determination to motion downward : this both points out: the kind and the degree or intenfity of the force of gravity. The fpace defcribed in a fecond by falling, is not an invariable meafure; for, in the fuccefive feconds, the body falls through $16,48,80,112,8 \mathrm{c}$. feet, but the changes of the body's itate in each fecond is the fame. At the beginning it had no determination to move with any appreciaible velocity; at the end of the firft fecond it had a determination by which it would have gone on for ever (liad no fubrequent force acted ou it) at the rate of 32 feet fer fecond. At the and of the fecond fecond, it had a determination by which it would have moved for ever, at the rate of $G_{4}$ feet per fecond. At the end of the third fecond, it had a determination by which it would have moved for ever, at the rate of 96 feet $p t r$ fecond, \&c. \&c. The difference of thefe determinations is a determination to the rate of 32 feet per fecond. This is therefore conftant, and the indication and poper me fure of the conftant or invariable tore of gravity. The fiace fal. len through in the fiuf fecond is of ufe only as is is one half of the meafure of this determination: and as halves have the proportion of their wholes, different ac. colerating forces may be fafely affirmed to be in the proportion of the fpaces through which they uniformly impel bodies in the fame time. But we fhould alwavs recoller, that this is but one half of the thue meafire of math the accelerating forcc: Mathematicians of the firt ran's tician: have committed great milakes by not attending to this, and it is neceffary to notice it juft now, becaufe cafes will occur in the profecation of this fubject, where we thall be very apt to confound our reafonings by a confulion in the ufe of thofe meafires. Thofe mathematicians who are accultomed to the geometrical confideration of curvilineal motions; are generally dippofed to take the aflual dofecion from the tangent is the meafure of the dcheaing force; while thofe who treat the fame fubject algelraically, by the afiffance of fluxions, take the chargre of qeilocity, which is meafured by twice the deflestion. The reafon is this: when a body paffes through the point $B$ of a cu:ve ABC , fig. I. if the deflecting force were to ceafe at t'at inftant, the body would defcribe the tangent BD in the fame time in which it defatibes the arch BC of the curve, and DC is the deflection, and is therefore taken for the meature of the deflecting force. But the algebrait is accuthomed to confider the curve by means of an cquation between the abrcifix Hia, $\mathrm{H} b, \mathrm{H} c$, and their refreative ordinates $\mathrm{A} a, \mathrm{~B} b, \mathrm{C} c$; and he meafures the deflections by the changes made on the increments of the ordinates. Thus the increment of the ordinate $A$, while the body defcribes the arch $A B$ of the curve, is BG. If the deflecting force were to ceafe

## r R O J E C T I L. E S.

ceafe when the body is at $B$, the next increment would have been equal to 1 GG , that is, it would have been EF ; but, in confequence of the deflection, it is only CF: therefore he takes EC for the meafure of the deflection, and of the deflecting force. Now EC is ultimately twice DC; and thus the meafure of the algebraill (derived fulcly from the nature of the differential method, and without any regard to phyfical confiderations) happens to coincide with the true phyfical meafure. There is therefore great danger of mixing thefe meafures. Of this we can-Leib- hoo give a more remarkable inftance than Leibnitz's attempt to demonfrate the clliptical motion of the planets in the Leiplic Aas, 1689 . He firlt confiders the fubjeet mechanically, and takes the defection or DC for the meafure of the deflecting force. He then introduces his differential calculus, where he takes the dif. ference of the increments for the me:fure; and thus brings himfelf into a confufion, which luckily compenfates for the fulfe reafoning in the preceding part of his paper, and gives $r$ is refult the appearance of a demonfration of Newton's great difcovery, while, in fact, it is at confufed jumble of affumptions, felf-contradiftory, and inconfiftent with the very laws of mechanics which are ufed by him in the invelligation. Seventeen years after this, in 1706 , having been criticifed for his bad realoning, or rather accufed of an envious and unfuccefsful attempt to appropriate Newton's inventions to himfelf, he gives a correction of his paralogifm, which he c.lls a correct:on of language. But he either had not obferved where the paralogifm lay, or weuld not let himfelf down by acknowledging a miftake in what he whed he world to think his own calculus (fluxions) ; be appli. . 1 the corredion where no fult had been commi"ed, for he had meafured both the centrifugal force and the foilicitation of gravity in the fame way, but had applied the flusionary exprefio in to the lat and not to the firt, and, by fo din:, he completely dellroyed all ccincilence betwee: his refult and the planetary motions. We mention this inf.nie, not only as a caution to our mathematical read re, bat alfo as a very curious literary anecdote. This differtation of Leibnitz is one of the molt obfeure of his obicure writings, but deferpes the atiention of an intelligent and curious reader, and cannot fail of making an indelible impreffion on his mind, with relation to the miodefty, c:indour, and probity of the author. It is preceded by a differtation on the fubject which we are now entering up n, the motion of projeates in a refinting medium. Newtom's Principia had been publifhed a few years before, and had been reviewed, in a manner fhamefully Ciight, in the Leiplic Acts. Both thefe fubjects make the capital articles of that immortal work. Mr Leibnita publifhed thefe differtationc, without (fays he) having feen Newton's book, in order to fhow the world that he had, fome years before, difcovered the fanie theorems. Nir Nicholas Fatio carried a copy of the Principia from the author to Hanover in 1086, where He expectel to find Mr Lcibnitz; he was then abfent, but Fatin fav him often before his return to France in 1687, and does not lay that the hook was not given him. Read along with thefe differtations Dr Keill's letter to John Berroulli and others, publifhed in the Tournal Literaire de la Hayée 1714, and to Joln Bernowlif in 1719.

Newton has beea accufed of a fimilar overfight by John Eernoulli, (who indeed calls it a mifake in prin-
ciple) in his Propofition X. Bock 2, on the very fuh. ject we are now contidering: But D) Ksill has thown it to be only an overfight, in drawins the tangent on the wrong lide of the ordinate. For in this very propofition Newton cahibits, in the fricicit and moft bealutiful manner, thic difference between the sfomatrical and algebraical manner of confidering the fibject; and exprefsly warns the read:r, that his algebraical fymbol expreffics the dufleation only, and not the vatiation of the increment of the ordinate. It is therefore in the But falfely. laft degree improbable that he would make this miftake. He meft exprefsly docs not; ard as to the real millake, which he correqed in the fecond cdition, the writer of this auticle has in his poffeffon a manatript copy of notes and illuftrations on the whole P'incipia, written in 1 Go3 by Dr David Gregory, Savilian profetier of allronomy at Oxford, at the defire of Mr Newton, as preparatory for a new edition, where he has teaified this and feveral other miftakes in that work, and fays that Mr Newton had feen and approved of the amentments. We mention there particulars, becaufe Mr Bernoulli publithed an elegant differtation on this Infinserity; fubject in the Leipfic Acts in 1713 ; in which he of terer. charges Newton (though with many proteftations of runpee with admiration and refipect) with this miltake in pinciple; bicewtun. and fays, that he communicated his correction to Mr
Newton by his nephew Nicholas Bernouli, that it and fays, that he communicated his correction to Mr
Newton by his nephew Nicholas Bernouli, that it might be corrected in the new edition, which he heart was in the prefs. And he afterwards adds, that it appears by fome theets being cancelled, and new ones fubAttuted in this part of the work, that the milake would Itituted in this part of the work, that the milake would
have continued, had he not corrected it. We would defire our readers to confult this dilfertation, which is extremely elegant, and will be dif fervice to us in this article; and let them compare the civil things which is here faid of the vir in:omparabilis, the onni lavit manor, the funmius Nisutonas, with what the fame author, in the fime year, in the Leiplic Acts, but under a borrowed name, fays of him. Our readers will have no hefitation in aforibing this letter to this author. For, after prailing Joln Bernoulli as fummus gemema, For, after praiing John Bernoulli as fummus, gemmera, fummi candaris at et modeflis, he betrays hinifeif by an unguarded warmth, when defending J. B.'s demonill ration of the inverfe problem of centripcial forces, by calling it MEAM demony?ralionent.

Let our readers now conlider the fune and iatention of this differtation on projestilice, and judge whether the authis's aim was to infruat the workl, or to acquire fame, by correcting Newtrn. The difertation does not contain one theorem, one corollary, nor one fep of not contan one theorem, one coroliary, nor ons fep rf edition; nor has he gone farther than Newion's fingle propolition the Xth. To ns it appears an cxact ccinpropointo this propofition on centripetarl forces, which he boafts of having firt demonfratect, althongh it is in every fep a tranfeript of the 42 d of the at Book of Newton's Principia, the geometrical haguage of Newton being changed into alrebraic, as he has in the pro-
fent cafe changed Newton's algetraic analytis into a ton being changed into alrebraic, as he has in the pre-
fent cafe changed Newion's algetraic analyfis into a very elegant genmetrical one.
We liope to be forgiven for this loag digrefion. It is a very cuitous piece of literary hiffory, and flows the combination which envy and want of honour-
able principle had formed againt the equitation of our itlufrious
$\qquad$

iiluntrious countryman ; and we think it.our duty to embrace any opportunity of doing it juftice.-To return
${ }_{3} 3$ to our fubject :

## Accurate

 ineafure of the accule fative powir of gravi1y.15
Ixamples of their uie red in falliug bodits.

The accurate meafure of the accelerative power of gravity, is the fall $16_{\text {re }}^{1}$ feet, if we meafure it by the ipace, or the willocity of $3 \frac{1}{6}$ feet per fecond, if we take the velocity. It will greatly facilitate calculation, and will be fufficiently exact for all our purpofes, if we take 16 and 32 , fuppofing that a body falls 16 feet in a fecond, and acquires the velocity of 32 feet per fecond. Then, becaufe the heights are as the fquares of the times, and as the fquares of the acquired velocities, a body will fall one font in one fourth of a fecond, and will acquire the velocity of eight feet per fecond. Now let b exprefs the height in feet, and call it the producing height ; v the velocity in feet per fecond, and call it the produced velocits, the velocity due; and the time in feconds.- We thall have the following formulx, which are of eafy tecollection, and will ferve, without tables, to anfiver all the quefions relative to projectiles.
I. $v=3 \sqrt{ } b,=8 \times 4 t=32 t$

1I. $t=\frac{\sqrt{ } b}{4},=\frac{v}{3^{2}}$
III. $\sqrt{ }^{b}=\frac{v}{8},=4^{t}$
IV. $b=\frac{v^{2}}{\sigma_{t}}=16 t^{2}$

To give fome examples of their ufe, let it be requi-

1. To firct the time of falling through 256 feet. Here $b=256, \sqrt{ } 256=16$, and $\frac{16}{4}=4$. An. freer 4 ".
2. To find the velocity acquired by falling four feconds. $t=4.32 \times 4=128$ feet per fecond.
3. To find the velocity acquired by falling 625 feet. $b=625 \cdot \sqrt{ } b=25 \cdot 8 \sqrt{ } b=2000$ feet per fecond.
4. To find the height to which a body will rife when projected with the velocity of 56 feet per fecond, or the hei, ht through which a body noult fall to acquire this velocity.

$$
\begin{aligned}
& v=56 \cdot \frac{56}{8}=7,=\sqrt{ } b \cdot 7^{2}=b,=49 \text { feet. } \\
& \text { or } 56^{2}=3136 \cdot \frac{3136}{64}=49 \text { feet. }
\end{aligned}
$$

5. Suppofe a body projected direstly downwards with the velocity of 10 feet per fecond; what will be its velocity after four feconds? In four feconds it will have acquired, by the action of gravity, the velocity of $4 \times 32$, or 128 feet, and therefore its whole velocity will be 138 feet per fecond.
6. To find how far it will have moved, componnd its motion of projection, which will be 40 feet inl four feconds, with the motion which gravity alf ne would have given it in that time, which is 256 feet; and the whole motion will be 296 feet.
7. Suppofe the body projected as already mentioned, and that it is required to determine the time it will take to go 296 feet downwards, and the velocity it will liave acquired.

Find the height $x$, through which it mult fall to acquire the velocity of projection, to feet, and the time
$y$ of falling from this height. Then find the time $z$ of falling through the height $296+x$, and the velocity acquired by this fall. The time of defcribing the 296 feet will be $z-y$, and $v$ is the velocity required.

From fuch examples, it is eafy to fee the way of anfivering every queftion of the kind.

Writers on the ligher parts of mechanics always More compute the actions of other accelerating and retarding ral for forces by comparing them with the acceleration of ${ }^{1} x$. gravity, and in order to render their expreflions more general, ufe a fymbol, fuch as g for gravity, leaving the reader to convert it into numbers. Agreeably to this view, the general formule will ftand thus:

$$
\begin{aligned}
& \text { I. } v=\sqrt{2 g b}, \text { i.e. } \sqrt{ } 2 \sqrt{ } g \sqrt{ } b \\
& \text { II. } t=\frac{q}{g}=\frac{\sqrt{4 b}}{\sqrt{2 g}},=\sqrt{\frac{4 b}{2 g}}=\sqrt{\frac{2 b}{g}} \\
& \text { IIII. } b=\frac{v_{z}}{2 g},=\frac{q t^{2}}{2}
\end{aligned}
$$

In all thefe equations, grarity, or its accelerating power, is entimated, as it ought to be, by the change of velocity which it generates in a particle of matter in an unit of time. But many mathematicians, in their inveftigations of curvilineal and other varied motions, meafure it by the deflection which it produces in this time from the tangent of the curve, or by the increment by which the fpace defcribed in an unit of time exceeds the fpace defcribed in the preceding unit. This is but one half of the incremeat which gravity would have produced, had the body moved through the whole moment with the acquired addition of velocity. In this feufe of the fymbol $g$, the equations ftand thus:

$$
\begin{aligned}
& \text { I. } v=2 \sqrt{g b} \cdot=2 g t \\
& \text { II. } t=\sqrt{\frac{B}{b}},=\frac{v}{2 \xi} \\
& \text { IV. } b=\frac{v^{2}}{4 g},=g t^{2}, \text { and } \sqrt{ } b=\frac{v}{2 \sqrt{ } g}
\end{aligned}
$$

It is alfo very ufual to confider the accelerating force of gravity as the unit of comparifon. This renders the expreffions much more fimple. In this way, exprefles not the velocity, but the height neceflary for acquiring it, and the velocity itfelf is expreffed by $\sqrt{v}$. Toreduce fuch an expreffion of a velocity to numbers, we muft multiply it by $\sqrt{2 g}$, or by $2 \sqrt{g}$, according as we make $g$ to be the generated velocity, or the pace fallen through in the unit of time.

This will fuffice for the perpendicular afcents or de- Bodies feents of heavy bodies, and we proceed to confider their project molions when projected obliquely. The circumftance oblighte which renders this an interefting fubject, is, that the flight of cannon thot and flells are inftances of fuch motion, and the art of gunnery muft in a great meafure depend on this doctrine.

Let a body B (fig. 2.), be projected in any direction $B C$, not perpendicular to the horizon, and with any velocity. Let $A B$ be the height producing this ceccx velocity; that is, let the velocity be that which a heavy body would acquire by falling freely through AB. It is required to determine the path of the body, and all the circumftances of its motion in this path?

1. It is evident, that by the continual action of gra-
vity, the body will be continually deflected from the line BC, and will defcribe a curve line BVG, concave towards the earth.
2. This curve line is a parabola, of which the vertical meter, and BC a tangent in B .

Through any two points $V, G$ of the curve draw VC, GH parallel to $A B$, meeting BC in C and HI , and draw VE, GK parallel to $B C$, meeting $A B$ in E , K. It follows, from the compolition of motions, that the body would arrive at the points $V, G$ of the curve in the fame time that it would have uniformly defcribed BC, BH, with the velocity of projection; or that it would have fallen through $13 \mathrm{E}, \mathrm{BR}$, with a motion uniformly accelerated br gravity; therefore the times of deferibing $\mathrm{BC}, \mathrm{BH}$, uniformly, are the fame with the times of falling through BE, BK. But, becaufe the motion along BHI is uniform, BC is to BH as the time of defcribing BC to the time of deferibing BH , which we may exprefs thus, $\mathrm{BC}: \mathrm{BH}=\mathrm{T}, \mathrm{BC}: \mathrm{T}, \mathrm{BH},=$ T, BE : T, BK. But, becaufe the motion along B K is uniformly accelerated, we have BE:BI $=\mathrm{T}^{4}$, $\mathrm{BE}: \mathrm{T}^{3}, \mathrm{BK},=\mathrm{BC}^{2}: \mathrm{BH}^{2},=\mathrm{EV}^{2}: \mathrm{KG}^{2}$; therefore the curve BVG is fuch, that the abfeifie BE, BK are as the fquares of the correfponding ordinates EV, KG; that is, the curve BVG is a parabola, and $B C$, parallel to the ordinates, is a tangent in the point 1 .
3. If through the point $A$ there be drawn the horizontal line $\mathrm{AD} d$, it is the direetrix of the parabola.

Let $B E$ be taken equal to $A B$. The time of falling through BE is equal to the time of falling through $A B$; But $B C$ is deferibed with the velocity acquired by falling through $A B$ : and therefore by $1^{\circ}$ 4. of perpendicular defcents, BC is double of AB , and EV is double of BE ; therefore $E V^{2}=4 \mathrm{BE}^{2}, \because 4 \mathrm{BE} \times$ $\mathrm{AB},=\mathrm{BE} \times 4 \mathrm{AB}$, and 4 AB is the parameter or la:us rectum of the parabola BVG , and AB being onefourth of the parameter, $A D$ is the diredrix.
4. The times of defcribing the differext arches BV, VG of che parabola are as the portions $\mathrm{BC}, \mathrm{BH}$ of the tangent, or as the portions $\mathrm{AD}, \mathrm{A} d$ of the directrix, intercepted by the fame vertical lines $A D, C V$, HG ; for the times of defribing $\mathrm{BV}, \mathrm{BVG}$ are the fame with thofe of defcribing the correfponding parts $\mathrm{BC}, \mathrm{BH}$ of the tangent, and are proportional to thefe parts, becaufe the motion along BH is uniform ; and $\mathrm{BC}, \mathrm{BH}$ are proportional to $\mathrm{AD}, \mathrm{Ad}$.
Therefore the motion eftimated horizontally is uniform.
5. The velocity in any point $G$ of the curve is the fame with that which a heavy body would acquire by falling from the diredrix along $d \mathrm{G}$. Draw the tangent GT, cutting the vertical $\mathrm{AB}^{\mathrm{S}}$ in T '; take the points $a$, $f$, equidiftant from A and $d$, and extremely ncar them, and draw the verticals $a b, f g$; let the points $a, f$, continually afproach A and $d$, and ultimately coincide with them. It is erident that $B 6$ will ultimately be to $g \mathrm{G}$, in the ratio of the velocity at B to the velocity at $G$; for the portions of the tangent ultimately coincide with the portions of the curve, and are defcribed in equal times; but $\mathrm{B} b$ is to $g \mathrm{G}$ as BH to TG: therefore the velocity at $B$ is to that at $G$ as $B H$ to TG. But, by the properties of the parabola, $\mathrm{BH}^{\circ}$ is to
$T G^{2}$ as $A B$ to $d G$; and $A B i$, to $d G$ as the equare of the velocity acquircd by f.lling through $A D$ to the fquare of the velocity acquired loy falling through $d \mathrm{C}$; and the velocity in BH, or in the print B of the parabola, is the velocity acquired by falling along $\triangle B$; thercfore the velocity in TG, or in the perint $G$ of the parabola, is the velecity acquired by fulling alorg $d \mathrm{G}$.
Thefe few fimple propofitions contain all the theory The pardof the motion of projectiles in vacuo, or independent bolic thenon the refintance of the air; and being a very eaffy and ry inycuineat piece of mathematical philofophy, and comected was, hut of with very interefting practicc, and a very refpectable trete ure in profefion, they have been much commented on, and have lurnifhed matter for many fplendid volumes. But the air's refiftance necafions luch a prodigious diminution of motion in the great velocities of mili ary paojeatiles, that this parabolic theory, as it is c.lled, is hardly of any ufe. A mulket-ball, difclarged with the ordinary allotment of powder, iflues fron the piece with the velocity of ic 70 feet per fecond: this velccity would be acquired by falling from the height of eight miles. If the piece be elevated to an angle of $45^{\circ}$, the parabola fhould be of fuch extent that it would reach 16 miles on the horizoutal plain; whereas it does not reach much above half a nile. Simi'ar ceficiencies are obferved in the ranges of cannon flot.

We do not propofe, therefore, to dwell much on this a flort theory, and flall only give fuch a fynoptical view of it vicw of if, as fhall make our readers underfand the more general circumfances of the theory, and be mafters of the language of the art.

Let OB (fig. 3.) be a vertical line. About the centres $A$ and $D$, with the difance $A B$, defcribe the femicircles ODB, AHK, and with the axis AB, and femiaxis GE, equal to $A B$, defribe the femie ellipfs $A E B$ : with the focus $B$, vertex $A$, diameter $A B$, and tangent $A D$, parallel to the horizon, deferibe the parabola AI'S.
Let a body be projeted from $B$, in any direation $B C$, with the velocity acquired by falling through $A B$. By what has already been demontrated, it will defuibe a parabola BVPM. Then,
I. ADL farallel to the horizen is the direation of every paraboln which can be defcribed by a body frojected from $B$ with this velocier. This is evident.
2. The femicircle AHK is the locus of all the foci of there parabolas: For the diftance BHI of a point Th of ary parabcla from the directrix $A D$ is equal to its diftance DF from the focus F of that patahold: therefore the foci of all the parabolas whicle pafs through $B$, and have $A D$ for their directrix, muft be in the citcumference of the circle which has $A B$ for its radius, and B for its centre.
3. If the line of direction BC cut the upper femi. circle in C , and the vertical line CF be draxn, curtins: the lower femicircle in $F, F$ is the focus of the pa:abola BVPM, defcribed by the body which is projected in the direction $B C$, with the velocity acquired by falling through BA : for drawing $\mathrm{AC}, \mathrm{BF}$, it is eviden: that $A C F B$ is a rhombus, and that the angle $A B F$ is bifected by BC, and therefore the focus lies in the line BF ; but it alfo lies in the circumference AFK, and therefore in $F$.

If C is in the upper quadrant of ODB, F is in the अррег

Plate cccexvir.
upper quadrant of $A F K$; and if C be in the lower quadrant of ODB (as when $B C$ is the line of direction) then the focus of the correfponding parabola $\mathrm{B} v \mathrm{M}$ is in the lower quadrant of AHK , as at $f$.
4. The elliptis AEB is the lecus of the vertex of all the parabolas, and the vertex $V$ of any one of them BTPM is in the interfection of this ellipfis with the vettical CF : for let this vertical cut the horizontal lines $\mathrm{AD}, \mathrm{GE}, \mathrm{BN}$, in $\theta, \lambda, \mathrm{N}$. Then it is plain that N $a$ is half of $N \theta$, and $\lambda V$ is half of $C \theta$; therefore NV is lalf of NC , and V is the vertex of the axis.

If the fricus is in the upper or lower quadrant of the circle AHK, the vertex is in the upper or the lower quadrant of the ellipre $A E G$.
5. If BFP be drawn throngh the focus of any one of the parabolas, fuch as BVM, cutting the parabola APS in P, the parabol: BVM touches the parabols $A P S$ in $P$ : fur drawing $P$ o $x$ parallel io $A B$, cutting the dicentix $O x$ of the parabolat APS in $x$, and the drectrix AL of the parabola BVM in $\delta$, then $\mathrm{PB}=\mathrm{P}_{x}$ : but $\mathrm{BF}=\mathrm{BA},=\mathrm{AO},=r \delta$ : therefore $\mathrm{P} \delta=\mathrm{PF}$, and the point P is in the parabola BVM. Alfo the tangrats to both parabolas in P coincide, for they bifedt the angle $x$ I'B ; theraf re the two parabolas having a common tangent, toueh each other in 1 '.

Cor. All the parabolas which can be defribed by is body projected from $B$, with the velocity acquired by falling through AB, will tonch the concavity of the parabola APS, and lie wholly within it.
6. $P$ is the moft diftant point of the line $B P$ which can be hit by a body pr jected from $B$ with the velocity acquired by falling through $A B$. For if the direstion is inote clevated than BC, the focus of the parabola dederibed by the body will lie between $F$ and $A$, and the parabola will tonch APS in fume point between $P$ and $A$; ind boing wholly within the parabola APS, it nuth cut th.e line BP in fome point within $P$. The fome thing may be fhown when the direstion is lefs elevatedthan BC.

7 . The parabol. APS is the locus of the greatef marges on any plares BP, BS, \&c. and no point lying without this parabola can be ttruck.

8, The greatelt range on any plane BP is produced when the line of direction BC bifects the angle $O B P$ formed by that plane with the vertical: for the paraiola clefribed by the body in this cafe touclies A i'S in 1 , and its foens is in the line BP, and therefore the tangent BC hirests the angle OBP.

Cor. The greateft range on a horizental plane is made with an elevation of $+5^{\circ}$.
9. A point M in any plane BS , lying between B and S , may be fruck with two directions, BC and $\mathrm{B} c$; and thefe diactions are equidifant from the direction Bt, which gives the greatelt range on that plane: for if ibout the centre M, with the dibance ML from the diredrix $M L$, we defribe a circle LF $f$, it will cat the circle AHK in two points F and $f$, whicl are evidently the foci of two parabolas BVM, $\mathrm{B} v \mathrm{M}$, having the directrix $A L$ and diameter $A B K$. The interfeation of the circle ODB , with the vericals $\mathrm{FC}, f c$, determine the directions $\mathrm{BC}, \mathrm{B}$ c of the tangents. Draw A t paral'el to BS, and join $t \mathrm{~B}, \mathrm{C} c, \Gamma f$; then OB : $=\frac{1}{2} O B S$, and $B t$ is the direction which gives the greatelt range on the plane BS : but becaute $\mathrm{F} f$ is a chord of the circles deferibed round the centres in and
$\mathrm{M}, \mathrm{F} f$ is perpendicular to BM , and $\mathrm{C}_{c}$ to $\mathrm{A} t$, and the arches $\mathrm{C} t, c t$ are equal ; and therefore the angles $\mathrm{CB} t, c \mathrm{~B} t$ are equal.

Thus we have given a general view of the fubject, which thows the connection and dependence of every circumflance which can influence the refult ; for it is evjdent that to every velocity of projection there beiongs a fet of parabolas, with their directions and langes; and every change of velocity has a line AB correfponding to it, to which all the others are proportional. As the height necelfary fur acquiring any velocity increafes or diminifhes in the duplicate propor in of that velocity, it is evident that all the ranges with given ele. vations will vary in the fame pre portion, a double ve. locity giving a quadruple range, a trple velocity giving a noncuple range, \&e. And, on the other hand, when the ranges are determined beforeland (which is the ufual cafe), the velocities are in the fubduplicate proportion of the ranges. A quadruple range will require a double velocity, \&cc.

On the principles now eflablifhed is founded the ordinary theny of gunnery, furnifhing rules which are to direct the art of tbrowing fhot and thells, fo as to hit the mark with a determined velocity.

But we muft obferve, that this theory is of little fervice for directing us iil the practice of cannonading. Here it is necefiary to come as near as we can to the object aimed at, and the hurry of fervice allows no time for geometrical methods of pointing the piece after each difcharge. The gunner either points the cannon directly to the object, when within 200 or 300 yards of it, in which cafe he is faid to fhoot point tlank (pointer au llanc, i. e. at the white mark in the middle of the gunners target) ; or, if at a greater difance, he eltimates to the beft if his judgment the deflection correfponding to his diftance, and points the camon accordingly. In this he is aided by the greater thicknefs at the breech of a piece of ordnance. Or, laftly, when the intention is not to batter, but to rake along a line occupied by the enemy, the cannon is elevated at a confiderable angle, and the thot difcharged with a fmall foree, fo that it drops into the enemy's poft, and bounds along the line. In all thefe fervices the gumner is directed entirely by trial, and we cannot fay that this parabolic theory can do him any fervice.

The prineipal ufe of it is to direct the bombardier in throving thells. With thefe it is propoled to break down or fet fire to buildings, to break through the vaulted ronfs of magazines, or to intimidate and kill troops lyy burfing among them. Thefe cbjects are always undcr cover of the enems's works, and eanno: be touched by a direet flot. The bombs and carcafes are therefore thrown upwards, fo as to get over the defences aud procluce their effect.

Thefe thells are of very great weight, frequently exceeding 200 lbs . The mortars from which they are difcharged muft therefore be very ftong, that they may refift the explofion of gunpowder which is necellary for throwing fuch a mafic of matter to a dillance ; they are confequently unwieldy, and it is found moft convenient to make them almof a folid and immoveablelump. Very little change can be made in their clevation, and therefore their ranges are regulated by the velocitics given to the flacll. Thete again are produced by the çuantities

## P R O J E C TM I. E S.

of powder in the charge; and experience (confirming city, diflance, pofition, elevation, and time, may bc inthe beft theoretical notions that we can lorm of the fubjeat) has taught us, that the ranges are nearly proportional to the quuntities of powder employed, only not increating quite fo faft. This method is much eafier than by differences of elevation; for we can felcet the elevation which gives the greateft range on the given planc, and then we are certain that we are employing the fmalleft quantity of powder with which the rervice can be pcrformed: and we have another advantage, that the der iations which unavoidable caufes produce in the real direations of the bomb will then produce the fmalleft poffible deviation from the intended range. This is the cafe in moft mathematical maxima.

In military projectiles the velocity is produced by the explofion of a quantity of gunpowder : but in our theory it is conceived as produced by a fall from a certain height, by the proportions of which we can accurately determine its quantity. Thus a velocity of 3600 feet per fecond is produced by a fall from the height of 40,000 feet or 3333 yards.

The height CA (fig. 4.) for producing the velocity of projection is called, in the language of gunnery, the impertus. We fhall exprefs it by the fymbol $b$.

The diftance $A B$ to which the fhell goes on any plane $A B$, is called the amplitude or the range $r$.

The angle DBA , made by the vertical line and the plane $A B$, may be called the angle of position of that plane, $p$.

The angle DAB , made by the axis or direstion of the piece, and the direction of the object, may be called the angle of elepation of the piece above the plane AB, $e$.

The angle ZAD, made by the vertical line, and the direction of the piece, may be called the zenith diftance, z.

The relations between all the circumfances of velo-
cluded in the following propofitions.
I. Let a thell be projected from A , with the velocity acquired by falling through CA , with the intention of hitting the mark $B$ fituated in the given line AB. the horizon. Defcribe on ZA an arch of a circle ZDA, containing an angle equal to DBA, and draw AD to the interiection of this circle with DB; then will a body projected from $A$, in the direction $A D$, with the velocity acquired by falling through CA, hit the mark B.

For, produce CA downwards, and draw BF parallel to AD, and draw ZD. It is evident from the cotiAruction that AB touches the circle in B , and that the angles $A \mathrm{DZ}, \mathrm{DBA}$, are equal, as aho the angles $\mathrm{AZD}, \mathrm{DAB}$; therefore the triangles ZAD, ADB are fimilar.

Therefore $\mathrm{BD}: \mathrm{DA}=\mathrm{DA}: \mathrm{AZ}$, And $\mathrm{DA}^{2}=\mathrm{BD} \times \mathrm{AZ}^{2}$;
Therefore $\mathrm{BF}^{3}=\mathrm{AF} \times \mathrm{AZ},=\mathrm{AF} \times 4 \mathrm{AC}$.
Therefore a parabola, of which AF is a diameter, and $A Z$ its parameter, will pafs through $B$, and this parabola will be the path of the flell projected as already mentioned.

Remark. When BD cuts this circle, it cuts it in two points $\mathrm{D}, d$; and there are two directions which will folve the problem. If $\mathrm{B} \mathrm{D}^{\prime}$ only touches the circle in $\mathrm{D}^{\prime}$, there is but one direction, and AB ' is the greatelt pofible range with this velocicity. If the vertical line through $B$ does not meet the circle, the problem is impofible, the velocity being too fmall. When $\mathrm{B}^{\prime} \mathrm{D}^{\prime}$ touches the circle, the two directions $\mathrm{AD}^{\prime}$ and $\mathrm{A} d^{\prime}$ coalefce into one direction, producing the greateft range, and bifecting the angle ZAB; and the other two directions $\mathrm{AD}, \mathrm{A} d$, producing the fame range AB , are equidiftant from $\mathrm{AD}^{\prime}$, agreeably to the general propofition.

It is evident that $A Z: A D=S, A D Z: S, A Z D,=S, D B A: S, D A B,=S, p: S$, $e$

Therefore AZ: $\mathrm{AB}=\mathrm{S}^{2}, p \times \mathrm{S}^{2}, e: \mathrm{S}^{2}, e \times \mathrm{S}, z ;=\mathrm{S}^{2}, p: \mathrm{S}, e \times \mathrm{S}, z$
Or $+b: r=S^{2}, p: S, e \times S, z$, and $+b \times S, e \times S, z=r \times S^{2}, p$

Hence we obtains the relations wanted.

$$
\begin{aligned}
& \text { Thus } b=\frac{r \times S^{2}, p}{4 S, e \times S, z}, \text { and } r=\frac{4 \times S e \times S, z}{S^{2}, p} \\
& \text { And } S, z=\frac{r \times S^{2} p}{4^{b} \times S, e}, \text { and } S, e=\frac{r \times S^{2}, p,}{4 b \times S, z},
\end{aligned}
$$

The only other circumftance in which we are interelted is the time of the fight. A knowledge of this is neceffary for the bombardier, that he may cut the fuzes of his fhells to fuch lengths as that they may burft at the very inflant of their hitting the mark.

Now $\mathrm{AB}: \mathrm{DB}=\operatorname{Sin}, \mathrm{ADB}: \operatorname{Sin}, \mathrm{DAB},=S, z:$ $\mathrm{S}, \mathrm{e}$, and $\mathrm{DB}=\frac{r \times \mathrm{S}, e}{\mathrm{~S}, z}$. But the time of the flight is the fame with the time of falling through DB , and 16 fcet: $\mathrm{DB}=1^{\prime \prime}: t^{\prime \prime}$. Hence $t^{\prime \prime 2}=\frac{r \times \mathrm{S}, \varepsilon}{16 \mathrm{~S}, z}$, and we have the following eafy rule.

From the fum of the logarithms of the range, and of the fine of elevation, fubtract the fum of the logarithms of 16 , and of the fine of the \%enith diftance, half the remainder is the logarithm of the time in feconds.

Vol. XV.

This becomes till eafier in practice; for the mortar fhould be fo elevated that the range is a maximum : in which cafe $\mathrm{AB}=\mathrm{DB}$, and then half the difference of the logarithms of $A B$ and of $: 6$ is the logarithm of the time in feconds.

Such are the deduction from the general propofitions which conttitute the ordinary theory of gunnery. remains to compare them with experiment.

In fuch experiments as can be performed with with expeaccuracy in a chamber, the coincidence is as great as can be wifhed. A jet of water, or mercury, gives us the finelt example, becaufe we have the whole parabola exhibited to us in the fimultaneous places of the fucceeding particles. Yet even in thefe experiments a deviation can be obferved. When the jet is made on a horizontal plane, and the curve carefully traced on a perpendicular plane held clofe by it, it is found that the diftance between the higheft point of the curve and the mark is lefs than the diltance between it and the fpout, and that the defcending branch of the curve is more perpendicular than the afcending branch. And this difference is more remarkable as the jet is made with
greater
greater velocity, and reaches to a greater diftance. This theory corrected, or as a fubject, of independent difcufis evidently produced by the refiltance of the air, which diminithes the velocity, without affecting the gravity of the projectile. It is flill more fenfible in the motion of bumbs. Thefe can be traced through the air by the light of their fuzes; and we fee that their higheft point is always much nearer to the mark than to the mortar on a liorizontal plane.

The greatef horizontal range on this plane fhould be when the elevation is $45^{\circ}$. It is always found to be much lower.

The ranges on this plane thould be 23 the fines of twice the elevation.
A ball difcharged at the elev. $19^{\circ} \cdot 5^{\prime}$ ranged 448 yards

| It flould have ranged by theory | 9.45 |
| :--- | :--- |
| $24^{\circ}$ |  |

The range at an elevation of $45^{\circ}$ fhould be twice the impetus. Mr Rubins found that a mufket-ball, difeharged with the ufual allotment of powder, had the velocity of 1700 feet in a fecond. This requires a fall of 45156 fect, and the range fhould be 90312 , or $17 \frac{1}{8}$ miles; whereas it does not much exceed half a mile. A 29 pound ball difcharged with 16 pounds of powder fhould range about 16 miles; whereas it is generally

This com- Such faxts thow incontrovertibly how deficient the parifon
thews the deficiency of the theory. parabolic theory is, and how unfit for directing the practice of the artillerilt. A very fimple confideration is fulficient for rendering this obvious to the molt uninftructed. The refiftance of the air to a very light body
fion. This we thall now attempt.
The motion of projestiles is performed in the atmo- Effer fphere. The air is cifiplaced, or put in motion. What the: ever motion is acquires mult be taken from the bullet. 「phe The motion communicated to the air mult be in the proportion of the quantity of air put in motion, and of the velocity communicated to it. If, therefore, the difplaced air be always finilarly dijplaced, whatever be the velocity of the bullet, the motion communicated to it, and loft by the bullet, mult be proportional to the fquare of. the velocity of the bullet and to the denfity of the air jointly. Therefore the diminution of its motion muft be greater when the motion itfelf is greater, and in the very great velocity of fhot and flells it mult be prodigious. It appears from Mr Robins's experiments that a glube of $4^{\frac{x}{2}}$ inches in diameter, moving with the velocity of 25 feet in a fecond, fuftained a reffiftance of 315 grains, nearly $\frac{3}{4}$ of an ounce. Suppofe this ball to move 800 feet in a fecond, that is 32 times fafter, its refiltance would be $32 \times 32$ times $\frac{3}{4}$ of an ounce, or 768 ounces or 48 pounds. This is four times the weight of a ball of calt iron of this diameter; and if the initial velocity had been 1600 feet per fecond, the refiftance would be at leaft id times the weight of the ball. It is indeed much greater than this.

This refiltance, operating conitantly and uniformly Com on the ball, muft take away four times as much from with its velocity as its gravity would do in the fame time, of $g$ r We know that is. one fecond gravity would reduce the may greatly exceed its weight. Any one will feel this in trying to move a fan very rapidly through the air; therefore this refiftance would occafion a greater deviation from uniform motion than gravity would in that lody. Its path, therefore, through the air may differ more from a parabola than the parabola itfelf deviates from the fraight line.
It is for fuch cogent reafons that we prefume to fay, that the voluminous treatifes whichlave beenpublifhed onthis fubject are nothing but ingenious amufements for young mathematicians. Few perfons who have been much engaged in the ftudy of mechanical philofophy have miffed this opportunity in the begiming. of their fudies. The fubject is eary. Some property of the parabolı occurs, by which they can give a neat and fyltematic folution of all the queftions; andat this time of fudy it feems a confiderable eflay of filll. 'Ihey are tempted to write a book on the fubject; and it finds readers among other young mechanicians, and employs all the mathematical knowledge that mof of the young gentlemen of the military profeffion are pofleffed of. But these performances de ferve little attention from the practical artillerift. All that feems poffible to do for his education is, to multiply judicious experiments on real pieces of ordnance, with the charges that are ufed in attual fervice, and to furnilh him with tables calculated from fuch experiments.

Thefe obfervations will ferve to juftify us for having given fo concife an account of this doatrine of the para-
bolic flight of bodies.
But it is the buinefs of a philofopher to inquire into the caufes of fuch a prodigious deviation from a well founded theory, and having difcovered them, to afcertain precifely the deviation they occafion. Thus we fhall obtain: mother theory, either in the form of the parabolic
velocity 800 to 768 if the ball were projected ftraight upwards. This refiftance of the air would therefore reduce it in one fecond to 672, if it operated uniformly: but as the velocity diminifhes continually by the refift. ance, and the refiftance diminifhes along with the velocity, the real diminution will be fomewhat lefs than 128 feet. We fhall, however, fee afterwards that in one fecond its velocity will be reduced from 800 to 687. From this fimple inftance we fee that the refiftance of the air muft occalion great deviation from parabolic motion.
In order to judge accurately of its effect, we mult And confider it as a retarding force, in the fame way as we derec confider gravity. The weight W of a body is the aq- retar gregate of the action of the force of gravity $g$ on each force particle of the body. Suppofe the number of equal particles, or the quantity of matter, of a body to be M, then $W$ is equivalent to $g M$. In like manner, the refiftance $R$, which we obferve in any experiment, is the aggregate of the ation of a retarding force $R^{\prime}$ on each particle, and is equivalent to $R$ 'M : and as $g$ is equal to $\frac{W}{M}$, fo $R^{\prime}$ is equal to $\frac{R}{M}$. We fhall keep this diftinetion in view, by adding the differcntial mark ' to the letter R or $r$, which expreffes the aggregate refintance.

If we, in this manner, confider sefitance as a retarding force, we can compare it with any other fuch force by means of the retardation which it produces in fimilar circumfances. We would compare it with gravity by uaifo comparing the diminution of velocity' which its unforms action produces in a given time with the diminution produced in the fame time by gravity. But we have no opportunity of doing this direcily; for when the refitance of the air diminifhes the velocity of a body, it diminifhe; it gradually, whichoccafions a gradual diminution of its

## P R O J E C ' $\quad$ I L E

own intenfity. This is not the cafe with gravity, which has the fime adion on a body in motion or at rett. We cannot, therefore, obferve the uniform attion of the ait's retitance as a retarding force. We mutt f.ll on fome other way of making the comparifon. We can fate them both as dead preffures. A ball may be fitted to the rod of a fipring fillyard, and expofed to the impulie of the wind. This will comprefs the fillyard to the mark 3, for in?ance. Perhaps the weight of the ball will comprefs it to the mark G. We know that half this weight would comprefs it to 3 . We account this equal to ihe prciliure of the air, becaufe they balance the lame clafticity of the fpring. And in this way we can entimate the refitance by weights, whofe preflures are equal to its prefiure, and we can thus compare it with other refiftances, weights, or any other preffures. In fact, we are meafuring them all by the elafticity of the fpring. This elafticity in its different pofitions is fuppofed to have the proportions of the weights which keep it in thefe pufitions. Thus we reafon from the nature of gravity, no longer conlidered as a dead prelfure, but as a retarding force; and we apply our conclufions to reliftances which exhibit the fame preflures, but which we cannot make to act uniformly. This fenfe of the words mult be carefully remembered whenever we fpeak of refiitances in pounds and ounces.
The moft direct and convenient way of tating the comparifon between the refittance of the air and the accelerating force of gravity, is to take a cafe in which we know that they are equal. Since the refiftance is here alfumed as proportional to the fquare of the velo. city, it is evident that the velocity may be fo increafed that the refintance fhall equal or exceed the weight of the body. If a body be already moving downwards with this velocity, it cannot accelerate; becaufc the accelerating force of gravity is balanced by an equal retarding force of refintance. It follows from this remark, that this velocity is the greatef that a body can acquire by the force of gravity only. Nay, we flall afterwards fee that it never can completely attain it ; becaufe as it approaches to this velocity, the remaining accelerating force decreafes fafter than the velocity increafes. It may therefore be called the limiting or terminal velocity by gravity.

Let $a$ be the height through which a heavy body mult fall, in vacuo, to acquire its terminal velocity in air. If projected directly upwards with this velocity, it will rife again to this height, and the height is half the fpace which it would delicribe uniformly, with this velocily, in the time of its afcent. Therefore the refiftance to this velocity being equal to the weight of the body, it would extinguifh this velocity, by its uniform action, in the fame time, and after the fame diflance, that gravity would.

Now let $g$ be the velocity which gravity generates or extinguihes during an unit of time, and let $u$ be the terminal velocity of any particular body. The theorems for perpendicular afcents give us $g=\frac{u^{2}}{2 a}$, $u$ and $a$ being both numbers reprefenting units of fpace; therefore, in the prefent cafe, we have $r^{\prime}=\frac{u^{2}}{2 a}$. For the whole refiftance $r$, or $\boldsymbol{r} M$, is fuppofed equal to the weight, or to $g \mathrm{M}$; and therefore $r^{\prime}$ is equal to $g,=\frac{a^{2}}{2 a}$ and $2 a=$
$\frac{u^{2}}{s}$. There is a conflueration which ought to have place here. $\Lambda$ body defeends in air, not by the whole of its wcight, but by the excefs of its weight alone that ef the air which it difplaces. It defeends by its $\iint_{2}$ cifis gravity only as a fone does in water. Suppole a body 32 times heavier than air, it will be buoged up by a force equal to $\frac{1}{32}$ of its weight ; and intead of acquiring the velocity of 32 feet in a feeond, it will ouly acquire a velocity of 31 , even though it fuftained no refiftance from the inertia of the air. Let $p$ be the weight of the body and $\tau$ that of an equal bulk of air: the accelerative force of relative gravity on cach partizie will be $g \times \pm-\frac{\pi}{P}$; and this relative accelerating force might be diffinguifhed by another fymbol 2. But in all cafes in which we have any interef, and particular$1 y$ in military projectiles, $\frac{\pi}{p}$ is fo fmall a quantity thatit would be pedantic affectation to attend to it. It is much more than compenfated when we make $g=32$ fect inftead of $32 \frac{1}{12}$ which it fhould be.

Let $e$ be the time of this afcent in oppofition to gravity. The fame theorems give us $e u=2 a$; and lince the refiftance competent to this terminal velocity is equal to gravity, will alfo be the time in which it wrould be extinguifhed by the uniform action of the refitance : for which reafon we may call it the extinguifhing time for this velocity. Let $R$ and $E$ mark the refiltance and extinguifing time for the fame body moving with the velocity I .

Since the refiftances are as the fquares of the velocities, and the refiftance to the velocity $u$ is $\frac{u^{2}}{2 a}, \mathrm{R}$ will $b e=\frac{1}{2 a}$. Moreover, the times in which the fame ve. locity will be extinguifhed by different forces, actins uniformly, are inverfely as the forces, and gravity would extinguifh the velocity $I$ in the time $\frac{1}{d},=$ (in thefe meafures) to $\frac{1}{\frac{u^{2}}{2 a}}=\frac{2 a}{u^{2}}$. Therefore we have the following proportion $\frac{1}{2 a}(=\mathrm{R}): \frac{u^{2}}{2 a}(=g)=\frac{2 a}{u^{2}}: 2 a$, and $2 a$ is equal to E, the time in which the velocity I will be extinguifled by the uniform action of the refiftance competent to this velocity.

The velocity I would in this cafe be extinguifhed after a motion uniformly retarded, in which the fpace defcribed is one-half of what would be uniformly defribed during the fame time with the conftant velocity 1. Theretore the fpace thns deferibed by a motion which begins with the velacity 1 , and is uniformly retarded by the refiftance competent to this velocity, is equal to the height through which this body mult fall in vacuo in order to acquire its terminal velocity in air.
All thefe circumflances may be conceived in a manner which, to fome readers, will be more faniliar and palpable. The terminal velocity is that where the refiftance of the air balances and is equal to the weight of the body. The refiftance of the air to any particular body is as the fquare of the velocity; therefore let $R$ be the whole refifta ce to the body moving with the velocity

1 , and $r$ the refiftance to its motion with the terminal velocity $u$; we muft have $r=\mathrm{R} \times u^{2}$, and this mult be $=W$ the weight. Therefore, to obtain the terminal velocity, divide the weight by the refiftance to the velocity 1 , and the quotient is the fquare of the terminal velocity, or $\frac{W}{R}=u^{2}$ : And this is a very expeditious me. thod of determining it, if $R$ be previoufly known.

Then the common theorems give $a$, the fall necoffary for producing this velocity in vacuo $=\frac{u^{2}}{2 g}$, and the time of the fall $=\frac{u}{g}=c$, and $e u,=2 a$, = the fpace uniform. ly deferibed with the velocity $u$ during the time of the fall, or its equal, the time of the extinction by the uniform :ction of the reffance $r$; and, fince $r$ extinguithes it in the time $s, R$, which is $u^{2}$ times fmaller, will cx . tinguih it in the time $u^{2} e$, and $R$ will extinguilh the velocity r , which is $u$ times lefs than $u$, in the time $u e$, that is, in the time $2 a$; and the body, moving uniformly during the time $2 a,=E$, with the velocity i , will defcribe the fpace $2 a$; and, if the body begin to move with the velocity 1 , and be uniformly oppofed by the refiftance $R$, it will be brought to reft when it has defcribed the fpace $a$; and the fpace in which the refiftance to the velocity I will extinguifh that velocity by its aniform action, is equal to the height through which that body mult fall in vacuo in order to acquire its terminal relocity in air. And thus every thing is regulated by the time $\mathbf{E}$ in which the velocity I is extinguifhed by the uniform action of the correfponding refifance, or by $2 a$, which is the fpace uniformly defcribed during this time, with the velocity I. And E and $2 a$ mult be expreffed by the fame number. It is a number of units, of time, or of length.

## P R O J E. C T I L E S.

be $\frac{1}{2 a d}$. The time in which this diminifhed refiftance will extinguifh the velocity I mult increafe in the proportion of the diminution of force, and mult now be E $d$, or $2 a d$, and the face uniformly deferibed during this time with the initial velocity mult be $2 a d$; and this mult gill be twice the height neceffary for communicating the terminal velocity $w$ to this body. We muit fill haveg $=\frac{w^{2}}{2 a d}$; and therefore $\varepsilon v^{2}=2 g a d$, and $\approx u=\sqrt{2 g a d},=\sqrt{2 g a} \sqrt{d .}$ But $u=\sqrt{2 g a_{0}}$ Therefore the terminal velocity $w$ for this body is $=$ $u^{\prime} \sqrt{d}$; and the height neceflary for communicating it is $a d$. Therefore the terminal velocity varies in the fubduplicate ratio of the diameter of the ball, and the fall neceflary for producing it varies in the fimple ratio of the diameter. The extinguifhing time for the velocity $v$ mult now be $\frac{\mathrm{E} d}{v}$.

If, in the 3 d place, the denfity of the ball be increafed in the proportion of 1 to $m$, the number of particles among which the refiftance is to be diftributed is increafed in the fame proportion, and therefore the retarding force of the refiftance is equally diminiflied ; and if the denfity of the air is increafed in the proportion of I to $n$, the retarding force of the refiftance increafes in the fame proportion : hence we eafily deduce thefe general expreffions.

The terminal velocity $=u \sqrt{d m}-=\sqrt{2 g a d m}$
The producing fall in vacua $=a d \frac{m}{n}$
The retarding power of refiftance to any velocity= $r^{\prime},=\frac{v^{2}}{2 a d}$.

The extinguifhing time for any velocity $v=\frac{\mathrm{E} d m}{v n z}$.
And thus we fee that the chief circumflances are regulated by the terminal velocity, or are conveniently referred to it.

To render the deductions from thefe premifes perfpicuous, and for communicating diftind notions or ideas, it will be proper to affume fome convenient units, by ceflar which all thefe quantities may be meafured; and, as quan this fubject is chiefly interefting in the cafe of military may projectiles, we thall adapt our units to this purpofe. Therefore, let a fecond be the unit of time, a foct the unit of face and velocity, an inch the unit of diameter of a ball or fhell, and a pound avoirdupoife the unit of preffure, whether of weight or of refiftance; therefore $g$ is 32 feet.

The great difficulty is to procure an abfolute mea. fure of $r$, or $u$, or $a$; any one of thefe will determine the others

Sir Ifaac Newton has attempted to determine $r$ by theory, and employs a great part of the fecond book of the Principia in demonftrating, that the reffifance to a ende fphere moving with any velocity is to the force which in thi would generate or deftroy its whole motion in the time that it would uniformly move over $\frac{8}{3}$ of its diameter with this velocity as the denfity of the air is to the denfity of the fphere. This is equivalent to demonftrating that the refiftance of the air to a fphere moving through it with any velocity, is equal to half the weight of a
column

## P R O J E C T I L E S.

column of air having a great circle of the fphere for its bafe, and for its altitude the height from which a body muft fall in vacto to acquire this velocity. This appears from Newton's demonfration; for, let the fpecific gravity of the air be to that of the ball as 1 to $m$; then, becaufe the times in which the fame velocity will be extinguithed by the uniform axtion of different forces are inverfely as the forces, the refiftance to this velocity would extinguith it in the time of defcribing $\frac{8}{3} m=d, d$ being the diameter of the ball. Now I is to $m$ as the weight of the difplaced air to the weight of the ball, or as $\frac{2}{3}$ of the diameter of the ball to the length of a column of air of equal weight. Call this length $a ; a$ is therefore equal to $\frac{2}{3} m . d$. Suppofe the ball to fall from the height $a$ in the time $t$, and acquire the velocity $u$. If it moved uniformly with this velocity during this time, it would defcribe a fpace $=2 a$, or ${ }_{3}^{4} m d$. Now its weight would extinguint this velocity, or deftroy this motion, in the fame time, that is, in the time of defcribing $\frac{4}{3} m d$; but the relittance of the air would do this in the time of deferibing $\frac{8}{3} \mathrm{md}$; that is, in twice the time. The refifance therefore is equal to half the weight of the ball, or to half the weight of the column of air whofe height is the height producing the velocity. But therefiftancestodifferent velocities are as the fquares of the velocities; and therefore, as their producing heights, and, in general, the refiftance of the air to a f.phere moving with any velocity, is equal to the half weight of a column of air of equal festion, and whofe altitude is the height producing the velocity. The refult of this inveftigation has been acquiefced in by all SirIfaac Newton's commentators. Many faultshaveindeed been found with his reafoning, and even with his pirnciples; and it mult be acknowledged that although this inveftigation is by far the moft ingenious of any in the Principia, and fets his acutenefs and addrefs in the moft confpicuous light, his reafoning is liable to ferious objections, which his moft ingenious commentators have not completely removed. However, the conclufion has been acquiefced in, as we have already flated, but as if derived from other principles, or by more logical reafoning. We cannot, however, fay that the reafonings or aflumptions of thefe mathematicians are much better than Newton's: and we muft add that all the caufes of deviation from the duplicate ratio of the velocities, and the caufes of increafed refifance, which the later authors have valued themfelves for difcovering and introducing into their inveftigations, were pointed out by Sir Ifaac Newton, but purpofely omitted by him, in order to facilicate the difcuffion in re difficillima. (See Schol. prop. 37. b. ii.)

It is known that the weight of a cubic foot of water is $62 \frac{\frac{1}{2}}{2}$ pounds, and that the medium denfity of the air is $\frac{1}{8 \cdot 5}$ of water ; therefore let $a$ be the height producing the velociy (in feet), and $d$ the diamerer of the ball (in inches), and $\pi$ the periphery of a circle whofe diameter is 1 ; the refiftance of the air will be $=\frac{62 \frac{1}{2}}{840} \times \frac{\pi}{4}$ $\times \frac{1}{1+4} \times \frac{a}{2} \times d^{2}=\frac{a d^{2}}{49^{28^{\frac{1}{2}}}}$ pounds, very r.carly, $=$ $\frac{v^{2}}{49^{28} \frac{v^{2}}{2} \times 64} d^{2},=\frac{v^{2} d^{2}}{315 t^{17}}$ pounds.

We may take an example. A ball of caft iron weighing 12 pounds, is $4 \frac{1}{2}$ inches in diameter. Suppofe this
ball to move at the rate of 25 ro feet in a fecond (the reafon of this choice will appear afterwards). The height which will produce this velocity in a falling body is 97 feet. The area of its great circle is 0,11044 feet, or rolot4 of one foot. Suppofe water to be 840 times heavier than air, the weight of the air incumbent on this greatt circle, and $9 \frac{7}{8}$ fcet high, is 0,081151 pounds: half of this is 0,0405755 or $\frac{405058}{408050}$ or nearly $z^{2} 5$ of a pound. This thould be the retittance of the air to this motion of the ball.

In all matters of phyfical difcufion, it is prudent to confront every theoretical conclufion with experiment. This is particularly ncceffary in the prefent infance, becaufe the theory on which this propofition is founded is extremely uncertain. Newton speaks of it with the molt cautious diffidence, and fecures the juntnefs of the conclufions by the conditions which he altumes in his inveltigation. He defcribes with the greatelt precifion the Itate of the fluid in which the body mult move, fo as that the demonfiration may be flicit, and leaves it to others to pronounce whether this is the real conflitution of our atmofphere. It mult be granted that it is not ; and that many other fuppolitions have been introduced by his commentators and followers, in order to fuit his inveftigation (for we muft affert that little or nothing has been added to it) to the circumftances of the cate.

Newton himfelf, therefore attempted to compare his Newton's propofitions with experiment. Some were made by experidropping balls from the dome of St Paul's cathedral; and inents. all thefe fhowed as great a coincidence with his theory as they did with each other: but the irregularities were too great to allow him to fay with precifion what was the refiftance. It appeared to follow the proportion of the fquares of the velocities with fufficient exactnefs; and though he could not fay that the refiftance was equal to the weight of the column of air having the height neceffary for communicating the velocity, it was always equal to a determinate part of it; and might be fated $=n a, n$ being a number to be fixed by numerous experiments.

One great fource of uncertainty in his experiments feems to have eicaped his obfervation: the air in that dome is almoft always in a flate of motion. In the fummer feafon there is a very fenfible current of air downwards, and frequently in winter it is upwards: and this current bears a very great proportion to the velocity of the defcents. Sir Ifaac takcs no notice of this.

He made another fet of experinjents with pendulums; and has pointed out fome very curious and unexpected circumftances of their motions in a refifing mediun. There is hardly any part of his noble work in which his addrefs, his patience, and his aftonithing penetration, appear in greater luftre. It requires the utmoll intenfenet's of thought to follow him in thefe difquifitions; and we cannot enter on the fubjec at prefent : fome notice will be taken of thefe experiments in the article Resist TANCR of Fluids. Their refults were much more uniform, and contrimed his general theory; and, as we have faid above, it has been acquiefced in by the firft mathematicians of Europe.

But the deductions from this theory were fo incon- fintility of fiftent with the obferved motions of military projestiles, the thenry when the velocities arc prodigious, that no application in pratite. could be made which could be of any fervice for deter-
mining the patlis and motion of cannen fhot and bombs ； and althongh Mr Juhn Bernonlli gave in 1718 a moß elegant determination of the trajectory and mution of a boovy projeeted in a flud which refifts in the duplicate ratio of the velocitie：（il problem which even Newton aid not attempt），it has remained a dead letter．Mr benjamin Robins，equally eminent for phyfical fcience and mathematical genius，was the firf whofufpected the true caule of the imperlection of the ufually received thenries；and in 1737 he publithed a fmall trast，in which he thowed clearly，that even the Newtonian the－ wry of refitance mutt caufe a cannon ball，difcharged with a full allotment of powder，to deviate farther from the paraboli，in which it would move in vaizo，than lie parabola deviates from a fraight line．Dut he farther allerted，on the authority of good reafoning，that in fuch great velocities the refiftance mult be much greater than this theory afligns；becaufe，befides the refiftance arifing from the inertia of the air which is put in motion by the ball，there mult be a refiltance arifing froma condenfation of the air on the anterior furface of the ball，and a rare－ faction behind it：and there muft be a thind refiftance， arifing from the ftatical preffure of the air on its ante－ rior part，when the motion is fo fwift that there is a va－ cuum behind．Even thefe caules of difagreement with the theory had been forefeen and mentioned by New－ tion（fee the Sckolium to prop．37，Book II．Princip．）； but the fubject feems to have been litile attended to． ＇the eminent mathematicians had few opportunities of making experiments；and the profeffional men，who were in the fervice of princes，and had their countenance and aid in this matter，were generally too deficient in mathematical knowledge to make a proper ufe of their rpportunitics．The numerons and fplendid volumes which thefe gentlemen have been enabled to publith by the patronage of fovereigns are little more than prolix cxtenfions of the limple theory of Galileo．Some of them，however，fuch as St Remy，Autonini，and Le Blond，have given moft valuable collections of experi－ ments，ready for the ufc of the profound mathematician． Two or three years after this firf publication， Mr Robins hit upon that ingenious method of meafuring the great velocities of military projectiles，which has handed down his name to pofterity with great honour． And having afcertained thefe velocities，he difcovered the prodigious refiftance of the air，by obferving the diminution of velocity which it occafoned．This made hin anxious to examine what was the real refifance to any velocity whatever，in order to afcertain what was the law of its variation；and he was equally fortunate in this attenpt．Fis method of meaturing the refiftance bas beenfully defcrihed in the article GUNNERy，$n^{\circ} 9, \& c$ ．
It appears（Rubins＇s Math．Works，vol．i．page 205．） that a fphere of $4 \frac{1}{2}$ inches in diameter，moving at the rate of $25 \frac{1}{5}$ feet in a fecond，fuitained a refiftance of 0,04914 rounds，or $\frac{4914}{100000}$ of a pound．This is a greater refiftance than that of the Newtonian theory， which gave $\frac{405755}{20000000}$ in the proportion of 1000 to 1211 ，or very nearly in the proportion of five to fix in fimall numbers．And we may adopt as a rule in all mo－ derate velocities，that the refiftance to a fphere is equal to $\frac{6 x}{100}$ of the weight of a column of air having the great circle of the fplere for its bafe，and for its altitude the height through which a heavy body mult fall in vo． cuo to acquire the velocity of projection．

This experiment is peculiarly vaiuable，becaure，the ball is precifely the fize of a 12 pound fhot of caft iron， and its accuracy may be depended on．There is but one fource of error．The whirling motion muft have eccafioned fome whirl in the air，which would continue till the ball again paffed through the fame point of its revulution．The refiftance obferved is therefore pro－ bably tomewlat lefs than the true refiftance to the velo－ city of $25 \frac{x}{5}$ feet，becaufe it was exerted in a relative ve－ locity which was lefs than this，and is，in fact，the re－ fiffance competent to this ielative and fmaller velocity． －Accordingly，Mr Smeaton，a moft fagacious natu－And， ralift，places great confidence in the oiffervations of a Roufe Mr Roufe of Leicefterfhire，who meafured the reliftance De br by the effect of the wind on a plane properly expoled to it．He does not tell us in what way the velocity of the wind was afertaned；but our deterence for his great penetration and experience difpofes us to believe that the point was well determined．The refiftance ob－ ferved by Mr Roufe exceeds that refulting from Mr Robins＇s experiments nearly in the proportion of 7 to 10. Chevalier de Borda made experiments fimilar to thofe They of Mr Robins，and his refults exceed thofe of Ro－ bins in the proportion of 5 to 6 ．Thefe differences are fo confiderable，that we are at a lofs what meafure to abide by．It is much to be regretted，that in a fub－ ject fo interefting both to the philofopher and the man of the world，experiments have not been multipli－ ed．Nothing would tend fo much to perfect the fcience of gunnery；and indeed till this be done，all the labours of mathematicians are of no avail．Their inveftigations muft remain an unintelligible cipher，till this key be fupplied．It is to be hoped that Dr Charles Hutton of Woolwich，who las fo ably extended Mr Robins＇s Examination of the Initial Velocities of Military Pro－ jectiles，will be encouraged to proceed to this part of the fubject．We fhould wifh to fee，in the firf place， a numerous fet of experiments for afcertaining the re－ fiftance in moderate velocities ：and，in order to avoid all error from the refiftance and inertia of the machine， which is neceffarily blended with the reliftance of the ball，in Mr Robins＇s form of the experiment，and is fepa－ rated with great uncertainty and rifk of error，we would recommend a form of experiment fomewhat different．

Let the axis and arm which carries the ball be con－ nected with wheelwork，by which it can be put in mo－of exp tion，and gradually accelerated．Let the ball be fo ment $r$ connected with a bent fpring，that this fhall gradually comme comprefs it as the refiftance increafes，and leave a mark of ed． the degree of compreffion；and let all this part of the apparatus be fcreened from the air cxcept the ball．The velocity will be determined precifely by the revolutions of the arm，and the refifance by the compreffion of the fpring．The beft method would be to let this part of the apparatus be made to flide along the revolving arm， fo that the ball can be made to defcribe larger and lar－ ger circles．An intelligent mechanician will eafily con－ trive an apparatus of this kind，held at any diftance from the axis by a cord，which paffes over a pulley in the axis itfelf，and is then brought along a perforation in the axis，and comes out at its extremity，where it is fitted with a fwivel，to prevent it from fnapping by be－ ing twifted．Now let the machine he put in motion． The contrifugal force of the ball and apparatus will caule it to Hy out as far as it is allowed by the cord；

## P R O J E C T I L E S.

and if the whole is put in motion by connceting it with fome mill, the velocity may be moft accurately afcer tained. It may alfo be fitted with a bell and hammer like Gravefande's machine for meafuring contrifugal forces. Now by gradually veering off more cord, the difance from the centre, and confequently the velocity and refifance increafe, till the hammer is difengaged and ftrikes the bell.
Another great advantage of this form of the experiment is, that the refilance to very great velocities may be thus examined, which was impoffible in Mr Robins's was. This is the great defideratum, that we may learn in what proportion of the velocities the refiflances increafe.

In the fame manner, an apparatus, confiling of Dr Lynd's Anemometer, defcribed in the article Preumarics, $n^{\circ} 3^{11, \& c c . m i g h t ~ b e ~ w h i r l e d ~ r o u n d ~ w i t h ~ p r o d i g i o u s ~}$ rapidity, and the fluid on it might be mate clammy, which would leave a mark at its greatef elevation, and thus difonver the refiftance of the air to rapid motions.

Nay, we are of opinion that the refiftance to very rapid motions may be me:tiured directly in the conduit pipe of fome of the great cylinder bellows employed in blatt furnaces; the velocity of the air in this pipe is afcertained by the capacity of the cylinder and the ftrokes of the pifton. We think it our duty to point out to luch as have the opportunities of trying them methods which promife accurate refults for afeertaining this moft defirable point.

We are the more puzzled what meafure to abide by, becaufe Mr Robiss himfelf, in his Practical Propofitions, does not make ufe of the refult of his own experiments, but takes a much lower meafure. We muft content purfelves, however, with this experimental meafure, becaufe it is as yet the only one of which anyaccount can be given, or well-founded opinion formed.
Therefore, in order to apply our formulx, we mult reduce this experiment which was made on a ball of $4^{\frac{x}{2}}$ inches diameter, moving with the velocity of $25 \frac{1}{5}$ feet per fecond, to what would be the refiftance to a ball of one inch, having the velocity if foot. This will evidently give us $R=\frac{0,04914}{4,5^{2} \times 25.2^{2}}$, being dimminifhed in the duplicate ratio of the diameter and velocity. This gives us $R=0,00000381973$ pounds, or $\frac{3.81973}{1000000}$ of a pound. The logarithm is $\overline{4}, 58204$. The refiftance here determined is the fame whatever fubfatnce the ball be of ; but the retardation occafioned by it will depend on the proportion of the refiflance to the vis infita of the ball; that is, to its quantity of motion. This in fimilar velocities and diameters is as the denfity of the ball. The balls ufed in military fervice are of caft iron or of lead, whofe fpecific gravities are 7,207 and 11,37 nearly, water being J . There is conliderable variety in calt iron, and this denfity is about the medium. Thefe data will give us.

W, or weight of a ball I inch in

| diametcr |  | lbs. 0,13648 | 0,21533 |
| :---: | :---: | :---: | :---: |
| Log. of W | - | 9.13509 | 9.33310 |
| $\mathrm{E}^{\prime \prime}$ | - | $1116{ }^{\prime \prime}, 6$ | 1761",6 |
| Log. of E | - | 3.04790 | 3.24521 |
| $u$, or terminal velocity | - | 189,03 | 237,43 |
| Log. ${ }^{\text {l }}$ | - | 2.27653 | 2.37553 |
| $a_{2}$ or producing height |  | $55^{8,3}$ | 880,8 |

Thefe numbers are of frequent ufe in all queltions on this fubject.

Mr Robins gives an expeditious rule for readily finding $a$, which he calls $F$ (fee the article Gunnery), by which it is made 900 feet for al call iron ball of an inch, diametcr. But no theory of refiftance which he profefles to ufe will make this height neceffary for producing the terminal velocity. His $F$ therefore is an $\mathrm{cm}-$ pirical quantity, anologous indeed to the producing height, but accominodated to his theory of the trajectory of cannon-fhot, which he promifed to publifh, but did not live to execute. We need not be very anxious about this; for all our quantities change in the fame proportion with $R$, and need only a correction by a multiplier or divifor, when R flall be accuratcly eftablifhed.

We may illuftrate the ufe of thefe formula by an example or two.

1. Then, to find the refiftance to a 24 pound ball Exanyples moving with the velocity of 1670 feet in a fecond, of their which is nearly the velocity communicated by 16 lbs , ufe, of powder. The diameter is 5,603 inches.
Log. R

$$
+4.58204
$$

Log. $d^{2} \quad-\quad+1.49674$
Log. $1670^{2}$ - +6.44548
Log. 334,4 lbs. $=r \quad$ 2.52426
But it is found, by unequivocal experiments on the retardation of fuch a motion, that it is 504 lbs . This is owing to the caufes often mentioned, the additional refinance to great velocities, ariling from the condendation of the air, and from its prefure into the vacuum left by the ball.
2. Required the terminal velocity of this ball?

| $\begin{aligned} & \text { Log. R } \\ & \text { Log. } d^{2} \end{aligned}$ |  | $\begin{aligned} & +4.5820+ \\ & +1.49674 \end{aligned}$ |

Mr Muller, in his writings on this fubjeat, gives a
much fmaller meafure of refiftunce, and confequently a much greater terminal velocity : but his theory is a miftake frombeginning to end (See his Suptlement to his Trcatio of Artillcry, art. 150, scc.) In art. 148. he affumes an algebraic expreffion for a principle of mechanical arghnent; and from its confequence draws erroneous conclufions. He makes the refiltance of a cylinder $\frac{2}{3}$ lefs than Newton fuppofes it ; and his reafon is falle. Newton's meafure is demonftrated by his commentators Le Seur and Jaquier to be even a little too fnall, upon his own principles, (Not. 277. Prop. $3^{66}$. 13. II.) Mr Muller then, without any feeming reafon, introduces a new principle, which he makes the chief fupport of his theory, in oppofition to the theories of other mathematicians. The principle is falfe, and even abfurd, as we fhall have occalion to lhow by and by. In confequence, however, of this principle, he is enabled to compare the refults with many experiments, and the agrecment is very flattering. But we fhall foon fee that little dependence can be had on fuch comparifons. We notice thefe things here, becaufe Mr Muller being head of the artillery fchool in Britain, his publications have become a fort of text-books. We are miferably deficient in works on this fubjeet, and mult have recourfe to the foreign writers.

We now proceed to confider thefe motions through their whole courfe : and we fhall firft confider them as affeeted by the refiftance only ; then we thall confider the perpendicular afcents and defcents of heavy bodies through the air; and, lafly, their motion in a curvilineal trajcitory, when projected obliquely. This munt be done by the help of the abftrufer parts of fluxionary mathematics. To make it more perfpicuous, we fhall, by way of introduction, confider the fimply refifted rectilineal motions geometrically, in the manner of Sir Haac Newton. As we advance, we fhall quit this track, and profecute it algebraically, having by this time acquired diftinct ideas of the algebraic quantities.

We mult keep in mind the fundamental theorems of vaied motions.

1. The momentary variation of the velocity is proportional to the force and the moment of time jointly, and may therefore be reprefented by $=\dot{v}=\dot{f}$, where $\dot{v}$ is the momentary increment or decrement of the velocity $v, f$ the accelerating or retarding force, and $i$ the moment or increment of the time $t$.
2. The momentary variation of the fquare of the ve. locity is as the force, and as the increment or decrement of the fpace jointly; and may be reprefented by $\pm v \dot{v}$ $=\dot{f} s$. The firft propofition is familiarly known. The econd is the $39^{\text {th }}$ of Newton's Principia, B. I. It is demonfrated in the article Oprics, p. 281. and is the mont extenfively ufeful propolition in mechanics.
Thefe things bcing premifed, let the fraight line AC (fig. 6.) reprefent the initial velocity $V$, and let CO , perpendicular to AC , be the time in which this velocity would be extinguifhed by the uniform action of the refiftance, Draw through the point $A$ an equilateral hyperbola A eB , having $\mathrm{OF}, \mathrm{OCD}$ for its af- fymptotes; then let the time of the refifted motion be reprefented by the line $\mathrm{CB}, \mathrm{C}$ heing the firt inftant of the motion. It there be drawn perpendicular ordinates $r e, g f, D B$ \&c. to the hyperbola, they will be pro-
portional to the velocities of the body at the inflants $x, g, \mathrm{D}, \& \mathrm{c}$. and the hyperbolic areas $\mathrm{AC} \times e \mathrm{AC} g$, $A C D D, \& c$. will be proportional to the faces defcribed during the times $\mathrm{C} x, \mathrm{Cg}, \mathrm{CB}$, ac.

For, fuppofe the time divided into an indefinite number of fmall and equal moments, $\mathrm{C} c, \mathrm{D} d, \& c$. draw the ordinates $a c, b d$, and the perpendiculars $b \beta, a \alpha$. Then, by the nature of the hyperbola, $\mathrm{AC}: a c=\mathrm{O} c$ : OC ; and $\mathrm{AC}-a c: a c=\mathrm{Oc}-\mathrm{OC}: \mathrm{OC}$, that is, $\mathrm{A}_{\alpha}$ $: a c=\mathrm{C}=\mathrm{OC}$, and $\mathrm{A} \alpha: \mathrm{C} c=a \varepsilon: \mathrm{OC},=\mathrm{AC} \cdot a c$ : $\mathrm{AC} \cdot \mathrm{OC}$; in like manner, $\mathrm{B} \beta: \mathrm{D} d=\mathrm{B} \cdot 6 \mathrm{D}: \mathrm{BD}$ OD. Now $\mathrm{D} d=\mathrm{C} c$, becaule the moments of time were taken equal, and the reatangles $\mathrm{AC} \cdot \mathrm{CO}, \mathrm{BD} \cdot \mathrm{DO}$, are equal, by the nature of the hyperbola; therefore $\mathrm{A} \alpha: \mathrm{B} \cdot \mathrm{B}=\mathrm{AC} \cdot a c: \mathrm{BD} \cdot b d:$ but as the points $c, d$ continually approach, and ultimately coincide with C , D , the ultimate ratio of $\mathrm{AC} \cdot a c$ to $\mathrm{BD} \cdot b d$ is that of $\mathrm{AC}^{2}$ to $\mathrm{BD}^{2}$; therefore the momentary decrements of AC and BD are as $\mathrm{AC}^{2}$ and $\mathrm{BD}^{2}$. Now, becaufe the refiflance is meafured be the momentary diminution of velocity, thefe diminutions are as the fquares of the velocities; therefore the ordinates of the hyperbola and the velocities diminifh by the fame law ; and the initial velocity was reprefented by AC: therefore the velocities at all the other inftants $x, g, D$ are properly reprefented by the correfponding ordinates. Hence,

1. Since the abicifle of the hyperbola are as the times, and the ordinates are as the velocities, the areas will be as the fpaces defcribed, and $\mathrm{AC} u e$ is to $\mathrm{A} c g f$ as the fpace defcribed in the time $\mathrm{C} x$ to the fpace defcribed in the time $\mathbf{C} g$ (In Theorem on varied motions).
2. The rectangle ACOF is to the area ACDB as the fpace formerly expreffed by $2 a$, or E to the fpace deicribed in the refifting medium during the time CD : for AC being the velocity V, and OC the extinguifhing time $f$, this rectangle is $=e \mathrm{~V}$, or E , or $2 a$, of our former difquifitions; and becaufe all the rectangles, fuch as ACOF, BDOG, \&sc, are equal, this correfponds with our former obfervation, that the fpace uniformly defcribed with any velocity during the time in which it would be uniformly extinguifhed by the correfponding refitance is a conftant quantity, viz. that in which we always hadev $=\mathrm{E}$, or $2 a$.
3. Draw the tangent $\mathrm{A}_{x}$, then, by the hyperbola $\mathrm{C} x=\mathrm{CO}$ : now $\mathrm{C} x$ is the time in which the refiltance to the velocity $A C$ would extinguifh it ; for the tangent coinciding with the elemental arc $\mathrm{A} a$ of the curve, the firt impulie of the uniform action of the refiftance is the fame with the firft impulfe of its varied action. By this the velocity AC is reduced to $a c$. If this operated uniformly like"gravity, the velocities would diminifh uniformly, and the fpace defcribed would be reprefented by the triangle $\mathrm{AC} x$.

This triangle, therefore, reprefents the height thro' which a heavy body muft fall in vacuo, in order to acquire the terminal velocity.
4. The motion of a body refifted in the duplicate ratio of the velocity will continue without end, and a fpace will be defrribed which is greater than any affignable fpace, and the velncity will grow lefs than any that can be affigned; for the hyperbola approaches continually to the affymptote, but never coincides with it. There is no velocity BD fo fmall, but a fmaller ZP will be found beyond it ; and the hyperbolic fpace
may be continued till it exceeds ans furface that ean be alligned.
5. The initial velocity $A C$ is to the final velocity BD as the fun of the extinguifhing time and the time of the retarded motion, is to the extinguifhing time alone: for $\mathrm{AC}: \mathrm{BD}=\mathrm{OD}($ or $\mathrm{OC}+\mathrm{CD}): O C$; or $V: v=c: c+t$.
6. The extirguifing tizze is to the time of the retarded motion at the final velucity is to the velocity loft during the scturded motion: for the rectangles $A F O C, 13 D O G$ are equal ; and therefore AVGF and $B V C D$ are equal and $\mathrm{VC}: V A=V G: V B$; there. fore $t=e^{V-v} v^{2}$, and $e=t \frac{v}{V-v}$.
7. Any velucity is reduced :n the proportion of $m$ to $n$ in the time $\frac{n-n}{n}$. For, let $\mathrm{AC}: \mathrm{BD}=n: n$; then $D O: C O=n: n$, and $D C: C O=2 \pi-n: n$, and $\mathrm{DC}=\frac{m-n}{n} \mathrm{CO}$, or $t=\frac{m-n}{n}$. Therefore any velocity is reduced to one half in the time in which the initial refiftance would have estinguithed it by its uniform action.

Thus may the chief circumflances of this motion be determined by means of the hyperbola, the ordinates and abfeiffex exhibiting the relations of the times and velocities, and the areas exhibiting the relations of both to the fpaces defcribed. But we may render the conception of thefe circumftances infinitely more eafy and fimple, by expreffing them all by lines, inftead of this combination of lines and furfaces. We fhall accomplifa this purpofe by confructing another curve LKP, having the line ML. $\delta$, parallel to OD for its abfiffa, and of fuch a nature, that if the ordinates to the hyperbola $\mathrm{AC}, e x, f g, \mathrm{BD}, \& \mathrm{cc}$. be produced till they cut this curve in $L$, $p, n, \mathrm{~K}$, \&c. and the abfeiffa in $L$, , $h, \delta, \& c$. the ordinates $s p, b n, \delta K, \& c$. may be proportional to the hyperbolic areas e A $c x, f a c \mathrm{O}$, $\therefore \mathrm{A} c \mathrm{~K}$. Let us examine what kind of curve this will be.

Make OC: $\mathrm{O} x=0 \mathrm{x}: \mathrm{O}_{\mathrm{g}}$; then (Hamilton's $C_{o}$. nics, IV. 14. Cor.), the areas AC $\times e, e \times g f$ are equal: therefore drawing $p s, n t$ perpendicular to OM , we thall have (by the affumed nature of the curve $L$ L $p \mathrm{~K}$ ), $\mathrm{M}_{\mathrm{s}}=s t$; and if the abfeiffa OD be divided into any number of fmall parts in geometrical progreffion (reckoning the commencement of them all from O), the axis $\mathrm{V} i$ of this curve will be divided by its ordinates into the fame number of equal parts; and this curve will have its ordinates LM, $p s, n t$, $\& e$. in geometrical progreffion, and its abfeiffe in arithmetical progreffion.

Alfo, let KN, MV touch the curve in K and L , and let $O C$ be fuppofed to be to $O c$, as $O D$ to $O d$, and therefore $\mathrm{C} c$ to $\mathrm{D} d$ as OC to OD; and let thefe lines $\mathrm{C} c, \mathrm{D} d$ be indefinitely fmall; then (by the nalure of the curve) I.o is equal to $\mathrm{K} r$ : for the areas a $\mathrm{AC} c, b \mathrm{BD} d$ are in this cafe equal. Alfo 10 is to $k r$, as LM to KI, becaufe $c \mathrm{C}: d \mathrm{D}=\mathrm{CO}: \mathrm{DO}$ :

Therefore $1 \mathrm{~N}: 1 \mathrm{~K}=r \mathrm{~K}: r k$
IK: ML=rk:ol
M11: MV = 0 I: 0I.
and $1 \mathrm{~N}: \mathrm{MN}=r \mathrm{~K}: o \mathrm{~L}$.
That is, the fubtungent IN, or MV, is of the fame mag. Vol. XV.
nitude, or is a conlant quatrity in ciely patit of the curve.

Latly, the fubtangent IN, correfponding to the poist $K$ of the curve, is to the ordinate $k$ it as ti:e refangle LDOG or ACOF to the patabolic area BDCA .

Firlet $f g h n$ be an ordinate very near in BD ) o K; and let in $n$ cut the curve in $n$, and the ordinate K 1 in $q$; then we have

$$
\begin{aligned}
& \text { K } q: q^{n}=\mathrm{KI}: \mathrm{IN} \text {, or } \\
& \mathrm{D} g: q n=\mathrm{IOO}: \mathrm{IN} ; \\
& \text { but } \mathrm{Bi}: \mathrm{AC}=\mathrm{CO}: \mathrm{DO} ;
\end{aligned}
$$

therefore BD. $\mathrm{D} g: \mathrm{AC} \cdot \mathrm{q}^{n}=\mathrm{CO}: \mathrm{IN}:$
Therefore the fum of all the ref:angles B3D. $\mathrm{D}_{z}$ is th the fum of all the rectangles AC. $q n$, as CO to $1 N$; but the fum of the rectangles $B D .1) g$ is the fpace ACBD; and, becaufe $A C$ is given, the fum of the reetangles $A C \cdot q n$ is the reflangle of $A C$ and the fum of all the lines $q n$; that is, the rectangle of $A C$ and RI : therefore the fpace $\mathrm{ACDB}: \mathrm{AC} \cdot \mathrm{RI}=\mathrm{CO}:$ IN , and $\mathrm{ACDB} \times \mathrm{IN}=\mathrm{AC} . \mathrm{CO}$. RL; and therefore $1 \mathrm{~N}: \mathrm{RL}=\mathrm{AC} . \mathrm{CO}: \mathrm{ACDB}$.
Hence it follows that QL exprefes the area BVA, and, in general, that the part of the line parallel to OM1, which lies between the tangent KN and the curve $\mathrm{L} p \mathrm{~K}$, expreffes the correfponding area of the hyperbold which lies without the rectangle BDOG.

And now, by the help of this curve, we have an eafy way of conceiving and computing the motion of a body through the air. For the fubtangent of our curve now reprefents twice the height through which the ball mult fall in vacuo, in order to acquire the terninal velocity ; and therefore ferves for a fcale on which to meafure all the other reprefentatives of the motion.

But it remains to make another obfervation on the curve $\mathrm{L} p \mathrm{~K}$, which will fave us all the trouble of graphical operations, and reduce the whole to a very fimple arithmetical computation. It is of fuch a nature, that when MI is confidered as the abfeiffa, and is divided into a number of equal parts, and ordinates are drawn from the points of divifion, the ordinates are a feries of lines in geometrical progreflion, or are continual proportionals. Whatever is the ratio between the firf and fecond ordinate, there is the fame between the fecond and third, between the third and fourth, and fo on; therefore the number of parts into which the abfcilla is divided is the number of there equal ratios which is contained in the ratio of the firft ordinate to the laft: For this reafon, this curve has got the name of the $\log \dot{j} / \mathrm{fic}$ or $\log$ arithmic curve; and it is of immenfe ufe in the modern mathematies, giving us the folution of many problems in the moft fimple and expeditions manner, on which the genins of the ancient mathematicians had been exercifed in vain. Fow of our readers are ignorant, that the numbers called logarithins are of equal utility in arithmetical operations, enabling us not only to folve common arithmetical problems with aftonifhing difpatch, but alfo to folve others which are quite inaceefibibe in any other way. Logarithms are ninthing more than the numerical meafures of the abfcifia of this curve, correfpunding to ordinates, which are meafured on the fame or any other feale by the naturat numbers ; that is, if ML o be divided into equal parts. and from the points of divition lines be drawn parallel to $+\mathrm{A}$

MI

56 The whole reduced to arithnele cal conipulation.

HI, cutting the curve $\mathrm{L} p \mathrm{~F}$, and from the points of interfeation ordinates be drawn to MI, thefe will divide MI into portions, which are in the fame profortion to the ordinates that the lograrithms bear to their natural nambers.

In conitruting this curve we were limited to no particular length of the line LR, which repiefented thie pare ACDB; and all that we had to take care of was, that when $\mathrm{OC}, \mathrm{O}, \mathrm{O} g$ were taken in geometrical progrelion, $\mathrm{M}_{s}, \mathrm{M} t$ thould be in arithmetical progretion. The abfcife having ordinates equal to $p s, n t$, \&c. might have heen twice as long, as is thown in the dotted curve , which is drawn through L. All the lines which ferve to aneafure the hyperbolic. paces would then have been duubled. But NI would alfo have been doubled, and our proportions would hare ttill held good ; becaufe this dibtangent is the fcale of meafurement of our figure, as E or $z a$ is the fcale of meafurement for the motions.

Since then we have tables of logarithms calculated for every number, we may make ufe of them initead of this geometrical figure, which fill requires confiderable trouble to fuit it to every cate. There are two fets of logarithmic tables in common ufe. One is called a table of hyperbolic or natural logarithms. It is fuited to fuch a curve as is drawn in the figure, where the fubtangent is equal to that ordinate $\sigma 0$ which correfponds to the fide $\pi \mathrm{O}$ of the fquare $\pi{ }^{9 \lambda} \mathrm{O}$ inferted between the hyperbola and its affymptotes. This fquare is the unit of furface, by which the hyperbolic areas are expreffed; its fide is the unit of length, by which the lines belonging to the hyperbola arc expreffed; $\tau u$ is. $=1$, or the unit of numbers to which the logarithms are fuited, and then IN is alfo 1 . Now the fquare ${ }_{07} \mathrm{O} \lambda$ being unity, the area BACD will be fome number; ; O being alfo unity, $O D$ is fome number: Call it v. Then, by the nature of the hyper bola, $\mathrm{OB}: \mathrm{O} \pi=$ o $\theta: D B:$ That is, $x: 1=1: \frac{1}{x}$, fo that DB is $\frac{1}{x}$. Now calling $\mathrm{D} d \dot{x}$, the area $\mathrm{B} \mathrm{D} d b$, which is the Auxion (ultimately) of the hyperbolic area, is $\frac{x}{x}$. Now in tiee curse $L p \mathrm{~K}$, MI has the fame ratin to NI that BACD has to $\forall_{\lambda} \mathrm{O}_{\pi}$ : Therefore, if there be a fcale of which NI is the unit, the number on this fale correponding to MI has the fame ratio to 1 which the number meafuring BACD has to I; and $\mathrm{I} i$, which correfpends to $\overline{\mathrm{BD}} d b$, is the fluxion (ultimately) of MI : 'Therefore, if MI be called the logarithm of $x$, $\frac{N}{x}$ is properiy reprefented by the fluxion of MII. In thort, the line MI is divided precifely as the line of , numbers on a Gunter's fcale, which is therefore a line of logarithms; and the numbers called logalithms are juft the lengths of the different parts of this line meafured on a fcaic of equal parts. Therefore, when we meet with fuch an expreffion as $\frac{\dot{x}}{x}$ viz. the fluxion of a quantity divided by the quantity itfelf, we coufider it as the fluxion of the logarithm of that quantity, becaufe it is really fo when the quantity is a number; and it is therefcre ftrietly true that the fluent of $\frac{x}{x}$ is the hyperbolic logarithm of $x$.

Certain reafuns of convenierice have given rifo to another fet of logarithms; thefe are fuited to a logiflic curve whofe fubtangent is only $\frac{4}{4} 3429$ of the ordinate $\tau v$, which is equal to the fide of the hyperbolic fquare, and which is aflumed for the unit of number. We thall fuit our applications of the preceding inveftigation to both thefe, and thall firt ure the common logarithms whofe fubtangent is 0,43429 .

The whole fulyect will be belt illuftrated by taking illui an example of the different queftions which may be pro- hy $\begin{aligned} & \text { ples } \\ & \text { poled. }\end{aligned}$ poled.

Recollect that the redangle ACOF is $=2 a$, or $\frac{n^{\prime \prime}}{g}$, or E , for a ball of calt-iron one iach diameter, and if it has the diameter $d$, it is $\frac{u^{2} d}{g}$, or 2 ad , or $\mathrm{E} d$.

1. It may be required to determine what will be the fpace defribed in a given time $t$ by a ball fetting out with a given velocity V , and what will be its velocity $v$ at the end of that time.

Here we have NI : MI=ACOF : BDCA; now NI is the fubtangent of the logific curve; $M I$ is the difference between the logarithms of OD and OC ; that is, the difference between the logarithms of $e+t$ and $e$; ACOF is $2 a d$, or $\frac{u^{2} d}{g}$, or $\mathrm{E} d$.

Therefore by common logarithms 0,43429: log. $\overline{e+t}-\log \cdot e=2 \mathrm{ad}: S,=$ fpace defribed,
or $0,43429: \log \cdot \frac{e+t}{e}=2 \mathrm{ad}: \mathrm{S}$,
and S. $=\frac{2 a d}{0,434^{29}} \times \log \cdot \frac{e+t}{e}$,
by hyperbolic logarithms $S=2 a d \times \log . \frac{e+t}{e}$.
Let the ball be a 12 pounder, and the initial velocity be 1600 feet, and the time 20 feconds. We muft firt find $e$, which is $\frac{2 a d}{\mathrm{~V}}$.

This muft be confidered as a common number by which we are to multiply $\frac{2}{0,434} \frac{a}{0 .}$.
Therefore add the logarithms of 2 ad
$+3.68557$

$$
\begin{array}{lll}
\log . \frac{e+t}{e} \\
\log .0,43429
\end{array} \quad-\quad+9.94490
$$

Log. S. 9833 feet ${ }_{\text {For the final velocity, }}$ -
OD: OC=AC: BD, or $e+t: e=\mathrm{V}: v$. $23^{\prime \prime}, 03: 3^{\prime \prime}, 03=1600: 210 \frac{1}{2},=2$.
The ball has therefore gone 3278 yards, and its velocity is redueed from 1600 to 210.

It may be agreeable to the reader to fee the gradual progrets of the ball during fome leconds of its motion.

| $\tau$ | $s$. | Dif: | $V$. | Diff. |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{I}^{\prime \prime}$ | 1383 |  | 1203 | 397 299 |
| $2 \prime$ | 2456 | 1073 880 | 964 | - |
| 3 3"1 | $\begin{aligned} & 3336 \\ & +080 \end{aligned}$ | 744 | $80+$ $6 y^{\circ}$ | 119 |
|  | 4725 | 645 | $60+$ | 86 |
| $G^{\prime \prime}$ | $529+$ | 509 | 537 | 7 |

The fillt column is the time of the motion, the fecond is the fpace defcribed, the third is the differences of the fpaces, fhowing the motion during each fucceffive fecond; the fourth colum is the velocity at the end of the time 1 ; and the lalt column is the differences of velocity, thowing its diminution in each fucceffive fecond. We fee that at the diftance of 1000 yards the velocity is reduced to one half, and at the diftance of lefs than a mile it is reduced to one third.
II. It may be required to determine the difance at which the initial velocity V is reduced to any other quantity $v$. This queftion is folved in the very fame manner, by fubttituting the logarithms of V and $v$ for thofe of $c+i$ and $c$; for $A C: B D=O D: O C$, and therefore $\log \cdot \frac{\mathrm{AC}}{\mathrm{BD}}=\log \cdot \frac{\mathrm{OD}}{\mathrm{OC}}$, or $\log \cdot \frac{\mathrm{V}}{v}=\log \cdot \frac{e+t .}{e}$

Thus it is required to determinc the diftance in which the velocity 1780 of a $2+$ pound ball (which is the medium velocity of fuch a ball difcharged with 16 pounds of powder) will be reduced to 1500 .

Here $d$ is 5,68 , and therefore the logarithm of $2 a d$ is
$\log \cdot \frac{V}{v}=0,07433$, of which the log. is
Log. 0:43429
Log. 1047,3 feet, or $3+9$ yards 3.02009 This reduction will be produced in about $\frac{7}{6}$ of a fecond.
III. Arother queftion may be to determine the time which a ball, beginning to move with a certain velocity, employs in paffing over a given fpace, and the dimanution of velocity whicl? it fultains from the refifance of the air.

We may proceed thus:
$=a d: S=0,43 \div 29: \log \cdot \frac{e+t}{e},=t$. Then to $\log$.
$\frac{t t}{c}$ add log. $e$ and we obtain log. $e+t$, and $e+t$; from which if we take $e$ we have $t$. Then to find $y$, fay $\epsilon+t: c=\mathrm{V}: v$.

Whe fhall conclude thefe examples by applying this in latt rule to Mr Robin's experiment on a muiket bulnot let of $\frac{3}{4}$ of an inch in diameter, which had its velocity reduced from $16 ; 0$ to $3+25$ by palling through 100 feet of air. This we do in order to difcover the rctilance which it fuftined, and compare it with the rcfiltance to a velocity of 1 toot fer fecond.

We mult firt afcertain the firk term of our analogy. The ball was of lead, and therefore $2 a$ mult be multiplied by $d$ and by $m$, which expreffes the ratio of the denficy of lead to that of caftiron. $d$ is 0,75 , and $m$ is V
$\frac{11,37}{7,21}=1,5: 7$. Therefure lig. 2 a 3.032 ?ú (d) $2.3750 \%$

Log. 2adm 3.1052i
ard $2 a d m=127 t, 2$.
Now $127+, 2: 100=0,43429: 0,03+0 S=\log . \frac{e+t}{e}$. Bute $=\frac{2 a d n t}{V^{-}}=0,763$, and its logarithm $=0.88252$, which, added to 0.03 .108 , gives 9.91660 , which is the $\log$. of $c+t,=0,825$, from which tahe $c$, and there rennains $t=, 0^{\prime \prime}, 062$, or $\frac{62}{1000}$ of a fecond, for the time of paffage. Now, to find the remaining reiucity, fay $825:, 763=1670: 154 t=2$.

But in Mr Robins's experiment the remaining velocity was only 1425, the b.ll having lott 245 ; whercas by this computation it fhould have loft only 126 . It appears, therefore, that the refitance is doubie of what it would have been if the refiftance increafed in the cuplicate propertion of the velocity. Mr Robins fays it is nearly criple. But he fuppofes the refiftance to fow motions much fmaller than his own experiment, fo cfien mentioned, fully warrants.

The time $e$, in which the refifance of the air would extinguifh the velocity is $0^{4}, 763$. Gravity, or the weight of the bul!et, mould have done it in $\frac{1670}{3^{2}}$ or $52^{\prime \prime}$; therefore the refiftance is $\frac{52}{0,763}$ times, or nearly 68 times its weight, by this thecry, or 5,97 pounds. If we calculate from Mr Robins's experiment, we muit fay log. $\frac{\mathrm{V}}{\mathrm{v}}: 0,434^{2} 9=100: \mathrm{eV}$, which will be 630,23 , ar.d $e=\frac{630,23}{1670}=0^{\prime \prime}, 3774$, and $\frac{5^{2}}{0,377+}$ gives 139 for the proportion of the refiftance to the weight, ard makes the refiftance 12,07 pounds, fully double of the other.

It is to be oblerved, that with this velocity, which greatly exceeds that with which the air can ruh into a void, there mult be a ftatical preffure of the atmosphere equal to $6 \frac{1}{2}$ pounds. This will make up the difference, and allows us to conclude that the refitance arifug fulely from the motion communicated to the air follows very nearly the duplicate proportion of the velocity.

The next experiment, with a velocity of $16 g \circ$ fest, gives a refiftance equal to 157 times the weight of the bullet, and this bears a much greatel proportion to the former than $1690^{2}$ dues to $1670^{2}$; which thows, that although thefe experiments clearly demonfrate a prodigious angmentation of refiftance, yet they are by no means fufceptible of the precilion which is necelfary for difcovering the law of this augmentacion, or for a good foundation of pratacal rules; and it is itill greatly to be wifhed that a more accurate mode of inveltigation could be difcovered.

Thus we have explained, in great detail, the princi- Recapittples and the procefs of calculation for the fimere cafe latiols.
of lise motion of projesilesthough the air. The learncd icaticr will think that we have been unteaionably prolix, and that the whole might have been comprited in lefs room, by tahing the algebraic method. We acknowledge that it might have been done even in a few lines. But we lave obferved, and our oblervaltion has been confirmed by perfons well verfed in fuch tubjeets, that in all cafes where the fluxionary procefs introduces the fluxion ot a logarithm, there is a great want of dittinct ideas to accompany the hand and eye. The folution comes out by a fort of magic or legerdemain, we cannot tell either how or why. We therefure thought it our duty to furnifh the reader with diftinet conceptions of the things and quantities treated of. For this reafon, after fhowing, in Sir Ifaac Newton's manner, how the fpaces defcribed in the retarded motion of a projectile followed the proportion of the byperbolic areas, we thewed the nature of another curve, where lines could be found which increafe in the very fame manner as the path of the projectile increafes; fo that a point defribing the abfiffa MI of this curve moves precifely as the projectile does. Then, difcovering that this line is the fame with the line of logarithms on a Gunter's fcale, we thewed how the logarithm of a number really reprefents the path or fpace defcribed by the projectile. And we were the more difpofed to do this, becaufe in the articles Logarithms and Logarithmic Curqe, there has not been that notice taken of it which would have been proper.

Having thus, we hope, enabled the reader to conceive diftinctly the quantities employed, we thall leave the geometrical method, and profecute the reft of the fub-

Of the per. We are, in the next place, to confider the perpendipondicular cular afcents and defcents of beavy projectiles, where the arcents of reliftance of the air is combined with the action of graheavy pro- vity: and we faill begin with the defcents. jectiles.

Let $u$, as before, be the terminal velocity, and $g$ the accelerating power of gravity : When the body moves with the velocity $u$, the refiftance is equal to $g$; and in every other velocity $v$, we muft have $u^{2}: v^{2}=g$ : $\frac{g v^{2}}{q^{2}},=r$, for the refiftance to that velocity. In the defcent the body is urged by gravity $g$, and oppofed by the refitance $\frac{g v^{2}}{u^{2}}$ : thetefore the remaining acce. Jerating force, which we flall call $f$, is $g-\frac{g v^{2}}{u^{2}}$, or $\frac{g v^{2}-v^{2}}{u^{2}}$, or $\frac{g\left(u^{2}-v^{2}\right)}{u^{2}},=f$.

Now the fundarnental theorem for varicd motions is $\dot{f}=u \dot{v}$, and $\dot{s}=\frac{v \dot{v}}{f},=\frac{u^{2}}{g} \times \frac{\dot{v} v^{2}}{u^{2}-v^{2}}$, and $s=$ $\frac{u^{2}}{g} \times f_{u^{2}}^{v} \frac{v}{-v^{2}}+C$. Now the fluent of $\frac{v^{2}}{u^{2}-\frac{v}{v^{2}}}$ is $=-$ lyperb. $\log$ of $\sqrt{u^{2}-v^{2}}$. For the fluxion of $\sqrt{u^{2}-v^{2}}$ is $\frac{v v}{\sqrt{u^{2}-v^{2}}}$, and this divided by the quantity $\sqrt{u^{2}-v^{2}}$, of which it is the fluxion, gives precifely $\frac{v v}{u^{2}-v^{2}}$, which is therefore the fluxion of
its hyperbolic logaithm. Therefore $\mathrm{S}=-\frac{u^{3}}{g} \times$ L $\sqrt{u^{2}-v^{3}}+C$. Where $L$ means the byperbolic logarithm of the quantity annesed to it, and $\lambda$ may be ufed to exprefs its common logarithm. (See arcicle Fluxions).

The conftant quantity $C$ for completing the fluent is determined from this confideration, tlat the face defcribed is $a$, when the velocity is $o$ : therefore C$\frac{u^{2}}{g} \times L \sqrt{u^{2}}=0$, and $\mathrm{C}=\frac{u^{2}}{g} \times \mathrm{L} \sqrt{u^{2}}$, and the complete fluent $S=\frac{u^{2}}{g} \times \bar{L} \sqrt{u^{2}}-L \sqrt{u^{2}}-v^{2}$, $=\frac{u^{2}}{g} \times \mathrm{L} \sqrt{\frac{u^{2}}{u^{2}-v^{2}}}=\frac{u^{2}}{0,434^{2} 9 g} \times \lambda \sqrt{\frac{u^{2}}{u^{2}-v^{2}}}$, or (putting M for 0,43429 , the modulus or fubtangent of the common logific curve) $=\frac{u^{2}}{\mathrm{M}} \times \lambda \sqrt{\frac{u^{2}}{u^{2}-v^{2}}}$.

This equation eftablifhes the relation between the fpace fallen through, and the velocity acquired by the fall. We obtain by it $\frac{g S}{u^{2}}=\mathrm{L} \sqrt{\frac{u^{2}}{u^{2}-v^{2}}}$, and $\frac{2 g S}{z^{2}}=\mathrm{L} \cdot \frac{u^{2}}{u^{2}-v^{2}}$, or, which is fill more convenient for us, $\frac{\mathrm{M} \times 2 g \mathrm{~S}}{u^{2}}=\lambda \frac{u^{2}}{u^{2}-v^{2}}$, that is, equal to the logarithm of a certain number: therefore having found the natural number correfponding to the fiaction $\frac{M \times 2 g}{u^{2}} S$, confider it as a logarithm, and take out the number correfponding to it: call this $n$. 'Then, fince $n$ is equal to $\frac{u^{2}}{u^{2}-v^{2}}$, we have $n u^{2}-n v^{2}=u^{2}$, and $n u^{2}-u^{2}=n v^{2}$, or $n v^{2}=u^{2} \times \overline{n-v}$, and $v^{2}$ $=\frac{u^{2} \times \overline{n-1}}{n}$.
To expedite all the computations on this fubject, it will be convenient to have multipliers ready computed for $M \times 2 g$, and its half,
viz. 27,794 , whofe log. is $\quad-\quad-\quad 1.44396$
and 13,897

But $v$ may be found much more expeditioully by obferving that $\sqrt{\frac{u^{2}}{u^{2}}-v^{2}}$ is the fecant of an arclu of a circle whofe radius is $u$, and whofe fine is $v$, or whofe radius is unity and fine $=\frac{v}{u k}$ : therefore, confidering the above fraction as a logarithmic fecant, look for it in the tables, and then take the fine of the are of which this is the fecant, and multiply it by $u$; the product is the velocity required.

We thall take an example of a ball whofe terminal velocity is $689 \frac{5}{3}$ feet, and afcertain its velocity after a fall of 1848 feet. Here,

$$
\begin{aligned}
& u^{2}=475200 \text { and its log. } \quad=5.67688 \\
& u=689{ }^{\frac{\pi}{3}} \quad-\quad . \quad 2.83844 \\
& g=32 \text {. } \quad 1.50515 \\
& \mathrm{~S}=184^{8} \quad \text { - } \quad 3.26670
\end{aligned}
$$

0,10809 is the logarithm of $1,2826=n$, and $n-1=$ 0,2826 , and $\frac{n^{2} \times \pi-1}{n}=323,6^{2},=0$, and $:=$ 323 , 6.

In like manner, 0,054045 (which is half of 0,10809 ) will be found to be the logarithmic fecant of $28^{\circ}$, whole line 0,46947 multiplied by $689 \frac{1}{3}$ gives 324 for the velocity.

The procefs of this folution fuggels a very perfpicuous manner of conceiving the law of defeent; and it may be thus expreffed:
$M$ is to the logarithm of the fecant of an arch whofe fine is $\frac{v}{u}$, and radius 1, as $2 a$ is to the height through which the body mutt fall in order to acquire the velocity $v$. Thus, to take the fame ex:mple.

1. Let the height $b$ be fought which will produce the velocity 33,62 , the terminal velocity of the bail being 689,34 . Here $2 a$, or $\frac{u^{3}}{g}$ is 14850 , and $\frac{323,62}{689,34}=$ 0,46947 , which is the fine of $28^{\circ}$. The logarithmic fecant of this arch is 0,05407 . Now $M$ or 0,43429 : $0,05407=14850: 1848$, the height wanted.
2. Required the velocity acquired by the body by falling 1848 feer. Say $14850: 1848=0,43429$ : 0,05407 . Look for this number among the logarithmic fecaunts. It will be found at $28^{\circ}$, of which the $10-$ garithmic fine is
Add to this the log. of $u$
The fum
is the logarithm of 323,62 , the velocity required.
We may obferve, from thefe folutions, that the acquired velocity continually approaches to, but never equals, the terminal velocity. For it is always expreffcd by the fine of an arch of which the terminal veloconeous city is the radius. We cannot help taking notice here artion of of a very frange affertion of Mr Muller, late profeffor : Mul- of mathematics and direstor of the royal academy at Woolwich. He maintains, in his Treatife on Gunnery, his Treatife on Fluxions, and in many of his numerous works, that a body cannot poffibly move through the air with a greater velocity than this; and he makes this a fundamental principle, on which he eftablifhes a theory. of motion in a refinting medium, which he afferts with great confidence to be the only jult theory; faying, that all the inveftigations of Bernoulli, Euler, Robins, Simpfon, and others, are erroneous. We ufe this Arong exprelfion, becaufe, in his criticifms on the works of thofe celebrated mathematicians, he lays afide good manners, and taxes them not only with ignorance, but with difhonefty; faying, for inftance, that it required no fmall dexterity in Robins to confirm by his experiments a theory founded on falfe principles; and that Thomas Simpfon, in attempting to conceal his whligations to him for fome valuable propofitions, by changing their form, had ignorantly fallen into grofs cirors.

Nothing can be more palpably abfurd than this affer-
tion of Mr Muller. A Llown bladder will have Lut a dinall terminal velocity; and when moving wath this velocity, or one very near it, there can be no doult that it will be made to move much iwifter by it fmart flroke. Were the alfertion true, it would be impofible for a purtion of air to be put into motion through the refí, for its terminal velocity is nothing. Yet this anther $r$ makes this affertion a principle of argument, faying, that it is impoffible that a bill can iflue from the mouth of a camon with a greater velocity than this; and that Robins and others are grofsly millaken, when they gire them velocities three or four times greater, and reliftances which are 10 or 20 times greater than is poffible; and by thus componfating his imall velocities by thili fmaller refiftances, he coufirms his theory by many experiments adduced in fupport of the others. No re:tfon whatever can be given for the affertion. Newton, or perhaps Huygens, was the firlt who obferved that there was a limit to the velocity which gravity could communicate to a body; and this limit was found by his commentators to be a term to which it was vafly convenient to refer all its other motions. It therefore became an object of attention; and Mr Muler, through inadvertency, or want of difcernment, has fallen into this miftake, and with that arroganec and felf-concei which mark all his writings, has made this miftake a fundamental principle, becaufe it led him to effablifh at novel fet of dostrines on this fubject. He was fretted at the fuperior knowledge and talents of Mr Simpfon, his inferior in the academy, and wats guilty of feveral mean attempts to hurt his reputation. But they were unfucceffful.

We might proceed to contidar the motion of a body projefted downwards. While the velocity of projection is lefs than the terminal velocity, the motion is determined by what we have already faid: for we muft compute the height neceffary for acquiring this velocity in the air, and luppofe the motion to have begun there. But if the velocity of projection be greater, this method fails. We pafs it over (though not in the leaft more difficult than what has gone before), becaufe it is of mere curiofit $y$, and never occurs in any interefting cafe. We may juft obicrve, that fince the motion is iwifter than the terminal velocity, the refiftance muft be greater than the weight, and the motion will be retarded. The very fame procefs will give us for the fipace defcribed $\mathrm{S}=\frac{u^{2}}{g} \times \mathrm{L} \sqrt{\frac{\overline{\mathrm{V}} \frac{-u^{2}}{V^{2}-u^{2}}}{}, \mathrm{~V} \text { being the velocity of } \mathrm{f}}$ projection, greater than $u$. Now as this fpace evidently increafes continually (becaufe the body always falls), but does not become infinite in any finite time, the frac. tion $\frac{V^{2}-u^{3}}{v^{2}-u^{2}}$ docs not beeome infinite; that is, $v^{3}$ does not become equal to $u^{2}$ : therefore although the velocity V is continually diminifhed, it never becomes fo fmall as $u$. Therefore $u$ is a limit of diminution as well as of augmentation.
We muft now afcertain the relation between the time Relation of the defcent and the fpace defcribed, or the velocity between acquired. For this purpofe we may ofe the other fun- the time damental propofition of varied motions $\dot{f}=\dot{v}$, which, in of defcent. $\overline{g_{u^{2}}-v^{2}}$. $\frac{g u^{2}-v^{2}}{n} i=\dot{v} ;$ therefore $i=\begin{aligned} & \text { defar } \\ & 8 .\end{aligned}$
$\frac{u^{2}}{g} \times \frac{v}{u^{2}-v^{2}},=\frac{u}{g} \times-\frac{u \cdot v}{u^{2}}-$ and $t=\frac{u}{g} \times f_{u^{2}} \frac{u v}{v^{2}}$.
Now (art. Fluxions) $f_{\overline{z^{2}}-\frac{u v}{i^{2}}}=L^{\int} \int \frac{u+v}{u-v}$. There-
fore $t=\frac{u}{g} \times \mathrm{L} \sqrt{\frac{u+v}{u-v}}=\frac{u}{M g} \times \sqrt{\frac{u+v}{u-v}}$. This fluent needs no conflant quantity to complete it, or rather $\mathrm{C}=0$; for $t$ mult be $=0$ when $v=0$. This will evidently be the cafe: for than $\mathrm{L} \sqrt{\frac{\overline{u+v}}{u-v}}$ is $\mathrm{L} \sqrt{\frac{u}{u}},=$ L $1,=0$.
But how does this quantity $\frac{n}{\mathrm{Mg}_{g}} \times 2 \sqrt{\frac{u+v}{u-v}}$ fignify a time ? Obferve, that in whatcver num.bers, or by whatever units of fpace and time, $u$ and $g$ are exprofifed, $\frac{\because 1}{\varepsilon}$ exprefies the number of units of time in which the ve. $\delta_{\text {iocity }} u$ is communicated or extinguifhed by gravity ; and $\mathrm{L} \sqrt{\frac{u+v}{u-v}}$, or $\frac{\lambda}{\mathrm{M}} \sqrt{\frac{u+v}{u-v}}$, is always an abftract number, multiplying this time.
We may illuftrate this rule by the fame example. In what time will the body acquire the velocity 323,62 ? Here $u+v=1012,96, u-v=365.72$; thercfore a $\sqrt{\frac{u+v}{u-v}}=0,22122$, and $\frac{u}{g}$ (in feet and feconds) is 24", 542. Now, for greater perficicuity, convert the cquation $t=\frac{u}{M g} \times \sqrt{\frac{u+v}{u-v}}$ into a proportion : thus $\mathrm{M}: \lambda \sqrt{\frac{\overline{u+q}}{z-v}}=\frac{u}{g}: t$, and we have $0,43+2 \mathrm{~g}: 0,22122$ $=21^{\prime \prime}, 542: 1^{\prime \prime \prime}, 973$, the time required.

This is by far the moft diftinet way of conceiving the fubject; and we fhould always keep in mind thiat the numbers of fymbols which we call logarithms are really parts of the line MI in the figure of the logittic curre, and that the motion of a point in this line is precifly fimilar to that of the body. The Marquis Poleni, in a difertation publifhed at Padua in 1725 , has with great ingernity confructed logarithmics fuited to all the cales which can occur. Herman, in his Phoronomia, has borrowed much of Poleni's methods, but has obfcured them by an affectation of language geometrically precife, but involving the very obfcure notion of abitract ratios.
It is eafy to fee that $\sqrt{\frac{u+v}{u-v}}$ is the cotangent of the $\frac{1}{2}$ complete of an arch, whofe radius is 1 , and Plate whofe fine is $\frac{v}{u}$ : For let KC (fig 6.) be $=u$, and eccexvin. $\mathrm{BE}=v$; then $\mathrm{KD}=u+v$, and $\mathrm{DA}=u-v$. Join KB and BA, and draw CG parallel to KB. Now GA is the tangent of $\frac{1}{2} \mathrm{BA},=\frac{1}{2}$ complement of HB . Then, by fimilarity of tiiangles, $\mathrm{GA}: \mathrm{AC}=\mathrm{AB}: \mathrm{BK},=$ $\sqrt{\mathrm{AD}}: \sqrt{\mathrm{DK}}=\sqrt{u-v}: \sqrt{u+v}$ and $\frac{\mathrm{AC}}{\mathrm{GA}}(=$ cotan. $\left.\frac{1}{2} \mathrm{BA}\right)=\sqrt{\frac{u+v}{u \rightarrow z}}$; therefore look for $\frac{v}{u}$ among the natural fines, or for log. $\frac{u}{v}$ among the logarithmic fincs,
and take the logarithmic cotangent of the haif complement of the correfponding arch. This, conlidered its a common number, will be the fecond term of our proportion. This is a florter procefs than the former.

By reverfing this proportion we get the velocity correfponding to a given time.
To compare this defent of 1848 feet in the air Fall of a with the fall of the body in vacuo during the fame hoily in time, fay $\overline{21^{\prime \prime}}, 542^{2}: \overline{10^{\prime \prime}, 973^{2}}=1848: 1926,6$, which $\begin{gathered}\text { air comp } \\ \text { red }\end{gathered}$ makes a difference of 79 feet.

Cor. 3. The time in which the body acquires the in yacue. velocity $u$ by falling through the air, is to the time of acquiring the fame velocity by falling in vacuo, as $u$. $\mathrm{L} \sqrt{\frac{u+v}{u-v}}$ to $v$ : for it would acquire this velocity in vacuo during the time $\frac{v}{g}$, and it acquires it in the air in the time $\frac{u}{g} \mathrm{~L} \sqrt{\frac{v^{u}}{u+v}}$.
2. The velocity which the body acquires by falling through the a.r in the time $\frac{u}{g} \mathrm{~L} \sqrt{\frac{u+v}{u-v}}$, is to the velocity which it would acquire in vacuo during the fame time, as $v$ to $u \sqrt{\frac{u+v}{u-v}}$ : For the velocity which it would acquire in vacuo during the time $\frac{u}{g}$ $\mathrm{L} \sqrt{\frac{u+v}{u-v}}$ muft be $u \mathrm{~L} \sqrt{\frac{u+v}{u-v}}$ (becaufe in any time $\frac{w}{g}$ the velocity $w$ is acquired).
In the next place, let a body, whofe terminal velo- Time of city is $u$, be projected perpendicularly upwards, with the afcen any velocity V . It is required to determine the height of a hody to which it afcends, fo as to have any remaining velo- projected city $v$, and the time of its aicent; as alfo the height perpendiand time in which its whole motion will be extinguifhed.
We have now $\frac{\left(u^{2}+v^{2}\right)}{u^{2}}$ for the expreffion of $f$; for both gravity and refiftance ast now in the fame direction and retard the motion of the afcending body : therefore $\frac{g\left(u^{2}+v^{2}\right)}{u^{2}} \dot{s}=-v \dot{v}$, and $\dot{s}=-\frac{u^{2}}{g} \times \frac{v^{2}}{u^{2}+v^{2}}$ and $s=-\frac{u^{2}}{g} \times \int_{u^{2}+v^{2}}^{v i}+\mathrm{C},=-\frac{u^{2}}{g} \times L \sqrt{u^{2}+v^{2}}+$ C (fee art. Fluxions). This muft be $=0$ at the beginning of the motion, that is, when $v=\mathrm{V}$, that is, $-\frac{u^{2}}{g} \times \mathrm{L} \sqrt{u^{2}+V^{2}}+\mathrm{C}=0$, or $\mathrm{C}=\frac{u^{2}}{g} \times \mathrm{L} \sqrt{u^{2}+\mathrm{V}^{2}}$, and the complete fluent will be $s=\frac{n^{2}}{g} \times\left(\mathrm{L} \sqrt{u^{2}+\mathrm{V}^{2}}-\right.$ $\left.\mathrm{L} \sqrt{u^{2}+v^{2}}\right)=\frac{u^{2}}{g} \times \mathrm{L} \sqrt{\frac{u^{2}+\frac{g}{V^{2}}}{u^{2}+v}}=\frac{u^{2}}{\mathrm{Mg}_{g}} \times \lambda \sqrt{\frac{u^{2}+V^{2}}{u^{2}+v^{2}}}$
Let $b$ be the greateft height to which the body will rife. Then $s=j$ when $v=0$; and $b=\frac{u^{2}}{g} \times$ $\mathrm{L} \sqrt{\frac{u^{2}+V^{2}}{u^{2}}},=\frac{u^{2}}{\mathrm{M}_{3}} \times \lambda \sqrt{\frac{u^{2}+\bar{V}^{2}}{u^{2}}}$. We ${ }^{g}$ have $\lambda \sqrt{\frac{u^{2}+V^{2}}{u^{2}+v^{2}}}=s \frac{m g}{u^{2}} ;$ thereforc $\lambda\left(\frac{u^{2}+V^{2}}{u^{2}+v^{2}}\right)=\frac{2 \mathrm{Mg}_{s}}{u^{2}}$ Therefore

Therefore let $n$ be the number whole common lurarithon is $\frac{2 M g s}{u^{2}}$; we flall have $n=\frac{u^{2}+V^{2}}{u^{2}+} \frac{v^{2}}{v^{2}}$, and $\tau^{2}=\frac{u^{2}+V^{2}}{2}$ - $t^{2}$; and thus we oltain the relation of $s$ and $e$, as in the cale of defcents: but we obtuin it 放l calier by ohferving that $\sqrt{u^{2}+} \overline{V^{2}}$ is the fecant of an arch whofe radius is $u$, ind whofe tangent is $V$, and that $\sqrt{n^{2}+} y^{3}$ is the fecant of another arch of the lime circle, whofe tangent is \%.

Let the fame ball be prejected uparats with the velocity f1r,05 fect per fecond. Required the wherle loeight to which it will site?

Here $\frac{V}{z}$ will be found the tangent of $30 .+^{8} \frac{1}{3}$, the logruithmic fecant of which is 0,66506 . This, muliiplied by $\frac{u^{2}}{\mathrm{Mg}}$, gives 2250 feet for the height. It would have rifen $26+0$ feet in a void.
ocity of Suppofe this body to fall down again. We can ietion compare the velocity of projection with the velocity pared h that hwhich eaches ground. with which it again reaches the ground. The afcent and defcent are equal : therefore $\sqrt{\frac{u^{2}+\sqrt{2}}{u^{2}}}$, which multiplies the conftant factor in the afcent, is equal to $\sqrt{\frac{u^{2}}{u^{2}-v^{2}}}$, the multiplier in the defcent. The firf is the fecant of an arch whofe tangent is V ; the other is the fecant of an arch whofe finc is $v$. Thefe fecants are equal, or the arches are the fame; therefore the velocity of projection is th the final returning velocity as the tangent to the fine, or as the radius to the cofine of the arch. Thus fuppofe the body projected with the terminal velocity, or $\mathrm{V}=u$; then $v=\frac{u}{\sqrt{2}}$. If $\mathrm{V}=$ $689, v=4^{87}$ :

We muft in the laft place afcertain the relation of the fpace and the time.
Here $\frac{g\left(u^{2}+v^{2}\right)}{. u^{2}} i=-v$, and $i=-\frac{u^{2}}{g} \times \frac{i}{u^{2}+v^{2}},=$ $-\frac{u}{g} \times \frac{u v}{u^{2}+v^{2}} ;$ and $t=\frac{-u}{g} \times f \frac{u v}{u^{2}+v^{2}}+$ C. Now (art. Fiuxions) $f \frac{u v}{u^{2}+v^{2}}$ is an arch whofe tangent $=\frac{v}{x}$ and radius $x$; thercfore $t=-\frac{u}{g} \times$ arc. $\tan \cdot \frac{v}{u}+C$. This muft be $=0$ when $v=\mathrm{V}$, or $\mathrm{C}-\frac{u}{\delta} \times$ arc. tan. $\frac{\mathrm{V}}{u}=0$, and $\mathrm{C}=\frac{u}{g} \times$ arc. tan. $\frac{\mathrm{V}}{u}$, and the complete fluent is $t=\frac{u}{g} \times\left(\operatorname{arcstan} \cdot \frac{V}{u}-\operatorname{arcs} \tan \cdot \frac{v}{u}\right) \quad$ The quantities within the brackets exprefs a portion of the arch of a circle whofe radius is unity; and are therefore abItract numbers, multiplying $\stackrel{u}{\mathrm{~g}}$, which we have fhown to be the number of units of time in which a heavy body falls in racuo from the height $a$, or in which it acquires the velocity $a$.

We learn from this expreflion of the time, that how. ever great the velocity of projection, and the height
to which this body will rie, may te, lac time of its ateent is limited. It never can caceed the time of follling from the height a in quatuo in a greater proportion than that of a quadrantal arch to the radius, nearly the proportion of 8 to 5 . A $2+$ pourd hon ball canne continue rifing above $t+$ feconds, even if the reliftanc: to quick motions did not increafe fater than the fquare of the velucity. It probably wiil attain its greatelt lieight in lef's than 12 leconds, let its velucity be cuer 10 great.

In the preceding cxample of the whole afeent, $r=0$, and the time $t=\frac{\pi}{g} \times$ arc. tan. $\frac{V}{16}$, or $\frac{\pi}{g}$ arc. $30^{\circ} \cdot \frac{1}{4} 8^{\circ}$. Now $30^{\circ} \cdot 4^{8^{\prime}}=1845^{\prime}$, and the radius a contains $343^{\circ}$; therefore the arch $=\frac{18+8}{3+38},=0,5370$;and $\frac{u}{6}=21^{\prime \prime}, 5 \%$
 ficconds. The body would hure sifen to the fime height in a void in $10 \frac{3}{4}$ feconds.

Cor. 1. Whe time in which a body, projected in the Thistime air with any velocity V , will attain its groateft height, compared is to that in which it would attain its greatelt height in in bodies vacuo, as the arch whofe tangent expreffes the velocity projected is to the tungent; for the time of the alcont in the air in vacuo. is $\frac{u}{g} \times$ arch; the time of the afcent in racuo is $\frac{\mathrm{V}}{\mathrm{g}}$. Now $\frac{\mathrm{V}^{5}}{u}$ is $=\cdot \tan$. and $\mathrm{V}=u \times \tan$, and $\frac{\mathrm{V}}{\frac{g}{\delta}}=\frac{u}{g} \times \tan$.

It is evident, by infpeeting fig. ${ }^{\circ}$. that the arch $A I$ is to the tangent $A G$ as the fector ICA to the triangle GCA ; therefore the time of attaining the greateft height in the air is to that of attaining the greatelt height in vacuo (the velocities of projection being the fame), as the circular fector to the corrciponding triangle.

If therefore a body be projected upwards wich the terminal velocity, the time of its afcent will be to the time of acquiring this velocity in vacuo as the area of a circle to the area of the circumicribed iquare.
2. The height $H$ to which a body will rife is a void, is to the height $b$ to which it wotld rite through the air when projected with the fame velocity V as $\mathrm{M} \cdot \mathrm{V}^{2}$ to $u^{2} \times \lambda \frac{u^{2}+\mathrm{V}^{2}}{u^{2}}$ : for the height to which it will rife in vacuo is $\frac{\mathrm{V}^{2}}{2 g}$, and the height to which it rifes in the air is $\frac{u^{2}}{M g} \lambda \sqrt{\frac{u^{2}+V^{2}}{u^{2}}}$; therefore $\mathrm{H}: b=\frac{\mathrm{V}^{2}}{2 g}$ :
$\frac{u^{2}}{M g} \sqrt{\frac{u^{2}+V^{2}}{u^{2}}},=\mathrm{V}^{2}: \frac{u^{2}}{\mathrm{M}} \times 2 \lambda \sqrt{\frac{2 g}{u^{2}+\mathrm{V}^{2}}},=\mathrm{V}^{2}$ $\frac{u^{2}}{\mathrm{M}} \times \lambda \frac{u^{2}+\mathrm{V}^{2}}{u^{2}},=\mathrm{M} \cdot \mathrm{V}^{2}: u_{1}^{2} \times \lambda \frac{u^{2}+\mathrm{V}^{2}}{u^{2}}$.

Therefore if the body be projected with its terminal velocity, fo that $\mathrm{V}=u$, the height to which it will tife in the air is $\frac{30103}{43429}$ of the height to which it will rife in? vacuo, or $\frac{5}{7}$ in round numbers.

We have been thus particular in treating of the perpendicular afcents and defcents or heavy bodies through. the air, in order that the reader may conceive diftinetly

Plate cecexvil
the quantites whichlae is thus combiuing inlas algebraic operations, and may fee their comection in nature with each other. We thall alfo lind that, in the prefent ftate of our mathematical knowledge, this fimple Rate of the cife contains almolt all that we can determine with any confidence. On this account it were to be wifhed that the profelional gentlemen would make many experiments on thefe motions. Where is no way that promifes fo mucl, for allitting us in forming accurate notions of the air's refiltance. Mr Robins's method with the pendulum is impracticalole with great thot; and the experiments which have been generally reforted to for this purpote, vi\%. the ranges of thot and fhells on a boiizontal plane, are fo complicated in themfelves, that the utmolt mathematical fill is necelfary for making any inferences from them; and they are fubject to fuch irregularities, that they may be brought to fupport almolt any theory whatever on this fubjen. But the perpendicular flights are affected by nothing but the initial velocity and the refiftance of the air ; and a contiderable deviation from their intended direction does not caufeany fenfible error in the confequences which we may draw from them for our purpofe.

But we mult now proceed to the general problem, to determine the motion of a body projected in any direction, and with any velocity. Our rcaders will be. lieve beforehand that this muft be a difficult fubject, when they fee the fimpleft cafes of rectilineal motion abundantly abltrufe: it is indeed fo difficult, that Sir Ifaac Newton has not given a folution of it, and has thought himfelf well employed in making feveral approxinations, in which the fertility of his genius appears in great luftre. In the terth and fubfequent propolitions of the fecond book of the Principia, lie thows what ftate of denfity in the air will comport with the motion of a body in any curve whatever: and then, by applying this difcovery to feveral curves which have fome fimilarity to the path of a projectile, he finds one which is not very different from what we may fuppofe to obtain in out atmofphere. But even this approximation was involved in fuch intricate calculations, that it feemed imponlible to make any ufe of $i t$. In the fecond edition of the Princifis, publithed in 1753 , Newton corrects fome mitakes which he had comnitted in the firt, and carries his approximations much farther, but ftll docs not attempt it direct inveftigation of the path which a body will defcribe in our atmofphere. This is fomewhat furprifing. In prop. If. Sic. he fhows how a body, actuated by a centripetal force, in a medium of a denfity varying according to certain laws, will defcribe an eecentric fpiral, of which he affigus the properties, and the law of defcription. Had he fuppofed the denfity conltant, and the difference between the greatelt and leat diftances from the centre of centripetal force exceedingly fimall in conıparifon with the dittances themdelves, his firal would have coincided with the path of a projectile in the air of uniform denlity, and the theps of his invefitgation would have led him immediately to the complate folution of the problem. For this is the real itate of the cafe. A heavy body is not acted on by equil and parallel gravity, but by a gravity inverfely proportional to the fquare of the diltance from the centre of the earth, and in lines tending to that centre nearly ; and it was with the view of fimplifying the
invelization, that mathematicians have adopted the other hypothefis.

Soon atter the publication of this fecond edition of the Primisia, the difpute about the invention of the fluxionary calculus became very violent, and the great liritifa promoters of that calculus upon the continent were in mathoma the habit of propofing diffcult problems to exercife the ticiaus. talents of the mathematician. Challenges of this kind frequently paffed between the Britifh and foreizners. Dr Keill of Oxford had keenly efpoufed the claim of Sir ltaac Newton to this invention, and had engaged in a very acrimonious altercation with the celebrated Jchn Dernoulli of Bafle. Bernonlli had publifhed in the AE, a Eruditorum Liffic an inveligation of the law of forces, by which a body moving in a relifting medium night defcribe any propoted cuive, reducing the whole to the fimpleft geometry. This is perhaps the moft elegant fpecimen which he has given of his great talents. Dr Keill propofed to him the particular problem of the trajectory and motion of a body moving through the air, as one of the mof difficult. Bernoulli very foon folved the problem in a way much more general than it had been propofed, viz. without any limitation either of the law of relitlance, the law of the centripetal force, or the law of denfity, provided only that they were regular, and capable of being expreffed algebraically. Dr Brooke Taylor, the celebrated author of the Method of Increments, folved it at the fame time, in the limited form in which it was propofed. Other authors fince that time have givenother folutions. But they are all (as indeed they muft be) the fame in fubftance with Bernoulli's. Indeed they are all (Bernoulli's not excepted) the fame with Newton's firlt approximations, modifed by the iteps introduced into the inveftigation of the fpiral motions mentioned above ; and we ftill think it moft ftrange that Sir Ifaac did not perceive that the variation of curvature, which he introduced into that inveftigation, made the whole difference between his approximations and the complete folution. This we fhall point out as we go along. And we now proceed to the problem itfelf, of which we fhall give Bernoulli's folution, reltricted to the cafe of uniform denfity and a re- Bernoul fiftance proportional to the fquare of the velocity, folution. This folution is more fimple and perfpicuous than any that has fince appeared.
Problem. To determine the trajectory, and all the circumitances of the motion, of a body projected thro* the air from $A$ (fig. 7.) in the direction $A B$, and refited in the duplicate ratio of the velocity.
Let the arch AM be put $=\approx$, the time of deforibing it $t$, the abicifla $\mathrm{AP}=x$, the ordinate $\mathrm{PM}=y$. Let the velocity in the point $M=v$, and let $M N,=\dot{z}$, be defcribed in the moment $i$; let $r$ be the refiftance of the air, $g$ the force of gravity, meafured by the velocity which it will generate in a fecond; and let $a$ be the height throush which a heavy body muft fall in wacuo to acquire the velocity which would render the refftance of the air equal to its gravity : fo that we have $r=\frac{v^{2}}{2 a}$; becaufe, for any velocity $u$, and producing height $b$, we have $g=\frac{u^{3}}{2 b}$

Let $M m$ touch the curve in $M$; draw the ordinate $p \mathrm{Nm}$
$p \mathrm{~N} m$, and draw $\mathrm{M}_{\rho}, \mathrm{N}_{n}$ perpendicular to $\mathrm{N}_{p}$ and $\mathrm{Mm}_{m}$. 'Then we have $\mathrm{MN}=\dot{z}$, and $\mathrm{Mo}_{0}=\dot{x}$, alpo mo is ultimately ${ }^{-}=y$ and Mm is ultimately $=\mathrm{MN}$ or $\dot{2}$. Lafly, let us fuppofe is to be a conftant quantity, the elementary ordinates being fuppofed equidiftant.

The action of gravity during the time $t$ may be meafured by $m \mathrm{~N}$, which is half the face which it would cause the body to defcribe uniformly in the time $i$ with the velocity which it generates in that time. Lect this be refolved into $n \mathrm{~N}$, by which it defeats the body into a curvilineal path, and $m m$, by which it retards the afeent and accelerates the defect of the body along the tangent. The refiftance of the air acts foley in retarding the motion, both in afcending and defeending, and has no deflective tendency. The whole action of gravity then is to its accelerating or retarding tendency as ${ }_{m} \mathrm{~N}$ to $m_{n}{ }^{6}$, or (by fimilarity of triangles) as $m \mathrm{M}$ to mo. Or $\dot{\approx}: \dot{y}=5: g y$, and the whole retardation in $\approx$.
the afcentwitl be $r+\frac{\sigma y}{6}$. The fame fluxionary fymbol will exprefs the retardation during the defcent, because in the deicent the ordinates decreafc, and $\dot{y}$ is a negative quantity.

The diminution of velocity is - $v^{\text {. }}$. This is proportonal to the retarding force and to the time of its action jointly, and therefore $-\dot{v}=r+\frac{g y}{z} \times \dot{t}$; but the time $\dot{i}$ is as the face $\dot{z}$ divided by the velocity $v ;$ therefore $-\dot{v}=r+\frac{g y}{\dot{z}} \times \frac{\dot{z}}{v}=-\frac{r \dot{z}+\dot{g y}}{v}$, and $-v \dot{v}=-$ $\because \approx-g y^{\circ},=\frac{v^{2} z}{2 a}-\dot{g} y^{2}$. Because $m \mathrm{~N}$ is the deflection by gravity, it is as the force $g$ and the fquare of the time $t$ jointly (the momentary action being held as uniform). We have therefore $m \mathrm{~N}$, or $-\ddot{y}=g t^{2}$. Obferve that $m \mathrm{~N}$ is in fact only the half of $-y$; but $g$ being twice the fall of a heavy body in a fecond, we have $-\ddot{j}$ fritly equal to $\left.\sigma_{0} \dot{t^{3}}\right)$. But $t^{2}=\frac{z^{2}}{v^{2}}$; therefore - $\ddot{y}=\frac{\dot{s}^{2}}{v^{2}}, f, \frac{a}{\dot{p} \sqrt{1+p^{2}+}+}$. Therefore $x=f \frac{a p}{p \sqrt{1+}+C}$ and $v^{2}=\frac{g z^{2}}{-y}$, and $-\varepsilon^{2} \ddot{y}=g \dot{z}^{3}$. The fluxion of this equation is $-v^{2} \ddot{y}-2 v \ddot{y} \dot{v}=2 g . \dot{z}$; but, because $\dot{z}: \dot{y}=m \mathrm{M}: m 0,=m \mathrm{~N}: m m, \ddot{y}: \ddot{z}$, we have $\approx \ddot{\approx}=\dot{y} \ddot{y}$. Therefore $2 g \dot{y} \ddot{y}=2 g z \ddot{z}$, = $2 \ddot{y} \dot{v}$, and - $2 v \dot{v} \ddot{y}=v^{2} \ddot{y},-2 g \dot{y} \ddot{y}$, and $v \dot{v}=\frac{v^{3} \ddot{y}}{2 \ddot{y}}-j \dot{y}$. But we have already -v $\dot{v}=$

$\dot{z}$, or $a \dot{y}=\dot{x} \dot{y}$, for the fluxionary equation of the curve.

If we put this into the form of a proportion, we Relation have $a: \dot{\approx}=\ddot{y}: \ddot{y}$. Now this evidently eftablifhes a re- between thant lation between the length of the curve and its variation of the of curvature ; and between the curve itself :and its cvo-curve and lota, which are the very circumflances introduced by its vuride Newton into his inveligation of the ferial motions. And time of the equation $\frac{\ddot{z}}{a}=\frac{\dot{x}}{\frac{y}{y}}$ is evidently an equation connercd with the logarithmic curve and the logarithmic feral. But we malt endeavour to reduce it to it lower order of fluxions, before we can cilablith a relation between $\approx, x$, and $y$.

Let $p$ exprefs the ratio of $\dot{y}$ to $\dot{x}$, that is, let $p$ be $=$ $\frac{\dot{y}}{\dot{y}}$, or $\dot{p} \dot{\dot{x}}=\dot{j}$. It is evident that this exprefies the inclination of the tangent at M to the horizon, and that $f$ is the tangent of this inclination, radius being unity. Or it may be confidered merely as a number, multiplying $\dot{x}$, fo as to make it $=\dot{y}$. We now have $\dot{y}^{2}=p^{2} \dot{x}^{2}$, and fince $\dot{z}^{2}=\dot{x}^{2}+\dot{y}^{2}$, we have $\dot{z}^{2}=\dot{x}^{2}+p^{2} \dot{x}^{2}$, $=\overline{I+p^{2}} \times \dot{x}^{2}$ and $\dot{z}=\dot{x} \sqrt{I+p^{2}}$.

Moreover, because we have fuppofed the abfifia $:$ to increase uniformly, and therefore $\therefore$ to be constant, we have $\ddot{y}=\dot{x} \dot{p}$, and $\ddot{y}=\dot{x} \ddot{p}$. Now let $q$ express the ratio of $p$ to $x$, that is, make $\frac{p}{x}=q$, or $q \dot{x}=\dot{p}$. This gives us $\dot{x} \dot{q}=\ddot{p}$, and $\dot{x}^{2} \dot{q}=\dot{x} \ddot{p},=\ddot{y}$.

By the fe fubtitutions our former equation $a^{\therefore} y=\dot{z} \ddot{y}$ changes to $a \dot{x}^{2} \dot{q}=\dot{x} \sqrt{1+p^{2}} \mid \dot{x} \dot{p}$, or $a \dot{q}=$ $p \sqrt{1+p^{2}}$, and, taking the fluent on both fides, we have $a q=f \dot{p} \sqrt{1+p^{2}}+\mathrm{C}, \mathrm{C}$ being the conftant quantity required for completing the fluent according to the limiting conditions of the cafe. Now $i=\frac{p}{q}$, and $\frac{I}{q}=$ Also, fince $\dot{y}=p \dot{x},=\frac{p p}{q}$, we have $\dot{y}=$ $\frac{\dot{p} \dot{p}}{f, p \sqrt{1+p^{2}}+C}$

$$
\text { Alfo } \dot{z}=\therefore \sqrt{1+p^{2}}=\frac{a \dot{p} \sqrt{1+p^{2}}}{\dot{f}, \dot{p}+\overline{1+p}+C}
$$

The values of ${ }^{\circ}, \dot{i}, \dot{y}$, give us

$$
\begin{aligned}
& y=f \frac{a p \dot{p}}{f, \dot{p} \sqrt{1+p^{⿹}}+\mathrm{C}},=a f \frac{p \dot{p}}{f, \dot{p} \sqrt{1+p^{2}}+\mathrm{C}} . \\
& =f, \frac{a \sqrt{1+p^{2}} \mid \dot{p}}{f f_{p} \sqrt{1+p^{2}}+\mathrm{C}}=a f \frac{\dot{p} \sqrt{1+p^{2}}}{f, \dot{p} \sqrt{1+p^{2}}+\mathrm{C}} .
\end{aligned}
$$

The procefs therefore of defcribing the trajectory is, $1 / f$. To find $q$ in terms of $p$ by the area of the curve whofe allfeifla is $p$ and the ordinate is $\sqrt{1+p^{2}}$.
$2 d$, We get $s$ by the area of another curve whofe abfciffa is $p$, and the ordinate is $\frac{1}{q}$.
$3^{d}$, We get $y$ by the area of a third curve whofe ab. fciffa is $p$, and the ordinate is $\frac{p}{q}$

The problem of the trajectory is therefore completely folved, becaufe we have determined the ordinate, ab. fciffa, and arch of the curve for any given pofition of its tangent. It now only remains to compute the maynitudes of thele ordinates and abfifize, or to draw them by a geometrical conftruction. But in this confilts the difficuly. The areas of thefe curves, which exprefs the lengths of $x$ and $y$, can neither be computed nor exhibited geometrically, by any accurate method yet difcovered, and we mult content ourfelves with approximations. Thefe render the defcription of the trajectory exceed. ingly difficult and tedious, fo that little advantage has as yet been derived from the knowledge we have got of its properties. It will however greatly affit our conception of the fubject to proceed fome length in this conftruction; for it muft be acknowledged that very few diftinct notions accompany a mere algebraic operation, efpecially if in any degree complicated, which we confefs is the cafe in the prefent queftion.

Let $\mathrm{D} m \mathrm{NR}$ (fig. 8.) be an equilateral hyperbola, of which $B$ is the vertex, DA the femitranfverfe axis, which we fhall affume for the unity of length. Let AV be the femiconjugate axis $=\mathrm{BA},=$ unity, and AS the aflymptote, bifecting the right angle BAV. Let PN, $p n$ be two ordinates to the conjugate axis, exceedingly near to each other. Join BP, AN, and draw B $\beta, \mathrm{N}_{v}$ perpendicular to the aflymptote, and $B C$ parallel to $A P$. It is well known that $13 P$ is equal to NP. Therefore $P N^{2}=B A^{2}+A P^{2}$. Now fince $B A=1$, if we make $\mathrm{AP}=p$ of nur formulx, PN is $\sqrt{1+p^{2}}$, and $\mathrm{P} p$ is $=$ $\dot{p}$, and the area $\mathrm{BAPNB}=f^{\dot{p}} \sqrt{\sqrt{1+p^{2}}}$ : That is to fiy, the number $f, \dot{p} \sqrt{1+p^{2}}$ (for it is a number) has the fame proportion to unity of number that the area BAPNB has to BCVA, the unit of furface. This area confits of two parts, the triangle APN, and the lyperbolic fector ABN . $\mathrm{APN}=\frac{1}{2} \mathrm{AP} \times \mathrm{PN},=$ $\frac{1}{2} p \sqrt{1+p^{2}}$, and the hyperbolic foetor $A B N=B N v p$, which is equivalent to the hyperbolic logarithm of the number reprefented by $\mathrm{A} v$ when $\mathrm{A} \&$ is unity. Therefore it is equal to $\frac{x}{2}$ the logarithm of $p+\sqrt{1+p^{2}}$. Hence we fee by the bye that $f, p \sqrt{1+p^{2}}=$ $\therefore p \sqrt{1+p^{2}}+\frac{x}{2}$ liyperbolic logarithm $\overline{p+\sqrt{1+p^{2}}}$.
Now let AMD be another curve, fuch that its ordinates $V m, \mathrm{PD}$, \&c. may be proportional to the areas $\mathrm{ABmV}, \mathrm{ABNI}$, and may liave the fame proportion to $A B$, the unity of length, which thefe areas have to $A B C V$, the unity of furface. Then VM: VC $=$
$\mathrm{V} n \mathrm{BA}: \mathrm{VCBA}$ and $\mathrm{PD}: \mathrm{P} \delta=\mathrm{PNBA}: \mathrm{VCBA}$, \&c. There ordinates will now reprefent $f, p \sqrt{1+p^{3}}$ with reference to a linear unit, as the areas to the hyperbola reprefented it in reference to a fuperficial unit.

Again, in every ordinate make $\mathrm{PD}: \mathrm{P}_{\delta}=\mathrm{P} s: \mathrm{PO}$, and thus we obtain a reciprocal to $\overline{P D}$ or to $f, \dot{p} \sqrt{1+p^{2}}$, or equivalent to $f, \frac{1}{\dot{p} \sqrt{+p^{2}}}$. This will evidently be $\frac{x}{a p}$, and PO op will be $\frac{\dot{x}}{a}$, and the area contained between the lines AF, AW, and the curve GEOH , and cut off by the ordinate PO, will reprefent $\underset{\sim}{2}$.

Laftly, make $\mathrm{PO}: \mathrm{PQ}=\mathrm{AV}: \mathrm{AP},=\mathrm{s}: p$; and then $\operatorname{PQ} q p$ will reprefent $\frac{y}{a}$, and the area ALEQP will reprefent $\frac{y}{a}$.

But we mult here obferve, that the fluents expreffed by thefe different areas require what is called the correction to accommodate them to the circumfances of the cafe. It is not indifferent from what ordinate we begin to reckon the areas. This depends on the initial direction of the, projectile, and that point of the abfciffa AP mult be taken for the commencement of all the areas which gives a value of $p$ fuited to the initial direction. Thus, if the projection has been made from A (fig. 7.) at an elevation of $45^{\circ}$, the ratio of the fluxions $x$ and $y$ is that of equality; and therefore the point E of fig. S. where the two curves interfes and have a common ordinate, evidently correfponds to this condition. The ordinate EV pafles through $V$, fo that AV or $p=\mathrm{AB},=1,=$ tangent $45^{\circ}$, as the cafe requircs. The values of $x$ and of $y$ correfponding to any other point of the trajectory, fuch as that which has AP for the tangent of the angle which it makes with the horizon, are now to be had by computing the areas VEOP, VEQP.

Another curve might have been added, of which the ordinates would exhibit the fluxions of the arch of the trajectory $\dot{z}=\frac{a p \sqrt{1+p^{2}}}{f, \frac{p}{1+p^{2}}}+C^{\text {a }}$
would exhibit the arch itfelf. And this would have been very eafy, for it is $\dot{z}=a \dot{p} \sqrt{1+p^{2}}$
$\overline{f, \dot{p}} \overline{\sqrt{1}+p^{2}}+\mathrm{C}$,
which is evidently the fluxion of the hyperbolic logarithm of $f, \dot{p} \sqrt{1+p^{2}} \mid$. But it is needlefs, fince $\dot{z}=$ $\therefore V_{1}+p^{2}$, and wehave already got $\therefore$. It is only increafing PO in the ratio of BA to BP .

And thus we have brought the inveltigation of this problem a confiderable length, havingafcertained the form of the trajectory. This is furely done when the ratio of the arch, abfcifs, and ordinate, and the pofition of its tan- know gent, is determined in every point. But it is fill very far of the from a folution, and much remains to be done before jector we can make any practical application of it. The only general confequence that we can deduce from the premifes

Proner'rilks. Fig. Plate ccceavil

Fig. 6

## P R O J E C T I L E S.

fes is, that in every cafe where the refiftance in any point bears the fame proportion to the force of gravity, the trajectory will be fimilur. Therefore two balls, of the fame denfity, projected in the fame direction, will deforibe fimilar t:ajectories if the velocities are in the fubduplicate ratio of the diameters. This we fhall find to be of confiderable practical importance. But let us now proceed to determine the velocity in the different points of the trajectory, and the times of deferibing its fevera, portions.

Recollect, thereforc, that $v^{2}=\frac{-g z^{3}}{\ddot{y}}$ and that $\dot{z}^{2}$ $=\dot{x^{3}} \overline{1+p^{2}}$ and $\ddot{y}=\dot{x} \dot{p}$. This gives $v^{2}=-\overline{g \times 1+p^{2}}$ But $\dot{p}=q \therefore . \quad$ Thercfore $v^{2}=-\dot{x} \overline{1+p^{2}}=p$
$\frac{-a g \overline{1+p^{2}}}{f, \dot{p} \sqrt{1+p^{2}+C}}$, and $v=\sqrt{\frac{-g}{q+p^{2}}}=$
$\sqrt{ } a \sqrt{ }=\delta^{1+p^{2}}$
$\sqrt{f \dot{\sqrt{1}+p^{2} \mid}+C}=$
Alfo $i$ was tound $=\frac{z}{v}=\frac{\dot{x} \sqrt{1+p^{2}}}{v},=$
$\frac{p}{q^{2}+\bar{p}^{2}}$. If we now fubtitute for $v$ its value jut found, we obtain $i=\frac{\dot{p}}{\sqrt{-g q}}$, and $t=f \frac{\dot{p}}{\sqrt{-g q}}$ $=f \frac{\dot{p} \sqrt{ } a}{\sqrt{-g f \dot{p} \sqrt{1+p^{2} \mid}+C}}=\frac{\sqrt{ } a}{\sqrt{-g}} \times$

## $f \frac{p}{\sqrt{f p \sqrt{1+\sqrt{p^{2}}}+C}}$.

The greateft difficulty ftill remains, viz. the accommodating thefe formulx, which appear abundantly fimple, to the particular cafes. It would appear at firft fight that all trajectories are fimilar ; fince the ratio of the fluxions of the ordinate and abfciffa correfponding to any particular angle of inclination to the horizon feems the fame in them all : but a due attention to what has been bitherto faid on the fubject will how us that we have as yet only been able to afcertain the velocity in the point of the trajectory, which has a certain inclination to the horizon, indicated by the quantity $p$, and the time (reckoned from fome affigned beginning) when the projectile is in that point.

To obtain abfolute meafures of thefe quantities, the term of commencement mult be fixed upon. This will be expreffed by the conftant quantity C , which is affumed for completing the fluent of $p \sqrt{\mathrm{I}+p^{2}}$, which is the bafis of the vwlole conftruction. We there found $q=$ $f_{\rho} \dot{p} \sqrt{1+p^{2}}$. This fluent is in general $q=$ $\mathrm{C}+f, \dot{p} \sqrt{1+p^{2}}$, and the conftant quantity C is to e. beaccommodated tofomecircumftances of the cafe. Different authors have feleted different circumflances, Euler, in his Commentary on Robins, and in a differtation in the Memoirs of the Academy of Berlin publifhed in 1753, takes the vertex of the curve for the begiming
of his abfciffa and ordinate. This is the fimpleft method of any, for C mult then be fo chofen that the whale fluent may vanifl when $p=0$, which is the cafe in the vertcx of the curve, where the tangent is parallel to the horizon. We flall adopt this mothod.

Thercfore, let AP (fig. 9.) $=x, \mathrm{PM}=\mathrm{f} \cdot \mathrm{AMI}=z \cdot \quad$ Pace Put the quantity C which is introduced into the fuent cc.cxvan. equall to $\frac{n}{a}$. It is plain that $n$ muft be a number; for it mult be homologous with $\dot{p} \sqrt{1+p^{2}}$, which is a number. For brevity's fake let us exprefs the fluent of $p^{1+p^{2}}$ by the fingle letter P ; and thus we fhall have $x=a \times f \frac{\dot{p}}{n+\mathrm{P}}, y=a \times f \frac{p+}{n+\mathrm{P}}, z=a \times$ $f \frac{\dot{p} \sqrt{1+p^{2}}}{n+P}$. And $v^{2}=\frac{-a_{0}\left(1+p^{2}\right)}{n+p^{2}}$. Now the height $b$ neceffary for communicating any velocity $v$ is $\frac{v^{2}}{2 g}=\frac{-a g\left(\mathrm{I}+p^{2}\right)}{2 g(n+\mathrm{P})},=\frac{-\frac{x}{2} a\left(\mathrm{I}+\hat{p}^{2}\right)}{n+\mathrm{P}}$. And lattly, $t=\frac{\sqrt{a}}{V^{\prime} g} f \frac{\dot{p}}{\sqrt{n+P}}$.

Thefe fluents, being all taken fo as to vanifh at the vertex, where the computation commences, and where $p$ is $=0$ (the tangent being parallel to the horizon), we obtain in this cafe $b=\frac{\frac{1}{2} a}{n}$, $=\frac{a}{2 n}$, and $n=\frac{a}{2 b}$.

Hence we fee that the circumftance which modifies all the curves, diftinguifhing them from each other, is the velocity (or rather its fquare) in the higheft point of the curve. For $h$ being determined for any body whofe terminal velocity is $u, n$ is alfo determined; and this is the modifying circumflance. Confidering it geometrically, it is the area which muft be cut off from the area DMAP of fig. 8 . in order to determine the ordinates of the other curves.

We mut farther remark, that the values now given relate only to that part of the area where the body is defcending from the vertex. This is evident; for in order that $y$ may increafe as we recede from thevertex, its fluxion muft be taken in the oppofite fenfe to what it was in our inveftigation. There we fuppofed $y$ to increafe as the body afcended, and then to diminifh during the defcent ; and therefore the fluxion of $y$ was firft pofitive and then negative.

The fame equations, however, will ferve for the afcendiug branch CNA of the curve, only changing the fign of $P$; for if we confider $y$ as decreafing during the afcent, we mult confider $q$ as exprefing $\frac{\cdots \dot{p}}{\dot{x}}$, and therefore $\dot{\mathrm{P}}$, or $f_{\dot{p}} \sqrt{1+p^{2}}$, which is $=\frac{q}{a}$, mutt be taken negatively. Therefore, in the afcending brancl2, we have A( or $x$ (increafing as we recede from $A$ )$a \times f \frac{\dot{p}}{n-\mathrm{P}}, \mathrm{QN}$ or $y=a \times f \frac{p \dot{p}}{n-\mathrm{P}}$, AN or $z=$ $a \times f \frac{\dot{p} \sqrt{1+p^{2}}}{n-\mathrm{P}}, t=\frac{\sqrt{ } a}{\sqrt{g}} \times f \frac{\dot{p}}{\sqrt{1-\mathrm{P}}}$, and the
height producing the velocity at $\mathrm{N}=\frac{\frac{x}{2} a\left(1+p^{2}\right)}{n-\mathrm{P}}$.
Hence we learn by the bye, that in no part of the curve afcending branch cau the inclination of the tangent be or trajec$+B 2$
fuch

## P R O J E C T I L E S.

A1:ch that $P$ thatl be greater than $n$; and that if we fuppore $P$ equal to $n$ in any point of the curve, the velocity in that point will be inlinite. That is to fay, there is a certain alignable elevation of the tangent which cannot be exceeded in a curve which has this velocity in the vertex. The beit way for forming a conception rithis circumtance in the nature of the curve, is to invert the motion, and fuppofe an accelerating force egaal and oppolite to the refiftance, to at on the body in conjuntion with gravity. It mult defcribe the fame farve, and this branch ANC nuft have an allymptote 1.O, which has this limiting polition of the tangent. Eor, as the body defeends in this curve, its velocity increafes to infinity by the joint action of gravity and this accelcrating force, and yet the tangent never approaches fo near the perpendicular polition as to make $P=n$. This remarkable property of the curve was thown to Newton, as appears by his approximations, which all lead him to curves of a hyperbolic form, having one affymptote inclined to the horizon. Indeed it is pretty obvious: For the refiftance increafing fafter than the velocity, there is no velocity of projection fo great but that the curve will come to deviate form the tangent, that in a finite time it will become parallel to the horizon. Were the refiftance propotional to the velocity, then an infinite velocity would produce a rectilineal motion, or rather a defleation from it lefs than any that can be affigned.

ITe now fee that the particular form and magnitude of this trajectory depends on two circumitances, $a$ and n. a affects chiefly the magnitude. Another circumthance might indeed be taken in, viz. the diminution of the accelerating force of gravity by the fatical effect of the air's gravity. But, as we have already obferved, this is too trifling to be attended to in military projectiles. $y^{y}$. was made equal to $p$. Therefore the radius of curvature, determined by the ordinary me-

- Simpron's Fluxions, 5 68, s.e.
$=\frac{a}{n+\mathrm{P}}$ for the defcending branch of the curve, the sadius of curvature at $M$ is $\frac{a \times \overline{I+p^{2}} \times \sqrt{1+p^{3}}}{n+P}$, and, in the afcending brancio at $N$, it is $\frac{a \times \overline{1+p^{2}} \times \sqrt{1+p^{2}}}{n-1}$. On both fides therefore, when the relocity is infinitely great, and P by this means fuppofed to equal or excced $n$, the radius of curvature is alfo infinitely great. We alfo fee that the two branches are mlike each other, and that when $p$ is the fame in both, that is, when the tangent is equally inclined to the horizon, the radius of curvature, the ordinate, the abrcifs, and the arch, are all greater in the afcending branch. This is pretiy nbvious. For as the refiftance acts entirely in diminifhing the velocity, and does not affen the deflection eccafioned by gravity, it mult allow gravity to incurvate the path fo much the more (with the fame inclination of its line of action) as the relocity is more diminithed. Fl? curvature, therefore, in thofe points which have the fame inclination of the tangent, is greatelt in the deicending branch, and the motion is fwiftent in the afeending branch. It is othernife in a void, where both
fides are alike. Here $u$ becomes infinite, or there is no terminal velocity; and $n 3$ alfo becomes infinite, being
$=\frac{a}{2 b}$.
It is therefore in the quantity $P$, or $f \dot{p} \sqrt{1+p^{2}}$, that the difference between the trajectory in a void and in a relifting medium confilts; it is this quantity which exprefles the accumulated change of the ratio of the increments of the ordinate and abfcifs. In vacuo the fecond increment of the ordinate is conftant when the firf increment of the abfcilfa is $f 0$, and the whole increment of the ordinate is as $1+p$. And this difference is fo much the greater as $D$ is greater in refpeet of $n_{0}$. P is nothing at the vertex, and increafes along: with the angle MTP; and when this is a right angle, $P$ is infinite. The trajectory in a refiting medium will come therefore to deviate infnitely from a parabola, and may even deviate farther from it than the parabola deviates from a ftraight line. That is, the diflance of the body in a given moment from that point of its parabolic path where it would have been in a void, is greater than the diftance between that point of the parabola from the point of the ftraight line where it would have been, independent of the action of gravity. This muft happen whenever the refiftance is greater than the weight of the body, which is generally the cafe in the begimning of the trajectory in military projectiles; and this (were it now necetfary) is enongh to thow the inutility of the parabolic theory.

Although we have no method of deferibing this several trajectory, which would be received by the ancient propert genmeters, we may afcertain feveral properties of it, of it afo which will affift us in the folution of the problem. In ${ }^{\text {tained. }}$ particular, we can aflign the abfolute length of any part of it by means of the logiftic curre. For becaufe $P$ $=f \dot{p} \sqrt{1+p^{2}}$, we have $\dot{p} \sqrt{1+p^{2}}=\dot{p}$, and therefore:, which was $=a \times \int \frac{p \sqrt{1+p^{2}}}{f \dot{p} \sqrt{1+p^{2} \mid}}+C$, or $=a \times$ $f \frac{\dot{p}}{n+\bar{p}}$, may be exprefed by logarithms ; or $z=a$ $\times$ hyp. log. of $\frac{n+P}{n}$, fince at the vertex $A$, where $\approx$ mult $b c=0, P$ is alfo $=0$.

Being able, in this way, to afcertain the length AMI of the curve (comnted from the vertex), corredponding to any inclimation $\hat{p}$ of the tangent at its extrenity M , we can afcertain the length of any portion of it, fuch as Mm , by firt fiuling the length of the part $\mathrm{A} m$, and then of the fart $\stackrel{A}{-} \mathrm{M}$. This we do more expeditioufly thus: Let $p$ exprefs the polition of the tangent in $M$, and $q$ its pofition at $m$; then $\mathrm{AM}=a \times \log \cdot \frac{n+\mathrm{P}}{n}$ and $\mathrm{Am}_{m}$ $=a \times \log \cdot \frac{n+Q}{n}$, and therefore $M_{m}$ is $=a \times \log$. $\frac{n+\mathrm{Q}}{n+\Gamma^{2}}$. Thus we can find the values of a great number of fmall portion, and the inclination of the tangents at their extromities. Then to each of thefe purtions we can afign its proportion of the abcifla and ordinate, without having recourfe to the values of $x$ and $y$. For the portion of abfeifs correfponding to the arch $\mathrm{M} m$, whofe

## P R O J E C T I L E S.

whofe middle point is inclined to the horizon in the angle $b$, will be MI $m \times$ cofine $b$, and the correfponding portion of the ordinate will be $M m \times$ fin. $b$. Then we obtain the velocity in each part of the curve by the equation $b=\frac{1}{2} a \times+\frac{p^{2}}{n}$; or, more directly the velocity

$$
n+p
$$

vat M will $\mathrm{be}=\sqrt{a g} \frac{\sqrt{1+p^{2}}}{\sqrt{n+P}}$. Lafly, divide the length of the little arch by this, and the quotient will be the time of deferibing $\mathrm{M}_{\text {ni }}$ very nearly. Add all thefe tngether, and we obtain the whole time of defcribing the arch AN, but a little too grear, becaufe the motion in the finall arch is not perfectly uniform. The error, however, may be as fmall as we pleafe, becaufe we may make the arch as finall as we pleate; and for greater accuracy, it will be proper to take the $p$ by which we compute the velocity, a modium between the $p$ for the beginning and that for the end of the arch.

This is the method followed by Euler, who was one of the moft expert analylts, if not the very firlt, in Europe. It is not the moftelegant, and the methods of fome other authors, who approximate direatly to the :rreas of the curves which determine the valucs of $x$ and $y$, have a more ficientific appearance ; but they are not ultimately very different: For, in fome methods, theie areas are taken piecemeal, as Euler takes the arch; and by the methods of others, who give the value of the areas by Newton's method of defcribing a curve of the parabulic kind through any number of given points, the ordinates of there curves, which exprefs $\dot{x}$ and $j$, mutt be taken fingly, which amounts to the fame thing, with the great difadrantage of a much more complicated calculus, as any one may lee by comparing the expreffions of $x$ and $y$ with the exprellion of $z$. As to thofe methods which approximate directly to the areas or values of $x$ and $y$ by an infinite feries, they all, without exception, involve us in moft complicated exprefions, with coefficients of lines and tangents, and ambiguous figns, and engage us in a calculation almoft endlefs. And we know of no feries which converges falt enough to give us tolerable accuracy, without fuch a number of terms as is fuficient to deter any perfon from the attempt. The calculation of the arches is very moderate, fo that a perfon tolerably verfant in arithmetical operations may compute an arch with its velocity and time in about five minutes. We have therefore no hefitation in preferring this method of Euler's to all that we have feen, and therefore proceed to determine fome other circunifances which render its application more general.

If there were no refinance, the fmallen velocity would be at the vertex of the curve, and it would immediately increafe by the action of gravity confining (in however fmall degrec) with the motion of the body. But in a relinting medium, the velocity at the vertex is diminifhod by a quantity to which the acceleration of gravity in that peint bears no afignable proportion. It is therefore diminifhed, upon the whole, and the point of imalleft velocity is a little way beyond the vertex. For the fame reafons, the greateft curvature is a little way beyond the vertex. It is not very material for our prefent purpofe to afcertain thic exatt pofitions of thofe points.

The velocity in the defeending branch augments continually: but it cannot exceed a certain limit, if the velocity at the vertex has been lefs than the terminal velo. city; for when the curve is infinite, $p$ is alio infnite, and $b=\frac{\frac{1}{2} a p^{3}}{\mathrm{P}^{2}}$, becauic $n$ in this cafe is nothing in refpect of $I^{2}$, which is infinite: and becaufe $p$ is infinite, the num. ber liyp. log. $p+\sqrt{1+p^{2}}$, though infinite, vanilhes in comparien with $p \times \sqrt{1+p^{7}}$; fo that in this cafe $1=$ $\therefore p^{2}$, and $h=a$, and $\tau=$ the icrminal velocity.

Ji, on the other hand, the velosity at the vertex has been greater than tlec terminal velocity, it will diminifh continually, and when the curve has become infinite, $v$ will be equal to the terminal velocity.

In either caffe we fee that the curve on this fide will have a perpendicular affymptote. It would require a long and pretty intricate araly fis to determine che place of this affymptote, and it is not material for our prefent purpofe. The place and pofition of the other aily mptote $L O$ is of the greatell moment. It evidently di. finguidhes the kind of trajectory from any other. Its pofition depends on this circumitance, that if $p$ malas the pofition of the tangent, $n-\mathrm{P}$, which is the denominator of the fractions expreffing the fquare of the velocity, mult be equal to nothing, becaufe the velocity is infinite: therefore, in this place, $\mathrm{P}^{\prime}=n$, or $n=$ ip $\sqrt{1+p^{2}+} \operatorname{lng} \cdot \overline{p+\sqrt{1+p^{2}}}$. In order, therefore, to find the point $L$, where the affymptote LO cuts the horizontal line $A \mathrm{~L}$, put $\mathrm{P}=n$, then will $\mathrm{AL}=\therefore-$ $\frac{y \cdot x}{\dot{y}}=a \times\left(f \frac{\dot{p}}{n-P}-\frac{1}{p} f \frac{\dot{p}}{n-1}\right)$. Through It is evident that the logarithms ufed in thefe expref of this arfions are the natural or hyperbolic. But the operations ticle $f$ may be performed by the common tables by making means fu. the value of the arch $\mathrm{M} m$ of the curve $=\frac{a}{\mathrm{M}} \times \log$. ${ }^{\text {ent. }}$ $\frac{n+Q}{n+P}$ \&c. where $M$ mcans the fubtangent of the common logarithms, or 0,43429 ; alfo the time of defcribing this arch will be expeditiouny had by taking a medium $\mu$ between the values of $\frac{\sqrt{1+p^{2}}}{\sqrt{n+\mathrm{P}}}$ and $\frac{\sqrt{1+q^{2}}}{\sqrt{n+\mathrm{Q}}}$ and making the time $=\frac{\sqrt{a}}{\mathrm{M}_{\mu} \sqrt{3}} \times \log \cdot \frac{n+\mathrm{Q}}{n+\mathrm{P}}$.

Such then is the procefs by which the form and magnitude of the trajectory, and the motion in it, may be determined. But it does not yet appear how this is to be applied to any queftion in practical artillery. In this this procefs prop has in pracprocefs we have only learned how to compute the mo- tice. tion from the vertex in the defcending brancle till the ball has acquireda particular direction, and the motion to the vertex from a point of the afcending branch where the ball has another direction, and all this depending on the greater velocity which the body can acquire by falling, and the velocity which it has in the vertex of the curve. But the ufual quellion is, "What will be the motion of the ball projected in a certain direction with a certain velocity ?"'
The mode of application is this: Suppore a trajestory computed for a particular terminal velocity. produced by the fall $a$, and for a particular velocity at the vertex,
which

## P $\quad \begin{array}{llllllllll}\mathrm{R} & \mathrm{O} & \mathrm{J} & \mathrm{E} & \mathrm{C} & \mathrm{T} & \mathrm{I} & \mathrm{L} & \mathrm{E} & \mathrm{S} .\end{array}$

which will be charaterized by $n$, and that the velocity at that peint of the affending branch where the inclination of the tangent is $30^{\circ}$ is 900 feet per fecond. Then, we are certain that if a ball, whofe terminal velocity is that produced by the fall $a$, be projected with the velocity of goo feet per fecond, and an elevation of $30^{\circ}$, it will defcribe this very trajefory, and the velocity and time correlponding to every point will be fuch as is here determined.

Now this trajectory will, in refpes to form, anfwer an infinity of cafes: for its characteriftic is the proportion of the velocity in the vertex to the terminal velocity. When this proportion is the fame, the number ${ }^{2}$ will be the fame. If therefore we compute the trajectories for a fufficient variety of thefe proportions, we fhall find a trajectory that will nearly correfpond to any cafe that can be propofed; and an approximation fufficiently exact will be lad by taking a proportional medium between the two trajectories which come neareft to the cafe propofed.
Corsured Accordingly, a fet of tables or trajectories have been tables ur trajestorics.
scc. Make $y=v$, and take the maximum by vary-
 $\left(1+\frac{2 b}{a \text { fine } e}\right)$, which gives us the angle $e$.

The numbers in the firf column, multiplied by the terminal velocity of the projectile, give us the initial velocity; and the numbers in the laft column, being multiplied by the height producing the terminal velocity, and by 2,3026 , give us the greatef ranges. The middle column contains the elevation. The table is not computed with fcrupulous exactnefs, the queftion not requiring it. It may however be depended on within one part of 2000

To make ufe of this table, divide the initial velocity by the terminal velocity $u$, and look for the quotient in the firt column. Oppofite to this will be found the elevation giving the greatent range; and the number in the laft colnmn being multiplied by $2,3026 \times a$ (the height producing the terminal velocity) will give the range.

## Table of Elceations giving the greatefl Range.

| $\frac{\text { Initial vel. }}{u}$, | Eleration. | $\left\lvert\, \frac{\text { Range. }}{2,3026 a}\right.,$ |
| :---: | :---: | :---: |
| 0,6909 | $43^{\circ} \cdot 40^{\prime}$ | 0,1751 |
| 0,7820 | 43.20 | 0,2169 |
| 0,8645 | $42 \cdot 50$ | 0,2548 |
| 1,3817 | 41.40 | 0,4999 |
| 1,5641 | 40.20 | 0,5789 |
| 1,7291 | 40.10 | 0,6551 |
| 2,0726 | 39-50 | 0,7877 |
| 2,3461 | 37.20 | 0,8967 |
| 2,5936 | 35.50 | 0,9752 |
| 2,7635 | 35. | 1,0319 |
| 3,1281 | $34 \cdot 40$ | r,1411 |
| 3,4544 | 34.20 | 1,2298 |
| 3,458 I | 34.20 | 1,2277 |
| 3,9101 | $33 \cdot 50$ | 1,3371 |
| 4,1452 | $33 \cdot 30$ | 1,3901 |
| 493227 | $33 \cdot 30$ | 1,4274 |
| 4,6921 | 31.50 | 1,5050 |
| 4,8361 | 31.50 | 1,5341 |

Such is the folution which the prefent Aate of our Advantag mathema ical knowledge enables us to give of this cele- to be debrated problem. It is exact in its principle, and the rived frol application of it is by no means difficult, or even ope- of the for rofe. But let us fee what advantage we are likely to problem. derive from it.

In the firt place, it is very limited in its application. There are few circumftances of general coincidence, and almot every caie requires an appropriated calculus. Perhaps the only general rules are the two following:
i. Balls of equal denfity, projected with the fame elevation, and with velocities which are as the fquareroots of their diameters, will detcribe fimilar curves. This is evident, becaufe, in this cafe, the refiftance will be in the ratio of their quantities of motion. Therefore

## P R O J E C T I L E S.

all the homologous lines of the motion will be in the tircly eftablifted on the experiments on the fights of proportion of the diameters.
2. If the initial velocities of balls projected with the fame elevation are in the inverfe fubduplicate ratio of the whole refiltances, the ranges, and all the homologous lines of their track, will be inverfely as thofe reliftances.

Thefe theorems are of confiderable ufe : for by means of a proper feries of experiments on one ball projected with different elevations and velocities, tables may be confructed which will afcertain the motions of an infinity of others.

But when we take a retrofpective view of what we have done, and confider the conditions which were affumed in the folution of the problem, we fhall find that mucl yct remains before it can be rendered of great practical ufe, or cven fatisfy the curiofity of the man of ficience. The refiltance is all along fuppofed to be in the duplicate ratio of the velocity; but even theory points out many caufes of deviation from this law, fuch as the preflure and condenfation of the air, in the cafe of very fivift motions; and Mr Robins's expen iments are fufficient to thow us that the deviations mult be exceedingly great in fuch cafes. Mr Euler and all fubfequent writers have allowed that it may be three times greater, even in cafes which frequently occur; and Euler gives a rule for afcertaining with tolerable accuracy what this increafe and the whole refiftance may amount to. Let $H$ be the height of a column of air whofe weight is equivalent to the refiffance taken in the duplicate ratio of the velocity. The whole refiftance will be expreffed by $\mathrm{H}+\frac{\mathrm{H}^{2}}{288_{45}}$. This number $288_{45}$ is the height in feet of a column of air whofe weight balances its elafticity. We thall not at prefent call in queftion his reafons for affigning this precife addition. They are rather reafons of arithmetical conveniency than of phyfical import. It is enough to obferve, that if this meafure of the refiftance is introdnced into the procefs of inveftigation, it is totally changed ; and it is not too much to fay, that with this complication it requires the knowledge and addrefs of a Euler to make even a partial and very limited approximation to a folution.Any lave of the refiftance, therefore, which is more complicated than what Bernoulli has affumed, namely, that of a fimple power of the velocity, is abandoned by all the mathematicians, as exceeding their abilities; and they have attempted to avoid the error arifing from the aflumption of the duplieate ratio of the velocity, either by fuppofing the refiftance throughout the whole tra. jeciory to be greater than what it is in general, or they have divided the trajectory into different portions, and alfigned different refiftances to each, which vary, through the whole of that portion, in the duplicate ratio of the velocities. By this kind of patchwork they make up a trajectory and motion which correfponds, in fome tolerable degree, with what? With an aceurate theory? No; but with a feries of experiments. For, in the firft place, every theoretical computation that we make, proceeds on a fuppofed initial velocity; and this cannot be afcertained with any thing approaching to precifion, by any theory of the action of gunpowder that we are yet poffeffed of. In the next place, our theories of the refifting power of the air are en-
fhot and faclls, and are corrected and amended till they tally with the moft approved experiments we can find.
We do not learn the ranges of a gim by theory, but the theory by the range of the gun. Now the variety anal irregularity of all the experiments which are appeated to are fo great, and the acknowledged difference between the refiftance to flow and fivift motions is alfo fo great, that there is hardly any fuppofition which can be made concerning the refiflance, that will not agree in its refults with many of thofe cxperiments. It appears from the experiments of Dr Hutton of Woolwich, in 1784, 1785, and 1786 , that the fhots frequently deviated to the right or left of their intended track 200,300 , and fometimes 400 yards. This deviation was quite accidental and anomalous, and there can be no doubt but that the hot deviated from its intended and fuppojed elevation as much as it deviated from the intended vertical plane, and this without any opportunity of meafuring or difcovering the deviation. Now, when we have the whole range from one to three to choofe among for our meafure of refiftance, it is evident that the confirmations which have been drawn from the ranges of fhot are but feeble arguments for the truth of any opinion. Mr Robins finds his meafires fully confirmed by the experiments at Metz and at Minorca. Mr Muller finds the fame. Yet Mr Robins's meafure both of the initial velocity and of the refiftance are at leaft treble of Mr Muller's; but by compenfation they give the fame refults. The Chevalier Borda, a very expert mathematician, has adduced the very fame experiments in fupport of his theory, in which he abides by the Newtonian meafure of the refiffance, which is about $\frac{7}{3}$ of Mr Robins's, and about $\frac{2}{3}$ of Muller's.

What are we to conclude from all this? Simply this, 20 that we have hardly any knowledge of the air's refift- its inutiance, and that even the folution given of this problem has lity. not as yet greatly increafed it. Our knowledge confits only in thofe experiments, and mathematicians are attenipting to patch up fome notion of the motion of a body in a refifting medium, which fhall tally with them.
There is another effential defect in the conditions affumed in the folution. The denfity of the air is fuppofed uniform ; whereas we are certain that it is lefs by one fifth or one fixth towards the vertex of the curve, in many cafes which frequently occur, than it is at the beginning and end of the flight. This is another latitude given to authors in their afumptions of the air's refitance. The Chevalier de Borda has, with confiderable ingenuity, accommodated his inveftigation to this circumftance, by dividing the trajefory into portions, and, without much trouble, las made one equation anfwer them all. We are difpofed to think that his folution of the problem (in the lifemoirs of the Academy of Paris for ${ }^{1769}$ ) correfponds better with the phyfical circumftances of the cafe than any other. But his procefs is there delivered in too concife a manner to be intelligible to a perfon not perfealy familian with all the refources of modern analyfis. We therefore preferred John Bernoulli's, becaufe it is elementary and rigorous.

After all, the practical artillerift muft rely chiefly on the records of experiments contained in the books of practice at the academaes, or thofe mate in at more public manncr. Even a perfect theory of the air's refiftance can do him little fervice, unlefs the force of gunpowder were uniform. 'I'his is far fron being the cafe cven in the fane powder. A fcw hours of a damp day will make a greater difference than occurs in any theory ; and, in fervice, it is only by trial that every thing is performed. If the firlt thell falls very much thort of the mark, a little more powder is added ; and, in cannonading, the correction is made by varying the elevation.

We hope to be forgiven by the eminent mathematicians for thefe obfervations on their theories. They by no means proceed from any difrefoent for their labours. We are not ignorant of the almott iniuperable difficulty of the tafk, and we admire the ingenuity with which fome of them have contrived to introduce into their analyfis reafonable fubltitutions for thofeterms which wonld render the equations intractable. But we muft ftill fay, upon their own athority, that thefe are but ingenious guefles, and that expesiment is the touchftone by which they mould their fubfitutions; and when they have fomd a coincidence, they have no motive to make any alteration. Now, when we have fuch a latitude for our meafurc of the air's refiftance, that we may take it of any value, from one to three, it is 110 wonder that compentations of errors fhould produce a coincidence ; but where is the coincidence? The theorift fuppofes the ball to let out with a certain velocity, and his theory gives a certain range ; and this range agrees with obfer-vation-but how? Who knows the velocity of the ball in the experiment? 'This is concluded from a theory incomparably more uncertain than that of the motion in a reftting medium.

The experiments of Mr Robins and Dr Hutton fhow, n the moft incontrovertible manner, that the refilance to a motion exceeding 1100 feet in a fecond, is almoft three times greater than in the duplicate ratio to the refiftance to modetate velocities. Euler's tranflator, in his comparifon of the author's trajectories with experiment, fuppofes it to be 70 greater. Yet the coincidence is very great. The fame may be faid of the Chevalier de Borda's. Nay, the fame may be faid of Mr Robins's own practical rules: for he makes his F , which correfponds to our $a$, almoit double of what thefe anthors do, and yet his rules are confirmed by practice. Our obfervations are therefore well founded.

But it mult not be inferred from all this, that the The theory is still of fome ufe in practice,
phyfical theory is of no ufe to the prasticalartilletift. It plainly thows him the improprity of giving the projectile an enormons velocity. This velocity is of no efteet after 200 or 300 yards at fartheft, becaufe it is fo rapidly reduced by the prodigious refiftance of the air. Mr Robins has deduced feveral practical maxims of the greatelt importance from what we already know of this fubject, and which could hardly have been even conjectured withont thisknowledge. Sce Gunnery.

And it muft fill be acknowledged, that this branch of phyfical fcience is highly interefting to the philofopher; nor fhould we delpair of carrying it to greater pertiction. The defects arife almof entirely from our ignorance of the law of variation of the air's refiftance. Experiments may te contrived much more conducive to our information here than thofe commonly reforted
to. 'Ihs oblique fights of projectiles are, as we have feen, of very complicated inveltigation, and ill fitted for inltructing us ; but numerons and well contrived experiments on the perpendicular afients are of great fimplicity, being affected by nothing but the air's refiftance. To make them inftrutive, we think that the following plan might be purlised. Let : fet of experiments be premifed for atcertaining the intial velocities. Then let fheils be difcharged perpendicularly with great varieties of denfity and velocity, and let nothing be attended to but the height and the time; even a coufiderable deviation from the perpendicular will not affect cither of thefe circumftances, and the effect of this circumftance can eatily be computed. The height can be afcertained with fufficient precifion for very valuable information by their light orifmoke. It is evident that thefe experiments will give direat information of the air's retarding force; and every experiment gives us two meafures, viz. the afcent and defcent: and the comparifon of the times of afient or defcent, combined with the obferved height in one experiment made with a great initial velocity, will give us more information concerning the air's refiftance than 50 ranges. If we fhould fuppofe the refiftance as the fquare of the velocity, this comparion will give in each experiment an exat determination of the initial and final velocities, which no other method can give us. Thefe, with experiments on the time of horizontal flights, with known initial velocities, will give us more inftruction on this head than any thing that las yct been done; and till fomething of this kind is carefully dore, we prefume to fay that the motion of bodies in a refifting medium will remain in the hands of the mathematicians as a matter of curious fpeculation. In the mean time, the rules which Mr Robins has delivered in his Gunnery are very fimple and eafy in their ule, and feem to come as near the truth as any we have met with. He hás nor informed us upon what principles they are fomaded, and we are difpofed to think that they are rather empirical than fcientific. Jut we profefs great deference for his abilities and penetration, and doubt not but that le had framed them by means of as fcientifie a difcuf. fion as his knowledge of this new and difficult fubject enabled him to give it.

We flall conclude this article, by giving two or three Tabl tables, computed from the principles eftablifhed above, culat and which ferve to bring into one point of view the the chief circumftences of the motion in a refilting medium. ding Although the refult of much calculation, as any purion cipto who confiders the fubject witl readily fee, they mull not be conlidered as ofiering any very accurate refults; or that, in comparifon with one or two experiments, the differences thall not be confiderable. Let any pcrfon perufe the publifhed regiters of experiments which have been made with every attention, and he will fee fuch enormous inegularities, that all expectations of perfert agreement with them muft ceafe. In the experimentsat Woolwich in 1735, which were continued for feveral days, not only do the experiments of one day differ among themfelves, but the mean of all the experiments of one day difers from the mean of all the experiments of a nother nolefs than me fourth of the whole. The experiments in which the greateft regularity may be expected, are thofe made with great clevations. When the elevation is finall, the

## I R O J E C T I L E S.

range is more affeted by a change of velocity, and aill more by any deviation from the fuppofed or intended di rection of the thot.
The firt table thows the diftance in yards to which a ball projected with the velocity 1600 will g", while its velocity is reduced one tenth, and the diltance at which it drops 16 feet from the line of its direation. This table is calculated by the refiftance obferved in Mr Robins's experiments. The firlt column is the weight of the ball in pounds. The fecond column remains the $f_{2 m e}$ whatever be the initial velocity; but the third column depends on the velucity. It is here given for the velocity which is very ufual in military fervice, and its ufe is to affift us in directing the gun to the mark. If the mark at which a ball of 24 pounds is directed is 474 yards diftant, the axis of the piece muft be pointed 16 feet higher than the mark. Thefe deflections from the line of direction are nearly as the fquares of the diflances.

| I. | I I | III. |
| :---: | :---: | :---: |
|  | 92 | 420 |
| 4 | 121 | 428 |
| 9 | 159 | 456 |
| 18 | 200 | 470 |
| 32 | 272 | 479 |

The next table contains the ranges in yards of a 24 pound fhot, projefted at an elevation of $45^{\circ}$, with the different velocities in feet per fecond, expreffed in the firft column. The fecond column contains the diftances to which the ball would go in vacuo in a horizontal plane ; and the third contains the diftances to which it will go through the air. The fourth column is added, to fow the height to which it rifes in the air ; and the fifth fhows the ranges corrected for the diminution of the air's denfity as the bullet afcends, and may therefore be called the correfed range.

| I. | II. | III. | IV. | V. |
| ---: | ---: | ---: | ---: | ---: |
| 200 | 416 | 349 | 106 | 360 |
| 400 | 1664 | 1121 | 338 | 1150 |
| 600 | 3740 | 1812 | 606 | 1859 |
| 800 | 6649 | 2373 | 866 | 2435 |
| 1000 | 10390 | 2845 | 1138 | 2919 |
| 1200 | 14961 | 3259 | 1378 | 3343 |
| 1400 | 20364 | 3640 | 1606 | 3734 |
| 1600 | 26597 | 3950 | 1814 | 4050 |
| 1800 | 33663 | 4235 | 1992 | 4345 |
| 2000 | 41559 | 4494 | 2168 | 4610 |
| 2200 | 50286 | 4720 | 2348 | 4842 |
| 2400 | 59846 | 4917 | 2460 | 5044 |
| 2600 |  | 5106 | 2630 | 5238 |
| 2800 |  | 5293 | 2762 | 5430 |
| 3000 |  | 5455 | 2862 | 5596 |
| 3200 |  |  |  | 5732 |

the The initial velocities can never be pufhed as far as ble. we have calculated for in this table; but we mean it for a table of more extenfive ufe than appears at firt fight. Recollect, that while the proportion of the veSol. XV.
locity at the vertex to the terminal velocity remains the fame, the curves will be fimilar : therefore, if the initial velocities are as the fquare roots of the diameters of the balls, they will defribe fimilar curves, and the ranges will be as the dianmeters of the bulls.

Therefore, to have the range of a 12 pound flot, if projected at an elevation of 45 , with the velocity 1500 ; liuppofe the diameter of the 12 pounder to be $d$, and that of the 24 pounder $D$; and let the velocitics be a and $\mathrm{V}:$ Then fay, $\sqrt{\bar{d}}: \sqrt{\overline{1}}=1500$, $w$ a fourth proportional V. If the 24 pounder be projected with the velocity V , It will deferibe a curve fimilar to that defcribed by the 12 pounder, having the initith velocity 1500. Thereforc find (by interpolation) the range if the 24 pounder, having the initial velocity V. Call this K . Then $\mathrm{D}: d=\mathrm{R}: r$, the range of the 12 pounder which was wanted, and which is nearly 3380 yards.

We fee by this table the immenfe difference between the motions through the air and in a void. We fes that the ranges through the air, inftead of increafing ia the duplicate ratio of the initial velocitics, really increafe flower than thofe velocities in all cafes of military fervice ; and in the moft ufual cales, viz. from 800 to 1600 , they increafe nearly as the fquare-roots of the velocities.

A fet of fimilar tables, made for different elevation:, would almolt complete what can be dore by theory, and would be much more expeditious in their ufe than Mr Euler's Trajectories, computed with great labour by his Englifin tranflator.

The fane table may alfo ferve for computing the ranges of bomb-fhells. We have only to fird what mult be the initial velocity of the 24 pound fhot which correfponds to the propofed velucity of the fhell. This mult be deduced from the diameter and weight of the fhell, by making the velocity of the 24 pounder fuch, that the ratio of its weight to the refiftance may be the fame as in the fhell.

That the reader may fee with one glance the relation of thofe different quantities, we have given this table, expreffed in a figure (fiz. 10). The abfilifa, or axis DA, is the fcale of the initial velocities in feet per fecond, meafured on a fcale of 400 equal parts in

Plate
ccecxrut 95 an inch. The ordinates to the curve ACG exprefs the the diffeyards of the range on a fcale containing 800 yards in rent quanan inch. The ordinates to the curve A $x \gamma$ exprefs $\begin{gathered}\text { titics } 3 \text { in } \text { it. }, ~\end{gathered}$ (by the fume fale) the height to which the ball rifes in the air.

The ordinate BC (drawn through the point of the abfciffa which correfponds to the initial velocity 2000 is divided in the points $4,9,12,18,24,32,42$, in the ratio of the diameers of cannon-fhot of different weights; and the fame ordinate is produced on the other fide of the axis, till BO be equail to BA ; and then 1 BO is divided in the fubduplicate ratio of the fame diameters. Lines are drawn from the point A, and from any point $D$ of the ablififa, to thefe divifions.

We fee diftinetly by this figure how the cffet of the initial velocity gradually diminithes, and that in very great velocities the range is very little incrafed by its augmentation. The dotted cuive Al'CR, fuows what the ranges in vacuo would be.

Dy this figure may the problems le folved. Thui, to find the range of the 12 pounder, with the inititl ${ }_{4} \mathrm{C}$ rclosisy
velocity 1500 . Set off 1500 from B to F ; draw FH parallel to the axis, meeting the line 12 A in H ; draw the ordinate HK ; draw KL parallel to the axis, meeting $2+B$ in $L$; draw the ordinate $L M$, cutting $12 B$ in N. MN is the range required.

If curves, fuch as ACG , were laid down in the fame manner for other elevations, all the problems might be folved with great difpatch, and with much more accirracy than the theory by which the curves are drawn can pretend to.

## PROJECTION

Stereogra= Hhic Projection of the Sphere.

THE projection of the sphere is a perfpective reprefentation of the circles on the firface of the fphere; and is varioufly denominated according to the different pofitions of the eye and plane of projection.

There are three principal points of projection; the Aereographic, the orthographic, and gnomonic. In the Aereographic projetion the eye is fuppofed to be placed on the furface of the fyhere; in the orthographic it is fuppofed to be at an infinite diftance; and in the gnomonic projection the eye is placed at the centre of the fphere. Other kinds of its projection are, the globular, Mcrciator's, fenograpbic, \&c. for which fee the articles Geggraphy, Navigation, Perspective, \&c.

## Definitions.

1. The plane upon which the circles of the fphere are defcribed, is called the plane of projection, or the primitive circle. The pole of this circle is the pole of projection, and the place of the eye is the projeding point.
2. The line of meafures of any circle of the fphere is that diameter of the primitive, produced indefinitely, which paffes through the centre of the projected circle.

## Axiom.

The projection, or reprefentation of any point, is where the fraight line drawn from it to the projecting puint interfects the plane of projestion.

## S E C T I O N I.

Of the Stereographic Projection of the Sphere.
In the ftereographic projection of the fphere, the cye is placed on the furface of the fphere in the pole of the great circle upon which the fphere is to be projected. The projection of the hemifphere oppofite to the eye falls within the primitive, to which this projection is generally limited: it, however, may be extended to the other hemilphere, or that wherein the cye is placed, the projection of which falls without the primitive.

As all circles in this projection are projected either into circles or itraight lines, which are eafily defcribed, it is, therefore more generally underfood, and by many preferred to the other projestions.

## Proposition I. Theorem I.

Every great circle which palfes through the projecting point is projected into a ftraight line paffing through the centre of the primitive; and every arch of it, reckoned from the other pole of the primitive, is projected into its femitangent.

## OFTHE SPHERE.

Let ABCD (fig. r.) be a great circle paffing thro, stc phi A, C , the poles of the primitive, and interfecting it in jeeA the line of conmmon feetion BED, E being the centre the of the fphere. From A, the projecting point, let there be drawn ftraight lines AP, AM, AN, AQ, to any number of points $P, M, N, Q$, in the circle $A B C D$ : thefe lines will interfect BED, which is in the fame plane with them. Let them meet it in the points $p, m, n, q$; then $p, m, n, q$, are the projections of P , $M, N, Q$ : hence the whole circle $A B C D$ is projected into the llraight line BED, paffing through the centre of the primitive.

Again, becaufe the pole $C$ is projected into $E$, and the point M into $m$; therefore the arch CM is projected into the ftraight line E , which is the femitangent of the arch CM to the radius AE. In the like manner, the arch CP is projected into its femitangent $\mathrm{E}_{p}$, \&\&c.

## Corollaries.

I. Each of the quadrants contiguous to the projecting point is projected into an indefinite ftraight line, and each of thofe that are remote into a radius of the primitive.
2. Every fmall circle which paffes through the projecting point is projefted into that Atraight line which is its common fection with the primitive.
3. Every fraight line in the plane of the primitive, and produced indefinitely, is the projection of fome circle on the fphere paffing through the projecting point.
4. The projection of any point in the furface of the fphere, is diftant from the centre of the primitive, by the femitangent of the diftance of that point from the pole oppofite to the projesting point.

## Proposition II. Theorem II.

Every circle on the fphere which does not pafs through the projecting point is projected into a circle.
If the given circle be parallel to the primitive, them a ftraight line drawn from the projecting point to any point in the circumference, and made to revolve about the circle, will defcribe the furface of a cone; which being cut by the plane of projection parallel to the bafe, the fection will be a circle. Se Conic-Settions.
But if the circle MN (fig. 2.) be not parallel to the primitive circle $B D$, let the great circle $A B C D$, paffing through the projesting point, cut it at right angles in the diameter MN, and the primitive in the diameter BD. Through M, in the plane of the great circle, let MF be drawn parallel to $B D$; let $A M, A N$ be joined
and meet BD in $n n$. Then, becaufe $\mathrm{AB}, \mathrm{AD}$ are quadrants, and BD, MF parallel, the arch AM is equal to $A F$, and the angle $A M F$ or $A m n$ is equal to $A N M$. Hence the conic furface defrcibed by the revolution of AM about the circle $M N$ is cut by the primitive in a fubcontrary polition; therefore the fection is in this cafe likewife a circle.

## Corollaries.

1. The centres and poles of all circles parallel to the primitive have their projections in its centre.
2. The centre and poles of every circle inclined to the primitive have their projections in the line of meafures.
3. All projected great circles cut the primitive in two points diametrically oppolite; and evety circle in the plane of projection, which paffes through the extremities of a dianeter of the primitive, or through the projections of two points that are diametrically oppofite on the fphere, is the projection of fome great circle.
4. A tangent to any circle of the fphere, which does not pafs through the projecting point is projected into a tangent to that circle's projection; alfo, the circular projections of tangent circles touch one another.
5. The extremities of the diameter, on the line of meafures of any projected circle, are diftant from the centre of the primitive by the femitangents of the lcaft and greateft diftances of the circle on the fphere, from the pole oppolite to the projecting point.
6. The extremities of the diameter, on the line of meafures of any projected great circle, are diftant from the centre of the primitive by the tangent and cotangent of half the great circle's inclination to the primitive.
7. The radius of any projected circle is equal to half the fum, or balf the difference of the femitangents of the leaft and greateft diftances of the circle from the pole oppofite to the projecting point, according as that pole is within or without the given circle.

## Proposition III. Theorem III.

An angle formed by two tangents at the fame point in the furface of the fphere, is equal to the angle formed by their projections.
Let FGI and GH (fig. 3.) be the two tangents, and A the projecting point; let the plane AGF cut the fphere in the circle AGL, and the primitive in the line BML. Alfo, let MN be the line of common fection of the plane AGH with the primitive: then the angle $\mathrm{FGH}=\mathrm{LMN}$. If the plane FGH be parallel to the primitive BLD, the propofition is manifeft. If not, through any point $K$ in $A G$ produced, let the plane FKH, parallel to the primitive, be extended to meet FGH in the line FH. Then, becaufe the plane AGF meets the two parallel planes BLD, FKH, the lines of common fection LM, FK are parallel ; therefore the angle AML=AKF. Dut fince $A$ is the pole of BLD, the chords, and confequently the arches AB AL, are equal, and the arch ABG is the fum of the arches $\mathrm{AL}, \mathrm{BG}$; hence the angle AML is equal to an angle at the circumference ftanding upon AG , and therefore equal to AGI or FGK ; confequently the angle $F G K=F K G$, and the fide $F G=F K$. In
like manner $H G=H K$ : hence the triangles GHF, stereograKHF are equal, and the angle $\mathrm{FGH}=\mathrm{FKH}=\mathrm{LMN}$.

## Corollaries.

1. An angle contained by any two circles of the fphere is equal to the angle formed by their projec. tions. For the tangents to thefe circles on the fiche are projected into ftraight lines, which either coincid: with, or are tangents to, their projedtions on the primitive.
2. An angle contained by any two circles of the fphere is equal to the angle formed by the radii of thcir: projections at the point of interfection.

## Proposition IV. Theorem IV.

The centre of a projected great circle is diftunt from the centre of the primituve; the tangent of the inclination of the great circle to the primitive, and its radius, is the fecant of its inclination.
Let MNG (fig. 4.) be the projection of a great circle, meeting the primitive in the extremities of the diameter MN, and let the diameter BD, perpendicular to MN, meet the projection in F, G. Bifeat FG in H , and join NH. Then, becaufe any angle contained by two circles of the fphere is equal to the angle formed by the radii of their projections at the point of interfection ; therefore the angle contained by the propofed great circle and the primitive is equal to the angle ENH, of which EH is the tangent, and NH the fecant, to the radius of the primitive.

## Corollaries.

2. All circles which pafs through the points $\mathrm{M}, \mathrm{N}$ are the projections of great circles, and have their centres in the line BG; and all circles which pals through the points $F, G$ are the projections of great circles, and have their centres in the line HI , perpendicular to BG.
3. If $\mathrm{NF}, \mathrm{NH}$ be continued to meet the primitive in $L, F$; then $B L$ is the meafure of the great circle's inclination to the primitive; and $\mathrm{MT}=2 \mathrm{BL}$.

## Proposition V. Theorem V.

The centre of projection of a lefs circle perpendicular to the primitive, is diftant from the centre of the primitive, the fecant of the diftance of the lefs circle from its ncareft pole; and the radius of projection is the tangent of that diftance.
Let MN (fig. 5.) be the given lefs circle perpendicular to the primitive, and $A$ the projecting point Draw AM, AN to meet the diameter BD produced in G and H ; then GH is the projected diameter of the lefs circle: bifect GH in C, and C will be its centre; join NE, N工. Then becaufe AE, NI are parallel, the angle $1 N E=$ NEA; but NEA $=2$ NMA. $=2 \mathrm{NHG}=\mathrm{NCG}$ : hence $\mathrm{ENC}=\mathrm{INE}+\mathrm{INC}=\mathrm{NCC}$. + INC $=$ a right angle; and therefore NC is a tangent to the primitive at $N$; but the arch ND is the diftance of the lefs circle from its neareft pole D: hence NC is the tangelt, and EC the fecant of the diftance of the lefs circle from its pole to the radius of the primitive.

Stcreapro.

## phic pro.

jestio: of
the: Sphere.

CCCCXIX.
are projected into $d, f$ : hence the arches $\mathrm{FD}, f d$ are $\mathrm{ft}-$ Steret milar ; but GB is equal to FD, therefore the intercep- phic ted arch of the primitive GD is fimilar to the projected arch $f d$.

## Corollary.

Hence, if from the angular point of a projected fpherical angle two ftraight lines be drawn through the projested poles of the containing fides, the intercepted arch of the primitive will be the meafure of the fpherical angle.

## Proposition IX. Problem I.

To defcribe the projection of a great circle through two given points in the plane of the primitive.
Let $P$ and $B$ be given points, and $C$ the centre of the primitive.

1. When one point $P$ (fig. 8.) is the centre of the primitive, a diameter drawn through the given points will be the great circle required.
2. When one point P (fig. 9.) is in the circumference of the primitive. Through P draw the diameter PD; and an oblique circle defcribed through the three points $\mathrm{P}, \mathrm{B}, \mathrm{D}$, will be the projection of the required great circle.
3. When the given points are neither in the centre nor circumference of the primitive. Throngh either of the given points $P$ (fig. 1c.) draw the diameter ED, and at right angles thereto draw the diameter FG. From F through P draw the fraight line FPH, meeting the circumference in H : draw the diameter HI, and draw the ftraigit line FIK, meeting ED produced in D ; then an arch, terminated by the circumference, being defcribed throngh the three points $\mathrm{P}, \mathrm{B}, \mathrm{K}$, will be the great circle.

## - Prorosition X. Probzem II.

To defcribe the reprefentation of a great circle about any given point as a pole.
Let $P$ be the given pole, and $C$ the centre of the primitive.
r. When $P$ (fig. 8.) is in the centre of the primitive, then the primitiye will be the great circle required.
2. When the pole P (fg. in.) is in the circumference of the primitive. Through $P$ draw the diameter PE, and the diameter $A B$ drawn at right angles to PE will be the projected great circle required.
3. When the given pole is neither in the centre nor circumference of the primitive. Through the pole $P$
(fig. 12.) draw the diameter $A B$, and draw the diameter DE perpendicular to AB ; through E and P draw the ftraight line EPF, meeting the circumference in $F$. Make FC equal to FD ; through $E$ and $G$ draw the Atraight line EGH, meeting the diameter AB produced if neceffary in H ; then from the centre H , with the radius HE, defrribe the oblique circle DIE, and it will be the projection of the great circle required.

Or, make DK equal to FA ; join EK, which interfeas the diameter $A B$ in $I$; then through the three points D, I, E, defrribe the oblique circle DIE.

Proposition XI. Problem III.
To find the poles of a great circle.

1. When the given grcat circle is the primitive, its centre is the pole.

Flate

## Proposition Vifi. Theorem VIII.

If from either pole of a projecred great circle, two flraight lines be drawn to meet the primitive and the projection, they will intercept limilar arches of thefe circles.

On a plane of projection AGB (fig. 7.) let the great circle CFD be projected into of $d$, and its pole $P$ into $p$; through $p$ draw the ftraight lines $p d, f f$, then are the arches $\mathrm{GB}, f d$ fimildr.

Since $p{ }^{d}$ lies both in the plane AGB and APBE , it is in their common fection, and the point B is alfo in their common fection; therefore $p d$ paffes through the point B . In like manner it may be fhown that the line of paffes through G. Now the points D, F
2. Tit) find the poie of the right circle ADC (fir. st.) Draw the diameter PI perpendicular to the given circle AI:; and its extremities P, E are the poles of the circle ACB.
3. To find the pole of the obliquac circle DEF (fig. 13.) Join $\mathrm{DH}^{2}$, and perpendicular thereto draw the diameter $A B$, cutting the given oblique circle DEF in E. Draw the fraight line FEG, meeting the circumference in G. Make GI, GH, each equal to AD ; then II being joined, cuts the dianselcr AB in P , the lower pole; through F and H draw the traight line FH $p$, meeting the diameter AB produced in $p$, which will be the oppofite or exterior pole.

## Proposition XII. Problem IV.

To defrribe a lefs circle about any given foint as a pole, and at any given difance fion that pole.

1. When the pole of the leis circle is in the centre of the primitive ; then from the contre of the primitive, with the femitangent of the diffance of the given circle from its pole, deferibe a circle, and it will be the projection of the lefs circle required.
2. If the given pole is in the circumfcrence of the primitive, from C (fig. 14.), the centre of the primitive, fet off $C E$ the fecant of the diftance of the lefs circle from its pole P ; then from the centre E , with the tangent of the given diftance, defcribe a circle, and it will be the lefs circle required. Or, make PG, PF each equal to the chord of the ditance of the lefs circle from its pole. Through B, G, draw the ftraight line BGD meeting CP produced in D : bifcat GD in H , and draw HE perpendicular to $G D$; and meeting $P D$ in E , then E is the centre of the lefs circle.
3. When the given pole is neither in the centre nor circumference of the primitive. Through 1 ' (fig. 15.), the given pole, and $C$ the centre of the prinitive, draw rhe diameter AB, and draw the diameter DE perpendicular to $A B$; join EP, and produce it to meet the primitive in $p$; make $p \mathrm{~F}, p \mathrm{G}$, each equal to the chord of the diftance of the lefs circle from its pole ; j in EF which interfeits the diameter AB in H ; from E through G draw the fraight line EGI, mecting the diameter AB produced in I ; bifect $\mathrm{H}[$ in K : Then a circle deferibed from the centre K , at the difance KH or KI, will be the projestion of the lefs circle.

## Proposition Xlit. Problem V.

To find the polcs of a given lefs circle.
The poles of a lefis circle are alio thofe of its parallel great circle. If therefore the parallel great circle be given, then its poles being found by Prob. IlI. will be thofe of the lefs circle. But if the parallel great circle be not given, let HMIN (fig. 15.) be the given lefs circle. Through its centre, and C the centre of the primitive, draw the line of meatures IA HB ; and draw the diametcr DE perpendicular to it, allo draw the fraight line EHF meeting the primitive in F ; make $\mathrm{F} p$ equal 10 the chord of the diftance of the lefs circle from its pole ; join E $P$, and its interfertion $P$ with the diameter AB is the interior pole. Draw the diameter $p \mathrm{CL}$ through E and L , draw EL $q$ meeting the diameter AB produced in $q$; then $q$ is the external pole. Or thus: Join EI interfecting the primitive in G ; join alfo EH, and produce it to meet the primitive in $F$, bifect
the arch GF in $p$; from $E$ to $p$ craw the firaizht line Stercopre$E P \rho$, and $P$ is the pols of the given lef's circle.

Praposition XIV. Problem VI. phic l'ruje. Ation on $\underbrace{\text { the Sphere. }}$

To meafure any arch of a great circle.

1. Arches of the primitive are meafured on the line of chords.
2. Right circles are meafured on the line of femitangents, beginning at the centre of the primitive. Thus, the meafire of the portion AC (fig. 16.) of the right circle DE, is found by applying it to the line of femitangents. The meafure of the arch $D B$ is found by fuberacting that of BC from $90^{\circ}$ : the meafure of the arch AF, lying partly on each fide of the centre, is obtained by adding the meafures of AC and CF. Laily, To meafure the part AB, which is nether terminated at the centre or circumference of the primitive, apply CA to the line of femitangents; then CB , and the difference between the mealures of there arches, will be that of AB .

Or thus, Draw the diameter GH perpendicular to DE ; then from either extremity, as D , of this diameter, draw lines through the extremities of the arch intended to be meafured; and the intercepted portion of the primitive applied to the line of chords will give the meafure of the required arch. Thus IK applied to the line of chords will give the meafure of AB .
3. To meafure an arch of an oblique circle : draw lines from its pole through the extremities of the arch to meet the primitive, then the intercepted portion of the primitive appiied to the line of chords will give the meafure of the arch of the oblique circle. Thus, let AB (fig. 17.), be an arch of an oblique circle to be meafured, and $P$ its polc ; from $P$ draw the lines PAD, PBE meeting the primitive in $B$ and $E$; then the arch DE applied to the line of chords will give the meafure of the arch of the oblique ciscle AB.

## Proposition XV. Problem VIt.

To meafure any arch of a lefs circle.
Let DEG (fig. 18.) be the given lefs circle, and DE the arch to be meaiured : find its internal pole P ; and defcribe the circle AFl parallel to the primitive, and whofe diffance from the projecting point may be equal to the ditance of the given lefs circle from its pole P: then join PD, PE, which produce to meet the parallel circle in A and F. Now AF applied to a line of chords will give the meafure of the arch DE of the given lefs circle.

## Proposition XVI. Problem VIII.

To meafure any fpherical angle.
r. If the angle is at the centre of the primitive, it is meafured as a plane angle.
2. When the angular point is in the circumference of the primitive; let A (fig. 19.) be the angular point, and $A B E$ an oblique circle inciined to the primitive. Through P , the pole of ABE , draw the line $A \mathrm{P} p$ meeting the circumference in $p$ : then the arch $\mathrm{E} p$ is the meafure of the angle BAD, and the arch $\mathrm{AF}_{p}$ is the meafure of its rupplement BAF : alfo $p F$ is the meafure of the argle BAC , and $p \mathrm{ED}$ that of its fupplement.

PROJECTION

Sterengrarhic Projection of the Sphere.

Plate
cccex.
3. If the angular point is neither at the centre nor circumference of the primitive. Let A (fig. 20.) be the angular point, and DAH, or GAF the angle to be meafured, $P$ the pole of the oblique circle DAF, and $p$ the pole of GAH: then from A, through the points $P \rho$, draw the fraight lines APM, ApN, and the arch MN will be the meafure of the angle DAH; and the fupplement of MN will be the meafure of the angle HAF or DAG.

## Proposition XVII. Problem IX.

To draw a great circle perpendicular to a projected great circle, and through a point given in it.
Find the pole of the given circle, then a great circle defcribed through that pole and the given point will be perpendicular to the given circle. Hence if the given circle be the primitive, then a diameter drawn through the given point will be the required perpendicular. If the given circle is a right one, draw a diameter at right angles to it ; then through the extremities of this diameter and the given point defcribe an oblique circle, and it will be perpendicular to that given. If the given circle is inclined to the primitive, let it be reprefented by BAD (fig. 2I.), whofe pole is P , and let A be the point through which the perpendicular is to be drawn : then, by Prob. I. defcribe a great circle through the points $P$ and $A$, and it will be perpendicular to the oblique circle BAD.

## Proposition XVIII. Problem X.

Through a point in a projected great circle, to defcribe another great circle to make a given angle with the former, provided the meafure of the given angle is not lefs than the diftance between the given point and circle.
Let the given circle be the primitive, and let A (fig. 19.) be the angular point. Draw the diameters AE, DF perpendicular to each other; and make the angle CAG equal to that given, or make CG equal to the tangent of the given angle; then from the centre G, with the diftance GC, defcribe the oblique circle ABE , and it will make with the primitive an angle equal to that given.

If the given circle be a right one, let it be APB (fig. 22.) and let $P$ be the given point. Draw the diameter GH perpendicular to $A B$; join GP, and produce it to $a ;$ mite $\mathrm{H} b$ equal to twice $\mathrm{A} a$; and $\mathrm{G} b$ being joined interfects AB in C . Draw CD perpendicular to AB , and equal to the cotangent of the given angle to the radius PC ; or make the angle CPD equal to the complement of that given : then from the centre D, with the radius DP, defcribe the great circle FPE, and the angle APF, or BPE, will be equal to that given.

If APB (fig. 23.) is an oblique circle. From the angular point $P$, draw the lines $P G, P C$ through the centres of the primitive and given oblique circle. Through C , the centre of APB , draw GCD at right angles to PG; make the angle GPD equal to that given ; and from the centre D , with the radius DP , def ribe the oblique circle FPE, and the angle APF, or BPE, will be equal to that propofed.

Proposition XIX. Problem XI.
Any great circle cutting the primitive bcing given, to

OF THE SPIIERE.
defcribe another great circle which thall cut the gi-Stere ven one in a propofed angle, and have a given arch phic intercepted between the primitive and given circles.
If the given circle be a right one, let it be reprefonted by APC (fig. 24.) ; and at right angles thereto draw the diameter BPM; make the angle BPF equal to the complement of the given angle, and PF equal to the tangent of the given arch; and from the centre of the primitive with the fecant of the fame arch defcribe the arch $\mathrm{G} g$. Through F draw FG parallel to AC, meeting $G g$ in $G$; then from the centre $G$, with the tangent $P F$, defcribe an arch $n o$, cutting $A P C$ in $I$, and jnin GI. Through G, and the centre P, draw the diameter HK ; draw PL perpendicular to HK , and IL perpendicular to GI, meeting PL in L. ; then L will be the centre of the circle HIK, which is that required.
But if the given great circle be inclined to the primitive, let it be ADB (fig. 25.), and E its centre: make the angle BDF equal to the complement of that given, and DF equal to the tangent of the given arch, as before. From P, the centre of the primitive, with the fecant of the fame arch, defribe the arch $\mathrm{G} g$, and from E , the centre of the oblique circle, with the extent EF, defcribe an arch interfeeting Gg in G. Nowr G being determined, the remaining part of the operation is performed as before.

When the given arch exceeds $90^{\circ}$, the tangent and fecant of its fupplement are to be applied on the line DF the contrary way, or towards the right ; the former conitraction being reckoned to the left.

## Proposition XX. Problem XII.

Any great circle in the plane of projection being given to defcribe another great circle, which fhall make given angles with the primitive and given circles.
Let ADC (fig. 26) be the given circle, and $Q$ its pole. About $P$, the pole of the primitive, defrribe an arch $m n$, at the diftance of as many degrees as are in the angle which the required circle is to make with the primitive. About $Q$ the pole of the circle $A D C$, and at a diftance equal to the meafure of the angle which the required circle is to make with the given circle ADC, defribe an arch o $n$, cutting $m n$ in $n$. Then about $n$ as a pole, defrribe the great circle EDF, cutting the primitive and given circle in $E$ and $D$, and it will be the great circle required.

## Scholium.

It will hence be an eafy matter to conftruct all the various fherical triangles. The reader is, however, referred to the article Spherical Trigonometat, for the method of confructing them agreeable to this projcction; and alio for the application to the refolution of problems of the frhere. For the method of projesting the fphere upon the plane of the meridian, and of the hasizon, according to the ftereographic projection, fue the article Geography.

> S E C T I O N II.

Of the Orthographic Projction of the Splete.
The orthographic projestion of the Cphere, is that in which the eye is placed in the axis of the phane of pro-
jection, at an infinite diftance with refpea to the dia. meter of the fphere; fo that at the fphere all the vifual rays are affiumed parallel, and therefore perpendicular to the plane of projection.

Hence the orthographic projection of any point is where a perpendicular from that point meets the plane of projection: and the orthographic reprefentation of any object is the figure formed by perpendiculars drawn from every point of the object to the plane of projection.

This method of projection is ufed in the geometrical delineation of eclipfes, occultations, and tranfits. It is alfo particularly ufeful in varicus other projections, fuch as the analemma. See Geography, \&c.

## Proposition I. Theorem I.

Every Atraight line is projected into a Atraight line. If the given line be parallel to the plane of projection, it is projected into an equal ftraight line; but if it is inclined to the primitive, then the given fraight line will be to its projection in the ratio of the radius to the cofine of inclination.
Let $A B$ (fig. 27.) be the plane of projection, and let $C D$ be a fraight line parallel thereto: from the extremities $\mathrm{C}, \mathrm{D}$ of the fraight line CD , draw the lines $\mathrm{CE}, \mathrm{DF}$ perpendicular to AB ; then by 3. of XI. of Eucl. the interfection EF, of the plane CEFD, with the plane of projection, is a fraight line: and becaufe the ftraight lines $\mathrm{CD}, \mathrm{EF}$ are parallel, and alfo CE, DF; therefore, by 34 . of I. of Eucl. the oppofite fides are equal ; hence the flraight line CD, and its projection EF, are equal. Again, let GH be the propofed ftraight line, inclined to the primitive; then the lines $\mathrm{GE}, \mathrm{HF}$ being drawn perpendicular to AB , the intercepted portion EF will be the projection of GH . Through G draw GI parallel to A13, and the angle IGH will be equal to the inclination of the given line to the plane of projection. Now GH being the radius, GI, or its equal EF , will be the cofine of IGH ; hence the given line GH is to its projection EF as radius to the cofine of inclination.

## Corollaries.

r. A frraight line perpendicular to the plane of projection is projected into a point.
2. Every ftraight line in a plane parallel to the primitive is projected into an equal and parallel fraight line.
3. A plane angle parallel to the primitive is projected into an equal angle.
4. Any plane rectilineal figure parallel to the primitive is projected into an equal and fimilar figure.
5. The area of any rectilineal figure is to the area of its projection as radius to the cofine of its inclination.

## Proposition II. Theorem II.

Every great circle, perpendicular to the primitive, is projected into a diameter of the primitive; and every arch of it, reckoned from the pole of the primitive, is projected into its fine.
Let BFD (fig. 28.) be the primitive, and ABCD a great circle perpendicular to it, paffing through its poles $A, C$; then the diameter BED, which is their
line of common fuation, will be the projertion of the Or:thogracircle $A B C D$. For if from any point, as $G$, in the phic Procircle ABC, a perpendicular GHI fall upon BD), it will jection of alfo be perpendicular to the plane of the primitive: : $\underbrace{-}$ therefore H is the projectinn of G . Hence the wholc circle is projected into BD, and any arch $\Lambda \mathrm{G}$ into EH equal to GI its fine.

## Cordlaries.

1. Every arch of a great circle, reckoned from its interfection with the primitive, is projected into its verfed fine.
2. Every lefs circle perpendicular to the primitive is projected into its line of common fection with the primitive, which is alio its own diameter ; and every arch of the femicircle above the primitive, reckoned from thic middle point, is projected into its fine.
3. Every diameter of the primitive is the projection of a great circle ; and every chord the projection of a lefs circle.
4. A fplerical angle at the pole of the primitive is projected into an equal angle.

## Proposition III. Theorem III.

A circle parallel to the primitive is projected into a circle equal to itfelf, and concentric with the primitive.
Let the lefs circle FIG (fig. 29.) be parallel to the plane of the primitive BND. The fraight line HE, which joins their centres, is perpendicular to the primitive ; therefore E is the projection of H . Let any radii HI and IN perpendicular to the primitive be drawn. Then IN, HE being parallel, are in the fame plane; therefore IH, NE, the lines of common fection of the plane IE, with two parallel planes, are parallel ; and the figure IHEN is a parallelogram. Hence NE $=$ IH , and confequently FIG is projested into an equal circle KNL, whofe centre is E.

## Corollary.

The radius of the projection is the cofine of the diftance of the parallel circle from the primitive, or the fine of its diflance from the pole of the primitive.

## Proposition IV. Theorem IV.

An inclined circle is projected into an ellipfe, whofe tranfverfe axis is the diameter of the circle.
r. Let ELF (fig. 30.) be a great circle inclined tathe primitive EBF, and EF their line of common fection. From the centre C, and any other point K, in EF, let the perpendiculars CB, -KI be drawn in the plane of the primitive, and CL, KN , in the plane of the great circle, meeting the circumference in $\mathrm{L}, \mathrm{N}$. Let LG, ND be perpendicular to CB, KI; then $G$, D are the projections of L, N. And becaufe the triangles $\mathrm{LCG}, \mathrm{NKD}$ are equiangular, $\mathrm{CL}^{2}: \mathrm{CG}^{2}:: \mathrm{NK}^{2}$ : $\mathrm{DK}^{2}$; or $\mathrm{EC}^{2}: \mathrm{CG}^{2}:: \mathrm{EKF}: \mathrm{DK}^{2}$ : therefore the points G, D are in the curve of an ellipfe, of which EF is the tranfverfe axis, and CG the femiconjugate axis.

## Corollarifs.

I. In a projected great circle, the femiconjugate axis is the coline of the inclination of the great circle to the primitive.

2. Per.

Orthograflic Projection of jection Sphere
2. Perpendiculars to the tranfverfe axis intercept correfponding arches of the projection and the primitive.
3. The eccentricity of the projection is the fine of

Cafe 2. Let AQB (fig. 31.) be a lefs circle, in-
cocexit. clined to the primitive, and let the great circle LBM, perpendicular to both, interfeet them in the lines AB, LM. From the centre O and any other point N in the diameter AB , let the perpendiculars TOP, NQ , be drawn in the plane of the lefs circle, to meet its circumterence in $\mathrm{I}, \mathrm{P}, \mathrm{Q}$. Alfo, from the points $\mathrm{A}, \mathrm{N}, \mathrm{O}, \mathrm{B}$, let $\mathrm{AG}, \mathrm{NI}, \mathrm{OC}, \mathrm{BH}$, be drawn perpendicular to LA ; :ind from $\mathrm{P}, \mathrm{Q}, \mathrm{T}$, draw $\mathrm{PE}, \mathrm{QD}, \mathrm{T}$ perpendicular to the primitive; then $\mathrm{G}, \mathrm{I}, \mathrm{C}, \mathrm{H}, \mathrm{E}, \mathrm{D}, \mathrm{F}$, are the projections of thefe points. Becauic OP is perpendicular to L.BM, and OC, PE, being perpendicular to the primitive, are in the fame plane, the plane COPE is perpendicular to LBM. But the primitive is perpendicular to LBM; therefore the common fection EC is perpendicular to LBM, and to LM. Hence CP is a parallelogram, and $\mathrm{EC}=\mathrm{OP}$. In like manner, $\mathrm{FC}, \mathrm{DI}$, are proved perpendicular to LM, and equal in OT', NO. Thus, I.CF is a ftraight line, and cqual to the diameter PT. Let QR, Dlk be parallel to AB, LM ; then $\mathrm{RO}=\mathrm{NQ}=\mathrm{DI}=\mathrm{KC}$, and $\mathrm{PR} \times \mathrm{RT}=\mathrm{EK} \times$ KF. But AO: CG::NO:CI; therefore $\mathrm{AO}^{2}$ : $\mathrm{CG}^{2}$ : : $\mathrm{QR}^{2}$ : $\mathrm{DK}^{2}$ and $\mathrm{EC}^{2}$ : CG. : EKF: $\mathrm{DK}^{2}$ 。

## Corollaries.

1. The tranfverfe axis is to the conjugate as radius to the cofine of the circle's inclination to the primitive.
2. Half the tranfverfe axis is the colme of half the fum of the greatett and leaft diftances of the lefs circle from the primitive.
3. The extremities of the conjugate axis ate in the line of meafures, diftant from the centre of the primitive by the cofines of the greateft and leaft diftances of the lefs circle from the primitive.
4. If from the extremities of the conjugate axis of any elliptical projestion perpendiculars be drawn (in the fame direction if the circle do not interfect the primitive, but if otherwife in oppofite directions), they will interfeetern arch of the primitive, whofe chord is equal to the diameter of the circle.

## Proposition V. Theorem V.

The projected poles of an inclined circle are in its line of meafures diftant from the centre of the primitive the finc of the inclination of the circle to the primitive.
Let ABCD (fig. 32.) be a great circle, perpendicular both to the primitive and the inclined circle, and interfecting them in the di.meters AC, MN. Then ABCD paffes through the poles of the inclined circle ; let thefe be $\mathrm{P}, \mathrm{Q}$; and let $\mathrm{P} p, \mathrm{C} f$, be perpendicular to $\mathrm{AC} ; p, q$ arc the projected poles; and it is evident that $p \mathrm{O}=$ fine of BP , or MA , the inclination.

## Corolqaries.

1. The centre of the primitive, the centre of the projcestion, the projected poles, and the extremities of the conjugate axis, are all in one and the fame ftraight line.
2. The ditance of the centre of projection from the
centre of the primitive, is to the cofine of the diftance Ort. of the circle from its own pole, as the fine of the circle's phic inclination to the primitive is to the radius.

## Propos!tion VI. Problem I.

To defrribe the projection of a circle perpendicular to the primitive, and whofe diffance from its pole is eq̧ual to a given quantits.
Let PA $p$ B (fig. 33.) be the primitive circle, and $P, p$ the poles of the right circle to be projected. Then if the circle to be projected is a great cincle, draw the diameter AB at right angles to the axis $\mathrm{P} p$, and it will be that required. But if the required projection is that of a lefs circle, make PE, PF each eqqual to the chord of the diftance of the lefs circle from its pole ; join EF, and it will be the projection of the lefs circle required.

## Proposition Vil. Problem II.

Through a given point in the plane of the primitive to defcribe the projection of a great circle, having a given inclination to the primitive.

1. When the given inclination is equal to a right angle, a ftraight line drawn through the centre of the primitive and the given point will be the projection required.
2. When the given inclination is lefs than a right angle, and the given point in the circumference of the primitive. Let R (fig. 34.) be a point given in the circumference of the primitive, through which it is required to draw the projection of a great circle, inclined to the primitive in an angle meafured by the arch QP of the primitive.

Through the given point R draw the diameter RCS , and draw GCg at right angles to it. Make the arch GV of the primitive equal to $Q P$, and draw VA at right angles to GC ; and in $\mathrm{G} g$, towards the oppofite parts of C , take CB equal to AC ; then, with the greater axis RS, and lefs axis $A B$, defcribe an ellipfe, and it will be the projection of the oblique circle required.
3. When the difture of the given point from the primitive is equal to the cofine of the given inclination.

Every thing remaining as in the preceding cafe; let A be the given point, and AC the cofine of an arch GV, equal to the given arch QP ; then drawing the diameter RCS at right angles to ACB, the ellipic defctibed with the given axis RS, AB will be the projection of the inclined circle.
4. When the diftance of the given point from the centre of the primitive is lefs than the femidiameter of the primitive, but greater than the cofine of the given inclination.

Let 1 be the given point, through which draw the diameter $1 \mathrm{C} i$; and at the point D draw DL perpendicular to DC meeting the primitive in L ; allio dra:w IK, making with LD the angle DLK equal to the complement of the given inclination. Let LK met Wall $D C$ in K ; then will DI be lefs than DC. On DC as the : a diameter defrribe a circle, and make DH equal to P . 15 DK; through $H$ draw a diameter of the primitive RCS, and defcribe an ellipfe through the points R, D, S , and it will be the projection of the inclined circe.c.

Threugh two given points in the plane of the phimitive to defcribe the projcesi no of a great circle.

1. If the two given foints and the centre of the primitive be in the fame flraight line, then a didmeter If the mimitive being drawn the ugh thefe points will Le the projection of the grat circle required.
2. When the two given points are not it the fume Araight line with the centre of the primitive; and (ne of them i: in the circumference of the primitive.

Let 1), R, (fin. 3t) be the two given points, of which R is mathe circum?erence of the primitive. Draw the diameter l:CS, and GCg, FDH perpendicular to it , mesting the primitive in Gg F . Divide $\mathrm{GC}, \xi_{\mathrm{C}} \mathrm{C}$, in $\mathrm{A}, \mathrm{B}$, in the fame proportion as FH is divided in D ; and deferibe the elliple whofe axes are RS, AB, and centse C ; and it will be the projection required.

When the given points are within the primitive, and not in the fame fraight line with its centre.

Let D, E (fye 35.) be the two given points; tirough C the ceinte of the primitive draw the flataght lines ID $i$, $\mathrm{KE} i$; draw DL perpendicular to $\mathrm{J} i$, and EO perpand cular to $\mathrm{K} k$, meeting the rrimitive ial $L$, O. Through E , and toward; the fame parts of C ', draw EP paralicl to DC, and in magnitude a fourth prnportional to LI), DC, OE. Draw the dianeter CP mesting the primitive in $R, S$, and defribe an cllipfe thr ught the points D and R or S , and it will alf, pafs through E., This ellip.e will be the projection of tie propoled inclined circle.

## Prorosition 1X. Problem IV.

To defribe the projection of a lefs circle paralitel to the primitive, i.s dittance from the pole of the primitive being given.
From the pole of the primitive, with the fine of the given dilance of the circle from its pole, defribe a circle, and it will be the projection of the given lefs circle.

## Proposition X. Problem V.

About a given point as a projected pole to defcribe the projestion of an inclined circle, whofe diftance from its pole is given.
Let P (fig. $3^{6}$.) be the given proj : Atet pole, through wheh draw the diamater $\mathrm{G} g$, and draw the diameter It i prependicular thereto. From P draw IL perjendicular to GP meeting the circumference in $\mathbf{L}$; through which draw the diameter L/. Make LIT, S. K each equal to the chord of the diftance of the lefs arcle from it; pole, and join TK, which interfects $L /$, in ( . From the points 'T, ( ) K draw the lines FA, (1,S, Kil?, perpendicular to GE; and make OR, OS, cich equal to CT, or CK. Then an ellipfe defcribed firmigh the prints $A, 5, B$, , will be the projeation of the propofid lefs circle.

## Propostion XI. Problem VI.

To find the poles of a given projefted circie.

1. If the projected circle be parallel to the primitive, the centre of the primitive will be it pole.

Vol. SiV.

## Of the Spllere.

 the projo?ted circle, will be the ruies or that circle
3. When the projecied circle is in lined io the prinitive.

Let ARLS (fig. 36, ar.) be the elf [t.eal rr.j.gion of any cbliquc circle; thongh the centre of whit, and C the conere of the primitye, baw the he of ne cafures CBA, mecting the ciliyto in $B, A$; and the 1 th mitive in G, g. lraw CII, DK, AT peppr. li.1.'s to $G$ r, meetig the frimitice in IJ, K, T. Bifut the arch K'1 in 1 , and draw $1 . \mathrm{P}$ perpendicular to $\mathrm{G} g$; then I' will be the projesied poic of the circle, of which ARDS is the prijution.

## Proposition Mit. Jpoblem Vil.

To meafure any prtion of a yrejected circl., and converfe's.

1. When the giren projecticn is that of a gratec:cle.

Let ADED (fig. $3^{3}$.) be the geven froat circ'e, either perpencicular or iaclined to the primitive, of Which the portion DE is to be retifured, and let lim be the line of meafures of the given ci:cle. Theorgh the points 1 , E diaw the lines EG, DF parallif to Mm ; and the arch FG of the frimitive will ic the meafure of the arch DE of the great circle, and convorfely.
2. Whea the projestion is that of a lefs circie parat. lel to the primitise.

Let DE (fig. 39.) We the portion to be mafured, of the lefs circle DEH para'lel to the primitive. Trom the centre C draw the lines CD, CE , and produce them to meet the primitive in the points $\mathrm{B}, \mathrm{F}$. Then t: e intercepted pertion BF of the primitive wi.l $b=$ the meafure of the given arch DE of the lefs circle DEF.
3. If the given lefs circle, of which an arch is to be meafured, is perpendicular io the prinitive.
Let ADEB (fig. 4o.) be the lets circle, of winch the meafure of the arch DE is required. Through $C$, the centre of the prinitive, daw the line of mentios $M m$, and from the inter fection $O$ of the given ristit circle, and the line of meafures, with the ratius O.A, or OB , defribe the femicircle AFGB ; through the points D, E craw the lines DF, EG prallicl to the line of meafures, and the arch FG will be the mea ure of 1)1, to the radius AO. In order to find a fimilar ar. in i:s the circumfererce of the primitive, join OF, OG, :an at the certre C of the primitive, mime the angion CEl equal to FOG, and the arcla $m$ Il to the ridil:s (' $m$ will te the meafure of the arch DE.
4. When the given projection is of a lefs circ'e inclined to the primitive.

Let RDS (fig. 4i.) be the projeqtion of a lefs circt: inclined to the frimitive, and DE a portion of that circle to be meafured. Thraugh $O$ the cenire of the projefed circle, and $C$ the catre of the primitive, d:aw the line of meafures Mm ; and from the centre O , with the radius OR, o: OS, deferib= the femisele RGlis: through the roints D, E diaw the lines DF, EC: paralich to the line of menfues, and lac will be the meafure of the arch DE to the radius ()R, o: (Ot. Join OF, $O G$, and make th.c angle mCHA cyival ha \& 1) Iice

Gnomonic Jrajectun of the
sphcre.

FOG, and the axh $m$ II of the primitive will be the meafurc of the arch $D E$ of tle inclimed circle RDS.

The converfe of this prepoftion, namely, to cut of an arch from a gival projected circle equal to a given arch of the primuive, is obvious.

The above operation would be greatly hortened by uling the line of fines in the fector.

It fexms unneceffary to infift farther on this projection, cfocially as the reader will fee the application of it to the projection of the fphere on the planes of the Miridiun, Equatcr, and Horizan in the ar.icle Geography ; and to the delineation of Echifis in the article Astronomy. The Andmma, Plate CCXII. in the article GcograPHY, is alfo according to this projection; and the method of applyitg it to the folution of aftronomical probicms is lhere exemplified.

## S ECTION Ill.

## Of the Ginomonic Prcjution of the Sphere.

Is this projection the eye is in the centre of the fphere, and the plane of projection touches the fphere in a given point parallel to a given circle. It is named gnomonic, on account of its being the foundistion of dialling: the plane of projection may alfo reprefent the plane of a clial, whofe centre being the pioj:Sted pole, the femiaxis of the fphere will be the ltile or gromon of the dial.

As the projection of great circles are reprefented by ftraight lines, and lefs circles parallel to the plane of projection are projected into concentric eircles; therefore many problems of the fphere are very eafily refolved. Other problems, howerer, become more intricate un account of fome of the circles being projested into ellipfes, parabolas, and hyperbolas.

## Proposition I. Theorem I.

Every great circle is projected into a flraight line perpendicular to the line of meafures; and whofe diftance from the cemire is equal to the cotangent of its inclination, or to the tangent of its nearef ditance from the pole of the projection.

Let BAD (Gg. 42.) be the given circle, and let the circle CBED be perpendicular to BAD , and to the plane of projection; whofe interfection CF with this lat plane will be the line of meafures. Now fince the circle CBED is perpendicular both to the given circle BAD and to the plane of projestion, the ecmmon fect on of the two laft planes produced will theyefore be perpendicular to the plane of the circle CBED produced, and confequently to the line of meafures: hence the given circle will be projected into that fection; that is, into a Araight line palling through $d$, perpendicular to $\mathrm{C} d$. Now $\mathrm{C} d$ is the cotangent of the angle $\mathrm{C} d \mathrm{~A}$, the inclination of the given circle, or the tangent of the arch $C D$ to the radius $A C$.

## Corollaries.

1. A great cirele perpendicular to the plane of projestion is projected into a flraight lire paffing through the centre of projection; and any arch is prijected into its eorrefpondent tangent.
2. Any point, as $D$, or the pole of any circle, is
mrjeated into a point $\sigma_{0}$, whof diflame from the pole Grum of projection is equal to the tangent of that dillance. Frijes
3. If two great circles be perpendicular to each of the cther, and one of thern paffes through the role of pro- Sphere jeation, they will be projected into two fraiglt lines perpendicular to azch other.
4. Hence if a great circle be porpendicular to fever 1 other great circles, and its reprefentation pafs through the centre of projection; then all thefe circles will be reprefented by lines parallel to one another, and perpendicular to the line of meafurcs, for reprefentation of that firft circle.

## Proposition If. Theorem Il.

If two great cireles interfect in the pole of pr jestion. their reprefentations will make an angle at the centre of the plane of projection, equal to the angle made by thete circles on the fypere.
For fi:ce both thefe circles are perpendicular to the plane of projection, the angle made ty their interections with this plane is the fame as the angle made by thefe cincles.

## Proposition III. Theorem Iif.

Any lefs circle parallel to the plane of projestion is projected into a circle whofe centre is the pole of projectir 11 , and its radius is equal to the tangent of the diflance of the circle from the pole of projection.
Let the cirele PI (fig. 42 ) be parallel to the plane GF, then the equal arches PC, CI are projected into the equal tangents $\mathrm{GC}, \mathrm{CH}$; and therefure C , the point of crntact and pole of the circle PI and of the projection, is the centre of the reprefentation $G, H$.

## Corollary.

If a eircle be parallel to the plane of projection, and 45 degrees from the pole, it is projected into a cirele equal to a great circle of the fyhere: and therefore may be conlidered as the primitive circle, and its radius the radius of projection.

Proposition IV. Theorem IV.
A lefs ci:cle not parallel to the plane of projection is projected into a ennic fection, whofe tranfierfe axis is in the line of meafures; and the diftance of its neareft vertex from the centre of the plane of projection is equal to the tangent of its neareft diftance from the pole of projection; and the diflance of the other vertex is equal to the tangent of the greatelf diftance.
Any lefs circle is the bafe of a conc whofe vertex is at A (fig. 43.) ; and this cone being produced, its interfection with the plane of projection will be a conic fection. Thus the cone DAF, having the circle DF for its bafe, being produced, will be cut by the plane of projection in an ellipfe whofe tranfverfe diameter is $d f$; and $\mathrm{C} d$ is the tangent of the angle CAD , and Cf the tangent of CAF. In like manner, the cone AFE, having the fide AE parallel to the line of meafures $d f$, being cut by the plane of projection, the fceting will be a rarabola, of which $f$ is the neareft ver-

Inonic tex, ard the point into which $E$ is projected is at an Esection infinte difance. Alfo the cone $A F G$, whofe bufe is fie
fre. the circle FG, being cut by the plane of projection, the fex̂ion will be a hyperbola; of which $f$ is the nearvelt vertex; and GA being produced gives $d$ the other vertex.

## Corollaries.

1. A lefs circle will be projected into an ellipfe, a parabola, or higperbola, according as the diltunce of its moft remote point is iefs, equal to, or greater tham, yo degrees.
2. If H be the centre, and $\mathrm{K}, k, l$ the fsens of the cilines, hyperbola, or parabula; then $\mathrm{HK}=\frac{\mathrm{A} d-\mathrm{A} f}{2}$ for the ellipfe ; $I I k=\frac{A d+A f}{2}$ for the hyperbol. ; and $f n$ being drawn perpendicular to $A E f l=$ $n E+F f$ for the parabola.

## Proposition V. Theorem V.

Plite Lct the plane 'IW (fg. 44.) be perpendicular to the cecrsir, plane of projection $T V$, and BCD a great circle of the phere in the plane TW. Let the great circle BED be projected into the ftraight line bek. Draw CQS perpendicular to $b \%$, and $C$ marallel to it and equal to $C A$, and make $Q S$ equal to $Q \mathrm{~m}$; then any angle QSt is the meature of the arch $\mathrm{C} t$ of the projucted circle.
Juin $A Q$; then bscaure $C m$ is equal to $C A$, the angle QC $m$ equal to QCA, each being a right anyle, and the tide CC common to both triangles; theretore $Q m$, or its equal QS, is equal CA. Again, fince the plane $A C O$ is perpendicular to the plane TV, and $b Q$ to the interfection $C Q$; therefore $b Q$ is perpendicular both to $A Q$ and $Q S$ : hence, fince $\bar{A} Q$ and $Q S$ are equal, all the angles at $S$ cut the line $b O$ in the fame points as the equal angles at $A$. But by the angles at A the circie BED is projected into the line $b \mathrm{Q}$. Therefore the angles at $S$ are the meafures of the parts of the projected circle $b \mathrm{Q}$; and S is the dividing centre thereof.

## Corolearies.

1. Any great circle $l \mathrm{Q}$ t is projected into a liae of tangents to the radius $S Q$.
2. If the circle $b \mathrm{C}$ filis through the centre of projection, then the projecting point $A$ is the dividing centre thercof, and $\mathrm{C} b$ is the tangent of its corte. pondent arch $C B$ to $C A$ the radius of projection.

## Proposition VI. Theorem VI.

Let the parallel circle GLH (Eig. 4 t.) be as far from the pole of projection C as the circle FivI is from its pole; and let the diflance of the poles $\mathrm{C}, \mathrm{P}$ be bifected by the radius $A O$; and draw $b A D$ perpendicular to $A O$; then any Araight line $l \mathrm{Q} t$ drawn through $b$ will cut of the arches $: l, \mathrm{~F} n$ equal to each other in the reprefentations of thefe equal circles in the plane of projection.
Let the projections of the lefs circles be defcribed. Ther, benaure ED is perpendicular to AO, the arches
$\mathrm{BO}, \mathrm{DO}$ are c Qulal ; but foren the lifs cisclus are Gemonic equally diftant each from its refpeciive poie, thercfore Projetion the arches $\mathrm{FO}, \mathrm{OH}$ ane equal; and herice the arch 13 P of the is equal to the arch DTH. Fur the fase retfon the $S_{1}$ h.re arches $1 \mathrm{NN}, \mathrm{DI}$. arc equal ; and the ang!2 FBN is equal to the angle I.DII; therefore, on the fonere, t... arches $\mathrm{FN}, \mathrm{HL}$ are equal. And fince the great ci-c.e BNLD is projeted into the fraigist line i (1) $l$, sc. therefore $n$ is the projecticn of $N$, an $1 /$ that of 1 ; hence $f n, l l$, the projections of $E \curvearrowright, H L$, reffacive?. are equal.

## Proposition VIt. Theorsat VII.

If $\mathrm{F} n k, b / g(\mathrm{gg} .45$.) be the proje tions of two equal circles, whereof one is as for from ita pole $P$ as the other from its pole $C$, which is Liee consere of prujection ; and if the ciltance of the projentel poles $C$, $t$, be divided in o, fo thit the derrees in Co, op be equal, and the perpendicular os be creacd to the line of meafures $g h$. Then the line $p n, C l$ drawn from the poles $C$, $\hat{r}$, through any prini $(\mathcal{C}$ in the lere o S, will cut off the arches $\bar{F}$, $b / b$ equal to ach ot?: and to the angle QC $p$.
The great circle AO perpendicular to the plane of the primitive is projefred into the itraight line of perpendicular to $g$ h, by l'rap. i. Cor. 3. Let $C$ be tie projection of $q$; and fince $p Q, C O$ ane firaght line-, they are therefore the reprefentations of the arches $\mathrm{P}_{q}$. $\mathrm{C} q$ of great circles. Now fince $\mathrm{P} q \mathrm{C}$ is a.l ifoferl.s foherical triangle, the angles PCO, CPO are therefor: equal; and hence the arches $P q, C q$ produced will cut off equal arches from the given circles If, GH, whofe reprefentations $F n, f l$ are therefore equal: and fince the angle QC $p$ is the me ifare of the a:ch $b /$ s it is alfo the meafure of its equal $F n$.

## Corollar:

Hence, if from the projected pole of any circle a perpendicular be crefed to the line of meafures, it will cut off a quadrant from the seprefantaion of that circle.

## Prorosition VIIf. Theorem VIll.

Let $F n k$ (fig. 45.) be the projection of any circle FI, and $p$ the projection of its pole P . If $\mathrm{C}_{g}$ be the cotangent of CAP, and $s \mathrm{~B}$ ferpendicular to the line of meafures $g \mathrm{C}$, let CAP be bieeted by $A O$, and the line o $B$ drawn to any point 13 , and aifo $p l$ cutting $\mathrm{F} n k$ in $d$; then the angle $g o B$ is the rueafures of the arch $F d$.
The arch $P G$ is a quadrant, and the angic so $A=$ $g \mathrm{PA}+o A \mathrm{P}=g \mathrm{AC}+0 \mathrm{AP}=g A \mathrm{C}+\mathrm{CA} 0=$ $g$ Ao; therefore $g A=g 0$; confequently $o$ is the dividing centre of $g B$, the reprelentation of $G A$; and hence, by Prop. v. the angle $g \circ B$ is the meafure of $g l$. But fince $p g$ reprefents a quadeant, therefore $p$ is the pole of $g \mathrm{~B}$; and hence the great circle $f d B$ pafing through the pole of the circles $\circ B$ and $F a$ will cut off equal arches in both, that is, $\mathrm{F} d=g \mathrm{~B}=$ angle $g \circ B$.

## Corollary.

The angle $g \circ \mathrm{~B}$ is the meafure of the angle $g \neq \mathrm{B}$. 4 D 2

For
 Pry-dinn fohere, whenein the arch which g D reprefents is equal of the splese. to the angle which the ang!e ${ }_{2}$ repretints ; becaufe $g$ g is a quadrant; therefore $g_{3} 0 B$ is the nualiut of beth.

## Proposition IX. Presle: I.

'To draw a great circle through a given point, ant whefe ditance from pooc if profation is equal to a given quanticy.

Lct C (fig. 48.) be the centre of projection, and Guomen TI a great circle parallel to the propocied lefs circle : Projculic at C make the angles ICN, TCO earh equal to the of the dilkance of the lefs circle from its parallel great circie Sphere. TI : let CI be the radius of projection, and from the Plate cxitemity L draw LMI perpendicular thereto; makz cecessum CV cqual to LM; or CF equal to CMI: then with the vertex $V$ aril affimptotes CN , CO defcribe the hyperberh WVK 1 ; or, with the focus F and CV de- + sce Co feribe the hyperbeli, and it will be the perpendicular sic Seco cirle deferibed.

## Profosimon XIV. Problem VI.

Tu deferibe the prujection of a lefs citcle inclined to the plane of projection.
Draw the line of meafures $d p$ (fig. 40.) and at $C$, the centre of projeation, draw $\mathrm{C} \Lambda$ perpend:cular to $d p$, and equal to the radius of prijection: with the centre A, and radius AC, defcribe the circle DCFG; and draw RAE parallel to $d p$ : then take the greatelt and leat difances of the circle from the pole of projection, and fet them from $C$ to $D$ and $F$ refpectively, for the circle DF; and from A, the prejerting point, draw the Atraight lines $\mathrm{AF} f$, and $\mathrm{AD} d$; then $d f$ will be the tranfverfe axis of the ellipfe: but if D fall beyond the line RE, as at $G$, then from $G$ draw the line GAD $d$, and $d f$ is the tranfycrfe axis of an hyperbola: and if the point D fall in the line RE, as at E, then the line AE will not meet the line of meafures, and the circle will be projected into a parabola whofe vertex is $f:$ bifect $d f$ in H , the centre, and for the ellipfe take half the difference of the lines $\mathrm{A} d, \mathrm{~A} f$, which laid from H will give K the focus: for the hyperbola, half the fum of $\mathrm{A} d$, A $f$ being laid from H , will give $k$ its fucus: then with the tranfverfe axis $d f$, and focus K , or $k$, deferibe the ellipfe $d M f$, or hyperbola $f m$, which will be the p:ojeation of the inclined circle: for the farabola, make EQ equal to $F f$, and draw $f n$ perpindicular to AC , and make $f k$ equal to one half of nQ: then with the vertex $f$, and facus $k$, defcribe the parabola $f m$, for the projection of the given circle FE.

## Proposition XV. Problem Vif.

## To find the pole of a given projected circle.

Let DMF (fig. 50.) lie the given prijected circle, whofe line of meafures is DF, and C the centre of projection; from C draw the radins of projection CA, perpendicular to the line of meafures, and A will be the projecting point: join AD, AF, and bifert the angle DAF by the ftraight line AP; hence $\Gamma$ is the pole. If the given projection be ar hyperbola, the angle $f$ AG (fig. 49.), bifectel, will give its prle in the line of meafures; and in a parabola, the angle $f$ AE bifesed will give its pule.

## Proposiricn XVI. Problem Vili.

To meafure any portion of a projected great circle, or to lay off any number of degrees therecn.
Let EP (fig. 5 I.) be the great circle, and IP a portion thereof to be meafured: draw ICD perpendicular to IP; let C be the centre, and CB the radius of projection, with which defcribe the circle EDD ; make
dennic $I A$ equaito $[B ;$ tleen $A$ is the dividing centre of EP; 1 jestion lience Al' being joined, the angle IAT is the meafure of the arch $1{ }^{2}$.
Or, if $[A P$ be raade equil to any given angle, then $1 P$ is the ecorefpondent arch of the projeation.

## Proposition XVII. Problem IX.

To medfure any arch of a proj cacd lels circle, or to lay off any number of degrees on a given projected Iffs circle.
Let $\mathrm{F} n$ (fig. $5^{2}$.) be the given lefs circle, and P its pole: from the centre of projection C lraw CA perpendicular to the line of neevsures GH, andequal to the radius of Pr jection; join AP, and bifect the angle CAP by the fraight line AO, to which draw AD perperpendicular: deferibe the circle $\mathrm{G} / \mathrm{Fl}$, as far dittant from the pole of projection C as the given circle is from its pole I'; and throngh any given point $n$, in the projecled circle F a, draw $\mathrm{D} a l$, then $\mathrm{H} /$ is the mafure of the arch $\mathrm{F} n$

Or let the meafure be laid from H to $l$, and the line D / joincd will cut off $\mathrm{F}_{\mathrm{n}}$ equal thereto.

## Proposition XVIII. Problem X.

To defribe the gnomonic projection of a fpherical triangle, when three fides are given; and to find the meafures of either of its angles.
Let $A B C$ (fig. 53.) be a fecrical triangle whofe three fides are given: draw the radius CD (fig. 54.) perpendicular to the diameter of the primitive EF; and at the print 1 make the angles CDA, CDG, ADI, equal refpectively to the fides $A C, B C, A D$, of the frherical triangle ABC (fig. 53.), the lines DA, DG int if fecting the diameter EF, produced if neceifary in the points A and G: make DI equal to DG ; then from the centre $C$, with the radius CG, defcribe an arch; and from $A$, with the d:fance AI defcribe another arch, interfecting the fermer in $B$; join $A B, C B$, and $A C B$ will he the projeation of the fipherical triangle (fig. 53.) ; and the reatlineal angle $A C B$ is the meafure of the fpherical angle ACB (fig. 53).

## Prozositicn XIX. Problem XI.

The three angles of a fpherical tiiangle being given, to project it, and to find the meafures of the fides.
Let ABC (fig. 55,) be the fpherical triangle of which the angles are given: cenftruf another fpherical triangle EFG, whofe fides are the fupplements of the given angles rit the triangle $A B C$; and with the fides of this fupplemental triangle defcribe the gnomonic prcjection, \&c. as before.

It may be obferved, that the fupplemental triang!e EFG has alfo a tupplemental part $\mathrm{EF}_{g}$; and when the fides GE, GF, which are fubfituted in place of the angles $A, B$, are obtufe, the'r fupplements $g$ E, $g \mathrm{~F}$ are to be ufed in the gnomonic projecticn of the triargle.

## Proposition XX. Problem Xit.

Given two fides, and the included angle of a fpheriral triangle, to defribe the gnemonic projection of that triangle, and to find the meafures of the other rarts.

Let the fules $\mathrm{AC}, \mathrm{CB}$, and the angle ACB (fiy. Gnomoni: 53.), be given: make the anghs CDA, CI) (fio. Prijection
 53.) ; allo make the angle ACP (fig. 56.) equal in sherio,
 $C G$, ind $A B C$ wi.l $b$ : the rroject on of the fphericil tiangle.
$T$ ofins the meafure of the fide $A B:$ from $C$ drave CI. perpondicular to $A B$, and CMI parallel therete, meeting the circunifurence of the primitive in M: make LN cqual to LAM; join AN, BN, and the and: AN13 will be the mealure of the fide $A$ Ib.
To find the reenfure of cither of the fpherical anglos, as BAC: from D dra:\% DK perpendicular to AD, and make KHI equal to KD : from K draw KI perpendicular to CK, and let AB produced meet KI ia I, and join HI : then the reatilineal angle KHI is the meafure of the fpherical angle BAC. By proceediag in a limilar manner, the meafure of the ctier angle wit be found.

## Proposition XXI. Problem XIIt.

Tho angles and the intermediate fide given, to defribe the gnomonic projection of the tiangle; and to find the meafures of the remaining parts.
Let the angles $\mathrm{CAB}, \mathrm{ACB}$, and the five AC of the fpherical triangle $A B C$ (fig. 53.), be given : make the angle CDA (lig. 56.) cqual to the meafure of the given fide AC (fig. 53.) ; and the angls ACB (fis. 56.) equal to the angle $\triangle C B$ (fig. 53 .); produce $A C$ to H , draw DR porpendicular to AD , and make KII equal to KD; Urav KI perpendicalir to CK, and nake the angle KHI equal to the fpheric: 1 aregla CAB : from I, the interfedion of KI, HI, to A draw IA , and let it interfect CB in B , and ACB will be the gnemonit projection of the frherical triangle ACB (fig. 53). The unknown parts of this triangle may be meatured by latt problem.

## Proposition IXIt. Problem XIV.

Two fides of a fpherical triangle, and an angle oppofite to one of them given, to defcribe the projertion of the triangle; and to find the meafure of the re. maining patts.
Let the fides $A C, C B$, and the angle $B A C$ of the fpherical triangle ABC (fig. 53.) be given: make the angles CDA, CDG (fig. 56.) equal refpectively to the meafures of the given lides $A C, B C$ : draw DK perpendicular to AD , make KH equal to DK , and the angle KHI equal to the given fpherical anglo BAC; draw the perpendiculat KI, mecting HI in I; join AI; and from the centre C , with the diftance CG, defrribe the arch GB, meeting AI in B, join $C B$, and $A B C$ will be the rectilineal frojection of the Splerical triangle ABC (fig. 53.) and the meafires of the unknown parts of the triangle may be found as before.

## Proposition XXIIL. Problem XV.

Given two angles, and a fide oppofite to ore of them, to defcribe the gnomonic projcatinn of the triangle, and to find the meafurcs of the other parts.
Let the angles $A, B$, and the file $D C$ of the tri-
finemonic angle ABC (fis. 55.), be given: let the fupplemental Projesion triangle EFE be dormed, in which the ang'es E, F, G, of the Shhere,

Plate
ccicasia: are the fuppicments of the fides $\mathrm{BC}, \mathrm{CA}, \AA \mathrm{A}$ refpectively: and the fides EF, FG, GE, the fupplements of the angles $C, A, B$ Now, at the contre $C$ (fig. 56.) mate the angles CDA, CDK cqual to the meafures
of the fides GE, GF refpectively, being the furpiements of the angles $B$ and $A$; and let the lines DA, DK intofent the diamoter of the primitive EF , in the points $A$ and $K$ : draw $D G$ perpendicular to $\Lambda D$, make GH equal to DC, and at the point II matie the anctle GHI equal to the angle E, or toits fupplement; and let EI, perpendichiar to CH , neet III in J, and join $A I$ : then fiom the centre $C$, will the ditance $\mathcal{C} G$, defuibe an arch interfecting $A I$ in $B$; join $C D$, and ABC will be the gnomonic projection of the given triangle $A B C$ (fig. 55.): the fupplement of the angle ACB (fig. 56.) is the meafure of the fide $A B$ (fig. 55.) ; the meafures of the other farts are found as bufure.

It has already been obferved, that this method of jrojeclion has, for the moft part, been applied to dialling only. Howewer, from the preceding propofitions, it appears that all the common problens of the $\mathrm{f}_{\mathrm{p}}$ pere may be more eafily refolved by this than by either of the preceding mathods of profetion ; and the facility tith which thefc problems are refolved by this method has given it the preference in dialling. It may not ferkaps he amis, in this place, to give a brief illuftration of it in this particular branch of tience.

In an horizontal dial, the contre of projection $Z$ (fig. 57.) reprefents the zenith of the place for which the dial is to be comfrueted; ZA the perpendicular height of the ftyle: the angle ZPA, cqual to the given l.utitude, determines the diftance ZP of the zenith from the poie; and AP the edge of the ftyle, which by its thadow gives the hour : the angle ZAl', equal alfo to the latitude, gives the difance of the equator $E Q$ from the zonith: let $\mathrm{E} a$ be equal to EA, and $a$ will be the dividing foint of the equator. Hence if the angles E a I, E a IL, \&c. Ea XI, EaX, \&c, be made equal to $I 5^{\circ}, 30^{\circ}$, 太e. the cquator will be divided into hours; and lines driwn from I' to thefe points of divifion will be hour lines.

If the dial is either vertical, or inclined to the hori\%on, then the puint $Z$ will be the 7 enith of that place whofe horizon is parallel to the plane of the dial: ZE
will be the latitude of that place; and the hours on the former dial will now be changed into others, by a quantity equal to the difference of longitude Letween the given place and that for which the dial is to be conftruct. ed. Thus if it is noon when the thadow of the ftyle falls $\in$ n the line $P \mathrm{X}$, then the difference of meridians is the ande E a X, or $30^{\circ}$. Hence, when a dial is to be confructed upon a given plare, either perpendicular or inclined to tlie horizon, the declination and inclina. tion of that plane mult be previonfly found.

In an ereat direat fouth dial, its zenith $Z$ is the futth point of the horizon, $Z P$ is the diftance of this point from the prie, and ZE its difince from the equitor. If the dial is directed to the north, $Z$, reprefents the rocrth point of the liovizon; Pre the difance of $Z$ fiom the fole under the horizon; and ZE the cleration of the equator above the horizon.

If the dial is an erect eaft or welt dial, the zenith $Z$ is the eaft or weft puints of the horizon accordingly, and the pole $P$ is at an infinite diftance, for the angle ZAP is a light angle; and therefore the line AP' will not meet the meridian 1'Z. Tlee line ZA produced is the equator, and is divided into hours by lines perpendicular to it.

If the plane of the dial is parallel to the equator, its zenith $Z$ coincides with one of the poles of the equator $P$; and hence the hour lines of this dial are formed by drawing lines from the point Z, containing angles equal to $15^{\circ}$.

In the preceding method, of projection of the fpheres equal portions of a great circle on the fphere are reprefented by unequal portions in the plane of projection, and this inequality increafes with the difance from the eentre of projestion. Hence, in projections of the eath, thofe places towards the circumference of the projection are very much dittorted. In order to avoid this inconveniency, M. de la Hire * propofed, that the eye flould be placed in the axis produced, at the diRance of the fine of $45^{\circ}$ beyond the pole: In this eafe arches of the fphere and their projections are very nearly proportional to each other. Hence in a map of the ly proportional to each other. Hence in a map of the sce atfo being divided into a line of femitangents, is divided Geograequally, in like manner as the circumference. The map of the world, Plate CCXIV. is conftructed agreeaable to this method of projection.

* IIIt. de 1 Academie $R$, de Scien, 1701. phy.

## P R O

Prejection.
EROJECTION, in perfecitive denotes the apjearance, or reprefentation of an object on the perfpective plane.

The projedion, e gr. of a point, as B (Firg. i. Phate CCCLXXXIII.) is a point $b$, through which the rptic ray BE paffes from the objective point through the $f$ lane to the eye ; or it is the point wherein the plane cuts the optic ray.

And hence it is eafly conceived what is meant by the projedion of a line, a plane or a folid.

Phogection in Alchemy, the catting of a certain imaginary powder, called powder of projection, into a crucible, or other veficl, full of fome preprared metal, or

P R O
other matter; which is to be hercby prefently tranf- Frojection muted into ricld.

Pouder of Progection, or of the philofupher's fone, is a powder fuppored to have the virtue of changingy any quantity of an imperfent metal, as copper or lead in a nocre perfen one, as filver or gold, by the admixture of a litile quantity thereof.

The mark to which alchemifs dircct all their en= deavours, is to find the powder of projeetion; which every ane of them has been within an ace of a hundred timies. See Phlosefhen's Sicne.

I'ROIAPSUS, in furgery, a prolapfiom or falling out of any fatt of the body from its ratural fituation: thus we hay, prolaffiss int fitini, "a prolaplion of the inteltine," Sic. See Surgery.

PROLA'TE, in genmetry, an epithet applied to a foheroid produced by the revolution of a femi-ellip fis ab ut its laryer diameter. See Spheroid.

PROLEGOMENA, in phlolones, certain prep?ratory obfervations or difcourfes prefixed to a bonk, \&c. containing fomething necelfary for the reader to be apprifed of, to enalile tim the better to underfand the book, or to enter deeper into the frience, \& E .

PROLEPSIS, a figure in rhetnric, by which we anticipate or prevent what might be objefted by the adverfary. See Oratory, $11^{\circ} 80$.

PROLEPTIC, an epithet applied to a periodical difeafe which anticipates, or whofe paroxyfm returns fooner and foorer every time; as is frequently the cale in acues.

PROLIFER rlos; (prolis, "an offspring;" and fers, "to bear);" a prolific flower, or a flower which from its own fubfance produces another; a fingular degree of luxusiance, to which full flowers are chiefly incident. Sec Botany, p. 428.

PROLIFIC, fomething that has the qualities necellary for gencrating.

The proilic powers of fome individuals among mankind are ver; extraordinary. -Intances have been found where children, to the number of fix, feven, eight, nine, and fometimes lixteen, have been brought forth after one fregnancy. The wife of Emmannel Gago, a labourer near Valladolid, was delivered, the t th of June 1779, of five giris, th:e two n̂rlt of whom were baptized : the other three were born in an hour after ; two of them were baptized; but the laft, when it came into the world, had every appearance of death. The ce!ebrated Tarfin was bronght to bed in the feventh month of her pregnancy, at Argenten:l near Paris, i 7 th July 1779, of thrce boys, each it inches and a half long, and of a girl 13 inches: they were all four baptifed, but did not live 24 hours.

The public papers for the month of June 1779 made mention of one Maria Ruiz, of the diftriat of Lucena in Andalufia, who was fuccefively delivered of 16 bors, without any girls; and feven of them were fill alive on the igtli of Auguft thereafter. The following, though a recent fact, is almoft incredible: In the jear 1755, a Mufcovite peafint, named Fam's Kyrloff, and his wife, were prefentel to the Emprefs of Ruffia. This peafant had been twies marricid, and was then 70 years of age. His fint wife was brought to bed 21 times; namely, four times of four clildren each time; feven times of three, and ten times of tivo ; making in all 57 children, who were then alive. His fecond wife, who accompanied him, had already been delivered feven times, once of three children, and fix times of twins, which made 15 children for her hate. Thus the Mufcovite patriarch had already had $7^{2}$ children by two marriages. We are aflured that the fultan Muftapha III, had iffue by his concubines 580 male children. What number of female children he had, and whether there were twins of both fexes, we are not informed. Thefe facts fuppofe great fecurdity;
and whinever crelit is given to them, we mat conlider
as entirely fabulnus what is reponted concerning a comnels of 1 Iolldal who was dulivered of 365 chil-
$\qquad$ Prolivity dren, of a very fimall fi: $:$.
PROLIXITY, in dicoure, the f.ult of entering intn too mins:e a det il, or being ton long, precite, and circumftantial, even to a degree of tedioufneis.

PROLOCUTOR of the convocation, the fpeaker or charmon of thatalfomby. Sec Consocation.

PROLOGUE, in dramatic pactry, a difcourfe addreffed to the audience before the dramat or play begins. The original intention was to advertife the audience of the fulf of of the piece, and to prepare them to enter more eafily into the ari n , and fometimes to make an apo'ngy fur the piet.

PROMETHEUS, the fon of Janet:s, fuppoied to h.ive been the firt difcuverer of the art of friking fire by flint and lleel; which grve rife to the fable of his ftealine fire from heaven: A renowned warior $r$; but whofe hifory is involved in fable. He fourifhed about 1687 B. C. The poetical account is, that he formed ia man of clay of fuch exquifite workmanhip, that Pallas, charmed with his ingenaity, offered him whatever in heaven could con:ribuie to finith his defign; and for this purpofe took him up with her to the celeftial manfions, where he fole fome fire from the chatiot of th: fun, which he uied to animate his image. At this theft Jupiter was fo enraged, that he ordered Valcan to chain lim down on Monnt Caucafus, and fent an eaglo or vulture to prey on his liver; which every night was ienewed, in proportion to the quantity caten up an the daytime, uncil at laft he was delivered by liercules, who kill. ed the vulture.

Prometheus, in ancient afternomy, was the name of a conitellation of the nurthern hemifphere, now called Hercules, Enyomafin. See Astronomy, $n^{\circ} 406$.

PROMISE, in ordinary cales, is a declaration of Pronife fome intention to be put in execution; but in morals is defined. a folemn alfereration by which one pledges his veracity that he thatl perform, or caule to be felformed, the thing which he mentions.
As fuch a declaration excites expefations in the minds of thofe to whom it is made; and as to frultrate thefe expectations might roufe indiznation, and be followed by confequences injurious to the perfon, the charafter, or intereft, of $h: m$ who made it-it becomes a How it matter of prudence in the promifer to keep his word. comestobe And farther, as a certain degree of confidence is found binding. neceffaly to the very exifence of civil fociety, and as others may have acted on the faith of his promife, it is now not a matter of prudence only to leep his wordit is a duty which he owes to all who have fpent their time, their money, or their labour, in confequence of thofe expectations which he has warranted them to entertain.

It, then, being confonant to found reafon, necelfary to the exiftence of civil fociety, and in general the iniereft of both the promifer and promife, that the words of the promife fhould be fulfilled, it has become a maxim in morals that a man is obliged to perform his promife.

In many infances, the great dificulty concerning a Intespretapromife is, how to explain it ; for although the grounds tion or a of its obligation be thofe expefations which it has promife railed, a queftion will occur, Is the promifer bound to fometimes anfwar

## 1 R O

Tromife.
anfwer fully all the expectations to whis the different confrudtions of his words may have given bit th? Should I, for inf:unce, clefire a man to run with a letter to fuch a place, and engage to fatisfy him upor his reum; and if on his actum I gave him double of the ufual hive in like cafes; but it he be not fatisfied with lefs than the triple of fuch a fum, am I obliged to grant his demands? This will lead us 10 confider the rules by which a promife fhould be interpreted.
If a promite were alwass to be deemed obligatery in the tenfe in which the promife receives it, it man would not know what he had promifed ; the promifee, from a difference of vicws, affociations, and interefls, might conceive a fenfe of which the promifer lad never dreamed; might fuppofe engagements which were never intended, which could not be forefeen, and, although forefeen, could not te performed. For hefe reaf ins it is matural to think that the fenfe of the fromificr flould rather direft the interpretation. He 1 nows procifely what it is he las undertaken, and is "uqueltionab:'y the bef judge of"what meaning he afthed to lis vords. His explanation fhould thee efore be atmitted, is ioformation alone could give himat ti:le to decide ia the affair.

But fomething macre than mere information, or a 1 nowledge of the cante, is expected from a judge, as integrity is equally eflential to his charafer. Woubts may arie when the words will admit of watous meanings, whether the promifer will be fo candid as imparbially to own the precife neaning which he had actually :mmexed to his cxpreflions: At any rate, if he wifled to dective, he might purpofely ufe an ambiguous phrafeulogy, and perform the promife in a fenfe of his own without fatisfying the realonable hopes of the promifec.

When the daughter of Tarpeius baryained with Tatius to betray the citadel fur what he and his Sabines wore on their left hands, meaning their rings and the:r golden bracclets, Tatius probably performed his promife in the way which he mended, when he caufed lier to be buried under their flields, which they carried alfo on their left hands. Dut who will fiy that here was not ireachery and a difiomouable abufe of that confidence which had been repofed in him?
in dubitral It mult therefore be obvious, that the import of a c.ncs the muctrota$i$ on $u f$ nejther is to lentificed. promife, where its meaning is difued, is not to be determined by the fenfe of the promiler ror by the expectations of the promifec; and if it was fadd that the ebligation of a promife arofe from thufe expectations which had been rafted by it, the affertion now muft be limited to thefe expectations which were intentionally railed by the proniter, or thote which to his knowledge the fromifee was induced to entertain in conferuence of that declaration which bal been made to him. should there dill be a doubt about what expectations were intentionalJy raifed, and what fhould have been reafonably entertaincd , ecourfe mult be had to the judgment of thofe who are allowed to be perfuns of candour, and who are acquainted with the charaders of the men, and with thoie circumfances in which the promife was made.

The following are fome of the ca'es in which a promire is not binding. As the obligation to ferform the promife arifes from thofe expedations which are intentemally raifed by the premifer; it is flain that no prowite can le binding Lefine acceptance, befire the proI. ife has tesn cormunicated to the promife, and be-
fore he lias entertained hopes of its performance. The cafe if fimilar where a pronife is relcafd, that is, where the performance is difienfed with by the promifee, and where he entertains no cxpectations on account of any hhing that the promifer has faid to him. Should a Whes it third perfon cont.itain: hopes on account of the promife, reteafal he is to chacifh there hopes at his own hazand, having tac prono encouragenent from the promiler to col f): jet if wifice. this perfon has been watranted to linpe by the promise, the promife has renouncel his privilege of rcleafing the pronife, and along with the promider becomes buund ior its performance.

A promife is not binding where the performance is where it unlauful; and the performance is unlawful where it is peforaseontrary to former promifes, or to any moral and re- ance is ut ligious precept, which from the beginaing to the end $\frac{1 . w}{}$ wul. of time is of perpetual and unaterable obligation. 'Thus no man is bound l:y his promife to give to me whit he has already pronifed to another; and no man is bound by lis promife to b'afpheme God, to comm't murder, or to criminate the innocent. Such promifes are uniwfu'ly made, and cannot be otherwie than unlawfully peiformed.

Some have even caried thicir fcruples fo far as to doubt, whetler any fromife, unlawfully made, can be where lawfully performed. Should a man, cluring the lifetime douthts of his wife, luppen to promife marriage to annther, fuch have aria man (they fay) by the Chritian religion has already fun. committed adultery in his heat; and thould he afierwards become a widwer, he is not bound, and he even ought rot, to fulal his engagements, as this would be puting his criminal intention into execution. This fpecies of reafoning, we mult confef, is to us unintelligible. - As the wife is dead, what now flonuld prevent the man from manying the objest of his affections? Why, fay the cafuifts, lee already is under a promife in m arry her, and his fromife was male at a time when it fhould net have been made. It is true, the performance, confidered by itfelf, is oppofed by no law human or divine ; but then it originated in what was wrong; and lowever much the Suprenie Beisog and the bulk of the cication may be ont of the fecret, we have difcovered by the ingenions logic of cafuiliry, that evil can nerer fpring out of good, nor good out of evil ; but that the means and the end, the motive and the astion are always of the fame complexion in morils.

When a promife is made, the particular circumf ances Firtoneous in which it is to be deemed nbligatory are fometimes 1 romilio. mentioned. "l promilic (for infance) to lend my fienj 200 pounds within three days, provided al cert in creditor which I nane do not make a demand on me befo:e that time." In other cafes no citcumfance is furefeen by the promifer to prevent the fulfilling of lis eng.agement; and hence we have erronechas promifes, which proceed on the fuppoition that things are true, polfible, and lawful, which are not fio. An crroneous promife, which proceeds on the falfe repre"catation of the promife, is not binding.

A Lonjon wentleman lately purchiled an efure in the fouth of England at a public fale, believing $t^{\prime}$ ee defcription which he faw in the nerfpapers, and whit Jikewife was given by the autionect, to be true; limt finding afterwards that the ellate nowi e corre?pondel to the defcription, the law freed him from his cn rage. ment, becaufe the feller lad cridently been gilty of

## PRO

a breach of promife in not fatisfying thofe expectations which he had intentionally and even ftudiounly excited in the buycrs.
An erronenus promife, whofe performance is impofinding fible, is not binding. Before the conclufion of the late war a planter of 'lonago promifed to fend to his friend in England 12 hoghtheds of fugar from the next year's produce of his eftate ; but before that time Tobagn fell into the hands of the French, and the Wef Indian found it imponible to anfwer the expectations of his friend in England.
An crroneous promife, whofe performance is unlawful, or, to fpeak more precifely, whofe performance is rontrary to a proor promile, or to any moral or religious obligation, is not binding. A father believing the accomits from abroad of his fon's death, foon after bequaathes his fortune to his nephew: but the fon, the report of whofe death had been falfe, returns home, and the father is releafed from the promife to his nephew, becaule it was contrary to a prior promife, which he had tacitly come under to his fon. This prior promife was implied in the whole of the father's condust, and was exprefled in figns as emphatic and as unequivocal as thofe of language. It had all the effeet too of the molt folemn promife on the fon, who, to his father's knowledge, was induced in confequence of this promife to entertain the molt fanguine hopes of fucceeding to his father, if he furvived. The world likewife could bear teftimony that thefe expentations were not rafhly cherifhed. He was brought into exif. tence by means of his father, who was therehy underftood to love him afferionately; he was uftered into fociety as the reprefentative of his family, and was therefore fuppofed to be the heir of its wealth. Religion ittelf fupported his pretenfions, pronouncing the father worfe than an infidel who neglects to thow that attention to his children which the world naturally expeets from a parent. - That the father's promife was:not releafed from the mere circumftance that the miftake was known to his nephew the promifee, will appear plain from the following circumitance. Suppofe the father a linded proprietor, that the leafe of one of his farms has expired, and that he has long been expecting to let it at L. 200; fuppofe that this fum is refufed, and that he agrees with the prefent tenaint to grant a new leafe at L. 150-the obligation here to perform his promife is not diffolved by an after offer of L. 200, though the tenant knew that L. 200 had been expected, and that only from defpaifing of that fum his landlord had granted the new leafe at L. 150 : the promife is binding, becaufe the performance is every way lavtul, contrary to no prior engagement, and oppofed to no principle in morals. The law of the land, were the proprietor reluctant, would enforce the obligation, and exact obedience in the tone of authority; becaufe breaches of faith, were they permitted in fuch cafes, rould deftroy all confidence, and annihilate the bonds of focial union:

Men live and prof rer but in mutual truft; $\Lambda$ confidence of one another's truth. Oroonok.
The great dificuity which many lave to encounter in determining when erroneous promifes ought or ought not to be kept, arifes from their proceeding on a prin. .anence or inconvenience, of good or evil, that might diry ciple of white confequences they do not feem to be al-

Promifc. minded, though the expectations excited by thefe "ra" tional and intelligent beings" may have "altered the nature of his fituation, and engaged him in undertakings from which he would otherwife have abltained." What the promifer takes to be the general utility and the fitnefs of things is to be his guide. And a breach of promife will be attended with the following advantages: "The promifee, and all other men, will be tanght to depend more upon their own exertions, and lefs upon the affitarce of othcis, which caprice may refufe or juftice with-hold. He and all others will be taught to acquire fuch merit, and to engage in fuch purfuits, as thall oblize any honeft man to come to their fuccour if they fhould Atand in need of affitance." This breach of promile, with a view to the general utility, will, fo far from being criminal, form a part of that refolute execution of juftice which would in a thoufind ways increafe the independence, the energies, and the virtue

- Goud-
win's inquiry conc.rning l'o litical Jufice, buk 3. ch. 3 .

16
A private indıvidual has nu right to intrude his fchemes of utility on the public. of mankind ${ }^{\text {T }}$."

Such are the views which determined this author to confider " the validity of promifes" as "inconfiftent with juRice," and as "foreign to general good." From one, however, who relies with ro much confidence on the promifer, it wou'd be cettainly defirable to know, whether the perfon, who violates his faith for the public utility, is alrvays to be candid. Where breach of faith promotes his own interelt, ought he alone to decide on the validity of his promife ? or wherc promifes are broken for the general good, is he to be guided by his own vilionary fchemes of utility? Is he to att as truftee for the public without any delegated power? and fhall the community fubnit to his decifions without fo much as putting the queftion, Who hath made thee a ruler over us? When a writer thus deviates fo far from the path of reafon, it is natural to afk, what was the ignus fatuus that mifled him? In the prefent cafe it is pretty obvious. Being fomething of opinion with * See Note the celebrated Turgot*, that romances are the only b. iii. ch. G. books in which moral principles are treated in an impartial manner, this gentleman, in his Chapter of Promifes, feems to have borrowed a part of his morality from the doggerels of Butler; and having adopted though from different motives, the political prineiples of Sir Hudibras's fquire, that obedience to civil government is not due becaufe it is promifed, he has come to exally the fame conclufion with refpect to the cbligation of keeping one's word. But Ralph has reafoned with more ingenuity; and has thown not only that the public good, but the glory of the Lord, may be fometimes promoted by a breach of faith.

- The
fairts are Codwin's rational and metelin gent be mis.

The faints, * whom oaths and vows oblige, Know little of their privilege;
Farther, I mean, than carrying on
Some felf-advantage of their own:
For if the dev'l, to ferve his turn,
Can tell t uth, why the faints fhould foorn,
When it ferves theirs, to fwe.rand lic, I think therc's little reafon why: Elfe h' has a greater pow'r than they, Which 'twere impiety to fay:
W' are not commanded to forbear,
Indefinitely, at all to fwear ;

But to fwear idly, and in vain,
Without felf-intereft and gain ;
For breaking of an oath and lying
Is but a kind of felf-denying,
A faint-like virtue; and from hence
Some have broke oaths by Providence:
Some, to the glory of the Lord,
Perjur'd themielves and broke their word :-
For faints may do the fame thing by
The fipirit, in fiticerity.
Which other men are tempted to,
And at the devil's inftance do.
Hudibras, Catiz. II.
Here are new views of utility; which, were they to be confidered as of any weight, would increafe the difficulty of determining when an erroneous promife ought to be kept.

But fhould views of utility be laid afide, and fhould it be made an invariable rule that truth is on no account to be violated, that deceit is never to be practifed, and that moral obligations are not to be diffolved for the view profpect of any phyfical advantage; thofe doubts utility which arife concerning the validity of erroneous pro- unfafe mifes will foon difappear. Difagreeable perhaps and guide ridicnlous confequences may fometimes arife to a few moral individuals from an honeft and confcientious adherence to their promife ; but will any affert that the general good, that lurdon of the fong, will ever be endangered by too much veracity?
So numerous inconveniences arife diily from the regular operation of thofe great phyfical laws, which are under the immediate direction of Providence, that thofe philofophers who have adopted the principle of utility, and are much furptifed to fee the univerfe fo aukwardly planned for the eafe and comfort of them and their fpecies, have been under the neceffity of imputing many events in nature to the malignity of fome evil independent being ; or of allowing that things have degenerated fince they fi: if came from the hands of the Creator, and that they mull now be exceedingly altered from what they had been when He cl:ofe to pronounce them all very good. Thus, abfurdity or impiety mut always be the confequence of judging of the vice and virtue of an astion by its utility, and of ellimating its utility by our limited views and erroneous conceptions.

As for extorted promifes, it is curious to obferve how this queftion thould always be flatted, whether or not they ought to he kept? and another queftion fhould feldom be thought of, whether or not they ought to be made? Fortitude was one of the cardinal virtues Extor among the ancients; and is deemed of fuch importance 1 rom in the Chriftian fyficm, that the fearful are clalled with the umbelievers, and are thought unworthy of the favour of Deity, as being incapable of fupporting thofe trials to which heaven expofes the faithful as the truelt teft of Chriftian virtne. -If a perfon fhould want the Whei neceffary fortitude to be vituous, it will be a poor ex- bindi cufe for his bafcnefs, that he has added deceit to his nnt. cowardice : and furely it is not the bufinefs of morality, when it has found him guilty of one erime, to grant him a difpenfation for committing two. The laws of jurifprudence, it will readily be allowed, cannot favour the claims of the promifee; becaufe they ought never
to lend their fupport to opprefion and violence. But their acquital, thould he violate his faith, will by no means vindicate the character of the promiler. Their acquitting a woman from the charge of adultery, goes a fhort way in refloring the fair reputation of her innocence.

Let jurifprudence decide as it will, the man of honour and the generous patriot can never be brought to refpett the perion who, fruck with a panic, conld betray cither himfelf or his friends. The n..grnanimous fipirits who could die for the truth will visw with contempt his pitiiul deceit. Thofe unfortunate men who may fuffer from that very diltruft which the breach of his faith has begotten, will always deteft him as a traitor and enemy; and heaven itfelf cannot be fuppoled to reward that foldier who deferts her catif, and relinquithes the polt which the has alligned him, at the fight of danger.

If we once begin to accommodate morality to the difpofitions and humours of mankind, it is hard to fay where this fpectes of emplaifance will end. The degrees of timidity are fo various, and fome tempers by nature fo yielding, that repeated importunity or an earneft requelt will extort a promife.

A young lady was frequently preffed by her dying huband to grant him a promife that the would not mary after his death. For fome time the was able to refi!t with becoming fpirit his abfurd requett; but upon his declaring of ener than once that he could not otherwife die in peace, the complied and promifed. Too young, however, for this effort of continence, the afterwards liftened to the addreffes of a fecond lover, and found her heart infenfibly engaged before the adverted to the impropricty of a new attachment. But propofals of marriage could farcely fail to remind her of her promife and awaken her fcruples. Thefe the foon communicated to her lover, with her firm refolution to remain a widow, if the contrary meafure, which fhe greatly preferred, and on which her eartlly happinefs depended, were not approved by fome firitual counfellor.

Upon this declaration it was agreed to take the advice of their own minifter, who was an eminent diffenting clergyman in the diocefe of Oxford: but this gentleman, unwilling to decide in a matter of fuch importance, propofed to refer it to Dr Secker, who was then bifhop of that fee. This prelate too declined to give any judgment in the cafe; but, as was his way, muftered up a number of arguments on each fide of the queftion, and committed them to a letter, which a learned gentleman of our acquaintance had fome time ago an opportunity of feeing in manufcript.

If the fentiments to which the bifhop was inclined could have been inferred from his ftatement of arguments, he feemed to think that the promife was binding. In our opinion, he ought to have given a politive decifion. It was no matter whether the premife was extorted or not: the promife was made; and the queltion was now, whether or not was the performance lawful? That it was lawful appears evident. The lady was under a moral obligation to remain a widow; and no moral obligation, fo far as we know, required her to marry.

To be fruitful and multiply, indeed, is declared in Scripture, and is found, to the wofulexperience of many, to be one of the general laws of our nature. But of all thofe laws intended by nature to regulate the conduct of inferior intelligences, the moral, which were meant
to be checks and correctors of thofe abufes to which the phyfical are apt to be carried, are ceitain'y the motl facred and obligatory. 'Toprocreate his fuccies, a man is not then to be guilty of adultery, ner of fornicatem, fuperiar is nor to liften to the lewd callo of incontinency. St l'anl's yly yieal is obfervation, that it is better to mary than bun, can- Jomer of not be allowed in this inftance to have much weight. obligaton. He has not defined what degiee of amorous infinima. tion conilitutes burning, nor in what cafes this burnaing would be a fufficient warrant for marrying. In the prelent inftance he does not even conlider marriage as a duty; he compares it with burning, and thinks it only the lealt of the two evils. Nut that marringe is evil of itfelf; for he that martieth doth weil: but there arecircumftances in which it would be inconvenient to mary, and in which lie that marrieth not is faid to do better. But if thofe inconveniences be reafons fufticient to deter from marrying, is that perfon to be held excufable who, in order to gratify an animal. pafion, fomewhat refined, fhould violate an oath, and trample on a facred moral obligation?

The young lady might indeed declare that her earthly happinels was at an end if fle were not permitted to marry again: but what circumltance prevented her from marrying? It was not the opinion of her own pallor, nor the bithop of Oxford: the truth is, it wa. certain feruples of her own, which being unable of herfelf to overcome, the had pioufly folicited the affiftance of others. It is certainly a misfortune that a devotional and amorous turn fhould always be fo clofely connected in the females. Both, however, cannot always be indulged. Who will fay, that the motive is rational which inclines nne to cherith a paffion which confcience difapproves? The virtue of continency might indeed have borne hard on this lady's conftitution, and in her way to immortal happinefs might have formed a gate fo Atrait and narrow as it might be difficult for her to pafs through : but after all, her cafe was not harder than that of nuns, who take the vows of perpetual chatity, and endure fufferings of a fimilar nature, and in fome infances even perhaps greater than hers; yet doing it cheertully, from the fuppofition that the Omnifcient is well acquainted with the nature of the great facrifice which they make, and that after death he will Audy to sequite them, and beltow on them fomething like :un equivalent, which in their opinion can fearcely be lefs than a happinefs in heaven as ample as their withes and as laling as their fouls.

Every promife, therefore, which is not releafed, nor fraudently obtained by the promifee, is to be held binding if the performance loe lawful and pofible.

The Chriftian cannot, and a man of honour will A pronife farcely venture to reject this maxim, that a good man of a fimitar ought not to change though he fwear to his hurt. Yet naturevith a timple promife and a promilfory oath are not very dif- an oath. ferent in point of obligation. Mof people know, and, where any moral duty is concemed, they ought particularly to reflect, that this world is governcd by an Al. mighty Being, who knows all thinge, who lives always, and who is juft to reward and to punith. The perfon who makes a promifiory oath does it arowedly under an immediate fenfe of thefe truths; the perton who makes a fimple promile, though he certainiy ought, yet may not reflect on thefe at the time. The former, when he violates his oath, exhibits, only to outward
appearance,

Promn- appearanee, a greater contempt of the Disine power, tory knowledge, and juftice, than he who violates a fimple II Pronunciation. promife under an impreffion of the fame truths. To Him who knows the fecrets of the heart, the breach of the promife mult appear as criminal as the breach of
the oath. See Assumpsir and OAth.

PROMONTORY, in geography, a high point of land or rock projecting out into the fea; the extremity of which towards the fea is called a cafe or becelland. See Plate CCXII.

PROMPTER, in the drama, an officcr pofted behind the fcenes, whofe bufinefs it is to watch altentively the ators fpcaking on the ftage, in order to fuggett and put them forward when at a ltand, to correet them when amifs, \&c. in their parts.

Promulgated, or Promulged, fomething publifhed or proclaimed, and generally applied to a law, to denote the publilhing or proclaiming it to the poople.

PRONAOE, in the ancient architefure, a perch to a church, palace, or other fpacious building. Sec the article Porch.

PRONATION, among anatomits. The radius of the arm has two kinds of motions, the one ealled pronution, the other fupination. Pronation is that whereby the palm of the hand is turned downwards; and fupination, the oppofite motion thereto, is that whereby the bacl: of the hand is turned downwards. The peculiar mufcles whereby prenation is performed, are call. ed pronatores, as thofe by which fupination is performed are ternied fiepinatores. See Anatomy, Table of the Mufctes, and Plates.

I'RONG-Hof, in hufbandry, a term ufed to exprefs an inftrument ufed to hoe or break the ground near and among the roots of plants.

The ordinary contrivance of the hoe is very defective, it being only made for fcraping on the furface; but the great ufe of hoeing being to break and open the ground, befide the killing of the weeds, which the ancients, and many among us, have thought the only ufe of the hoe, this dull and blunt inftrument is by no neeans calculated for the purpofes it is to ferve. The pronghe confifts of two hooked points of fix or feven inches long, and when fruck into the ground will Atir and remove it the fame depth as the plough does, and thus anliwer both the ends of cutting up the weeds and opening the land. It is ufful even in the horle-hocing hufbandry, becaufe the hoe-plough can only come within three or four inches of the rows of the corn, turnips, and the like; whereas this inflrument may be ufed afterwards, and with it the land may be raifed and firred even to the very falk of the plant. See Agriculture and Hoe.

PRONOUN, Pronomen, in grammar, a declinable part of fpeech, which being pur inflead of a noun, points out fome perfon or thing. Sec Grammar.

PRONUNCIATION, in grammar, the manner of anticulating or founding the words of a language.

Pronunciation makes the moft difficule part of written grammar ; in regard that a book expreffing itfell to the eyes, in a matter that wholly concerns the eals, feems next akin to that of teaching the blind to dintinguith colours : hence it is that there is no part fo defelive in grammar as that of pronunciation, as the witer has freguently no term whereby to give the read-
er an idea of the found he would exprefs; for want of pronun a proper term, therefore, he fubnitutes a vicious and $\underbrace{\text { tion. }}$ precarious one. To give a jult idea of the pronunciation of a language, it feems neceffary to fix as nearly as polfible all the ieveral founds employed in the pronumciation of that language. Cicero tells us, that the pronunciation underwent feveral changes among the Romans: and indeed it is more precarions in the living languages, being, as Du Bos tells us, fubfervient 10 fafthion in thefe. The French language is clogged with a difficalty in pronunciation from which mot others are free ; and it conlifts in this, that moft of their words have two different pronunciations, the one in common profe, the other in verfe.

As to the pronunsiation of the Englifh language, the ingenious Mr Martin, in his Spelling-Book of Arts and Sciences, lays down the following rules: I. The final (c) lengthens the found of the foregoing vowel; as in can, cane; rob, robe; tun, tune, \&c. 2. The final $(e)$, in words ending in $r e$, is founded before the $r$ like u; as maffacre, mafla-cur; lucre, lu-sur, \&c. 3. The Latin dipthongs $a, a$, are founded like $c$; as NEtna, Eina; aconomy, cconomy, \&c.: but at the end of the words oe, founds like o; as in toe, foe, \&cc. 4. Alfo the Englifh improper diphthongs, eu, eo, eu, ue, found only the $e$ and $u$; as tea or te; feeffee or feffe; due or $d u$; true or tru, \&c. though fometimes eo and ca are promounced like ee, as in prople, fear, near, \&cc. 5. Sometimes the diph:hong (ie) is pronounced like e in cieling, like $e e$ in field, and, at the end of words, always like $y$, as in $l i e$, \&c.; and $e i$ is pronounced either like $e$ or $a i$, as in deceit, reign, \&c. 6. The tripthong eau is pronounced like 0 , in beau and jet d'eau; and ieu founds like " in lien, adieu, \&c. 7. The found of $c$ is hard before the vowels $a, o, u$, as in call, cold, cup, \&ic.; alfo fometimes before $b$, as in clbart, cold, \&xc. ; and befure $l$ and $r$, as in clear, creep, \&c. It is otherwife generally foft, as in city, cell, cydor, child, \&c. 8. In French words ch is founded like $f$, as in clargreen, machine; and fometimes like $q u$, as in choir. 9 . the found of $g$ is hard before $a, o, u, l, r$, as in gail, go, gumb, glean, grope; alio beto:e $u i$, as in guilt, guild, zec.; and before $b$, as in $g h \cdot 3$; fometinus before $i$, as in giblous, gibberif. It is allio gencrally hard before e, as in get, geld, \&cc.; but foft in many words desived from the Greek and Iatin, as in geom try, genealogy, genus, \&c. Two gg are always hard, as in dagg:r, \&ic. The found of $g$, when foft, is like that of $j$. 10 . In any part of a word, ph founds like $f$, as in philefophy, isc. 11. The found of $q u$, at the end of French werds, is like $k$, as in rifque, \&ic. 12. The fyllables $i$ and $c i$, if fullowed by a vowel, found like $\sqrt{2}$ or $\beta i z$; as in fiction, logician, \&c. 13. When cc occurs hefore $i$, the filf is hard and the latter is foft; as in flacid, \&c. 14. The letter $p$ is not pronounced at the beginning of fyllables before $\int$ and $t$; as in ffa'm, ftarmias, \&cc. As to othor pecnliarities regarding the pronunciation of fingle letters, many of them have been taken notice of at the beginning oi each, in the courfe of this work.

But it is not enough to know the juft pronunciation of fingle letters, but alfo of words: in order to which, the accenting of words ought to be well underlood; fince nothing is more harth and difagreeable to the ear, than to hear a perfon fpeak or read with wrong aecents. And indeed in Englifh the fame word is often

## PRO [ 580$]$ PRO

noia- both a noun and a verb, ditinguif.ed only by the acthe lat of the verb; as firmest and fermint; record and
record, \&ec. We are to obferve alfo, that in order to a juft expretion of words, fome require only a fingle ac. cent on the fyllable, as in torment, \&c.; but in others it thould be marlied double, as in anima!, becaufe it is pronounced as if the letter was wrote double, vi\%. arnimal.

Mr Sheridan's Dietionary will be found extremely ufeful as a directory in acquiting the pronmetation of the Englifh langunge ; but cate mutt be taken to avoid his provincial brogue, which has certainly mifled him in feveral inftances, Mr Walker's Proncuncing DiAtionary, lately publifhed, will likewife deferve the fludent's attention. It is a wok of great labour and merit, and is highly ufeful. It has indeed fome faults and inaccuracies, but it is notwithltanding, in all probability, the beft of the kind.

Pronunciation is alfo ufed for the fifth and laft part of the rhetoric, whic! confilts in varying and regu. lating the voice agreeably to the matter and words, to as mont effectually to perfuade and touch the hearers. See Oratory, Part IV.

PROOF, in law and logic, is that degree of evidence which carries conviction to the mind. It differs from demonftration, which is applicable only to thofe truths of which the contrary is inconceivable. It differs likewife from probability, which produces for the molt part nothing more than opinion, while proof produces belief. Sce Probibility.

The proff of crimes was anciently effected among our anceftors divers ways; viz. by duel or combat, fire, water, \&c. Sce Duel and Ordeal.

Procf of Arillery and fmall Arms, is a trial whether they ttind the quantity of powder allotted for that purpofe. The rule of the board of ordnance is, that all guns, under 24 -pounders, be loaded with powder as much as their Got weighs; that is, a brafs 24 -pounder with 2 t lb a brafs 32 -pounder with 26 lb .12 oz and 2. 42 -pounder with 31 lb .8 oz ; the iron 24 -pounder with 18 lb . the 32 -pounder wish 21 lb .8 oz , and the 42 -pounder with 25 lb .

The brafs light field-pieces are proved with powder that weighs half as much as their fhot, except the $24^{-}$ pounder, which is leaded with io 1 b only.

Government allows is bullets of lead in the pound for the pronf of mukets, and 14.5 , or 29 in two pounds, for fervice; 17 in the pound for the proof of carabines, and 20 for fervice; 28 in the pound for the proof of piftols, and 34 for fervice.

When guns of a new metal, or of lighter conftruction, are proved; then, befides the common proof, they are fired 200 or 300 times, as quick as they can be, loaded with the common chargegiven in actual fervice. Our light 6 -pounders were fired $30 c$ times in 3 hours 27 minutes, loaded with ilb. 40 oz . without receiving any damaze.

Proof of Pouvder, is in order to try its goodnefs and ftrength. Sce Guxpowder.

Proor of Camon, is made to afcertain their being well calt, their having no cavities in their metal, and, in a word, their being fit to refift the effort of their charge of powder. In making this proof, the piece is laid upon the ground, fupported only by a piece of
wood in the midlle, of about 5 or 6 inclies thick, to
Proof. raife the mukzle a little; and thea the pioce is ured againft a folic! buit of c:rth.

Tools tefidin the Proof of Ciannan are as follow:
Searther, an iron focket with branches, from + to 8 in number, bending outwards a little, will fmall poin:s at their ends: to this focket is fixed a wooden handle, from 8 to 12 fect long, and $1_{7}^{\frac{3}{7}}$ inch in diameter. This fearcher is introduced into the gun after each firing, and furned gently round to difcover the cavities within: if any are found, they are marked on the outfide with chalk; and then the

Sarclier with one foint is introdued; about which point a misture of wax and tallow is put, to take the impreflion of the holos; and if any ale found of onefourth of an inch decp, or of any confiderable length, the gun is rejected as unierviceable to the governmeat.

Keliever, is an iron ring fixed to a handle, by means of a focket, fo as to be at right angles; it ferves to dilcngage the firft fearcher, when any of its points are retained in a hole, and cannot otherwife be got out. When guns are rejected by the proof-mafters, they order them to be marked $x$ thus, which the contractors gencrally alter $W P$ thus; and after fuch alteration, difpofe of them to fereign powers for Weolwich proof.

The moft cutious inftrument for finding the principal defects in pieces of artillcry, was lately invented by lieutenant-general Defaguliers, of the royal regiment of artillery, This inftrument, grounded on the trucit mechanical principles, is no fooner introduced into the hollow cylinder of the gun, than it difcovers its defects, and more particularly that of the picce not being truly bored; which is a very important one, and to which moft of the difafters happening to pieces of artillery are in a great meafure to be imputed; for, when a gua is not truly bored, the mof expert artillerift will not be able to make a good fhot.

Prosf of AMortars and Howvitzers, is made to afcertain their being wall caft, and of ltrength to refift the effort of their charge. For this purpofe the mortar or howitzer is placed upon the ground, with fone part of their trunnions or breech funk below the furface, and relting on wooden billets, at an elevation of about 70 degrees.

The mirrof is generally the only inftrument to difcover the defcets in mortars and howitzers. In order to ufe it, the fun mult frine; the breech mult be placed towards the fun, and the glafs over-againt the mouth of the piece: it illuminates the bore and chamber futhciently to difcover the Hlaws in it.

Proof of Foreign Brafs-Artillery. ift, The Prufians. Their battering-train and garrion artillery are proved with a quantity of powder equal to the weight of the fhot, and fired 75 rounds as falt as in real fiervice: that is, 2 or 3 rounds in a minute. Their light fiekttrain, from a 12 -pounder upwards, are proved with it quantity of powder $=1-3 d$ of the weight of the thot, and fired 150 rounds, at 3 or + rounds in a minute. From al 12 -pounder downwards, are proved with a quana tity of powder $=1.5$ th of the fhot's weiglt, and fired 300 rounds, at 5 or 6 rounds each minutc, properly founged and loaded. Their mortars are pro:ed with the chambers full of powder, aricl the thells loaded. Three rounds are fired as quick as poffible.

2 d , The Dutch prove all their artillery by firing

Prouf, each piece 5 times; the two firf rounds with a quan-I'ropaga- tity of powder $=2-3 \mathrm{ds}$ of the weight of the flot; and tion. the three laft rounds with a quantity of powder $=\frac{1}{\text { t }}$ the weight of the fhot.

3 d , The French the fame as the Dutch.
Proof, in brandy and other firitunus liquors, is a little white lather which appears on the tep of the liquor when poured into a glafs. This lather, as it diminithes, formsitfelf into a circle called by the French the chapelet, and by the Englifh the biad or bubble.

## Nichols's

Life of Ho
garth.
Proors of Prints, were anciently a few imprefinns taken off in the courfe of an engraver's procefs. He proved a plate in different flates, that he might afcer-
tain how far lis labours had been fuccedsful, and when they were complete. The excellence of fueh early im. preflions, worked with care, and under the artift's eye, occafioning them to be greedily fought after, and liberally paid for, it has been euftoma:y among our modern printfellers to take off a number of thens anmunting, perhaps to hundreds, from every plate of confiderable value; and jet their want of varenefs has by no means abated their price. On retouching a plate, it has been alfo ufual, among the fane confcientious fraternity, to cover the infeription, which was immediately added after the firit proofs were obtained, with nips of paper, that a number of fecondary proots might alfo be created.

Proof, in the fugartrade. See Sugar.
Pronss, in pinting. See Printing, p. 524, col. 2.
PROPAGATION, the act of multiplying the kind. See Gereration.

Propag ation of Plants. The mof natural and the moft univerfal way of propagating plants is by feeds. See Plants, and Natural History, p. 654. But they may allo be propagated by fets, pieces, or cuttings, taken from the parent plant. Willows are very eafily propag:ated by fets: fuch as rife to be ecnliderable timber trees being raifed from fets 7 or 8 feet long, fharp. ened at their larger ends, which are thruft into the ground by the fitles of ditches, on the barks of rivers, or in any moitt foil. The fallow trees are raifed from fets only 3 teet leng. The plane tree, mint, \&c. may be propagated in the fame way. In providing the flips, fprigs, or cuttings, however, care mult be taken to cut off fuch branches as have knots or joints 2 or 3 inches beneath them; fmall top firigs of 2 or 3 years growth are the beft for this operation. Plants are alfo propagated by parting their roots, each part of which, properly managed, fends out freth roots. Another mode of propagating plants is by layering or laying the tops of the branches in the ground.

The method of layering is this: Dig a ring-trench round the floo!, of a depth fiitable to the nature of the plant; and having pitched upon the fhoots to be layercd, bend them to the bottom of the rench (ei her with or without plafhing, as may be found moft convenient), and there peg them faft; or, putting fome mould upon them, trad them hard enough to prevent their furing. ing up again-fill in the mould-place the top of the layer in an upright pofture, treading the noould hird behind it; and cut it carefully off above the firft, fccond, or third eye. Plants are alfo propagated by their bulbs.

The number of vegetables that may be prop.iga*ed from an individual is very remarkable, efpecial $y$ in lle molt minute plants. The annual product of one ficd
even of the common mallow has been found to be no lefs than 200,000; but it has been lince proved, by a ftrict examination into the more minnte parts of the vegetable world, that fo defpifed a plant as the common wall mofs produces a much more numernus offepring. In one of the little heads of this plant there have been comed 13824 feeds. Now allotting to a root of this plant eight branches, and to each branch fix heads, which appears to be a very moderate computation, the produce of one feed is $6 \times 13824=82944$; and $8 \times 82944$, gives 663,552 feeds as the annual produce of one feed, and that fo fmall that 13824 of them are contained in a capfule, whofe length is but one ninth of an inch, its diameter but one 23 d of an inch, and its weight but the y th part of a grain.

For the propagation or culture of particular plants, fee Agriculture, Part II. fect. 3. p. 288. and Hus. bandry.

PROPER, fomething natural and effentially belonging to any thing.

PROPERTIUS (Sextus Aurelius), a celebrated Latin poet, bern at Mevania, a city of Umbria, now called Bevagna, in the duchy of Spoletto. He went to Rome atter the death of his father, a Roman knight, whorad been put to death by order of Auguftus, for having followed Antony's party during the triumvirate. P.opertius in a thort time acquired great reputation by his wit and abilities, and had a confiderable fhare in the efteem of Mæcenas and Cornelius Gallus. He had alfo Ovid, Tibulius, Balfus, and the other ingenious men of his time, for his friends. He died at Rome 19 B. C. He is printed with almof all the editions of Tibullus and Catullus: but the beft edition of him is that which was given feparately by Janus Brouckhufus at Amfterdam, 17C2, in 4to, and again in 1714, 4to. cum curis fecundis ejuflem. We have tour books of his Ele. gies or Amours with a lady called Hofia, or Hofilia, to whom he gave the name of Cynthia.

PROPERTY, in a general fenfe, is a partirnlar virtue or quality which nature has befowed on tome things exclulive of all others : thus, colour is a property of light ; extenfion, figure, divifibility, and impenetrability, are properties of body:

Property, in law, is deferibed to be the higheft right Definiti which a perfon has or can have to any thing.

There is nothing which fo generally frikes the imagination, and engages the affections of mankind, as the riglit of property ; or that fole and defpotic dominion which one man claims and exercifes over certain external things of the world, in total exclufion of the right of any other individual in the univerfe. And set there are very few that will give themfelves the trouble to confider nal fow the original and foundation of this right. Pleafed as tion of we are with the poffeffion, we feem afraid to look back right to to the means by which it was acquired, as if fearful of propert fome defect in our title; or at beft we relt fatisfied with the decifion of the laws in our favour, without examin- cally co ing the reafon or atatimrity upon which thofe laws have been built. We think it enongh that our title is derived by the grant of the former proprietor, by defeent from nur anceltors, or by the laft will and teftament of the dying owner: not caring to reflect, that (accurate ly and Arictly fpeaking) there is no foundation in matturc or in natural law, why a fet of words upon parchment thould convey the dominion of land; why the fon fhould have a right to exclude his fellow-creatures from

## PR O

## PR O

ficty. a determinate fpot of ground, becaufe his father had done fo before lim; or why the necupier of a particular field or of a jewel, when lying on his dearlh-bed and no longer able to maintain poffelion, flould be entitled to tell the reft of the world which of them fhould enjoy it after him. Thefe inquiries, it mun be owned, would be ufelel's and even troubleform in common life. It is well if the mats of mankind will obey the laws when made, without frutinizing too nicely into the reafons of making them. But when law is to be confidered not only as a matter of practice, but alfo as a rational fcience, it cannot be improper or ufelets to examine more deeply the rudiments and grounds of theie pofitive confitutions of fociety.
In the begianing of the worll, we are informed by holy writ, that the all-bountiful Creator gave to man "dominion over all the earth; and over the fifh of thic "fea, and over the fowl of the air, and over every li" ving thing that moveth upon the earth," This is the only true and foliul foundation of man's dominion over external things, whatever airy metaphyfical notions may have been farted by fanciful writers upon this fubject. The carth, therefore, and all things therein, are the general property of all mankind, exclufive of other beings, from the immediate gift of the Creator. And, while the earth continued thinly inhabited, it is reafonabie to fuppofe, that all was in common among them, and that every one took from the public flock to his own ufe fuch things as his immediate neceffities required.
Thefe general notions of property were then fufficient haps fill have anfivered them, had it been pofitible for mankind to have remained in a thate of primeval fimplicity : as may be culleoted from the manrers of many American nations, when firlt difcovered by the Europeans; and from the ancisnt method of living among the firlt Europe ns themflves, if we may credit cither the memorial of then preferved in the golden age of the poets, or the uniform accounts given by hiforians of thefe times whereia erant omita commania et indivifa omnilus, veluti unum cunctis patrimoniume effet. Not that this communion of goods fecms ever to have been applicable, even in the earleft ages, to anght but the futfance of the thing; nor could it be extended to the ufe of it. For, by the law of nature and reafon, he who firlt began to ufe it, acquired thereina kind of tranfient property, that latted fo long as he was uling it, aad no longer: or, to fpeak with greater precifion, the right of pofieffion continued for the fane time only that the act of porfeffion lafted. Thus the ground was in common, and no part of it was the permanent propetty of any man in particular; yet whoever was in the occupation of any determinaie fpot of it, for reft, for hasde, or the like, acquired for the time a fort of ownerhip, fiom which it would have been unjuft, and contrary to the law of nature, to have driven him by force; but the inftant that he quitted the ufe or occupation of it, another night feize it witheut injufice. Thus alfo a vine or other tree might be faid to be in common, as all were evinally entited to its produce; and yot any private individual migl.t gain the fole property of the fruit, which he had gathered for his own repatt. A doctrine weil illuftrated by Cicero, who compares the world to a great theatre, which is common to the public, and yet the place which any man has talen is for the time his own.

But when mankind iacreafed in nnmber, crafe, and roperty. ambition, it became necelfary to entcriaira conceptions of more permanent dominiun ; and to approprite to in- Rife ofper dividuals, not the immedia'e ufe only, but the very matent fulfanse of the thing to be ufod: otherwife innume-propery in rable tumules muft hare arifun, and the good order of Various the world been cominually hroken and ditturbed, while this ge: a variety ef perions were friving who thould get the firt occupution of the farce thing, or diputing which of them had actually gained it. As human life itfo grew more and nore refined, abundance of conveniercies were devifed to render it more cafy, commodious, and agrceable; as habitations for fiel ler whd f.fe: y, :nd raiment f. r wamth and deconcy. Bat no man would be at the trouble to provide either, fo lang as he had only an utirroctuary property in them, which was to ccaie the inflant that he quited polferion; -il, as foon as he walked out of his tent, or prulled off his garment, the next flranger who came by would have a right to inhalit the one and to wear the oiber. In cafe of habitations in particular, it was natural to obferye, that even the biute creation, to whom every thirg elfe was in common, nuintained a permanent property in their dwellings, efpecially for the protection of their young; that the birds of the air hail nelts, and the beafts of the fild had caverns, the invalion of which they eftecmed a very flagrant injuftice, and would facrifice their lives to preferve them. Hence a property was foon eftablithed in evcry man's honfe and tome-Rall; which feem to hive been originally mere temporary huts or moveable cabins, fuited to the defign of Provilence for morc fpeedily peopling the earth, and fuited to the wandering life of their owners, before any extenfive property in the foil or ground wats eftablifhed. And there can he no doubt, but that moveables of every kind became fooner appropriated than the permanent fublantial foil : pattly becaufe they were more fufceptible of a long occupancy, which might be continued for months togerher without any fenlibie interruption, and at length by ufage ripen into an eftablified right ; but pri:acipally becaufe few of them could be fit for ufe, till impro. ved and meliorated by the bodily labour of the occupant; which bodily labnur, beftowed upon any fubject which before lay in common to all men, is univer. fally allowed to give the faireft and moft seafonable title to an cxclufive property therein.

The article of food was a more immediate ca!l, and in foor therefore a more early confideration. Such as were not and othes contented with the fontancous produr of the earth necellury fought for a more folid refrefhment in the flell of bealts, articics. which they obtained by hunting. But the frequent difappointments incident to that nethod of provifion induced them to gather together fuch animals as were of a more tame and fequacious nature ; and to eftabliilh a permanent praperty in their flocks and herd, in order to fultain themelves in a lefs precarious manner, partly by the milk of their dauns, and partly by the fleth of the young. The fupport of thefe their cattle made the article of quater alfo a vers important point. And therefore the book of Genefis (the mort venerable monument Nature of of antiquity, cotfifdered merely with a view to hiftory) patriarch of will furnifh us with frequcnt inflances of violent conten-property. tions concerning wells; the exclufive property of which appears to have been eftablifhed in the firlt digger or occupant, even in fuch places where the ground and heroage remained

Property. remained yet in common. Thus we find Abraham, who was but a fojourner, afferting his right to a well in the country of Abimelech, and exacting an oath for his fecurity, " becaufe he had digged that well." And Ifac, about $n o$ years afterwards, reclaimed this his father's property; and, after much contention with the Philiftines, was fuffered to enjoy it in peace.

All this while the foil and pafture of the earth remained Atill in common as before, and open to every oc. cupant: except perlaps in the neighbourlond of towns, whace the neceffity of a folc and exclufive property in lands (for the fake of agriculture) was eanlier felt, and therefore more readily complied with. Other wife, when the multitude of men and cattle had confumed every convemience on one fpot of ground, it was deemed a natural right to feize upon and occupy fuch other lands as would more cafily fupply their neceflities. This practice is fill retained among the wild and uncultivated nations that have nover been formed into civil flates, like the Tartars and others in the eall ; where the climate itfelf, and the boundlefs extent of their tenitory, confpire to retain them fill in the fame fuvage flate of vagrant liberty, which was univerfal in the carlicft ages, and which Tacitus informs us continued among the Germans till the declinc of the Romin empire. We have alfo a ftriking example of the fame kind in the hiftory of Abtaham and his nephew Lot. When their joint fublanie became fo great, that pafture and other conveniencies grew fearce, the natural confequence was, that a frife arofe between their fervants; fo that it was no longer practicable to dweil together. This contention Abraham endeavoured to compofe: "Let there he no fhiie, I pray thec, between thee and me. Is not the whole land before thee? Separate thyfelf, I pray thee, from me: If thou wilt take the left hand, then I will go to the right; or if thou depart to the right hand, then I will go to the left." This plainly implies an acknowledged right, in either, to occupy whatever ground he pleafed, that was not pre-occupied by other tiibes. "And Lot lifted up his cyes, and beheld all the plain of Jordan, that it was well watered everywhere, cven as the garden of the Lord. Then Lot chole him all the plain of Jordan, and journeyed eaft ; and Abrahan dwelt in the land of Canaan."

Upon the fame principle was founded the right of migration, or fending colonies to find out new habitations, when the mither-country was overcharged with inhabitants; which was practifed as well by the Phocnicians and Greeks, as the Germans, Scythians, and other northern people. And, fo long as it was confined to the foeking and cultivation of defert uninhabited countries, it kept friatly within the limits of the law of nature.
Necetli'y of property daily became more diffichlt to find out new fpots to aud of laws inhabit, without encroaching upon former occupants; refipesting
it. the fruits of the earth were confumed, and its fponta-
of a more permanent property in the foil than had hitherto been received and adopted. It was clear that the earth would not produce her fruits in fufficient quantities without the affitance of tillage; but who would be at the pains of tilling it, if another might warch an opportunity to feize upon and enjoy the product of his induftry, art, and labour? Had not therefore a feparate property in lands, as well as moveables, been vefted in fome individuals, the world mult have continued a foreft, and men have been mere animals of prey; which, according to fome philofophers, is the geruine fate of nature. Whereas now (fo graciounly has Providence interwoven our duty and ru: happinefs together) the refult of this very neceffity has been the ennobling of the human fpecies, by giving it opportunities of improving its rational faculties, as well as of exerting its natural. Neccflity begat property: and in order to infure that property, recourfe was had to civil fociety, which brought alung with it a long train of infeparabie concomitants; fates, government, laws, punifhments, and the public exercife of religious duties. 'thus connected together, it was found that a part only of fociety was fufficient to provide, by their mannal labour, for the neceflay fubfillence of all; and leifure was given to orhers to cultivate the human mind, to invent ufeful arts, and to lay the foundations of fcience.

The only queftion remaining is, How this property Prope became atually refted; or what it is that gave a man acquire an exclufive right to retain in a permanent manner firl by that ipecific land which before belonged generally to cupan every lody, but particularly to mobody? And as we before obferved, that occupuncy gave the right to the temporary $u f e$ of the foil; fo it is agreed upon all hands, that occupancy gave alfo the original right to the permanent property in the fubllarce of the earth itfelf, which excludes every one elfe but the owner from the ufe of it. There is indeed fome difference among the writers on natural law, concerning the reafon why occupancy thould convey this right, and invelt one with this abfolute property: Grotius and Puffendorf infifting, that this right of occupancy is founded upon a tacit and implied affent of all mankind, that the tirft occupant fhould become the owner; and Barbeyrac, Titius, Mr Locke, and others, holding, that there is no fuch implied afient, neither is it necefliary that there fhould be; for that the very ait of occupapcy, illone, being a degree of bodily labour, is from a principle of natural jullice, withont any confent or compact, fufficient of itifelf to gain a title. A difpute that favours too much of nice and fcholafic refinement. However, both fides agree in this, that occupancy is the thing by which the title was in fact originally gained; every man feizing to his own contmued ufe fucle fipots of ground as he found moft arreeable to his own convenience, provided he found them unoccupied by any one elfe.
Properey, both in lands and moveables, being thus by wha originally acquired by the frrt taker, which taking means amounts to a declaration, that he intends to appropriate preferv the thing in his own ufe, it remains in him, by the or loft. principle of univerfal law, till fuch time as be does fome other act which thows an intemtion to abandon it; for then it becomes, naturally fieciking, publici jamis once more, and is liable to be agm appropria- neous produce deftroyed, withont any provifion for a future fupply or fuccefion. It therefore became neceffary to purfue fome regular method of providing a contant fubfifence; and ihis neceflity produced, or at leat promoted and encourared, the art of atriculure. And the art of agriculture, by a regular conncation and confequence, introduced and eftablifliced the idea

Ferty. ted by the next occupant. So if one is peffeffed of a jewel, and calts it into the fea or a public higriway, this is fuch an exprefs dereliction, that a property will be velted in the lirt fortumate finder that thatl feine it to his own ufe. But if he hides it pivately in the earth, or oller foeret place, and it is difcovered, the finder acquires no property therein; for the owner hatlo not by this act declared any intention to abandon it, but rather the contrary: and if he lrfes or drops it by aecident, it cannot be collected from thence that he detigned to quit the pofledion; and therefore in fuch cale the property thil renains in the lofer, who may clam it again of the finder. And this, we may remember, is the deetrine of the Englifh law with relation to Treaserk-Trove.

But this me hod, of one man's abandoning his property, and another feizing the vacant poffeffion, however well founded in theory, could not long fubfit in fact. It was calculated merely for the rudiments of civil fociety, and neceffarily ceafed among the complicated interefts and artificial refinements of polite and eftablithed governments. In thefe it was found, that what became inconvenient or ufelefs to one man, whas highly convenient and ufeful to another; who was ready to give in exchange for it fome equivalent that was cqually defirable to the former proprietor. This mutual convenience introduced commercial traffic, and the reciprocal transfer of property by fale, crant, or conveyance: which may be confidered either as a continuance of the original poffefion which the firft occupant had; or as an abandoning of the thing by the prefent owner, and an immediate fucceffive occupancy of the dame by the new proprietor. The voluntary dereliction of the owner, and delivering the poffelion to anothor individual, amount to a transfer of the proper. ty; the proprietor declaring his intention no longer to occupy the thing himfelf, but that his own right of occupancy thall be relted in the new acquirer. Or, taken in the other light, if I argree to part with an acre of $m y$ land to Titius, the deed of conveyance is an evidence of my intending to abondon the property ; and Titius, being the only or firf man acquainted with fuclimy intention, immodiately fteps in and feizes the vacant poffefion: thus the confent expreffed by the conveyance gives Titius a good right againt me ; and poffelfion or occupancy confirms that right againft all the world befides.

The mof univerfal and cffectual way of abondoning property is by the death of the occupant: when, butl the actual polfeflion and intention of keeping poffelion cealing, the property, which is founded upon fuch pofiellion and intention, ought alfo to ceafe of courfe. For, naturally fpeaking, the inftant a man ceafes to be, he ceafes to have any dominion: elfe, if he had a right to difpofe of his acquilitions one moment beyond his life, he would alfo have a right to direet their difpofal for a million of ages after him ; which would be hiohly abfurd and inconvenient (A). All property mult therefore ceafe upon death, confidering men as abfolute individuals, and meonnegted with ciVol. XV.
vil focicty: for then, by the principles lefore eftablithed, the next immediate occupant would acquire at right in all that the deceafed poffelled. liut as, tinder civilized governments, which are calculated for the peace of manhind, fuch a conftitution would be produstive of endlefs difturbances, the univerfill law of almoft cevery nation (which is a lind of feenndary law of nature) has cither given the dying perfon at power of continuing his property, by difpoting of his poileffions by will; or, in cafe he neglects to difpofe of it, or is not permitted to make any difpeftion at all, the municipal law of the country then lleps in, and declares who thall be the fuccelfor, reprefentative, or leeir of the deceaded : that is, who alone flall have a right in enter upon this vacant poffeffion, in order to avoid that confution which its becoming again common would ncealion. And further, in cale no teftament be permitted by the law, or none be made, and no hoir can be found fo qualified as the law requires, ftill, to prevent the robutt title of coupancy from again taking place, the doctrine of ef:heats is adopted in almolt cvery country; whereby the fovereign of the fate, and thofe who claim under his authority, are the ultimate heirs, and fucceed to thofe inheritances to which no other title can be formed.

The right of inheritance, or defeent to the cliidren of the and relations of the deceafed, feems to have been al- right of in. lowed much earlier than the right of devifing by tefta- heritance. ment. We are apt to conceive at the firft view that it has nature on its lide; yet we often mifake for nature what we find eftablifhed ly long and inveterate cuftom. It is certainly a wife and effestual, but clearly a political, eftablifhment; fince the permanent right of property, vefted in the ance:tor himfelf, was no netural, but merely a civil, right. It is true, that the tranfmifion of one's poffefions to polterity lias an evident tendency to make a man a good citizen and a ufeful member of fociety : it fets the pafions on the fide of duty, and prompts a man to deferve well of the public, when he is fure that the reward of his fervice; will not die with himfelf, but be tranfmitted to thofe with whom he is connected by the dearelt ard moft tender affentions. Yet, reafonable as this foundation of the right of inheritance may feem, it is probable that its immediate original arofe not from fpeculations altogether fo delicate and refined, and, if not from fortuitous circumfances, at leat from a plaincr and more fimple principle. A man's children or meareft relations are ofnally about him on his death-bed, and are the carlief witneffes of his deceafe. They became therefore generally the next immediate occupants, till at length in procefs of time this freq̧uent ulage ripened into general law. And therefore allo in the earlieft ages, on failure of children, a man's fervants born under liis roof were allowed to be his heirs; being immediately on the fpot when he died. For we find the old patriarch Abraham exprefsly declarins, that "fince Go 1 had given him no feed, his feward Eliezer, one bom in his houfe, was his heir."

While property continued only for life, telaments
4 F were
(A) This right, inconvenient as it certainly is, the law of Scothand gives to every man over his realeftate, by ruthorifing him to entail it on his heirs forever. Sec Law, claxx. 9, 10, 11. and Tablzif.

Conmicnt.
were nfelefs and unknown; and when it became inhesitable, the inheritance was long indefeafible, and the children or heirs at law were incapable of exclution by will. Till at length it was found, that fo ltrita a rule cf inheritance made heirs difobedient and headftrong, defrauded creditors of their jutt debts, and prevented many provident fatliers from dividing or charging their eftates as the eaigence of their families required. This introduced pretty generally the right of difpofing of onc's property, or a part of it, by teflament; that is, by witten or oral inftructions properly witneffed and authenticated, according to the pleaflure of the deceafed; which we therefore emphatically ftyle his will. This was eftablifhed in fome countries much later thin in others. In England, till modern times, a man could only dipofe of one-third of his moveables from his wife and children; and, in general, no will was permitted of lands till the reign of Henry VIII. and then only of a certain portion; for it was not till after the Reforation that the power of devifing real property became fo univerial as at prefent.

Wills, therefore, and teftaments, rights of inheritance, and fucceffions, are all of them creatures of the civil or municipal laws, and accordingly are in all refpeets regulated by them ; every diftinet country having different ceremonies and requifites to make a tef. tament completely valid; neither does any thing vary more than the right of inheritance under different national eftablifhments. In England particulauly, this diverfity is carried to fuch a length, as if it had been meant to point out the power of the laws in regulating the fucceftion to property, and how futile every claim muft be that has not its foundation in the pofitive rules of the fate. In perfonal eftates, the father may fucceed to his children; in landed property, he never can be their immediate heir by any the remotelt pofibility: in general, only the eldeft fon, in fome places only the youngeft, in others all the fons together, have a right to fücceed to the inheritance: In real eltates, males are preferred to females, and the eldeft male will ufually caclude the reft ; in the divifion of perfonal eltates, the females of equal degree are admitted together with the males, and no right of primogeniture is allowed.

This one confideration may help to remove the fcruples of many well meaning perions, who fet up a miftaken confcience in oppotition to the rules of law. If a man difinherits his fon, by a will duly executed, and leaves bis eftate to a Atranger, there are many who conflder this proceeding as contrary to natural juftice; while others fo fcrupuloufly adhere to the fuppofed intention of the dead, "that if a will of lands be attelted by only tron witnefles inftead of three, which the law requires, they are apt to imagine that the heir is botmd in confcience to relinquith his title to the devifee. But both of them certainly proceed upon very erroneous principles: as if, on the one hand, the fon had by mature a right to fucceed to his father's lands: or ats if, on the other hand, the owner was by nature entitled to direct the fuccelion of his property after his own deceafe. Whereas the law of nature fuggefts, that on the death of the poffeffor, the eftate thould again become common, and be open to the next occupant, unlefs otherwife ordered, for the fake of civil
peace, by the pofitive law of fociety. The pofitive Proper law of fociety, which is the municipal laws of England and Scotland, directs it to velt in fuch perfon as the laft proprietor flall by will, attended with certain requifites, appoint ; and, in defect of fuch appointment, to go to fome particular perfon, who, from the refult of certain local conftitutions, appears to be the heir at law. Hence it follows, that, where the appointment is regularly made, there cannot be a fhadow of right in any one but thic perfon appointed: and, where the necelfary requifites are omitted, the right of the heir is equally ftrong and built upon as tolid a foundation, as the right of the devifee would have been, fuppoling
fuch requifites were obferved.

But, after all, there are fome few things, which, notwithutanding the general introduction and continuance of property, muft itill unavoidably remain in common; being fuch wherein nothing but an ufufructuary property is capable of being liad: and therefore they ftill belong to the firft occupant, during the time he holds polfellion of them, and no longer. Such (among others) are the clements of light, air, and water; which a man may occupy by means of his windows, his gardens, his mills, and other conveniences: fuch alfo are the gencrality of thofe animals which are faid to be fere natura, or of a wild and untameable difpofition; which any man may feize upon and keep for his own ufe or pleafure. All thefe things, fo long as they remain in poffeflion, every man has a right to enjoy without difturbance ; but if once they efcape from his cuftody, or he voluntanily abandons the ufe of them, they return to the common fock, and any other man has an equal right to feize and enjoy them afterwards.
Again, there are other things in which a permanent of fimilas property may fubfitt, not only as to the temporary ufe, things but alfo the folid filmfance; and which yet would be which hav frequently found without a proprictor, had not the wifdom of the law provided a 1 emedy to obviate this ineen apwhich were omitted to be appropriated in the general diftribution of lands: fuch allo are wrecks, eftrays, and that fpecies of wild animals, which the anbitrary conItitutions of politive law have ditinguilhed from the reft by the well-known appellation of game. With regard to thefe and fome others, as difurbinces and quarrels would freq̧uently arile among individuals contend. ing about the acguitition of this pecies of property bes firt occupancy, the law has therefore wifely cut up the root of difenfion, by vefting the things themfelves in the fovereign of the fate ; or elfe in his reprefentatives appointed and authorifed by him, being witally the lords of manors. And thens the legiflature has univertally promoted the grand ends of civil iocicty, the peace and lecurity of individnals, by fteadily purliug that wife and ordcrly maxim, of affigning to every thing capable of ownerfhip a legal and dcterminate owner.
In this age of paradox and innovation, much has been faid of lieerty and equality; and fome few have contended for an equalization of property. One of the wildelt declaimers on this fubject, who is for abo. lifhing property altogether, has (inadvertently we furpore) given a complete confutation, not only of his property own arguments, but alfo of the arguments of all who

have written, or, we think, can write, on the fame fide of the queflion. After labouring to prove that it is grofs injultice in any man to retain more than is abfolutly neceffary to fupply $h \mathrm{~m}$ with food, cloathes, and theiter, this zealous reformer Aates an objection to his theory, ariling from the well-known allurements of floth, which, if the accumulation of property were not permitted, would banith indultry from the whole world. The objection he urges fairly, and anfwers it thus: "It may be offerved, that the equality for which we are pleading is sin equality that would fucceed to a flate of great intellectual improvement. So buld a revolu. tion cannot take $p$ ace in human affars, till the general mind has teen lighly cultivated. 'The prefent age of mankind is greatly enlightened; but it is to be teared is not yet culightened enough. Hafty and undigelled tumults may take place, under the idea of an equalization of property; but it is only a calm and clear conviction of juitice, of juttice mutually to be rendered and received, of happineis to be proluced by the defertion of our $\sim 20 /$ rosted halits, that can introduce an invariable fyftem of this fort. Attempts without this preparation will be productive only of confufion. Their effect will be momentary, and a new and more barbarous inequality will fucceed. Each man with unaltered appetite will watch his opportunity to gratify his love of power, or his love of diftinction, by ufurping on his inattentive neighbours."
Thefe are juft obfervations, and fuch as we have often made to ourelves on the various propofed reformations of government. The illumination which the author requires before he would introduce his abolition of property, would conflitute men more than angels; for to be under the influence of no paffion or appetite, and to be guided in every action by unmixed benevolence and pure intellect, is a degree of perfection which we can attribute to no bcing inferior to God. But it is the object of the greater part of this writer's book to prove that all mer: mult arrive at fuch perfection before his ideal republic can contribute to their happineff; and therefore every one who is confcious of being at any time fwayed by paffion, and who feels that he is more attached to his wife or children than to Atrangers, will look without envy to the prefent inequalities of property and power, if he be an intelligent dif. ciple of Mr Godwin.
Literary Properti. See Corr-Right.
PROPHECY is a word derived from Tpoqutua, and in its original impor: fignifies the prediction of future events.

As God alone can ferceive with certainty the future actions of free agents, and the remote confequences of thofe laws of nature which he himfelf eftablithed, prophecy, when clearly fulfilled, affords the molt convincing evidence of an intimate and fupernatural communion between God and the perfon who uttered the prediction. Together with the power of working miracles, $i_{i}$ is indeed the only evidence which ean be given of fuch a communi $n$. Hence among the profeffors of every relisious fy tem, except that which is called the religion of nature, there have becn numberlefs pretenders to the git of prophecy. The pagan nations of antiquity had their oracles, augurs, and foothfayers. Modern idolators have their necromancers and divines and the

In this article, however, it is chiefly of importance to confine ourfelves to that kind of prophecy, which, in declaring truths either paft, prefent, or future, requived the immediate infpiration of God.

Every one who looks into the hiltory of the world mult obferve that the minds of men have from the begiuning been gradually opened by a train of evcits atill improving upon, and adding light to each other ; as quired. that of each individual is, by proceeding from the firlt elements and feeds of fcience, to more enlarged views, and a ftill higher growth. Mankiad neither are nor ever have been capable of entering into the depths of knowledge at once; of recciving a whole fyItem (f natural or moral truths together; but mult be let into them by degrees, and have them communicated by little and little, as they are able to bear it. That this is the cafe with refpect to human fience, is a fact which cannot be queltioned; and there is as little room to queflion it with refpect to the progrefs of religious knuwledge among men either taken collectively or in earh individual. Why the cafe is thus in both, why all are not adult at once in body and mind, is a quelticn which the religion of nature is equally called upon with revelation to anfwer. The fact may not be eafily accounted for, but the reality of it is incontrovertible.

Accordingly, the great olject of the feveral revelations recorded in the Old Tellament was evidently to keep alive a fenfe of religion in the minds of men, and to train them by degrees for the reception of thofe fimple but fublime truths by which they were to be faved. The notions which the early defcendants of $A$ dam entertained of the Supreme Being, and of the relation in which thay flood to him, were probably very grofs; and we fee them gradually refined by a feities of revelations or prophecies, each in fucceffion more ex. plicit than that by which it was preceded, till the a.d. yent of Him who was the waty, the truth, and the life, and who brought to light life and immortality.

When a revel.tion was made of any important truth, the grounds of which the mincl of man has not facul-

Fropisis. ties to comprchend, that revelation, though undoubteily a proplhecy, niult have been fo far from confirming the truth of revealed religion in general, that it could not gain credit itfelf, but by fome extrinfic evidence that it came indeed from God. Hence we find Mofes, atter it was revealed to lim from the burning buth that he fhould deliver his countrymen from Egypiin bondage, replying, "Behold, they will not believe me, bor heatea to my voice; for they will fay, the Lord hath not appeared unto thee." 'I'his revelation rertaidly corftituted him a prophet to Ifrael ; and there cunnct be a doubt but that he perfectly knew the divine fuarce from which he received it : but he very naturally and reafunably concluded, that the children of Ifrael would not belizve that the Lord had appeared to him, miels he could give them fome other proof of this preternatural appearance than his own fimple afirmation of its reality. This proof he was immediately enabled to give, by having conferred upon him the power of working miracles in confirmation of lis prophecy. Argain, when Gideon was called to the deliverance of Ifrat, the angel of the Lord came and faid unto him, "The Lord is with thee, thou mighty man of valour: go in this thy inight, and thou fhalt fave Ifiael from the hand of tio Midianites. Have not I fent thee ?" Here was a prophecy delivered by the angel of the Lord to cncourage Gideon's undertaking: but he, being probably afraid of fome illufion of fenfe or imagination, demanded a fign that he was really an angel who tallied with him. A fign is accordingly given him, a miraculous fign, with which he is fatisfied, and under-
to do, in a literal fenfe, is abfolutely impoflib.e. He knew well that it was the great God of heaven and earth who was fpeaking, and that fuch a being was incapable of triffing with the wretchednefs of his fallen creaturc. The fentence denounced upon himfelf and his wife uras awful and fevere. The woman was doom. ed to forrow in conception; the man to forrow and travel all the days of his life. The ground was curfed for his fake; and the end of the judgment was, "Dutt thou art, and to dult thou fhalt return." Had our firf parents been thus left, they muft have looked upon themfelves as rejeeted by their Maker, delivered up to trouble and forrow in the world, and as having no hope in any other. With fuch impreflions on their minds they could have retained no fenfe of religion ; for reli. gion, when unaccompanied by hope, is a ltate of frenzy and diftration : yet it is certain that they could have no hope from any thing cxpretily recorded by Mofes, except what they might draw from this fentence pafied on their deceiver. Let us then endeavour to afo certain what confolation it conld afford them.

At that awful jundure, they mult have been fenfible that their fall was the victory of the ferpent, whom by experience they had found to be an enemy to God and to man. It could not therefore but be fome comfort to them to hear this enemy firf condemned, and to fee that, however he had prevailed again! them, he had gained no victory over their Maker. By his condemnation they were fecured from thinking that there was any malignant being equal to the Creator in power and dominion; an opinion which, through the prevalency of evil, gained ground in after times, and was deftructive: of all true religion. The belief of God's fupreme dominion being thus preferved, it was nill neceflary to give them fuch hopes as might induce them to love as well as to fear him ; and thefe they could not but conceive when they hard from the mouth of their Crator and Judge, that the Serpent's victory was not complete even over themfelves; that they and their pofterity fhould be enabled to conteft his empire; and that though they were to fulfer much in the fruggle, they thould yet finally prevail, bruife the ferpent's head, and dcliver themfelves from his power and dominion.

This prophecy therefore was to our firft parents a light fhining in a dark place. All that they could certainly conclude from it was, that their cale was not defperate ; that fome remedy, fome deliverance from the evil they were under, would in time appear; but wheat or whire, or by subat means they were to be delive:cd, they could not poffibly underftand, unlefs the matter was further revealed to them, as probably it was at the in!tiLution of facrifice (fee Sacrifice). Obleure, however, as this promife or prophecy was, it ferved after the fall as a foundation for religion, and tratt and confidence towards God in hopes of deliverance in time from the evils of dilobedience : and this appears to have been the fole purpofe for which it was given, and not, as fome well-meaning, though weak advocates for Chriftianity have imagined, as a prediction pointing diredtly to the crofs of Chiit.

As this prophecy was the firf, fo is it the only confiderable one in whicl we have any concern from the creation to the days of Noah. It was proportioned to the then wants and necefifies of the world, and was the grand charter of God's merey after the fill. Nature

## PR O [ 597 ] PR O

pl. had no certain hetp for finners; her rights wete loft with her innocence. It was therefore neceffary cither to deftroy the offenders, or to raife them to a capacity of falvation, by giving them fuch lonpes as might enatble them to exercile a realonable religion. So far the light of this prophecy extended. By what mans God iatended to work their falvation, he did not expretisly declare : and who has a right to complain that he did not, or to preferibe to him rules in difpenfing his mercy to the chideren of men?

Upon the hopes of mercy which this prophecy gives in very general terms, mankind refted till the birth of Noah. At that period a new prophecy was delivered by Lamech, who furetels that his fun fhould comfort them concerning the work and toil of their hands, "bseaule of the earth aubich the Loril had curf.d." We are to remember that the cuff pronounced upon the earth was part of the fentence palled upon our find pat rents ; and when that part was remitted, if it cere was remitted, markind would acquire now and more lively kopes that in God's good time they fhould be freed from the whole. But it has been fhown by bilhop Sherlock *, that this declaration of Lamech's was a prediction, that during the life of his fon the curfe fhould be taken off from the earth: and the fame prelate has proved with great perficicuity, and in the moft fatisfactory manner, that this happy revolution aftually took place after the flood. The limits preferibed to an article of this kind will not permit us ever to abridge his arguments. We thath only obferve, that the truth of his conclufion is manifell from the very words of feripture ; for when God informs Noah of his defign to dettroy the world, he adds, "But with thee will I eftablifh my covenant :" and as foon as the deluge wats over, he declared that he "would not again curfe the ground any more for man's fake ; but that while the earth thould remain, feed-time and harvelt, and cold and heat, and fummer and winter, and day and night, fhould not ceafe." From this laft declaration it is apparent that a. curfe had been on the earth, and that feed-time and harvelt had often failed; that the curfe was now taken off; and that in confequence of this covemant, as it is called, with Noah and his feed and with every living creature, mankind fhould not henceforth be fubject to toil fo fevere and fo generally fruitlels.

It may feem furprifing perlops to fome, that after fo great a revolution in the world as the ocluge made, Cod floould fay nothing to the remnant of markind of the punifhments and rewards of another life, but ihould make a new covenant with them relating merely to fruitful feafons and the bleffings of the earth. But in the fcriptures we fee plainly a gradual working of providence towards the redemption of the world from the curfe of the fall ; that the temporal bleflings were firf rellored as an earnelt and pledge of better things to follow; and that the covenant given to Noah had, Atrictly fpeaking, nothing to do with the hopes of futurity, which wete referved to be the matter of another coremant, in another age, and to be revealed by him, whofe province it was to "bring life and immortality to light through the gofpel." But if Noah and his forefathers expected deliverance from the whole curfe of the fall, the aftual deliverance from one part of it was a veiy good pledge of a further deliverance to be expetted in time. Man himfelf was curfed as well as the ground; he was doomed to duft : and fruitful feafons
are but in fmall reli,f, compared to thic greasenef of has Prytest lufs. Diut when fruitful feafo:ss came, and one put if the curfe was cridently abated, it gave ercoit animance that the other thould nat ladk forever, but that 1 1y fome means, ni'l unkncwn to dom, they fiould le fred from the whole, and finally bruife the ferpent's head, who, at the deluge, had fo fevercly bruifed mon's heel.

Upon this affurance mankind refted for fome gencrations, and pracifed, as we have cvery reafon to believe, a rational worthip to the one God of the urirerie. At laft, however, ilolatiy was by ferne means or other introduced (fee Polyturism), and fread fo univerfally through the world, that truc religion would in all piobability lave entircly failed, had not God vifibly interpefed to preferve fuch a ienfe of it as was necellary for the acconplifhment of his great defign to refore monkind. 'This he did b; caling Abraham fro:n ansiat fromife to his idolatrous kindred, and rentewing to him the word (f Abrahara, prophecy: "Get thee out of thy ccuntry (faid lie), and from thy kindred, and from tly father's housc, unto a land that I will thew thec. And I will make of thee a great nation, and I will blefs thee and make thly name great ; and thou foalt be ablefing. And I will blefs them that blefs thee, and curie them that curfe thee; and in thee fluall all the families of the cavth bo bleffed." Thefe magnificent promifes are feveral tines repeated to the father of the faithful with additional circumftances of great importance, fuch as, "that he fhonld be multiplied exceedingly; that he thould be a father of many nations; that kings floould cone cut of lim;" and above all, that God would e!tabiifh an crevlofing covenant with him and his feed, to give him and thera a! the land of Canaan for an evorl fing suff: fion, and to be their God."

Upon fuch of thefe promifes as relate to temporal blefings we need not dwell. They are much of the fame nature with thofe which had been given before to Lamech, Noah, Shem, and Japheth; and all the world knuws how amply and literally they have been fulfilled. There was however fo little prebability in nature of their accomplifhment at the time when they were made, that we find the patiturch anking "Whercby he thould krow that he fhould inherit foch an extent of country !" And as the promiles that he fhould $f$ Gonefis inherit is were meant to be a foundation for reigion ${ }^{\mathrm{xv}}$, 8 . Eec. and confidence in Gud, a miraculous lign was given bim that they came indeed from the fpirit of trith. This removed front his mind every doubt, and made lim give the fulleft credit, not only to them, but alfo to that other promife, "that in his feed fhould all the nations of the cat th be bleifed."

What diftinct notion he had of this b.cling, or in what manner he hofed it fhomld be efiected, we cannot pretend to fay. "But that he unfterfood it to be it promife of relloring narkind, and deliverine them frem the remaining curfe of the fall, there can be no doubi. He knew that death had entered by fin ; he knew that God had promicas viatory and reienmention to the feed of the woman. Upon the hopes of this reftoration the religion of his ancettors was tounded; and when God, from whom this blefines on all men was expecied, did exprefly promifa bleding on all men, ant in this promifefonnded his everlaning covenąnt-what could abrahan elfe cxpect but the completion in his feed of that ancient promife and proplecy concerning the viftory
to be obtained by the woman's feed ? The curfe of the crourd was expiated in the flood, and the carth reftored witha blelling, whels was the foundation of the tempa1al covenant with Noah; a large flare of which God exprefsly grants to Abraham and his pofterity particu. larly, together with a promife to bring, by their means, In new and further blelling upon the whole race of men. It we lay the fe things to heart, we cannot fuppofe that lefs could be expeicd from the new promile or prophecy given to Abraham than a deliverance from that part of the curfe ftill remaining on man: $D_{u} /$ thou art, and to duft thiu foalt return. In virtue of this covenant Abraham and his polterity had reafon to expert that the time would come when man fhould be called from lis dull again. For this exnectation they had his afturance who gave the covenant, that he would be their God forever. Well might our Saviour then tell the fons of Abraham, that even Mofes at the buil fhowed the refurrection of the dead, when he called the Lord the God of Abralam, and the God of liaac, and the God of Jacob *."

Thefe promifes made to Abraham were renewed to Ifac and Jacob; to the laf of whem it was revealed, nat only that all the nations of the earth foold be blefed in his feed, but that the blefling thould fpring from his fon Judah. It is, however, by no means evident that any one of thofe patriarchs knew precifely by what mians (A) the cure of the fall was to be entirely removed, and all men called from their duft again. It was enough that they were convinced of the fact in genoral terms, fince fuch conviction was a fufficient foundation of a rational religion; and the defcendants of Abraham had no other foundation upon which to reft their hopes, and pay a cheertul worfhip to the God of theil fathers, till the giving of the law to Mofes. Then inleed they were incorporated into a focicty with municipal laws of their own and placed under a theocratic covernment ; the temporal promifes made to their fathers were amply fulfilled; religion was maintained among them by rewards and punithments equally difthibuted in this world (fee Thbology) : and a feries of prophets fucceeding one another pointed out with greattr and greater clearnefs, as the fulnefs of time approachcd, the perton who was to redeen mankind from the power of death; by what means le was to work that great redemption, and at what precife period he was to make lis appearance in the world. By thefe fupernatural interpolitions of divine providence, the principles of pure the fm and the practice of true religion were preferved among the children of Itrael, when all other mations were funk in the grolleft idolatry, and wallowed in the moft abominable vices; when the far-famed Eryptians, Greeks, and Rumans, fell down with ado-
ration to ftocks and ftones and the vileft reptiles; and $\operatorname{Pr}$ when they had no well groundsd hope of another life, and were in fact without Gud in the world.

From this thort deduction, we think ourfelves intilled w to conclude, that the primary ufe and intent of prophecy, under the varions difpenfations of the Old Tellameut, was not, as is too often fuppofed, to eftablifh the divine mifion of Jefus Chrift, but to keep alive in the minds of thofe to whom it was given, a fenfe of religion, and a lope of future deliverance from the curfe of the fall. It was, in the exprefine language of St Peter, "، a light that fhone in a dark place, tnto which ment did well to take heed until the day dawned and the day. ftar arofe in their hearts." But though this was certainly the origimal intent of prophecy (for Chrif, had he never been foretold, would have proved himfelf to be the Son of God widl power by his aftonifhing miracles, and his refurrection from the dead), yet it cannot be denied, that a long feries of prophecies, given in different and far diftant ages, and having all their completion in the life, death, and refurrection, of Jefus, concur very forcibly with the evidence of miracles to prove that he was the feed of the woman ordained to bruite the head of the ferpent, and reftore man to his forteited inheritance. To the Jews the force of this evidence mult have been equal, if not fuperior, to that of miracles themfelves; and therefore we find the Apo. fles and tirtt preachers of the gofpel, in their addrelfes to them, conftantly appealing to the law and the prophets, whillt they urged upon the Gentiles the evidence of miracles.

In order to form a right judgment of the argument Th for the truch of Clariftianity drawn from the fure word of prophecy, we mult not confider the prophecies given in the Old Teflament as fo many prediftions only indefendent of each other ; for if we do, we fhall totally lofe to fight of the purpofe for which they were originally given, and hall never be able to fatisfy ourfelves when confronted by the objections of unbelievers. It is cafy for men of leifure and tolerable parts to find difficulties in particular predictions, and in the application of them made by writers, who lived many hundred years ago, and who had many ancient books and records of the Jewifl church, from which they drew many paffages, and perhaps fome prophecies; which books and records we have not to enable us to underfand, and to juflify their applications. But it is not fo eafy a matter to thow, or to perfuade the world to believe, that a cliain of prophecies reaching through feveral thoufand years, delivered at different times, yet manifeflly fubfervient to one and the fame adminiftration of providence from beginning to end, is the effect of art and contrivance and religious fraud. In examining the feveral prophe-
(A) This they certainly could not know from the promifes expreffed in the very general tcrms in which they are recorded in the book of Gencfis. It is, however, not improbable that thofe promifes, as they immediately received them, were conceived in terms more precife and patticular; and, at all events, Dr Warburton has proved to the full conviction of every man who is not a determined unbeliever, that Abraham was commanded to facrifice his fon Ifaac, not only as a trial of his obedience, but alfo that God might give him what he earnefly defired, a feenical reprefentation of the means by which mankind were to be redeened from death. The learned writer thinks, and his reafoning compels us to think with him, that to this traniaction our Saviour alludes when he fays, "Your father Abraham rejoiced to fee my dur, and he law it and was glad."
cies recorded in the Old Teftament，we are not to filp－ pofe that each of them expreffly pointed out and cear－ ly characterized Jefus Chrift．Had they done fo，in－ Itcad of being a fupport to religion in general，the pur－ pofe for which they were originally intended，they would have had a very different effeet，by making thofe to whom they were given repine at being placed under difpenfations fo very inferiur to that of the gorpel．We are therefore to inquire only whether all the notices， which，in general and often metaphorical terms，God gare to the fathers，of his intended falvation，are perfect－ ly aniwered by the coming of Chritt；and we fhall find that nothing has been promifed milh refpect to that fub－ jeft which has not been performed in the ampleft man－ ner．If we examine the prophecies in this manner，we fhall find that there is not one of them，which the Apo－ fles have applied to the Mefliah，that is not applicable in a rational and important fenfe to fomethiag in the birth，life，preaching，death，refurrection，and alcenfion of Jefus of Nazarcth；that as applied to him they are all confiftent with each other；and that though fome fev of them mas be applied without abfurdity to per－ fons and events under the Jewifh difpenfation，Chrift is the only perfon that ever exifted in whom they all meet as in a contre．In the limits prefcribed us，it is im． pofible that we floould enter upon a particular proof of this pofition．It bas been proved by umberlefs wri－ tcrs，and，with refpect to the moft important prophecies， by none with greater fuccels than bilhop Sherlock in his Ufe and Intent of Proplecy in the feieral ages of the world； a work which we tecommend to our reavers as one of the moft valuable on the futbect in our own or any other language．

Lut admitting that it would have been improper，for the reafons already linted at，to have given a clear and precife defeription of Chrift，and the Chriltian difpen－ fation，to men who were ordained to live under difpen－ fations lefs perfect，how，it may be akked，comes it to pafs that many of the prophecies applied by the wri－ ters of the gofpel to our Saviour and his actions are fill dark and obfcure，and fo far from belenging evi－ dently to him and to him only，that it requires much learning and fagacity to thow event now the connec－ tion between fome proplecies and the events？

In anfwer to thefe queftions，the learned prelate juft referred to obferves，＂Thit the oblcurity of prophecy does not arife from hence，that it is a relation or deicip． tion of fomething future；for it is as eafy to fpeak of things future plainly，and intelligibly，as it is of things palt or prefent．It is not，therefore，of the nature of prophecy to be obicure；for it may eafily be made， when he who gives it thinks fit，as plain as hifory．On the other fide，a figurative and dark defcription of a future event will be figurative and dark Bill when the event happens；and confequently will have all the ob－ fcurity of a figurative and dark defcription as well after as before the event．The prophet Ifaiah defcribes the feace of Chrif＇s kingdom in the following manner： －The wolf fhall dwell with the lamb，and the leopard fhall lie down with the kid，and the calf and the young lion，and the fatling，together，and a little child thall lead them．＇Nobody，fome modern Jcws excepted， ever underfood this literally；nor can it now be lite－ rally applied to the fate of the gofpel．It was and is capable of differeat interpretations：it may mean tem．

599 ］I＇R O
poral peace，or that interalal and firitual peas－－inat Peryl y． tranquillity of niad，which fets a man ：it peace with God，himelf，and the world．Dut whatever the tre： meaning is，this proplecy docs no more obtinde cns detcrminate fente upon the mind fince the coming of Chrit than it did lefore．But then we f．y，the itwe of the gofpel was very properly preligured in this de－ frription，and is as properly prefigured in a hundred more of the like kind；and lines they all agree in a fai： application to the fate of the gofpe！，we flongly crn－ clude，that this flate was the thing foretold unocr fuch exprelions．So that the argument from proplecy fir the truilh of Chrifianity does not refl an this，that the event has necellarily limited and afcertained the parti－ cular fenfe and mataning of every prophecy；but in this， that every prophecy has in a proper fenfe been completed by the coming of Chrilt．It is abfird，therefure，to expect clear and evident conviction from every fingle prophecy applied to Chrit；the evidence muf arife． from a view and comparifon of all together．＂It is doubtlefs a great mitake to fuppofe that proplecy was intended folely or chiefly for their fakes in whofe time the events predifted are to happen．What great ocea－ fron is thetc to lay in fo long beforehand the evidence of prophecy to convince men of things that are to hap pen in their own times；the truth of which they may， if they pleafe，learn from their own fenfes？Yet fome people are apt to talk as if they thought the trith of the events predicted depended very much on the evi－ dence of prophecy：they fpeak，for inftance，as if they imagined the certainty and reality of our Saviour＇s re－ furrection were much concerned in the clearnef＇s of the prophecies relating to that great and wonderful cvent， and feem to think that they are confuting the truth of his refurrection when they are pointing out the ablur－ dity of the prophecies relating to it．But can any thing be more abfurd？For what ground or pretence is there to itquire whether the prephecies furetelling that the Mefiah thould die and rife again do truly belong to Chrin，unlefs we are firf fatisfied that Chrift died and rofe again？
The part which unbelievers ought to take in this quaftion，if they would make any ufe of propheç， thould be，to thow from the prophets that Chrilt was necclfarily to rife from the dead；and then to prove that in fact Jefus never did rife．Here would be a plain confequence．But if they like not this methnd，they ought to let the prophecies alone；for if Clirift dil not ife，there is no harm done though the prophets have not faretold it．And if they allow the relite－ rection of Chrif，what do they gain by difereliting the prophets？The event will be what it is，let the prophecies be what they will．

Thefe confiderations thow how far the gofpel is nee．f． farily concerned in prophetical evidence，and how ciear the prophecies hould be．Chrilt claims to be the per－ fon foretold in the law and the prophets；and as tru：h muft ever be confintent with ittelf，this cl：im muft he true as well as a！l others．This is the part then to be tried on the cvidence of prophecy：Is Chrift that per－ fon decribed and foretuld mader the Old Tcitament or not？Whetler all the prophecies relating to him be plain． or not plain，it matters little ；the fingle queftion is， Are there enongla plain to flow us that Chrif is the： perfon foretoint ubutr the Old Tefament？Tf there be，

To an infidel of this age, if he has the dime ability and knowledge of hillory that Porphyry had, all the fubeqnent proplecies of Daniel, except thofe which are litll ful wisten in the diys of Antiochus Epiphanes, or of the Maccales, and eftablithes the credit of Duniel as a proFhet beyond contradition, that there are feveral of thofe prophecies which have been fulfilled fince that pe-

But fo mmeafon ble are unbelievers, tiat whilit fome of them object to tine obfority of the prophecies, others have rejeeted then altogether on account of their clearnes, pretending that they are nifories and not preditions. The prophefies agrint which this ohjetion has been chiefly urged are thofe of Daniel, which were firt called in queftion by the fimous Porphyry. He affirmed that they were not compofed by Laniel, whone name they bear, but by iome author who lived in Jule about the time of Antiochus Epiphanes; becaule all to that time contained trme hiltory, but that all the ficts beyond that were manifefly falle.

This method of oppofing the prophecies, as a father jod as well as before; nay, that there are prophecies of Daniel which are fultilling at this very time in the world.

Our limits will not permit us to enter into the objcetions which have been made to this prophet by the suthor of The Literal Schene of Prephecy Confidered; nor is there occafion that we thould enter into them. They have been .ill examined and completely anfwered hy Bithop Chand!cr in his Findicatioz of bis Defence of Clrijliarty, by Mr Samuel Chandler in his Vindication of the Antiquity ani Aubority of Danicl's Propheics, and by Bilhop Newton in his excellent Difertations on "3 from the prophecies. To thefe authors we refer the reader; Gastofthe an! flaill conclude the prefent article with a view of gefone fone prophecies given in very remote ages, which are in are. this age receiving ileir aconmplifhment.

Of thete the firlt is that of Noal conceming the fervitude of the polterity of Canatas. In the greater part nt eriginal menuferipts, and in cur verfion of the holy ic: ipturec, this prophecy is thus exprefed: "Curfed be Cinaan; a fervant of fervants flabll be be unto his brethren :" but in the Arabic verfion, and in fome copies of the Septuagint, it.is," Curfed be Ham the father of Caman; a fervant of fervants thatl he be to his brethren." Whether the curfe was really pronounced upen Han, which we think mof probable, or only apon his fon Canaan, we fhall find the prediction remarkably fulfilled, not barely ages after the book of Genefis was very generally known, but alfo at this very day. It is needlefs to inform any man who has but looked into the Old Tefament, that when the ancient patriarchs pronounced either a curfe or a blefling upon uny of their fons, they moant to declare the future fortunes, not of that ion individually, but of his defeendants as a tibe or a nation. Let us keep this in mind,
and proceed to compare with Noah's prophecy fryt Proy the fortumes of the defcendants of Canaan, the fourth fon of Ham, and then the fortunes of the poferity of Ham by his cther funs.

With the fate of the Cimanites every reader is acquainted. They were conquerel by Johua leveral centuries after the clelivery of this prophecy ; and fuch of them as were not exterminated were by him and Solo. mon reduced to a flate of the loweit fervitude to the Ifraelites, the polferity of Shem the brother of H.an:. The Greeks and Romans, too, whon were the defcendents of Japheth, not only fubdued Syria and Paleftine, but alfo purfued and conquered fuch of the Canaanites as werc anywhere remaining, as for infance the Tyrians and Carthaginians, of whom the former were ruined by Alexander and the Grecians, and the latter by Scipio and the Romans. Nor did the effects of the cuife ftop there. The miferable remainder of that devoted people have been ever fince flaves to al freign yoke; firft to the Saracens who are defcended from Shem, and afterwards to the Turks who are defended from Japheth; and under the Turkifh dominion they groan at this day.

If we take the prophecy as it Itands in the Arabic verfion, its accompliflment is fill more remarkable. The whole continent of Atrica was penpled principally by the pofterity of Him. And for how many ages have the better parts of that country lain under the dominion firlt of the Romans, then of the Saracens, and now of the Turks? In what wickednef, ignorance, barbarity, tlavery, and mifery, live mof of its inhabitants? and of the poor negroes how many thoufands are every year fold and bought like beafts in the market, and conveyed from one quarter of the world to do the work of beafts in another; to the full accomplifhment indeed of the prophecy, but to the lating difgrace of thofe who are from the love of gain the inftruments of fulfilling it. Nothing can be more complete than the execution of the fentence as well upon Ham as upon Canaan; and the hardieft infidel will not dare to fay that it was pronounced after the event.

The next prophecy which we fhall notice is that of Abralam concerning the multitude of his defcendants: which every one knows is ltill fulfilled in the Jews even in their difperfed fate, and therefore cannot have been given after the event of wheh it fpeaks.

Of the fame kind are the feveral prophecies concerning Ithmael; of which fome have been fulfilled, and others are at prefent fulfilling in the molt altonifhing manner. Of this fon of Abraham it was forerold, that " he fhould be a wild man; that his hand thould be again't every man, and every man's hand againtt him; that he fhould dwell in the prefence of all his brethren; that he fhould be multiplied exceedingly, beget twelve princes, and become a great nation." The facred hifrorian who records thefe prophecies adds, that "God was with the lul, and he grew, and dwelt in the wildernef., and became an archer."

To thow how fully and litcrally all thefe proplecies have been accomplithed, would require more room than we have to bellow ; and to the reader of hittory the labour would be fu;:erfluous. We flall therefore only requeft the unbeliever to attend to the hiftory of the Arabs, the undoubted defcendints of Thmael; and to fay how it enmes to puls, that though they have been robbers by land and pirates by fea for time immemo.
ial, though their hands have been a gaint crery man,
and every man's hand againft them, they always have dwelt, and at this day dwell, in the prefence of their brethren, a free and independent peoplc. It cannot be fretended that no aticmpt has cver been made to conyuer them; for the greatef conquetors in the wonld lave all in their turns attempted it: but though fome of them made great grogrefs, not one was ever crowned with fuecefs. It canust be petended that the inaccerablenefs of their coun:ry lias been their protetion; for thair country has heen often penetrated, though it never was entirely fubdued. When in :!ll human probability they lave been on the brink of tuin, they were fignally and providentially delivered. Alexander was preparing an expedition againft them, when he was cut off in the flower of lis age. Pompey was in the career of his conquefts, when urgent affairs called him elfewhere. NXlins Gallius had penetrated far into their country, when a fatal difeafe deftroyed great numbers of his men, and obliged him to returu. Trajan befieged their capital city, but was defeated by thuader and lightning and whirlwinds. Sererus befieged the fame city twice, and was twice repelled from before it. The Turks, though they were able to wref from them their foreign conquefts, have been fo little able to fubdue the Arabs themielves, or eren to reftrain their depredations, that they are obliged to pay them a fort of :unnual tribute for the fafe pafage of the pilgrims who go to Mecea to pay their devotions. On there fadts we fhall not exclaim. He who is not Aruck upon comparing the fimple hiftory of this fingular people with the prophecies folorg ago delivered of them and their great ancenor, whofe love of liberty is compared to that of the wild afs, would tife wholly unmoved from our exclamations.

A fourth prophecy of this kind, which cannot be alleged to have beein uttered after the event, is the denunciation of Mofes againfl the children of Ifrael in cafe of their difobedience; which is fo literally fulfilleJ, that even at this moment it appears rather a biflory of the prefent fate of the Jews, than a remote prediction of their apofacy and punithment. "And the Lord thall fcatter thee among all people from the one end of the earth even unto the other. And among thefe nations fhalt thou find no eafe, meither fhall the tole of thy foot have reft ; but the Lord thall give thee there a trembling heart, and failing of eyes, and forrow of mind. And thy life fhall lang in doubt before thee; and thou fhalt fear day and night, and fhalt have none alfurance of thy life." (Deut. xxviii. $\sigma_{4}, \sigma_{5}, 66$.) "And thou fhalt become an aftonifhment, a proverb, and a bye-word, among all nations, whither the Lord thall lead you." (Deut. xx riii. 37.)

Similar to this, denunciation, but attended with fome circumftarces fill more wonderful, is the following prediation of the prophet Hofea: "The children of Ifrael thall abide many days withont a king, and without a prince, and without a facrifice, and without an image, athd without an ephod, and without teraphim. Atterwards fhall the children of Ifrael retarn, and feek the Vol. XV.

Lord thait God, and Durid their ki. ${ }_{2}$; and full fan $1: y^{*} \because$. the Lord and lis goodnefs in the lutherdys (b)" In this pafinge we find the fate of the Jewa for the lafte 1700 years clearly and ciRialaly deribed with all its circumfances. Irom the time that thes rej:cre il ther Mefliah all thingi bagan to work tward, the de?ruetion of their poitites both civil and relizinus; and viti:in a few yeirs from his death, their cies, temple, and government, were utterly ruincl ; an abey them「.'ve, not carried into a gentli: captivity, t enjoy hasi: law: and live under governors of hair own as they didis Balsylon, but they were fold like leaft, in a marthe, and became fleves in the frime? ferfe; and from the: day to this have had neither prince rer chief amones them. Nor will any cne of thera ever be able, afersall their pretences, to prove his defent from Aaror, of iv fay with certainty whether lie is of the tribe o! ! yata. or of the tribe of Ievi, till he fhall dicover that unknown country where never mankind Awelt, and whese the apocryphal Eftras bas phaced thei: Eratiren of the ten tribes. This leing the cafe, it is imponible iner can bave either an altar, or a facrifice, or a prien? oci, according to the inftution of Mofes, but are cridenily an outcait people living under laws which camot b: Ju. filled.
The caufe of this deplomble cond tion is likemie af. Ant $:=$ figned with the fame perficuity : They are featercd cuufc ul over the face of the earth, becauie ther do not achnow. 2. ledge Chrift for the Mefiah; becanfe they do roo Sabmit to their own king, the the David. In the frophetic writings the name of David is frequen ly givea to the Mefiah, who was to defeend from that pince. Thus Ezekiel, fpeakirg of the kingtom of Chrift, firso "I will fet up one Shepherd over them, and he fhai feed them, even my fervart Duvid; he fhill feed theni, and he fall be their fhepherd." And Jeremiah fiy:, "They fhall ferve the Lord their God, and David their king, whom I fhall raife up unto them."

That in thefeplaces, as well as in the paffage undur conlideration, the Meffiah is meant, is undeniable; for David the fon of Jeffe was dead long before any of the three prophets was born, and by none of them i: is faid, "aiterwards David their king thall come again ;" but "afterwards the children of Iirael ihall return to David their king," they thall zecover froan their thrid infatuation, and feek him whom they have not yet known. By their not receiving Jefus for the Chrill, they have forfeited all claim to the divine favour, and are, of confequence, "without a king, and withent: chief, and without a facrifice, and without an altar, atal withont a priefthood.

The time, however, will come, when they thall re. Their return and feck "the Lord their God and David their turn a": king ;" when they fhall tranble before him whom their furetulu. fathers crucified, and honour the fon cyen as they honour the father. That this part of the prophecy will in time be as completely fulfilled as the other has bean, may be confidently expeited from the wonderful prefervation of the Jews for fo many ages. Scattered es

4 G
they
(E) Such is onr tranflation of this remarkable prophecy; but the Greek verfion of the Seventy has it, perlaps more properly, thus: "The children of Ifrael thallabide many days witl nut a king, and without a chief, an.l without factifice, and without an altar, and without a priefthood, and without promecies. Aferwards," si:

Prophe:y they are over the whole earth, and hated as they are by all nations, it might naturally be thought, that in procefs of time they would have coalefced with thei: conmerors, and have been uhimately abortod and annibilated by the umion, fo that not a trace of them thould now have remained; yet the fact is, that, difperfect as they have ever fince been over the whole face of the g'obe, they have never, in a fingle inftance in any countey, lof their religious or national difinstions; and they are now generally fuppofed to be as numerous as they were under the reigns of David and Solomon. This is eontrary to all hiftory, and all experience of the courfe of human affairs in timilar cales; it has heea boldly and jufty fyled a tanding miracle. Within 1000 or 1200 years back, a great variety of extrao:dinary and important revolutions have taken place among the mations of Europe. In the fouthern part of Bitain the Britons were conquered by the Sasons, the saxons by the Danes, and the Danes and Saxons thy the Normans; but in a few centuries thefe oppofite and hontile nations were confolidated into one indifincuilhable mafs. Italy, about the fame time that Britain was fuldued by the Saxons, was conquered by the Goths and Vandals: and it is not eafy to conceive a more flriking eontraft than that which fubfifted between the polilhed inhatitants of that delighteful country and their firage invaders; and yet how foon did all diftinc. thin ceate between thim! In France, the Reman colories gradually allimilated with the ancient Gauls; and ia spain, though the Moors continued for feveral ages, and till their final expulfion, a diftinct people, yet atter they were once reduced to a tate of fubjection, the:r numbers very fenfibly diminilhed; and fuch of them as "cre fuffered to remain after their laft overchrow have been long fince fo blencled with the Spaniards that they fannot now be dilinguifhed. But with regard to the fewi, the wonder is, that though they do not in any commery where they are fettled bear any proportion to the natural inhabitants, thougl they are univerfally reduced to a flate of the loweit fubjection, and even exprifed to hatred, contempt, and perfecution; yet in no Entance does there feen to be the leatt appearance or protability of their numbers being diminifled, in no initance do they dificover any decay of attachment to their religicus principles. Whence then comes it that this people :hone, who, having no form of goverment or a republic any where fubfifing, are without the means by which other people are kept united and diftinct, fhould a'1 be preferved among fo many different nations? How comes it, when they have been thus fcattered into fo many diftant corners, like duft which cannot be purceived, that they fhould till follong furvive the dinolution of their own fate, as well as that of fon many sthers? To thefe quelions the anfwer is obvious: They are preferved, timat, as a nation, "they may return and feek the Lord their God and David their king, and fear the Lord and his goodnets in the latter days."
Tive might here fubj: in many prophecies both from the O:d and the New Tefament, and efpecially from the writings of St Paul and St Jobn, which fo clearly defribe the various fortunes of the Chritian church, her progrefs to that fate of general corruption under which the was funk three ceninties ago, and her gradual eftoration to her primitive puity, that they cannot be fippofed to proce ed from the cumiang craftinefs
of men, or in have lieen written after the events of which they fpeak. 'To do juflice to there, howcycr, would require a volume, and many excellent volumes have been written upon them. Thie reader who wilhes for fitisfation on to interefling a fubject will do well to confult the writings of Mr Mede and Sir If face Nev:ton, together with Bithop Newton's Dififrtations, and the Sermons of Hurd, Halifax, and Bagot, preachcd at Wab burton's lecture. We thall only obferre, that one of the ableft reafoncrs that Great Britain ever produced, after having paid the clofelt attention to the prediations of the New Teftament, hath been bold enough to put the truth of revealed religion itfelf upon the reality of that prophetic fpirit which foretoid the defolatinn of Chrift's church and kingdom by antichrit. "If (hays he), in the days of St Paul and St John, there was any footftep of fuch a fort of power as this in the world; or if there had beevany fuch power in the wold; or if there was then any appearance or probability that could make it enter into the heart of manto imagine that there ever could be any fuch kind of power in the world, much lefs in the temple or church of Gool; and if there be not now fuch a power astually and confoicuoully exercifed in the world; and if any piature of this power, drawn after the event, can now defcribe it more plainly and exacty than it was orig:nally deferibed in the words of the propheir-ithen may it, with fome degree of plaufibility, be duggefted, that the prophecies are nothing more than enthuliaftic imaginations."

Upon the whole, we conclude with Bifhop Sherloek, that the varions prophecies tecorded in the Holy Scriptures were given, not to enable man to forefee with eleamefs future events, but to fupport the feveral difpenfations of religion under which they were refpective$I_{y}$ promulgated. The princip:al prophecies recorded in the Old Teftament led mankind to hope for a complete deliverance from the curle of the fall; and therefore tended to fill their minds with gratiude, and to enforce a cheerful obedience to that God who in the midft of judgment remembereth nerey. The propheeies, whether in the Old or New Teftament, that pourtray the prefent tate of the Jews, and the various fortunes of the Chriflian chureh, as they are daily fulfilling in the profence of all men, are the Itrongeft poffible proof of the divinity of our holy religion, and fupply to us in the latter days the place of miracles, by which it was at firt eftabliflied.

PROPHET, in general, a perfon who foretels future events; but is particularly applied to fuch infpired perfons among the Jews as were commifinned by God to declare his will and purpofes to that people. Among the canonical books of the Old Teftament we have the writings of 16 prophets, four of whom are denominated the greater proppets, viz. Ifaiah, Jeremiah, Ezekiel, and Daniel; fo called from the length or extent of their writings, which exceed thofe of the others, viz. Hofen, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zecha:iah, and Malachi, who are called the ief rprophets, from th:e thortnefs of their witings. The Jews do not place Dimiel among the prophets, becaufe, they fay, he lived the life of a courticr rather than that of a prophet. An afcount of the feveral writings of the prophets may be feen each under its particulat head. See the article Isaidh, \&cc.

Sous of the Propnets, in feripture hifory, an appellation giver to young men who were educated in the rtion fchools or colleges under a proper malter, who was comnoonly, if not always, in infpired prophet, in the kowladge of religion and in facred mulic, and thus were qualifed to be public preachers; which feems to lave been part of the bulinets of the prophets on the Sabbath-days and feftivals. It is probable that God generally chole the proplets, whom he infpired, out of thefe fchools. See Prophecy.

PROPITIANION, in theol ayy, a facrifice offered to God to alluage his wath and render him propitions. Among the Jews, there were both ordinary and public facrifices, is holocaufts, cic. oflered by way of thankfgiving; and extriordinary ones, offered by particular perfons guilty of any crime, by way of propitiation. the Romifh church believe the mafs to be a facrifice of propitation for the living and the dead. The reformed churches allow of no propitiation but that one offered by Jefus Chrift on the crofs. Sec Sacrifice.

PROPITIATORY, any thing rendering God propitious; as we fay prosifiatory facrifices, in contradithinction to facritices which were euchariftical. Among the Jews the propitiatory was the cover or lid of the ark of the covenant; which was lined both within and withoutlide with plates of gold, infomuch that there was no wood to be feen. This propitiatory was a type or figure of Chrift, whom St Puul calls the propitiatory ordained from all ages. See $A_{\text {re }}$ of the Covenant.

PROPOLIS, the name of a certain lubftance more tenacious than wax, with which the bees fop up all the holes or cracks in the fides of their hives. See Bee, $11^{\circ} 13$.

PROPONTIS, or Sea of Marmora, a part of the Mediterranean, dividing Europe from Afia; it has the Hellefpont or canal of the Dardanelles to the fouthwelt, whereby it communicates with the Archipelago, and the ancient Bofphorns of Thrace, or Strait of Confantinople, to the north-ealt, communicating with the Black or Euxine Sea. It has two cafles: that on the Afia fide is on a cape, where formerly ftood a temple of Jupiter. The caftle of Europe is on an oppofite cape, and had anciently a temple of Serapis. It is 120 miles long, and in fome places upwards of 40 miles broad.

PROPORTION, the identity or fimilitude of two ratios. Hence quantities that have the fame ratio between them are faid to be proportional? ; e. gr. if $A$ be to B as C to D , or S be to + as 30 to $15 ; A, \mathrm{~B}, \mathrm{C}, \mathrm{D}$, and $8,4,30$, and 15 , are faid to be in proportion, or are fimply called proportionals. Proportion is frequent. Iy confounded with ratio; yet have the two in reality very different ideas, which nught by all means to be diltinguifhed. Ratio is properiy that thation or habitude of two things, which determines the guantity of one from the quantity of another, withont the interven. tion of any third: thus we fay the ratio of 5 and 10 is 2 , the ratio of 12 and 24 is 2 . Proportion is the famenefs or likenefs of two fuch relations: thus the relations between 5 and 10 and 12 and $2+$ being the fame, or equal, the four terms are faid to be in propotion. Hence ratio exills between two numbers, but proportion requires at leaft three. Proportion, in fine, is the habitude or selation of two ratios vihen compared toge-
ther ; as ratio is of two quantitics. Scc Aifarra, $A=3$ ritumetic, and Gemmeiry.

Arithmetical and Gesmetrica! Prolokilow. Sà Irocression.

Harmonical or Mrufical Proportion is a hind of rat meral proportion formed thus: of three nur.bes , if ile : lirft be to the third as the dillicence of the fint and frcond to the differcnce of the fecond and thind; $t$ ? : three numbers are in farmonical preportion.
'1hus 2, 3, 6 , are himmonical, bccaufe $2: 0,::: 3$. So alio four numbers are harmonical, when th: that is to the fourth as the diference of the firf and fecond to the diffesence of the third and fourth.

Thus $24,16,12,9$, are hammonical, tecanfe $2 f: 1$ $:: 8: 3$. By continuing the proportional terms in $t 1:$ firt cafe, there arifes an harmonical progrenien or f:ries.

1. If three or four numbers in harmonical proportion be nultiplied or divided by the lame number; the products or quotients viil alfo be in harmonical proportion: thus, if $6,8,12$, which are hamonical, te divided by 2 , the quotients 3,4 , 6 , are allfo barmonical ; and reciprocally their produsts by 2 , viz. 6,8 , 12.
2. To find an harmonical mean betwcen two num. bers given; divide double the product of the two numbers by their fum, the quotion: is the mean required; thus fuppofe 3 and 6 the extrenes, the prodnct of theie is 18 , which doubled gives 36 ; this divided by 9 (the fum of 3 and 6) gircs the quotient 4 . Whence 3,4 , 6 , are harmonical.
3. To find a third harmonical proportional to two numbers given.

Call one of them the firft term, and the other the fecond: multiply them together, and divide the product by the number remaining after the fecond is lib. tradted from double the firt; the quotient is a third harmonical proportional: thus, fuppofe the giventerms 3.4 , their product 12 divided by 2 (the remainder after 4 is taken from 6, the double of the fi: $f$ ), the quotiert is 6 , the liarmonical third fourcht.
4. To find a fourth harmonical proportion to tliree terms given: multiply the firt into the thind, and divide the product by the number remaining aftor the middle or fecond is fubtracted from double the fiff; the quotient is a third harmonical proportion; thus fuppofing the numbers $9,12,16$, a fourth will be found by the rule to be 24 .
5. If there be four numbers difpofed in order, whereof one extreme and the two middle terms are in arithmetical proportion; and the fame nidatle ternis with the other extume ate in harnonical proportion, the four are in geometrical proportion ; as here $2: 3:: 4: 6$, which are geometrical; whereof $2,3,4$, are arithmerical, and $3,4,6$, hamonical.
6. If betwist any two numbers you put an arihmes. tical' mean, and affo an harmonical one, the four will be in geometrical proportion: thus betwiat 2 and 6 an arithmetical mean is 4 , and an hamonical one 3 ; and the four $2: 3:: 4: 6$, are geometrical.

We have this notable difference between the thire: kinds of proporion, arithmetical, harmonical, and genmetrical ; that from any given number we can rotie at continued arithmetical feries inctafing in is him : $\mu$, but $\div G=$ not

Propntion not dicreafing: the larmonical is cecreatable in infuniI tum, but not increa!able; the geometrical is both.

## Raiprocal Paerofticer. See Rechprocal.

Mroportion is alf, ufed for the relation between unerual things of the fame hind, whereby their feveral pints correfpend to each ctlier with an equal augmen. tation ar diminution.

Thue, in reducing a figure into litele, or in enlarging $i$, cure is taken to obferve an equal diminution or enlargement, through all its parts; fo that if ore line, e. $\mathrm{gr}^{r}$. be contrated by one.th:ird of its length, all the relt fhall be contracted in the fame proportion.

Proportion, in architeciure, denotes the jult mag. r.itude of the members of each part of a building, and the relation of the feveral parts to the whele ; e. gr. of the dimenfirns of a column, \&c. with tegard to the ordenance of a whole building.

Onie of the greatelt differences among architêts, M. Perrault obferve, is in the propertions of the heights of entablatures with refpect to the thichnefs of the columns, to which they are always to be accommodaled.

In effet, there is fcarce any work, either of the ancients or modernc, wherein this proportion is not different; fome cntablatures are cven hear twice as high as rthers:-yet it is ceatain this proportion ought of all others to be mofl regulated; none being of greater importance, as there is none wherein a defect is fooner fpied, nor any wherein it is more fhocking.

Compa's of Prorortion, a name by which the French, and after them fome Englifh, authors call the Secรก?.

PROPORTIONAL, relating to proportion. Thus we firy, propertional compaffes, parts, fcales, fpirals, \&c.

Proportionals, in geometry, are quantities, either iis ear or numeral, which bear the fame ratio or relation to each other.
PROPOSITION, in logic, part of an argument where:n fome quality, either negative or pofitive, is attributed to a fubject.

Propasitiov, in mathematics, is either fome truth atvanced and thown to be fuch by demonfration, or fome opera ion propefed and its folution fhown. If the propofition be deduced frem feveral theorctical definitions compared together, it is called a theorenz; if from a praxis, or feries of operations, it is called a problun. See the atticles Thenrem and Proelem.

Proposition, in oratory. See Oratory, $\mathrm{n}^{\circ} 28$. $1 \approx+$ 。

Proposition, in poetry, the firf part of a poem, wherein the author prepofes brieHy, and in general, what he is to fay in the body of his work. It fhould comprehend only the matter of the poem, that is, the action and perfens that â̂. Horace prefcribes modefy and fimplicity in the propofition, and would not have the poet promife ton much, nor raife in the reader too great ideas of what he is going to relate.

PROPREFEC' $\Gamma$, among the Romans, the prefeft's lieutenant, ro an officer whom the perfect of the preintium comnifioned to do part of his duty in his place.

PROPRETOR, a Roman magilrate, who, having difcharged the oflice of pretor at home, was fent into a province to command there with his former pretorial auhority. It was alfo an appelldtion, given to thofe who, withont having been pretors at Rome, were fent extraordinarily into the provinces to adminifer juftice with the authority of pretors.
proprietor, or Proprietary, is he who poffeffes any thing as his own in the utmolt degree. Shach monks were called propritary as had referved goods and effects to themfelves, notwithotanding their formal renunciation of all at the time of their profefion. They are frequently mentioned in the Mona?. Anglic. \&cc. and were to be very feverely dealt with; to be excommunicatcd, deprived of burial, \&c. Monachi proprietarii excommuniccinur ab abbatibus: et, $f_{2}$ in mot te proprictarius inventus fucti, collffiffica carcat fopulura, \&c. Addit. ad Matt. Par.

PRO RATA, in commerce, a term fometimes ufed by merchants for in proprtion; as each perfin mult reap the profit or fuftain the lofs, pro rata to his interef, that is, in proportion to his ftock.

PROROGATION, the ade of prolonging, adjourning, or putting off, to another time. The difference between a prorogation and an adjournment of parliament is, that by prorogation the feffien is ended, and fuch bills as paffed in either houfe, or both houfes, and had not the royal affent, muft at the next affembly begin again.

PROSCRIPTION, a publication made in the name of ihe chief or leader of a party, whercby he promifes a reward to any one who fhall bring him the head of one of his enemies.

Sylla and Marius by turns proferibed cach other's adherents - Under the triumvirate a great part of the teik and braveft of the Romans fell by prefcription.

The term took its tife from the practice of writing down a lift of the perfons names, and pofing it in public; from pro and fcribo "I wite."

PROSE, the natural language of mankind, I oofe and unconfined by poctical meafiures, rhymes, \&c. In which femfe it itands oppofed to verfe.

There is, however, a fpecies of profe which is meafured, fuch as that in which epitaphs and other inferiptions are generally written; and indecd every man who has formed for himfelf a fyle writes in un'form periods regulatly recurring. It has been much difputed whether a poem can be writen in profe. We enter not into that difpute, as we have faid enough on the fubject elfewhere. See Novel.

The word profe corres from the Latin profa, which fome will have derived from the Hebrew poras, which fignifies expendit: others deduce it from the Latin prorfu, of prorfus, "going forwards;" by way of oppofition to verfa, or "turning backwards," as is neceflary in writing.

PROSECUTION, in the criminal law. The next ftep towards the punithment of offenders after Commit. MENT, is their profeculion, or the manner of their formal accufation. And this, in the Englifh law, is either upon a previous findirg of the fact by an inqueft or grand jury ; or without liach previnus finding.

The former way is either by Presentment or Indictment. See thefearticles.

## 1RO [ 0 ; ] PRO

## iclu:nr

The remaining methou's of profecution are without previcus minuing by a jury, to fix the aluhoritative the ${ }^{2}$ berminilitude upon the acculation. Ore of quit's t'se manose, that is, with the thing folen ufon him, in murt. For he might, when fo detceted, fengraike dilito, be brought into cont, arraigned, and tiied, without indionment: as by the Danilh law he might be taken and hanred upon the foot withont accuftion or trial. But this procedling wa; tiken away by feveral Aatutes in the reign of Edward III. thongh in Scotlind a fimilar procefs rem:ans to this day. So that the only fpecies of proceeding at the fitit of the king, without a previous indiament or prefentment by it grand jury, now feems to be that of Information; which fee.

Thefe are ail the methods of profecution at the fuit of the king. There yet remains ancther, which is merely at the fuit of the fubject, and is called an Appeal. Sce that aticle.

But of all the methods of profecution, that ty indictment is the moit general. Sce Indictmfnt.

PROSECUTOR, in law, he that puffues a caufe in another's name.

PROSEIYTE, a new convert to fome religion or religious fea.

PROSERPINACA, in botany: A genus of the trigynia order, belonging to the triandria clats of plants; and in the natural nicthod ranking under the 1 gth order, Inundata. The calyx is tripartite fupetior; there is no corolla; there is onc trilecular feed.

PROSERPINE, in fabulous hiftory, the daughter of Jupiter and Ceres, was carried off by Pluto as the was gathering flowers with her compinions. Ceres, difeonfolate for the lofs of her daughter, after having long fought her, heard where the wate, and intreated Jupiter to let her retum from hell. This requett Jupiter granted, on condition fhe had talled nothing in 1'lato's dominions. Ceres therefore went to fetch her ; but when her daughter was prepaing to retum, Afcalaphus gave information that he had feen I'roferpine eat fome grains of a pomegramate the had gathered in Pluto's garden ; on which the was fentenced to continue in Tartarus in quality of Muto's fpoufe, and the queen of thofe gloomy regions: but to mitigate the grief of Ceres for her difappeinemert, Jupiter granted that her daughter lhould only fpend fix months together in hell with her hulband, and the other fix on carth with her mother.

Some mythologits imagine that the latter part of the fable alludes to the corn, which mutt remain all the winfer hid in the earth, in order to fpout farth in the fpring, and produce the havelt.

PROSEUCHE, in autiquity, properiy fignifies prayer ; but it is taken for the places of prayer of the 'Jews, and was pretty near the fame as their fynagegues. But the fynagogues were originally in the cities, ard were covered places: whereas, for the moft part, the frofeuches were ont of the cities, and on the hanks of fivers; having no covering, except pellaps the thade of fome trees or covcred gallcries. The word is Greet, тpresun frayer.

PROSLAMBANOMENE, the name of a mufical rete in the Greck fyitom.

As the iwo tetrachords of the Greeks were conjunc-
tive, or, in ohise words, as the highen note of the fult Picfocy ferved likewife for the lowat note of the fecond, it is plain that a complete oftare could not be formed. To remedy this deficieney, therefore, one note beneath the lowelt tatrachord was added, as an ofave to the higheft of the lat tetrachord. Thus, if we fuppofe the fuit to have begun oas B, the lait mut have ended upon A, to w's'c's one note fubjoincel immediately beneath the loweft B in the ditatic or jer muth have formed an oftave. This note was called proflumbanome. Lit it burecy's appzars fiom authors who have forninized antiquity Hił. nf with fome dilizunce, and perhaps with as much fuccets as the data upon which they proceded could produce, that the names of the notes in the Grec'e fytem, whith originilly fignined their natural fation in the feale of afcending ur defeending founds, were artcrwards appliad to their poltions in the lyre. Highor or lawer. then, according to this appication, did not hognity their degrecs of acutenefs or gravity, but their higher or lower fituation upon this inftrument.

PROSODY, that part of Erammar which treats of the quantities and accents of fyllables, and the mannet of making verfes.

The Englifh profody turns chiefly on two ilinge, numbers and rhyme. Sec loetry, $n^{\circ}$ 60́- -6 . and Partlll.

PROSOPIS, in botany: A genns of the monogyni. order, belonging to the decandria claf; of platts. The calyx is hemifpherical and guadridentate; the ligmar is fimple; the legumen inflated and monofermous.

PROSOPOPEIA, a figure in oratory, whereby we raife qualities of things inanimate into perfons. Sce Oratory, p. 539 and 452.

PROSTATAS, in anatomy, a rland, seneral?y furporel to be two feparate bodies, though in reality but one, fituated jult before the neck of the bladder, and firrrounding the beginning of the urcthra. See Anatony, p. 738.col. 2.

PROSTYLE, in architecture, a range of columes in the front of a temple.

PROTAGORAS, a famous Greek philofopleer, was born at Abdera. In his youth, his poverty obliged Enfield's him to fubmit to the fervile office of frequently car-Hifinry of rying logs of wood from the neighbouring fields to PhilofoAbjera. It happened, that as he was one day going phy Vol. 1. on brikly towards the city under one of the: loads, he was met by Democritus, who was particnlarly ftruck with the neatnels and regularity of the bundle. De. firing him to ftop and reft himfelf, Democritus es. amined more clofely the fructure of the load, and found that it was put together with mathematical crainnefs; upon which he afked the youth whether he himfelf had made it up. Protagorus affured him tha: he had; and immediately taking it to pieces, with great eafe replaced every leg in the fame exact crder as before. Democritus expreffed much admiration of his ingenui:y: and faid to him, "Young man, follow me, and yout talents thall b: employed upon greater and better things." The gouth confented, and Democritus took him lome, maintained him at his own expence, and tanght him philofophy, which qualified him for the office of legiflator of the Thurians. He was more fubtile than folid in his rafonings; however, he taught ai Athens with grat reputation, but was at length

## PRO

Yrotafis length banithed from thence for the impiety of his doctrines. He then travelled, and vifited the iflands in the Mediterranean, where it is faid that he was the fiff philufopher who taught for money. He died in a voyage to Sicily, in a very advanced age. He consmonly reatoned by dilemmas, and left the mind in fufpenfe with refpect to all the gueftions, he propofed. His moral principles were adopted by Hobbes. (Sce Moral Phinosorhy). Plato wrote a dialogue againit lim. He tlourimed 400 years B. C.

ProTASIS, in the ancient drama, the firf part of a comic or tragic piece, wherein the feveral perfuns are thown, their characters intimated, and the fubject of the piece propofed and entered upon.

It might reach as far as our two firf afts; and where it ended the epitafis commenced. Sce the article Lipitasis.
Protea, the Silver-tree: A genus of the monogynix order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 4 th order, Stellatic. There is cne quadrind petal firlounding the germ; there is no proper calyx; the reeeptacle is paleaceous. There are 36 fpecies, all natives of the Cape of Good Hope; of which the mott remarkab.c are, 1. The conifera, with linear, fpearthaped, entire leaves, grows to the heizht of 10 or 12 feet, with a ftraight regular them. The banclies naaurally form a lage regular hatad. The leaves are long and ndrrow, of a hhining filver colour; and as they remain the whole year, make a fine appearance in the greenhoufe. 2. The arrenta, commonly callcif filver-tree, has a ftrong upright fem coverel with purplith bark, dividing into feveral branches which grow erect, garnifhed with broad, thinag, filvery leaves, which nake a fine appearance when internixed with wher exotics. Through the whole year it exhibits its gloffy white or filvery leaves. It has at firl a very uncommon and beautiful appearance, and fometimes in the courfe of 12 or $: 5$ years teaches the lheight of 20 feet, which it never eaceeds. In a rich foil it grows wice as quick, and is by far the largeft of the protea kind. They are gencrally planted near fone farms,

* Voyage and very feldom grow wild; Mr Sparman * thinks it if Gool
Hope,
vol. i.

1. 33 . was probably brought to the Cape of Good Hope from
Ansmaquat, for he had travelled over the whole northeant fide of Hottentot's H. Hland, without finding it either in its wild late or phinted. 3. The nitida, or wageboom, greatly refembles the fecond fort : the leates are very ilky :und white, with erect purple branches.

All thefe plants, being tender cxotics, require to be continually kept in the greenhoule during winter. The firl may be propagated be cuttings, whith the uld be cut off in Aprit, juit bufore the plants begin to thout ; the fecond and third forts may be propagated by feeds.

PROTECTOR, a perion who undertakes to fhelter and defent the weak, helplefs, and diticied.

Every Catholic mation, and every religious order, has a protector refiding at the court of Rome, who is a cardinal, and is calied the cardinal protctor.
Protektor is alfo fometimes ufe! for a regent of a hingdom, made choice of to govera it during the minority of a prince.

Cronswell affumed the title and quality of lord protceHA, of the commonaverlh of Euglend, Scs.

PROTESILAI turris, the fepulchre of Protefi- Protefili laus, with a temple, at which Alesander facrificed, (Avian) ; fituated at the fouth extuemity of the Hellepont, neest the Chenfonefus Thracia. Protefilans was the firnt Creek who landed on the coan of Troy, and the finl Greck nain by the Triman, (Homer, Ovid.) IIs wifc Ladamin, to afoage hicr grict, begged the gods for a light of lis fhade; and obtaining her requeft, fhe expircd in his cmtraces, (Hyginus.) Proteflhas was aifo called P'bylacides, from Phylace, a town of Theflals.

PROTLEST, in law, is a call of witnefs, or an open affimation that a perfon does, either not at all, or but conditionally, yield his confent to any act, or to the proceeding of any judge in a court in which his jurildistion is doubtful or to anfwer upon his oath farther than lee is bound by law.

Any of the lords in parliament have a right to protef their diffent to any bill paffed by a majority: which proteft is entered in form. This is faid to be a very ancient privilegs. The commons have no right to protef. Sie Parliament.
Protest, in commerce, a fummons written by a notary-public to a merchant, banl:cr, or the like, to accept or difeharge a bill of exclange drawn on him, after his having refufed either to accept or pay it. See Bill of Excharg.
PROTESTANT, a name firt given in Germany to thofe who adhered to the doctrine of Luther; becaufe in 1529 they protefted againf a decree of the Emperor Charles V. and the diet of Spires; decharing that they appealed to a general council. The fame name has alfo been given to thofe of the fentiments of Calvin; and is now become a common denomination for all thofe of the reformed churches.

PROTEUS, in heathen mythology. See Ecypt, $\mathrm{n}^{\circ} 6$.

PROTHONOTARY, a term which properly fignifies furf nutary, and which was amciently the title of the principal notarics of the emperors of Conftantinoplc.

Prothonotary, in England, is ufed for an officer in the court of king's bench and common-pleas; the former of which couits has onc, and the latter three. The prothonotary of the king's.bench records all civil actions fued in that comt, as the clerk of the crown-ofice does all chiminal caufes. The prothonotaries of the common pleas erter and enrol all declarations, pleadings, allizes, judernents, and actions: they alfo make out all judicial writs, except writs of labeas corpus, and dififrigus jurator, for which there is a parti:uar oflice, called the buticas corpora offue: they likcwite enter $1 \mathrm{e}-$ cognizances acknowletged, and all commun recoveries; mate exemplifications of records, \&cc.

In the court of Rome there is a college of 12 prelates, called apyfolical prothonotaries, impowered to receive the laft wills of cardinals, to make all informations and pruceedings neceflary for the camonization of faints, and all fuch acts as are of great confequence to the Papacy : for which purpofe thes have the right of admition into all confiteries, whether public or half public. They alio attend on the pope, whenever he performs any extraordinary ceremony out of Rome.

PROTO, a Greek term, frequently wfed in con?pofition of prionity: thus, froto-cellum, in the ancient ju: icrudence,
 martyr, the firlt nartyr; protophaft, the firtl man formed, Ecc.
PROTOGENES, a celebrated anciont painter, was born at Caunas, a city of Carin, fubjest to the Rho. dians, and flourith d 300 years before the birth of our Saviour. He was at firt obliged to paint thips for his livelihood; but afterwards acquired the higheft reput.tion for hiftory-painting ; though Appetles blamed him for finilhing his pieces too highly, and not knowing when to have done. The linett of his pitures was that of Jalitus, which is mentioned by leveral ancient authors, though mone of them give any defoription of it. Hic worked feven years on this picture; during which time he lived entirely upon lupines and water, being of opinion that this light and fimple nourilhment left him greater freedom of fancs. Apelles, on feeing this picture, was Aruck with fuch admiration, that he was unable to fpeak, or to find words fufficient to exprefs his idea of its beauty. It was this pisture that faved the city of Rhodes when befieged by Demetrius king of Macedon ; for being able to attack it only on that fide where Protogenes worked, which he intended to burn, he chofe rather to abandon his defign than to deltroy fo finc a piece. Pliny fays, that Apelles afking him what price he had for his pictures, and Protogenes naming an inconfiderable fum, Apelles, concerned at the injutice done to the beaty of his productions, gave him 50 talents, about 10,000 l. for one picture only, declaring publicly that he would fell it for his own. This generofity made the Rhodians fenfible of the merit of Protogenes; and they were fo eager to purchafe the picture Apelles had bought, that they paid him a much greater price for it than he had given.

PROTOTYPE, is the original or model after which a thing was formed; but chiefly uled for the patterns of things to be engraved, calt, Sic.

PROTRACTOR, an inttument for laying down and meaturing angles upon paper with accuracy and difpatch; and by which the ute of the line of chords is fuperfeded. This intrument is varioully formed, as femicircular, reqangular, or circular; and conteructed of differ ent materials, as braif, ivory, \&c. It is neceffiry in laying down thefe furveys or other plans where angles are concerned. For the femicircular protractor, and its utc in laying down and meafuring angles, fee Geometri, p. 676. prop. xx. Sic.

The rectangular protractor is conftucted in form of a right-angled parallelogram, which, when applied to a cale of mathematical inftruments, is fubftitured in place of the femicircular protracter and fale of equal parts. Fig. 1 . is a reprefentation of it : the mamer of ufing it is exactly fimilar to that of the femicircular one.
The circular protractor, as its name inmplies, is a complete circle, and is fuperior by far to either of the former, both in point of accuracy and difpatih, efpe. cially when feveral angles are to be formed at the fame point. The limb of this inftument is divided into 360 degrees, and each degrce in fume protrafors is halved: it has a fubdividing fale or vernicr, by which an angle may be laid down or meatured to at fingle minutc. In the centre of the protractor is a fine mark, which, when an ang! is to be protracted or meafured,
is to be laid upon the angnlar point, and o, or zero on Piotrathor. the limb, upon the given linc forming one lide of the angle.

Fig. z. reprefents a circular protractor whofe limb is divided as above defcribed, and the dividing fale on the index, which moves romid the limb of the protractor on a conical centre, gives every minute of a degree. That part of $t c$ index begond the limb has a fleel point fireed at the end, in a dirca line with the centere of the protrat. $r$, and whofe ufe is to prick oft the propoled angles.

Firg 3. is another circular protrator, a little differently confruged from the former. 'The central puint is formed by the interfection of two lines crolling each
 The limb is divided into degrees and half degrees, having an irdex with a vernier graduated to count to a lingle minute, and is fumifhed with a tooth and pinion, by means of which the index is moved round by turn. ing a fmall atut. It has two pointers, one at cach end of the index, furnilked with fpings for leeping them fufpended while they are bringing to any angle; and being brought, applying a finger to the top oi the pointer, and prefing it down, pricks off the ande. There is this advantage in having two pointers, that all the bearings round a circuit may be laid or priched off, although the index travenfes but one half of the protractor.

Another circular protractor, different from tither of the former, is reprefented at fig. 4 . The centre is alfo formed by the interfecticn of two lines at right angles to each other, which are cut on glafs, that all paralla: may thereby be avoided. The index is moved rund by a tooth and pinion. The limb is divided into degrees and hati degrees, and fubdivided to every minute by the vernier. The puinter may be fit at any convenient difance from the centre, as the focket which carrics it moves upon the bar BC, and is fixed thereto by the nut 1 , at sight angles to the bar $B C$, and moveable with it. There is another bar EF: On this bar different feales of equal parts are placed; lo that by moving a fquare ngainft the inner edge thereff, angles may be transferred to any difance within the bimits, from the centre containing the fume number of degrees marked ont by the index.

It would indeed be fuperflunus to deforibe any more of thefe circular protractors, efpecially as the little altcrations in then depend very much upon the fancy of the artit. Suffice it however to fay, that we have feen others titl differently confructed, one of which we fhall brielly defcribe. The divilions upon the limb of this inftunient are fimilar to thote already deferibed; but the index is a ftraight bar continued to fome confiderable dift:mee each way beyond the limb of the inftrument, and has a vernier to thow minutes as ufual; a mark upon one of the edges of the index always coincides with the centre of the inftrument. InAcad, therefore, of pricking down the angle as in the former, part of the line containing the angle may be drawn, which, although perhaps not fo atcorate as a point, is more confpicuons, and the line is edfly completed upon removil of the protractor. The common dimenfions of the circular pat of thele inltruments is from dix to ten inches diameter; and they are made of brafs.

PROTUBERANCE 2

## PRO

Protube. rarice fil Drevidasice

PROTUBERANCE, in anatomy, is any en:incnec, whether natual or preternatural, that projects of advauces out beyond the reft.

PROVEDITOR, an officer in feveral parts of Italy, particularly at Venice, who has the direction of matters relating to policy.

1ROVELCE, a province or government of Frane, bounded by D.uphine on the north, by Piednont on the eaff, by the Meditermean on the fouth, and by He tiver lithone, which feparates it from Languedoc; on the wolt : it is about 100 miles long, and near as many broad.

PROVEND, or Protender, original!y fignified a hind of veffel contaning the meafure of com daily given to a loorfe, or other beaft of labour, for his fublittence; but is now genemily uied to fignify the food for cattle, whatever it is.

PROVERB, according to Cambden, is a concire, witty, and wife ipeech, grounded uponexperience, and tor the molt part containing fome ufful inftruction.

Soon' of Proverbs, a canonical book of the Old T'eftament, contaning a past of the proverbs of Solomon the fon of David king of Ifrael. The firft 24 chapters are acknowledged to be the genuine work of that pince; the next five chapters are a collection of feveral of his proverbs made by order of king Hezeliah; and the two laft feem to have heen added, thourg belonging to different and unknown authors, Agur the fon of Jakeh, and ling Lemuel.

In this excellent book are contained ru!es for the conduat of all conditions of life; for lings, courtiers, mafters, fervants, fathers, mothers, Children, \& \& .

PROVIDENCE, the fuperintendence and eare which God exercifes over creation.

That there exifts a divine providence which attends to the affairs of this world, and directs their courfe, has been a received opinion among the human race in every country and in every period of hiftory. Every altar that is erected, every prayer and every facrifice that is offered up, affords a proof of this belief. So fully have men been convinced of the fincerity of each other's faith upon this fubject, that in one firm, that of an appeal to the Divine Kulcr of the world, by the folemnity of an oath, they have introduced it both into the molt ordinary and the molt important butuefs of life.
This univerfal convition of men of all degrees of knowledge, fiom the mof profound philofopher to the rudeft barbatian, is probably to be traced to fome primaval tradition, never totally effaced from any mation under beaven. The truth iffelf, however, is fufceptible of the moft complete proof from principles of fcience. If the woild had a beginning, it may obvioufy have an end, and can be continued in exittence only by the conflant energy of that power by which it was at firft crea ied. He therefore who achowiledges a craation and denies a providence, involves himfelf ia this palpable contradiction-" that a fy'fem, which of i:felf had not an original and momentary exiftence, may yet of itfelf have a perpetual exiftence; or that a being which canunt of itfelf exilt for a fecond of time, may yet, of itfelf, exiff for thoufinds of ycars!" Or fhould we be fo complaifant, as for a moment to fuppofe, with certain theites, ancient and modern, that the matter of the univere is icle exifent and ctenal, and that the power of

God was exe:ted, not in creating fubftances, but in re Provid, ducing the criginal matter frem a ftate of chaos into that beautiful order in which we fee it arranged; the couftant encrgy of providenes muft fill be adinited as sccelfay to preferve the forms and to continue the motions which wee originally impreffed upon the chaotimals. Frm late caporiments it appears extremely dubtful wheiher any two atoms of the moot fulid body Le in actual contian; and that they are not all in contact is certain. (See Meiaphysics, $1^{n} 176$. and Oprics, $n^{\circ} 4^{6}, 6,6,66$.) let it requires a very confiderable degrce of force to carry to a greater difance from one anobler the parts of a ftone or of a bar of iron. Dy what power then are thefe parts keft coniguous? It cannot be by their own; becaufe nothing can itt where it is not preenne, and becaufe cur teft pl:ilof phy has long taught us that the atoms of mat:er are eflentially inactive. Again, it requires a very great degree of force to bring two bodies, however fmall, into apparent contat (fee Opics, t bi fitira) ; and therefore it follows that they muft be kept afunder by fome foreign power. Every attempt to folve thefe phenomera by the intervention of a fubtle fluid is vain; for the quellion recurs, what leeeps the parts of the fluid itfelf contiguous, and yet feparated from each other?

The cohefion thee efore of the parts of malter, and that which is called their repulfive poser, demoriftra:e, through the whole fyitem, the immediate escrgy of fomething which is not matter, and by whith every body frall and great is preeerwed in its proper form. It has been elfewhere flown (fee Mitaphysics, Part II. chap. 5. and Motoos, $1^{\circ} 19,20$ ), that the varicus motions which are regularly carried on through the univerfe, by which animals and veretables grow and cecay, and by which we have day and night, fummer and winter, cannot be accounted for by any laws of mere mechanim, tut neceffaily imply the conftant agency of frmething which is itielf diftinet from matter. But the forms of bodies are preferved, and their natural motions carried on, for purpofes obvioufly planned by Wif. dom. The power therefore which effeets thefe things muft be combined with intelligence : but power and intelligence preferving the order of the univerfe conflitute all that is meant by a general providence ; which is therefore as certainly adminillered as the fun daily rifes and fets, or as bodies are kept folid by what is termed cohefien and repulfion.

Abfracted and metaphyfical as this reafoning may Reafunir appear, it is by no means peculiar to the philofophers of of the Bt lurope, Its force las been felt from time immeemno mine of
tial by the Dramins of Hindeftan, who, as Sir William Hido dofa Jones informs us*, "bcing unable to form a difinet idea - a fartic of brute matter independent of mind, or to conceive Fefarch that the work of fupreme goodnefs was left a moment Yul. 1. to itflef, imagine that the Deity is ever prefent to his work, not in fabftance but in fpirit and in encrgy." On this rational and fublime conception they have indeed built numberlefs abfurd fuperfitions; but their holding the opinion itfelf, ihows that they believe in the reality of providence upon philofophical principles: and what truth is there on which the mind of man has met ingralted marks of its own weaknefs?

Few mations, bowever, cxcept the ancient Greeks, have han philofophers equally futtile with the Dramurs

## PRO [ 609 ]

vidence of India; and therefore though all mankind have in general agreed in the belict of a fuperiatending Providence, they have in diflerent ages and countries admitted that truth upon different kinds of evidence, and formed very diffe:ent not ons concerning the mode in which the Divine fuperintendance is exerted.

While focieties are ftill in a rude and unpolifhed fate, while individuals polfés little fecurity and little leifure for the exertion of their ration.l powers, every imporiant or lingular appearance in nature becomes an object of wonder or of terror. In this Itate of ignorance, men fee not the univerie as it is, at grat collefion of connected parts, all c ntributing to form one grand and beautiful fyltem. Every appearance feems to ftand alone; they know that it muld have a caufe, hat what that cauf: is they are ignorant. The phenomena exh bited by nature are fo complicated and fo various, that it never occurs to them that it is pullible for one Being to govern the whole. Hence arofe the different fyftems of polythcifm that have appeated in the world. Nature was diviled inte different regions, and a particular invifible fower was affigned to each department: ore conducted the flaming chariot of the fun, another wielded the terrible thunuerbolt, and others were employed in diffufing plenty. and introducing the uleful arts among men. Thus, although the various fy'tems of polytheifm in gever.ll acknowledged one Supreme Ruler, the father of gods and men, yet they at the fime time peopled not only the regions above, the air and the heavens, but they alfo filled the ocean and the land, every grove, and every monntain, with active but invifible natures. Having arifen from the fame caufes, thefe fyltenss of polytheifm, which are fo many hypothefes concerning Divine providence, are all extremely timilar ; ard we have a very favourable $\int_{\text {pecimen }}$ of them in the elegant mythology of Greece and Rome, which gave to every region of nature a gitardian genius, and taught men in the deep recelfes of the foreft, or in the windings of the majeftic flood, to expect the prefence of prozesting and friendly powers. Sce Polytheism.

Notwithltanding this univerfal reception, in fome form or other, of the doctrine of a divine providence, it has in every age met with fome opponents. The mof ancient of thefe were Democritus and Leucippus. They denied the exiftence of a Deity-afferted that all things were mechanically neceffary, and that thought and fenfe were only modifications of matter. This is atheifm in the frieteft fenfe, and the only form of it that has crer been consiftently fupported. Epicurus followed upon the fame principles; hut he rendered the fytem allogether asford, by confefing the freedom of the human will. To avoid the imputation of atheifin, he afferted the esiftence of God; but declared that he refided alove the heavens, and interfered wot in human affairs. One of his maxims was, that "the bleffed and immortal Being neither hath any employment himfelf, nor trombles himfelf with others." Maximus Tyrius* jufly obferves, that this is rather a defcription of a Sardanapalus than of a Deity. And fome of the momilits + of andiun $y$ remarked, that they knew many men among themfelves $p$ lielled of astive and generous minds, whofe ch srafiers they valued more highly than that of Eficurus's god. Some of the ancients alfo appear to have emtertained the following frange notion: '1"her ackn wledged the exifteace of a Supreme and of

Vol. XV.
many inferior deitics; but at the fame time, they fup- irowidrou pofed that there is a certain fate which rules eser all, and is fuperior to the frods themiclves. See Necfsitit in Mythology.

The previdence exerted by the Author of nature over his works is ufually divided into twon branches: a general, refering to the managemerit of the unives ie at large ; and a paricular provider:ce, chichy regarding particular men.
Upon the firlt of thefe, in The Re'igion of Noture de. General linealed, the quefion is flated fomewhiat in the follow, proviing mamer: The world may be frid to be goveraled, deasco. or at leart cannot be faid to fluctuate fortuitounly, if there are laws or rules by which natural caufes an ; if the Several phenomena in it fucceed regularly, and in general the conflitution of things is preferved; if thete are rules obferved in the produation of herbs, trees, and the like; if the feveral kinds of animals are furnifhed with faculties proper to determine their actions in the different flations which they hold in the general conomy of the world ; and, laftly, if rational beings are taken care of in fuch a manner as will at laft agree belt with reafon. By the providence of God we ought to under fand his governing the world by /uch laws as thefe now mentioned: fo that if there are fuch, there muft be a Divine providence.
With regard to inanimate oljects, the cafe agrees pie As it recifely with the above fuppofition. The whole of that freetsinauniverfe swhich we fee around us is one magnificent and pamate ohe well regulated machinc. The world that we inlabit jcts. is a large globe, whicli, conduted by an invifible power, flies will a rapidity of which we have no cenception, through an exter.t of frace which fets at defiance every power of fancy to embody it into any dillinet image. A large faming orb fanós immoveable in the heavens; around which this, and other worlds of different magnitudes, perform their perpetual revolutions. Hence arife the expected returns of day and night, and the segula: diverfity of feafons. Upon thefe great operations a thoufand other circumfances depend. Hence, for example, the vapours afend from the oce:m, meet above in clouds, and after being condenfed, defcend in fhowers to cover the carth with fertiiity and beauty. And thefe appearances are permanent and reşular. During every age fince men lave been placed upon the earth, this aftonifhing machine continued fleadily to perform its complicated operations. Nothing is left to chance. The fmalleft bodies are not lefs regular chan the largent, and obferve continually the fame rules of attraction, repulfion, \&cc. The apparent variations of nature [ro. ceed only from different circumftances and combinations of things, ating all the while under their ancient laws. We ourflives can calculate the effects of the laws of gravitation and of motion. We can render them fulhfirvient to our own purpofes, with entire certainty of fuccefs if we only adlacre to the rules eltablilhed by nature, that is in fay, by providence.

Vigetalles alfo live and flourifl according to preferi- Vegtables, bed methods. Each fort is produced from its proper feed; has the fame texture of fibres, is at all times nourilhed by the fame kind of juices, dizefted and pre. pared by the fame vefiels. Trees and fhrubs recsive annually their peculiar liveries, and bear their proper fruits: fo regular are they in this lant refpeef, that every rpecies may be faid to have its profelion or trade ap-

## PR O

Providence pointed to it , by which it furnilhes a ecrtain portion of manufature, or of tood, to fupply the wants of animals: being created for the purpofe of confumption, all verretables produce great quantities of feed to fupply the necelfary wafte. Herc, too, then, thare is evidently a rgulation by which the feveral orders are preierved, and the ends of them anfivered according to their firit cttablifament.

With regard to animals, they too, in ftructure of their form, are fubject to laws fimilar to thofe which govern the vegetable world. In the fenticrt part of their conftitution they are no lefs fubject to rule. The lion is always fierce, the fox is crafty, and the hare is timid. Every fyecies retains from age to age its appointed place and character in the great family of nature. The valious tribes are madic and placed in fuch a manner as to find proper means of fupport and defence. Beafts, bircls, filhes, and infects, are all poffefied of organs and faculties adapted to their refpective circumbances, and opportunitizs of finding their proper food and prey.

Man is fubject to the ordinary laws which other material and animal fubltances obey; but he is left more at large in the determination of his actions. Yet even here things do not fluctuate at random. Individuals do indeed rife :md perifll according to fixed rules, and narions themfelves have only a temporary endurance. But the fpecics advances with a fleady progrefs to intellectual improvenient. This progrefs is often interrupted; but it appears not to be leis fure at the longfun than even the mechanical laws which govern the material part of our conflitution. Amidlt the convulfion of llates and the ruin of empires, the ufeful arts, when once invented, are never lof. Thefe, in better times, render fubliftence ealy, and give leilure for reffection and fudy to a greater number of individuals. Tyre and Sydon have paffed away, Athens itfelf has become the prey of barbarians, and the profperity of mucient Egypt is departed, perhaps for ever; but the thip, the plow, and the lonm, remain, and have been perpetually improving. Thus every new convollion of fociety does lefs mifchief than the laft; and it is loped that by the alliftance of printing the mon polifhed arts and the moft refined feculations have now become immortal.

The world is not then left in a ftate of confufion: it is reduced into order, and methodifed for ages to come; the feveral fpecies of beings having their offices and provinces affigned them. Plants, animals, men, :and nations, are in a ftate of contimual change; but fucceftors are appointed to relieve them, and to carry on the focme of Providince.

But the great dificulty is, how to account for that providence which is called particular: For rational beings, and frec agents, are capable of doing and deferving well or ill; and the dafety or danger, that happinefs or unhanpinets, of a man hore, mult depend upon many things that feem fearcely cufable of being determined hy Providence. Bufles kimfle and his own conduct, he deponds upon the conduct of other men; whote actirns, as we naturally tuppore, cannot, conffently wit! their free will, be controuled for the advantage of another ind.vidual. The attons of numbers of men groceeding upon their private frecdom, with different degrees of ability, as they crots and impede, or directly
oppofe each other, mut produce very different effects Prov upon men of different cliaracters, and thus in a ftrange manner embarrafs and entangle the general plan. And as to the courfe of nature, it may juftly be aiked, is the force of gravitation to be fufpended till a good man pafs by an infirm building? (See I'rayer.) Add to this, that forne circumftances :ppear abfolutely irreconcileable. The wind which carries one into port drives another back to fea; and the rains that are juft fufficient upon the hills may drown the inhabitants of the valleys. In fhort, may we expect miracles? or can there be a particular Irovidence that forefees and prepares for the feveral cafes of individuals, without force frequently committed upon the laws of nature and the freedom of intelligent agents?

In whatever way it is brought about, there is little No gor doubt that fomething of this kind muf take place. For as the Deity does direct, as already mentioned, the great and gencral progrefs of things in this world, he mult alfo manage thofe of lefs inportance. Nations are compufed of individuals. The progrefs of individuals is the progrefs of the nation, and the greatelt events ufually depend upon the hiftory and the moft trifling actions of private perfons. The difficulty is to con. csive how the fuperintendance and management of all this can be brought about. But as the ways and the thoughts of the Omnipotent Spirit, whofe influence pervades, and rules, and snimates nature, refemble not the limited operations of men, we can only form conjectures concerning the means by which his government is conducted.

1. In the firlt place, then, it is not impoffible that the Deity thould forefee the future actions of intelligent beings. Many of thefe actions depend upon the mechanifm of the material world, which was formed by himifelf, and muft be entirely known to him. Many men among ourfelves poffers mueh fagacity in difcerning the future actions of others, from attending to their known characters, and the circumftances in which they are placed. If fuperior natures do exift, and minds more perfect than the human, they muft poffefs this penetration in a more eminent degree in proportion to the excellence of their intellectual powers. Jut if this difcenment be in God proportionable to his nature, as in luwer beings it is proportionabie to theirs, it then becomes altogether unlimited, and the future actions of free agents are at once unlocked and expofed to his view. Add to this, that the Author of nature is well acquainted with the creatures iliat he has made; he knows the mechanifin of our bodies, the natme and cxtent of our underfandings, and all the circlimftinces by which we are furrounded. With all there advantages, it is making no great ftretch to fuppoic him capable of difcerning the line of conduct which we will parfue; and this even fetting afide the infinity of his nature, to which a thoufand years are as one day, and fuppofing him to reafon from probabilities in the imperfect manner that we do.
2. There is no imponibility at leat, that men, whole And ${ }^{\text {rs }}$ ma characters and actions are thus foreknown, may be in-thence fi troduced into the world in fuch times and places as them for that their astand behaviour m. $\%$ not only concide with the general plan of things, but may alfo anfwer fins in many private cafes. The cclellial bodies are fo placed that their jarsing attractions make out a folendid fy flem.

Asidence Why then may there no: be in the Divine mind fomething like a projection of the future hiltory of mankinct, as well as of the motions of the he.rvenly bodies? And why thould it not be thought potible for men, as well as for them, by fome fecret liw, or rather by the manigement of an unfeen power, to be brought into their places in fuch a manner as that, by the free ufe of their fitulties, the conjunstions and oppofitions of their interefts and inclinations, the natural influence of their dificerent degrees of talents, power, and wealth, they may corfpire to make out the great fcheme of human affirs ? There is no abfurdity in this fuppofition: it is not beyond the power of an almighty and perfect Being; and it is worthy of him. Let us take from the Jewifh hitory, as moft generally known, an example of what may be fuppofed to happen daily. It was the intention of provideace to place David the fon of Jeffe upon the throne of the Hebrews. The country is inraded by a foreign enemy : the hoftile armies meet, and lie encamped upon oppolite nountains. A man comes forth from the army of the invaders, as was extremely comm in in thofe times, and defies the Hebrew holt to fend forth a champion to meet him in fingle combat. Terrified by the gigantic bulk and mighty force of Goliah, no man would rink the unequal conflict. David, who was too young to carry arms, had been fent to the camp with provifions for his brothers, and heard the challenge. In defence of his flock he had killed fome bealts of prey in the wildernefs, and he was an excellent markfman with the fling. He thought it might probably be as eafy to kill a man as a wild beaft; at all events, he knew that a fone well directed would prove no lefs fatal to a giant than to a dwarf: he therefore refolved to try his filll ; and he tried it with fuccefs. Here no man's free will was interrupted, and no miracle was accomplifhed: Yet by this train of circumftances thus brought together, a foundation was laid for the future fortunes of the fon of Jeffe, for the greatnefs of his country, and for accomplithing the purpofes of Providence. According to Seneca, "Hoc dico, fulmina non mitti a Jove, fed fic omnia difpofita, ut ea etiam qua ab illo non fiunt, tamen fine ratione non fiunt : quæ illius eft.-Nam etfí Jupiter illa nunc non facit, facit ut fierent."-I fay, that the lightning comes not direatly from the band of Gove, but things are praporly difpofed for the indired execution of bis will; for be adts not immediate $y$, but by the intervention of means.
3. Laftly, it is not impoffule that many things may be accomplifhed by fecret infuence, upon the human mind, either by the Deity himfelf, or by the intervention of arents paffefled of powers fuperior to thofe which belong to uls. "For inftance, if the cafe flould require tha: a paricular man be delivered from fome threatening rinin, or from fome misforturn, which would certainly befal him if he thould goo fuch a way at fuch a time, as he intended: upon this occafion fome neru reafons may be prefented to his mind why he fhould not go at all, or not then, or not by that road; or he may forget
to go. Or, if he is to be delivered from fome danger Provi'eaic ous enomy, cither fome new thrn given to his thongl:is may divert him from going where the cucry will bc, or the ensmy may be after the fame mamer liserted frums coming where be flatl be, or his refentmeti may be gualifiel; or fome proper meibod of def.fite may be fuggefted to the perfon in danger. After the fume mansner advantages and fuccefles may be conferred on tla* deferving ; as, on the other lide, men, by way of punilisment for their crimes, may incur mifchicis a 9 calamities. Thefe things, and fuch as thele (fiys Mr Wollaf ton *), may be. For fince the motions and aktons of men, which depend upon their wills, do alfo depend upon their judgments, as thefe ag:ain do upon the frefont appearances of things in their minds; if a netr profeent of things can be any way produced, the lights by which they are feen altered, new forces and directions imprelted upon the firits, pallions exalted or abited, the power of judging enlivened or debilitated, or the attention taten oft without any fufpenfion or alteration of the ftanding laws of nature,-then, without that, new volitions, dicfigns, meafures, or a ceffation of thinking, may alfo be produced; and thus many things prevented that otherwife would be, and many brought about that would थes. That there may poffibly be fuch infpirations of new thoughts and counfels (continues our author), may perhaps appear farcher from this, that we frequeently find thoughts arifing in our heads, into which we are led by no difcourfe, nothing we read, no clue of reafoning, but they furprife and come upon us from we know not what quarter. If they proceeded from the mobility of fpirits ftraggling out of order, and fortuitous affections of the brain, or were they of the nature of dreams, why are they not as wild, incoherent, and extravagant as they are ?" Is it not much more reafonable to imagine that they come by the order and direction of an all feeing and all-gracious God, who continually watches over us, and difpofes every thing in and about us for the good of ourfelves or others? not to fpeak of the agree. ablenefs of this notion to the opinions of the beft and wifert men in all ages (A). "If this, then, be the cafe, as it feems to be, that men's minds are fufeeptible of fuch infinuations and impreffons, as frequently, by ways unknown, do affect them, and give them an inclination towards this or that; how many things (afks our author) may be brought to pafs by thefe means withont fixing and refixing the laws of nature, any more than they are untixed when one man allers the opinion of another by throwing in his way a bouk proper for that purpofe?"

All this may be effected either by the immediate in- And riay terpofition of God himelelf, or by that of beings ixyifible, be effected and in nature fuperior to us, who act as the minifters by beins of his providence. That thare are fuch beings we can furtuor to hy hardly doubt, as it is in the higheft degree improbable the Deity, that fuch imperfect beings as men are at the tup of ti:c fcale of created exiftence. And fince we ourfelves, ly the ufe of our limited powers, do often alter the contre $\therefore \mathrm{H}_{2}$ of
(A) That fuch was the general belief of the Greeks in the days of Homer, is plain from that poet's conflantly introducing his deities into the narrative of his poems, and telling us that Mincrva, or fome ohher god, altered the minds of his heroes. "By this," fays Plutarch, "the poet does not mean to make God diffroy the will of man, but only move him to will: nor does he miraculoufy produce the appetites themfelves in men, but only caufes fuch imaginations as are capabie of exciting them."
rovicicase of things within our fiphere from what they wonld be if left to the ordinary laws of motion and gravitation, without being faid to alter thofe laws; why may not fuperior beings do the fame as influments of divine providence? This idea of the interventina of fuperior matures is beantifully illuftrated by Thomfon in the following paffage :

Thefe are the haunts of meditation, thefe The fcenes where ancient bards th' infpiring breath, Eeftatic, felt ; and from this world retir'd, Convers'd with angels and immortal forms, On gracious errands bent : to fave the fall Of virtue flroggling on the brink of vice; In waking whifpers, and repeated drcams, To hint pure thought, and warn the favoured foul For future trials fated to prepare.
We agree, however, with Mr Wollafton, in thinking the power of thefe beings not fo large as to alter or fufpend the general law's of nature (fee Miracle) ; for the world is not like a bungling piece of clock-work, which requires to be often let backwards or for wards. Wie are likewife perfenly fatisfied, that they cannot change their condition, to ape us or inferior beings; and confequently we are not apt haftily to credit ftories of poricnts, $\hat{\&} \mathrm{c}$. fuch as cannot be true, unlefs the nature of things and their manner of exitence were occafionally reverfed. Yet as men may be fo placed as to become, even by the free exercife of thcir own powers, infruments of God's particular providence to other men ; fo may we well fuppofe that thefe higher beings may be fo rifiributcd through the univerfe, and futject to fuch an economy, unknown to us, as may render thenn a'fo inftruments of the fame providence; and that they may, in proportion to their greater abilities, be capable, confifently with the lazus of nature, of influencing human af-
19. fairs in proper places.

Objections We thall next proceed to flate fome of the chief to the doc- oljections which in ancient or modern times have been rince of providence.

20 From the ispperfec. tions of nature.

Solwercu. brought againft the opinion, that the world is governed by a Divine providerice.

1. The firft of thefe is this, that the fynem of nature contains many imperfections which it ought not to do if it be the work of a perfecily wife and good Being. To avoid the force of this objection, fome modern writers have deferted the ground of fupreme and abfolute goodnefs, which the ancient theifts always occupied, and have afferted that the divine perfection confints in unlimited power and uncontrouled fupremacy of will ; that confequently the Deity does not always that which is beft, but mercly what he himfelf pleafes; and that for no other reafon but becaufe he wills, to do fo. But this is no better than atheifn itfelf. For it is of no importance to us whether the univerfe is governed by blind fate or chance, that is to fay, by ncthing at all; or whether it is governed by an arbitrary fovereign will that is directed by chance, or at leaft by no principle of beneficence.

The true anfwer to this objection is, that no created fythem can liave cvery perfection, becaufe it muft neceffarily be deftitute of felf-exiftence and independence; and theretore if beings defitute of fome perfections be better than nothing, it was worthy of infinite power and perfert goodnefs to create fuch beigegs. In our prefent
ftate, we mortals fand upon too low ground to take a Provid commanding view of the whole frame of things. We can only reafon concerning what is unknown from the little that is within our reach. In that little, we can fee that wifdom and goodnefs reign; that nature always aims to produce perfection; that many falutary effects refult even from the thunder and the form: and we doubt not that a view of the whole ftructure of the univerfe vould afford an additional tiumph to the goodnefs and filll of its great Architect.

We fee a regular afeent in the feale of beings from mere lifelefs matter up to man; and the probability is, that the feale continues to afeend as far above men in perfection as created beings an pofibly be raifed.The fole purpofe of God in creating the world mot have been to produce happinefs: but this would be mott effectually dore by creating, in the firft place, as many of the mof: perfeet clafs of bcings as the fytem could contain; and aftersards other claffes lef; and lefs perfect, till the whole univerfe fhould be completely full. We do not pofitively affert fuch a fcheme of creation,

> Where all mult full, or not cohcrent be ;

And all that rifes, rife in due degree,
was actually in the divine Architect's intention ; but that it is poffible, is fufficiently obvious. No man will pretend to fay, that this earth could afford a comfortable fubfiftence to a greater number of the human race, were all the inferior animals annibilated, than it could at prefent, fwarming as every clement is with life.Suppofe then, that as many men had been placed at firit upon the earth as it could poffibly fupport, and that matters had been fo conflituted, as that the number fhould never have been either increafed or diminifhed; we beg leave to ank, whether, fince there would have been evidently room for inferior animals, it would have been moft worthy of infinite grodnefs to leare the whole globe to men, cr to introduce into it difierent orders of lefs perfer beings, which, while they could not incommode this principal i thabitant, would each find pleafure in its own exiftence? To this quellion differcut anfwers cannot furely be given. Let the reader then extend his riew, and confider the univelfe, which, however vaft, cannot be pofitively infinite, as one fyftem as much united as the feveral parts of this globe; let him fuppofe that there were at firf created as many of the higheft order of beings as it could have contained had creation there ftopt; let him remember that happinefs in many different degrees is valuable;-and he will not furely think it any impucation on the goodnefs of God that there are in the univerfe many beings far from perfestion. The moft imperfect of thefe are by thenfelves better than nothing; and they all contribute to make up a fyifem which, conlidered as a whole, we have every reafon to believe to be as perfect as any thing not felf-exiftent can poffibly be.
2. If the world is conduated by a benevolent provi- nuejsio dence, how came evil to be introduced into it? This from the quention has perplexed mankind in all ages. The an- introduc cient Perlians refolved it, by afferting the exiftence of two gods, Oromafdes the author of good, and Arimanius the author of evil. From them the Chriftian heretics called Minnichees borrowed their doetrine of two oppofite

## I: R O

nee oppofite co.ctermal puinciples. Loth the Platonifts and Stoies aferibed the origin of evil to the perverfenefs or imperfection of matter, which they thought the Deity could not alter; and Pythagoras imaegined a flate of pre-exifence, in which the fouls of men had committed offenes, for which they are herefuffering the punilhment. But thefe hypothefis are, fome of them impious, and all unfatisfatory.
Taking the exprellion in its mon extenfive fenfe, the evils to which the human race are expofed nay be reduced to pain, uncafinefs, difappointment of appelites, and dealh; of which not one could have been wholly prevented without occafioning greater evils, inconfiftent with the perfect groeduef's of the Creator. As long as we have folid bodies capable of motion, fupported by food, fubject to the influence of the atmolphere, and divilible, they mult necefarily be liable to diffolution or death : Dut if a mancould fuffer death, or have hus limbs broken, without feeling pain, the human race hid been long ago cxtinct. A fever is a fate of the body in which the fluids are in great diforder. Felt we no uneafinefs from that diforder, we thould have no inducenent to pay the proper attention to our Itate, and fhould sertainly die unawares, without fufpecting ourfelves to be in danger ; whereas, under the prefent adminiftration of divine providence, the pain and fickncfs of the difeafe compel us to have recourfe to the remedies proper for reftoring us to foundnefs and to health. Of the uncafinefles to which we are liable, and which are not the effect of immediate pain, the greatell has been fometimes faid to arife from the apprehenlion of death, which conftantly fares us in the face, :und frequently embitters all our pleafures even in the hour of perfect health.But this dread of death is implanted in our breafts for the very beft of purpofes. Had we no horror at the apprehenfion of death,, we fhould be apt, whenever any misfortune befcl us, to quit this world rafhly, and rufh unprepared into the prefence of our Judge: but the horror which attends our reflections on our own diffolution, atifing not from any apprehenfions of the pain of dying, but from our anxiety concerning our future flate of exiftence, tends ftrongly to make us ast, while we are here, in fuch a manner as to enfure our happinefs hereafter. Add to this, that the fear of death is the greatell fupport of human laws. We every day fee perfons breaking through all the regulations of fociety and good life, notwithltanding they know death to be the certain confequence, and feel all the horrors of it that are natural to man: and therefore were death divefted of thefe horrors, how infignificant would capital punifhments be as gu:rdians of the law, and low infecure would individuals be in civil fociety?
